ABBREVIATIONS

The titles of subjects, which are printed first in bold type, have been abbreviated within each article to the initial letter or letters.

ac. , acre(s).	lb. , pound(s).
agric. , agricultural.	l. b. , left bank.
ambas. , ambassador(s).	long. , longitude.
Amer. , American.	m. , mile(s).
anct. , ancient.	manuf. , manufacture(d).
ann. , annual.	M.E. , Middle English.
arron. , arrondissement.	min. , minute(s).
A.-S. , Anglo-Saxon.	Mod. E. , Modern English.
A.V. , Authorised Version.	m.p.h. , miles per hour.
b. , born.	mrkt tn. , market town.
Biog. Dic. , Biographical Dictionary.	MS., MSS. , manuscript(s).
bor. , borough.	mt, mts. , mount, mountain(s).
bp. , birthplace.	N. , north; northern.
Brit. , British.	N.T. , New Testament.
c. , about.	O.E. , Old English.
C. , Centigrade.	O.F. , Old French.
cap. , capital.	O.T. , Old Testament.
cent. , century (7th cent.).	oz. , ounce(s).
chem. , chemistry.	par. , parish.
co. , county.	parl. , parliamentary.
com. , commune.	pop. , population.
cub. ft. , cubic feet.	prin. , principal.
d. , died.	prof. , professor.
Dan. , Danish.	prov. , province; provincial.
dept. , department.	pub. , published; publication.
dimin. , diminutive.	q.v. , Lat. <i>quod vide</i> , which see.
dist. , district.	R. , riv., river.
div. , division.	R.A.F. , Royal Air Force.
E. , east; eastern.	Rep. of Ireland , Eire.
eccles. , ecclesiastical.	R.N. , Royal Navy.
ed. , edition; edited.	Rom. , Roma.
educ. , educated.	r.p.m. , revolution per minute.
e.g. , for example.	R.V. , Revised Version.
Ency. Brit. , <i>Encyclopaedia Britannica</i> .	S. , south; southern.
Eng. , English.	sec. , second(s).
estab. , established; establishment.	sev. , several.
fl. , flourished.	Sp. , Spanish.
Flem. , Flemish.	sp. gr. , specific gravity.
fort. tn. , fortified town.	sq. m. , square miles.
Fr. , French.	temp. , temperature.
ft. , feet.	ter. , territory.
Ger. , German.	tn. , town.
Gk. , Greek.	trans. , translated; translation.
gov. , government.	trib. , tributary.
Heb. , Hebrew.	U.K. , United Kingdom.
hist. , history.	U.N. , United Nations.
horticult. , horticultural.	univ. , university.
h.p. , horse-power.	U.N.O. , United Nations Organisation.
H.Q. , headquarters.	urb. , urban.
hr(s) , hour(s).	U.S.A. , United States of America.
in. , inch(es).	vil. , village.
inhab. , inhabitant(s).	vol. , volume.
is. , island(s).	W. , west; western.
It. , Italian.	Wm. , William.
Jap. , Japanese.	yd(s) , yard(s).
jour. , journal.	
Lat. , Latin.	
lat. , latitude.	

Mura, see SLOVENIA.

Murad, see AMURATH.

Murakami, city of Niigataken, Japan, 32 m. NE. of Niigata. A centre of agriculture, it has metal and chemical industries. Pop. 33,000.

Mural Decoration (Lat. *murus*, wall), art of adorning walls by means of surface painting in fresco, oils, or encaustic, by mosaic compositions, and by carving in wood, terra-cotta, stone, or marble. The term is also extended to the decorative treatment of vaults and ceilings. In early Egyptian art interior walls were covered with figure and other designs in low relief, or deeply incised, and were gaily coloured. Wonderful examples of M. D. of the Mycenaean Age have been discovered at Knossos. In Assyria walls were decorated with sculptured dadoes and coloured friezes, representing groups of figures. The sculptured friezes and metopes of ancient Greece, used as decorations for temples and public buildings, are of incomparable beauty. The Romans employed 3 principal methods of M. D.: painting in fresco, mosaics, and marble incrustations. Some remains of mural paintings have been preserved at Pompeii. In later cents. It. artists painted in oils on plaster. Cimabue and Giotto painted in fresco, leading the way in a form of M. D. which superseded all others. During the Middle Ages mural painting was used extensively in churches until the introduction of large areas of stained glass. In modern times the art of M. D. has declined, save in special cases such as saloons of great liners, restaurants, and schoolrooms. See also FRESCO PAINTING; MOSAIC; TAPESTRY. See A. L. Baldry, *Modern Mural Decoration*, 1902; F. H. Jackson, *Mural Painting*, 1904; J. C. Wall, *Medieval Wall Paintings*, 1914; H. Feibusch, *Mural Painting*, 2nd ed., 1947; E. W. Anthony, *Romanesque Frescoes*, 1951.

Murano, suburb of Venice (q.v.), in Veneto (q.v.), Italy. It is built on sev. is. in the lagoon, and has been famous for its glass since medieval times (see GLASS). The industry, which had been in decline since the 18th cent., has been revived, and optical glass is also now made. There is a museum of glass, and the Byzantine church of S. Maria e Donato has some fine 12th-cent. mosaics. Pop. 8600.

Murat, Joachim (1767-1815), Fr. soldier and King of Naples, son of an innkeeper, b. La Bastide-Fortunière, near Cahors, France. He entered the Fr. Army, in which he served under Napoleon in Italy and Egypt, distinguishing himself at the battle of the Pyramids (1798). For his part in the 13th Vendémiaire he was made a lieutenant-colonel and first aide-de-camp to Napoleon, and after Aboukir was made a general of div. He dispersed the Council of Five Hundred at St Cloud in 1799, and in the following year married

Napoleon's youngest sister, Marie Armonciade Caroline. He was made governor of the Cisalpine rep. in 1801, and after taking part in the battles of Jena, Eylau, Austerlitz, etc., was made Grand Duke of Berg and Cleves for his share in the last-named. In the invasion of Spain in 1808 he commanded the Fr. armies, but shortly afterwards Napoleon gave him the crown of Naples, and he was proclaimed King of the Two Sicilies. He styled himself King Joachim-Napoleon and his rule was generally liberal in character; but he

JOACHIM MURAT

soon offended Napoleon by his sumptuous court life and by the number of marshals he created. In 1812, however, he rallied to his old master and commanded the cavalry of the grand army which invaded Russia; but after the battle of Leipzig he hurried back to his kingdom and, having broken with Napoleon, made overtures to Austria and Great Britain. When Napoleon escaped from Elba M. thought he could himself win all Italy and then treat with Napoleon as an equal, but he was checked at Ferrara and routed at Tolentino. He then organised an expedition to Calabria against the restored Bourbons, but his popularity had vanished, and he was captured and shot at Pizzo. See lives by J. Chavanon and G. Saint-Yves, 1905; H. Weil, 1909-10; A. H. Atteridge, 1911; A. de Tarle, 1914; also L. Monnier, *Murat et le Congrès de Vienne*, 1937.

Muratori, Lodovico Antonio (1672-1750), It. scholar, antiquary, and historian, b. Vignola, near Modena. In 1694 he became director of the Ambrosian College and Library at Milan, and while there pub. *Anecdota Graeca* and *Anecdota Latina*, previously unedited fragments. Recalled to Modena (1700), he

Murav'ev

became librarian and archivist to Duke Rinaldo I. His 3 chief works are *Rerum italicarum scriptores*, 1723-51, dealing with the sources of medieval It. hist.; *Antiquitates Italicae medii aevi* (1738-1743), describing the constitution, customs, and thought of the Middle Ages; and *Annali d'Italia*, 1744-9, first complete ed. 1758-6, a critical hist. of Italy from the birth of Christ down to 1750. His collected works were pub. 1767-80 and 1790-1810 and his letters, ed. by M. Cămpari, 1901-22. See lives by F. G. Muratori, 1756, and G. Bertoni, 1926.

Murav'ev, Count Mikhail Nikolayevich (1796-1866), Russian administrator, strong opponent of Alexander II's reforms. In 1863-5 he was Governor-General in Vilna; he ruthlessly suppressed the Polish rising of 1863.

Murchison, Sir Roderick Impey (1792-1871), geologist, b. Tarradale, Ross-shire, Scotland. He served in the Peninsular campaign, being present at the battle of Corunna. He left the army in 1816 and devoted himself to geology. He studied the older rocks of large parts of England and Scotland, and later travelled in Europe, studying the geological structure of the Alps. He advised the Russian Gov. on geological matters and succeeded de la Beche as director general of the Geological Survey of the U.K., 1856. M.'s chief title to fame was the estab. of the Silurian system and his exposition of the Permian, Devonian, and Laurentian systems. Amongst other works he pub. *The Silurian System*, 1838, and *The Geology of Russia in Europe and the Urals*, 1845. See life by Sir A. Geikie, 1875.

Murchison, gold-field of W. Australia, N. of Lake Austin, 21,600 sq. m. in area. Cue is the cap. of the dist., 540 m. NNE. of Perth. The M. R. forms the E. boundary of M. Pop. 1800.

Murchison Falls, in Uganda on the Victoria Nile about 20 m. from its exit from Lake Albert. At these falls there is a drop of the riv. of about 130 ft, the whole volume of the Nile passing through a rock-cleft only 19 ft wide in the elevated scarp at its narrowest point and then thundering down 401 ft in a series of splendid cascades. In the pool below are thousands of enormous fish and crocodiles. M. F. is easily reached by road or by steamer from Butiaba. The surrounding dist. is immensely rich in the characteristic fauna of E. Africa, including elephants, lions, rhinoceros, buffaloes, monkeys, and an infinite variety of antelope. During the winter season the Kenya and Uganda Railways and Harbours organises special excursions. See H. B. Thomas and Robert Scott, *Uganda*, 1935.

Murcia: 1. Region in SE. Spain, comprising the provs. of M. and Albacete (q.v.). It was once a kingdom, which arose after the defeat of the last Visigoth king, Roderic (q.v.), and which, although Christian, was trib. to the Moors. The Moors later absorbed it and, finally, in 1242 it was taken by Ferdinand III and joined to Castile (q.v.). Area 10,109 sq. m.; pop. 1,169,300.

2. Sp. prov. in the region of M., with

Murder

a coastline on the Mediterranean. It is watered by the Segura and its tribs., the Sangonera and Quipar, and is very mountainous in the S. and E. Oranges, olives, palms, mulberry-trees, and vines are grown, and there are large deposits of salt and minerals, especially lead and zinc. Area 4370 sq. m.; pop. 766,300.

3. Sp. city, cap. of the prov. of M., on the Segura, in a celebrated *huerta* (garden country). It has a 14th-16th-cent. cathedral, with an 18th-cent. Baroque façade, and other old churches, but the greater part of the city has been rebuilt since the 18th cent. There is a univ.,

MURCIA: THE CATHEDRAL

1915. Textiles, iron, copper, and gunpowder are manuf. Pop. 223,650 (city proper, 45,000).

Murder. The generally accepted definition of M. in Eng. law is that of Coke: 'when a person of sound memory and discretion unlawfully killeth any reasonable creature in being, and under the king's peace with malice aforethought, either express or implied' (see MALICE). Paraphrased this means: (1) That within limits children and idiots, or lunatics, cannot be guilty of M. But a lunatic who kills another person may be confined in Broadmoor or some other criminal lunatic asylum during the royal pleasure (see also INFANT and CRIMINAL LAW). (2) That the mere killing of another by whatsoever means, whether by an act or omission likely to result in death, raises a presumption of felonious homicide which the accused must rebut by showing some justification (see HOMICIDE) or excuse (as, for example, self-defence). (3) That it is not M. to kill an infant in the womb, though such act of procuring abortion is punishable as a felony with penal servitude to the extent of life. But where a child born alive (in Scots law this

is proved by anyone who heard the child cry; in Eng. law by medical testimony that it breathed) afterwards dies by reason of drugs or wounds received while in the womb (*a fortiori* afterwards), those who administered such drugs or wounds are, according to the better opinion, guilty of M. (4) That it is not M. to kill an alien enemy actually participating in warfare against the state, but M. committed by a Brit. subject upon a foreigner (not an enemy) abroad is an extraditable crime, and the murderer can be punished by an Eng. court. (5) That the guilty state of mind essential to M., though generally one of sedate and deliberate intention to kill, may be inferred from any wanton or cruel act against another likely to result in death (*see also* MANSLAUGHTER and MALICE). 'Constructive' M. means the killing of a person while engaged in committing another felony; for example, if a burglar fearing capture rushes so violently past an inmate of the house as to cause his death, that will be M. however unintentional the killing. But in practice the death penalty is never inflicted in a clear case of merely 'constructive' M. There is no *crime passionnelle* in Eng. law, for no provocation, however great, will justify killing, though if there be no *express* malice (q.v.), the charge will be reduced to manslaughter.

Attempted suicide or self-murder is a felony punishable by imprisonment, but it is a commonplace of Eng. criminal law that if 2 people agree to commit suicide together and 1 survives, the survivor is guilty of M. Accessories before the fact to M. are equally guilty and punishable with the prin. offender; and an attempt to commit M. is punishable with life imprisonment. The punishment for M. is life imprisonment, except in certain cases called 'capital' M. (*see* CAPITAL PUNISHMENT). In A.-S. times it was redeemable by payment of *werild* (q.v.), or blood money, to relatives of the murdered man. In some of the United States M. is classified into degrees. For example, M. by poison or by any premeditated design is M. in the first degree, and punishable with death; all other kinds of M. are said to be in the second degree, and punishable with imprisonment. For recent discussion on the question of the suspension or abolition of the death

penalty, and the suggestion that Eng. law and practice should recognise degrees of M., *see* CAPITAL PUNISHMENT. *See also* CRIMINAL LAW.

Murdock, William (1754-1839), engineer and inventor, *b.* Auchinleck, Ayrshire. In 1792 he used coal gas as an illuminant in his own house, and 10 years later it was used for lighting Soho. He also experimented on a high-pressure locomotive, and in 1784 made a small locomotive steam engine. He improved greatly on Watt's steam engine, and invented apparatus by which it was possible to use compressed air, devising the first oscillating steam engine.

Mure, Sir William (1594-1657), poet, *b.* Rowallan, Ayrshire. He became M.P. in Edinburgh in 1643, the following year being wounded at Marston Moor. He wrote a poetical trans. of Boyd's *Hecatombe Christiana*, 1628, *The True Crucifixe for True Catholics*, 1629, a version of the Psalms, *The History and Descent of the House of Rowallan* (pub. 1825), and sev. miscellaneous poems.

Mures River, riv. in Rumania and Hungary, and a trib. of the R. Tisza, which it joins at Szeged. It rises in the Carpathians and is 450 m. long.

Muret, or Muretus, Marc Antoine (1526-1585), Fr. humanist, *b.* Muret, near Limoges. In 1563 he went to live in Rome, where he lectured and taught civil law till 1584, when he retired. He ed. Lat. authors and wrote *Orationes, Epistolae*, 1838, and *Variorum Lectionum Libri XIX.* His collected works were ed. by C. H. Frotscher, 1834-41.

Muret, Fr. tn, cap. of an arron., in the dept of Haute-Garonne, at the confluence of the Garonne and the Louge. In 1213 the Albigenses (q.v.), supported by the Catalans, were defeated here by the Crusaders of Simon IV de Montfort (*see* under MONTFORT). M. produces a white wine. Pop. 4400.

Murfreesboro, city and co. seat of Rutherford co., Tennessee, U.S.A., 29 m. SE. of Nashville. It lies in an agric. dist., and carries on a considerable trade in cotton, grain, livestock, timber, etc. It is the seat of Middle Tennessee State College. M. was settled in 1811, and incorporated in 1817. Near by was fought the battle of Stones R. in 1862. Pop. 13,050.

against Mary at her trial. He was murdered at Linlithgow by James Hamilton of Bothwellhaugh, and was buried in St Giles's Cathedral, Edinburgh.

JOHN MURRAY (1778-1843)

Murray, John, name of sev. generations of Eng. publishers, and one that will long remain associated with many a classic writer of Eng. literature. John M. (1745-93), the founder, b. Edinburgh, first served as an officer in the Royal Marines. In 1768 he purchased the book-selling business of Wm Sandby, and thenceforth became a bookseller and publisher at 32 Fleet Street. His son John M. II (1778-1843), Byron's publisher, founded, 1809, the *Quarterly Review*, and moved the firm to Albemarle Street, where they operate to-day. John M. III (1808-92) founded the *M. Handbooks* for travellers.

Murray, Sir John (1841-1914), Canadian naturalist and geographer, b. Coburg, Ontario, and educ. in Ontario, the High School, Stirling, Scotland, and at Edinburgh Univ. He was one of the naturalists who made the famous voyage in the *Challenger*, and was appointed editor of the reports of the expedition. He also took part in the explorations in the *Triton* and *Knight Errant* to the Farø Channel. He wrote books and articles on geographical and marine subjects.

Murray, Lindley (1745-1826), Anglo-Amer. grammarian, b. Swatara, Pennsylvania. He was called to the Bar in 1765. In 1784 he settled in England and devoted himself to literature. His first book was *Power of Religion on the Mind*, 1787. Later he wrote *English Grammar*, 1795, which went through 200 eds. before 1850, long a standard work and his chief claim to a place in literature. These were followed by various works, such as Eng. readers, etc. See *Memoirs in Letters written by Himself*, 1826.

Murray, William, see MANSFIELD, W. **Murray, or Hume**, prin. riv. of Australia, rising in the Australian Alps and flowing W. to the sea through the shallow Lake Alexandrina. For the greater part of its

course it forms the boundary between New S. Wales and Victoria. In conjunction with the Darling it drains almost the entire SE. quarter of the continent. Its total length is about 1600 m. Owing to sandbars at its mouth it is inaccessible for large vessels but navigable for small steamers. Its chief tribs. are the Murrumbidgee, Lachlan, and Darling. The water of the M. is used for irrigation purposes, being dammed at the Hume Reservoir, where the Mitta Mitta joins it, so that it is available in the dry season. The Hume Reservoir stores 1,382,000 ac. ft of water (to be enlarged to 2,500,000 ac. ft), which runs off a catchment area of about 6000 sq. m. of mountainous country on the border of Victoria and New S. Wales. It is composed of an earthen embankment 411 ft long and a massive concrete wall, forming the spillway and outlet works, across the riv. for 1042 ft on the New S. Wales side. On the Victorian side an earthen embankment 3827 ft long brings the total length to 1 m. The reservoir forms a vast inland lake of 33,000 ac.—3 times the size of Sydney Harbour. The large volume of water stored in it ensures an adequate flow of water in the irrigated areas in the lower reaches of the M. It. In 1949 the govs. of New S. Wales and Victoria agreed on a scheme for the diversion of the headwaters of the Snowy R. (q.v.) across the Australian Alps into the Upper M. and Tumut R.s in connection with a vast hydro-electric irrigation project now in course of construction by the Snowy Mts Hydro-electric Authority (q.v.). See J. M. Holmes, *The Murray Valley*, 1948.

Australian News and Information Bureau

MURRAY RIVER
The Concrete Wall.

Murray Bridge, tn. of S. Australia, on the R. Murray, 50 m. SE. of Adelaide, on the Adelaide-Melbourne road and railway line. Centre of an extensive dairying

Murraysburg

industry, its other pursuits are agricultural and pastoral. It is a popular tourist resort. Pop. 4000.

Murraysburg, vil. and div. of Cape Prov., S. Africa. The vil. is 50 m. WNW. of Graaf Reinet (q.v.). Important wool-producing centre. Pop.: Whites, 659; Others, 1673.

Murree, tn of W. Pakistan, some 40 m. NE. of Rawalpindi. M. is a well-known hill station (altitude 7500 ft) with fine views of the snow mts of Kashmir, and is the site of one of the Lawrence schools for the children of soldiers.

Mürren, vil. of the Bernese Oberland, Switzerland, above Lauterbrunnen, from where it is reached by a funicular railway. It is situated at an altitude of 5115 ft, and affords a fine view of the Jungfrau. M. is a popular resort and winter sport centre.

Murrhine, or **Myrrhine**, **Vases**, celebrated vessels of antiquity, brought from Asia to Rome by Pompey after his victory over Mithridates.

Murrumbidgee, riv. of New S. Wales, rising on the NE. of the Australian Alps, and flowing 1000 m. westwards to join the Murray, 90 m. SE. of the mouth of the Darling. It is navigable for 500 m. during the wet season.

Murry, John Middleton (1889-1957), critic, b. Peckham, London. He was educ. at Christ's Hospital and Brasenose College, Oxford, and was on the staff of the *Westminster Gazette*, 1912-13, being art critic, 1913-14. During the First World War he served in the political intelligence div. of the War Office, and was awarded the O.B.E. Editor of the *Athenaeum*, 1919-21, and of the *Adelphi*, 1923-30, he became Clark lecturer at Cambridge Univ. in 1924. His writings largely consist of literary criticism and criticism of existing social institutions. Among his many works are *Aspects of Literature*, 1920, *The Things We Care*, 1922, *Things to Come*, 1928, *God*, 1929, *Son of Woman* (a study of D. H. Lawrence), 1931, *The Necessity of Communism*, 1932, *Between Two Worlds* (an autobiography), 1934, *The Defence of Democracy*, 1939, *The Betrayal of Christ by the Churches*, 1940, *Christocracy*, 1942, *Adam and Eve*, 1944, and *The Free Society*, 1947. In 1919 he pub. a collection of *Poems*. He collaborated with Ruth E. Mantz in a biography of his wife, Katherine Mansfield (q.v.), in 1933, and also wrote studies of Blake, 1933, Shakespeare, 1936, Keats, 1949, and Swift, 1954. He rejected criticism which lacks that reference to life as a whole which, in his later years, he came to regard as essential to all criticism, and considered that 'the function of true criticism is to establish a definite hierarchy among the great artists of the past, as well as to test the production of the present; by the combination of these activities it assists the organic unity of all art.' It is said that the character of Denis Burlap in Aldous Huxley's *Point Counter Point* is founded on M.'s personality. See study by R. Heppenstall, 1934; see also Katherine Mansfield, *Letters to John Middleton Murry*, 1951.

Muscadet

Mursa, see OSIJEK.

Murshidabad, city of W. Bengal state, India. The city lies 115 m. N. of Calcutta, and extends along both sides of the sacred R. Bhagirathi. M. was the residence of the Nawab Nazims of Bengal, of whom Suraj-ud-Daula, whose name is connected with the Black Hole of Calcutta, was one. M. was formerly a great centre for ivory carving and embroidery, but few craftsmen remain. Both Clive and Warren Hastings stayed here, and the pleasure garden near the Pearl Lake is still known as the Company Bagh.

Murten (Switzerland), see MORAT.

Murtoza, tn of Portugal, in Aveiro dist., on the Aveiro lagoon, 6 m. N. of Aveiro (q.v.). It has fishing and salt industries. Pop. 3000.

Murviédro, see SAGUNTO.

Murwillumbah, tn on Tweed R., 581 m. N. of Sydney, close to the New S. Wales-Queensland border in Australia. M. is 20 m. from the coast and the main rural pursuits are banana-growing and dairying. Pop. 6800.

Mus, Mush, or Moush, prov. (il) of Turkey, 55 m. W. of Van Göll Lake. Pop. 136,248.

Musa, Abu Abdallah Mohammed Ben, Arabian mathematician, the first of his countrymen to write on the science of algebra, to whom Europe is indebted for its introduction.

Musa, Antonius, see ANTONIUS MUSA.

Musa, Ibn Nusair, or Noseir (AD 640-715), was appointed Governor of Ifriqiya (Rom. Africa) in 698 or 699 by the brother of the caliph, who was Governor of Egypt; and from this base he conquered N. Africa. He left as his deputy in the extreme W. his freedman Tariq, who began in 710 a successful invasion of Spain. M. was jealous, followed him in 712, and conquered most of the country up to Saragossa, leaving Spain in 714. On reaching Damascus he found that he was not in favour with the caliph, though the tales of his last years are legendary.

Musaeus (late 5th cent. AD), Gk poet, author of a short epic entitled *Hero and Leander*, a work of great charm. There is a Ger. ed. by A. Ludwig, 1912, and a trans. by F. L. Lucas, 1949.

Musäus, Johann Karl August (1735-1787), Ger. novelist, b. Jena. His first work, entitled *Grandison der Zweite*, was pub. in 1762 and rewritten about 20 years later under the title of *Der deutsche Grandison*, its object being to satirise the Eng. novelist Richardson's hero. His most important work was *Volksmärchen der Deutschen*, a series of satirical tales, 1782-6. See M. Müller, J. K. A. Musäus, 1867; also Carlyle's trans. and biographical notices.

Musca (Lat. 'fly'), constellation situated between Chamaeleon and the S. Cross, originally called Apis Musca Australis. It contains 20 stars catalogued as brighter than magnitude 6 and hence, under ideal conditions, visible to the naked eye, but probably only about half of these would usually be so visible.

Muscadet Wine is made from the M. grape grown largely in the Nantes dist. of

the Lower Loire. The M., which gives a sound ordinary wine, must not be confused with the muscat (q.v.); it is the *gamay blanc* or melon of Burgundy.

Muscardine, or **Silkworm Rot**, disease which causes much loss among silkworms. It is caused by a fungus, many allied species of which are parasites on Lepidoptera, both in the caterpillars and the perfect insects.

Muscat, tn and seaport on the SE. coast of Arabia, cap. of the sultanate of Muscat and Oman (q.v.). It is under Brit. political influence. The climate is hot and unhealthy. Dates are the prin.

Mississippi R. (bridged), 25 m. WSW. of Davenport. It manufs. pearl buttons (from riv. mussel shells), steel pulleys, pumps, and castings. Pop. 19,000.

Musci, see **MOUSES**.

Muscle, structure of the body capable of causing motion by the contraction of its fibres. Muscular tissue consists of elongated cells or fibres. The fibres making up some of the M.s consist of protoplasmic material with transverse stripes; these are called striped or striated fibres. Others possess no transverse markings, and are therefore known as non-striated or plain muscular fibres.

MUSCLE

1. B, biceps muscle; O, origin, attachment to scapula by two tendons; L, insertion on radius.
2. Diagrammatic representation of nerve, F, and its end-plates on a striated muscle fibre; N, nucleus.
3. Connected cells of cardiac muscle (diagrammatic); N, nucleus.
4. Unstriated muscle fibre (diagrammatic); C, cytoplasm; N, nucleus.

export. M. was taken by the Portuguese in 1508 and remained under their rule till 1650, when they were finally expelled. M. was once an important, prosperous tn, but has been falling into decay for many years and most of its former trade now goes to the sister port of Matrah, which is the starting point of the trade route to the interior; but M. still remains the seat of gov. Pop. of M., about 3500; of Matrah, 8500.

Muscat, name of the most highly scented genus of *Vitis vinifera*, the European vine. It is generally grown for dessert grapes, but the M. flavour is conspicuous in the Fr. Muscat de Frontignan and the Portuguese Setubal. The name Muscatel is given to a cheap, sparkling wine with elder-flower essence imitating the M. flavour.

Muscatine, city, cap. of Muscatine co., Iowa, U.S.A., and rail centre, on the

Every muscular fibre has the property of contracting, that is, on the receipt of a certain stimulus a chemical change is brought about, resulting in a change in the elastic tension of the cell. An increase of tension occurs in the points of attachment of the cell to neighbouring tissues, which ordinarily move under the strain, so that the length of the fibre decreases, while its diameter becomes proportionately bigger. In some M.s this contraction is voluntary; that is, it is the result of an act of will. This modification of consciousness is accompanied by a certain mode of activity in some of the cells of the large brain, or cerebrum. By this means an impulse is communicated to the nerve-fibres supplying the M.s and is conveyed to the M. by end-plates or expansions of the nerve-fibres situated on the surface of the muscular fibres. Other M.s are not under the control of the will.

Such are the M.s causing the movements of the stomach and other parts of the alimentary canal. They are called involuntary M.s, and are made up of non-striated fibres, except the cardiac M., which resembles voluntary M.s in being striated. It is, however, not always possible to classify M.s as voluntary and involuntary, for some of them, such as those of the tongue, larynx, and eyeballs of the Vertebrata, and certain M.s of Arthropoda, are intermediate in type. The capacity of a M. for responding to a stimulus is termed its excitability. In cardiac M. the extent of contraction does not depend upon the intensity of the stimulus, but in M.s attached to the bones a relation is maintained between contraction and stimulus. If, however, a M. has been repeatedly contracted without much intermission, a stimulus does not evoke the usual degree of contraction. This condition is called muscular fatigue, and further evidence of it is afforded by the increasingly long periods of relaxation. Eventually the M. will fail to respond at all to the stimulus. Muscular fatigue is due to the formation of lactic acid from the glycogen in the M. cells. This glycogen is produced by the action of insulin (q.v.) on the sugar dissolved in the blood, and, apparently by an internal rearrangement of the molecule, glycogen is converted into lactic acid. This change accompanies the contraction of the M., and heat is produced during the process. A young athlete, running as fast as he can, produces about 4 grammes of lactic acid per sec.

During relaxation some of the protein in the M. cell combines with and neutralises the lactic acid, and recovery from fatigue is effected by oxidation of the product. This process results in the re-formation of protein, the conversion of some of the lactic acid into glycogen, and the complete oxidation of the remainder with the elimination of carbon dioxide and the production of heat.

When exercise is moderate the amount of lactic acid in the blood reaches its maximum after a few minutes and is quickly removed by the increase of the oxygen supply by deep and rapid breathing. If exercise be very strenuous the lactic acid increases until there are symptoms of distress, and eventually a type of *rigor mortis* may be caused. The fleshy part of a M. is usually attached at each end to bands, or tendons, of white fibrous tissue, which is itself non-contractile, but in Vertebrata serves to join the M. to some bone. The attachment which is more fixed is called the origin; that which is more movable is called the insertion. Thus the biceps has 2 origins, in the coracoid process and the glenoid cavity; its insertion is in the tuberosity of the radius, or the outer bone of the forearm. Every M. is supplied with blood-vessels, and lymphatics to carry the substances for repair of tissue, for the combustion which liberates the energy resulting in contraction, and for the removal of waste products.

Muscovy, Russian 14th–18th-cent. state. Princes of Moscow first appeared as vassals of the Grand Princes of Vladimir (q.v.) in the 13th cent. after the Mongol-Tatar conquest (see BATU and GOLDEN HORDE). Thanks to its advantageous geographical position in the centre of the then NE. (now central) Russia (which facilitated commercial development and sheltered it from Tatar raids), and to the consistent and tenacious policy of its princes, Moscow in the 14th cent. gradually achieved supremacy over neighbouring principalities and replaced Vladimir as the cap. of the Grand Principality. The most outstanding rulers of this period were Ivan the Money-bag (q.v.) and Dmitriy Donskoy (q.v.), who achieved the first victory over the Tatars in 1380. The struggle against the Tatar overlordship continued until it was finally abolished in 1480 by Ivan III (q.v.). The territorial expansion of M. continued until it absorbed all Russian lands (including the reps. of Novgorod in 1478, Vyatka in 1489, and Pskov in 1510, and the Grand Principalities of Tver' in 1485 and Ryazan' in 1521 (qq.v.)) which had not been annexed by Lithuania (q.v.). In 1547 Ivan the Terrible (q.v.) assumed the title Tsar (q.v.) of All Russia. During his reign the Tatar Khanates of Kazan', Astrakhan', and Siberia were conquered, and M. became a multi-national state. Soon afterwards the house of Iturikidae (q.v.) died out, and the country went through the Time of Troubles. The new house of Romanov (q.v.) continued the policies of their predecessors (conquest of the rest of Siberia, incorporation of the Ukraine). Peter the Great (q.v.), the last tsar of M. and the first Russian emperor (from 1721), inaugurated a new epoch of Russian hist. M. was the cradle of the Great Russian people (see GREAT RUSSIANS). Politically it was an autocracy limited by the Boyars' Duma (see BOYARS and DUMA) and the Zemskiy Sobor (q.v.). Its legal system was successively developed in the Codes of 1497, 1550, and 1649, which gradually centralised administration and introduced peasant serfdom. Culturally M. was isolated from the rest of Europe, first through Tatar domination, and after the Florentine Union (see EASTERN ORTHODOX CHURCH) in 1439 and the fall of Constantinople in 1453 by antagonism between the Orthodox and the Rom. Catholic Churches. The political ideology of the Muscovite state rested on the conceptions of gathering the 'Russian land' (see KIEVAN RUSSIA) and 'Moscow—the third Rome.'

Muscovy, or **Musk**, Duck (*Catrina moschata*), species of wild duck native to central and S. America, where it nests in the trees of forest swamps. It is often reared in poultry yards of European countries as an ornamental bird for lakes and parks. It is also called Barbary duck.

Musel, El, see GLJON.

Muselier, Emile Henri (1882–), Fr. admiral, b. Marseilles and educ. at the Brest naval school. He was a corvette

captain in 1918, and, after the First World War, became frigate captain (1922), rear-admiral (1933), and vice-admiral (1939). Among his commands before the Second World War were those of the defences of Cherbourg and of the second cruiser div. in the Mediterranean; in 1938 he was appointed admiral commanding the navy and defences of Marseilles. On the collapse of France in 1940 M. joined de Gaulle (July 1940), who made him commander-in-chief of the Free Fr. naval forces (1940-2), and of the Free Fr. air forces (1940-1). M. led the Free Fr. naval forces in the occupation of Saint-Pierre and Miquelon Is. against the representatives of the Vichy Gov. there. He was made national commissioner of navy and merchant navy in the Fr. National Committee, but resigned in Mar. 1942 and in the following year became assistant to Gen. Giraud (q.v.) in Algiers. After the war he was chief of the Fr. naval delegation of the military mission for Ger. affairs till 1945.

Museo di San Marco (Florence), see **UFFIZI AND PITTI GALLERIES**.

Muses, The, inspiring goddesses of song, who were later thought to preside over the different arts and sciences. They were the daughters of Zeus and Mnemosyne, b. Pieria, at the foot of Mt Olympus. Originally 3, later they were always spoken of as 9 in number. They are (1) Clio, the muse of hist., represented sitting or standing with an open roll of paper, or chest of books; (2) Euterpe, the muse of lyric poetry, with a flute; (3) Thalia, the muse of comedy and of merry or idyllic poetry, appears with a comic mask, a shepherd's staff, or a wreath of ivy; (4) Melpomene, the muse of tragedy, with a tragic mask, the club of Hercules, or a sword; her head is surrounded with vine leaves, and she wears a cothurnus; (5) Terpsichore, the muse of choral dance and song, appears with the lyre and the plectrum; (6) Erato, the muse of erotic poetry and mimic imitation, sometimes also has the lyre; (7) Polymnia or Polyhymnia, the muse of the sublime hymn, appears in a pensive or meditating attitude; (8) Urania, the muse of astronomy, with a staff pointing to a globe; (9) Calliope or Calliopea, the muse of epic poetry, bears a tablet and stylus, and sometimes a roll of paper or a book. The worship of the M. was introduced from Thrace and Pieria into Boeotia; their favourite haunt was Mt Helicon, with the sacred fountains of Aganippe and Hippocrene. Mt Parnassus was likewise sacred to them, with the Castalian spring.

Museums (from Gk *mousetion*, temple of the Muses), name now given to buildings where collections of scientific and natural curiosities and works of artistic and literary merit are maintained for the benefit of the public. The first of the kind was the famous univ. building at Alexandria (q.v.), including the Alexandrian Library (q.v.). Here were lodged and entertained the men of learning, each of whom had a handsome revenue. Its foundation is attributed to Ptolemy I (q.v.), c. 283 BC. See also **LIBRARIES**; **NATIONAL GALLERY**;

and articles on individual museums: **ASHMOLEAN MUSEUM**; **BRITISH MUSEUM**; **FITZWILLIAM MUSEUM**; **IMPERIAL INSTITUTE**; **IMPERIAL WAR MUSEUM**; **LONDON MUSEUM**; **LOUVRE**; **PRADO**; **MUSEO DELI**; **SCIENCE MUSEUM**; **VATICAN**; **VICTORIA AND ALBERT MUSEUM**; etc. See A. S. Wittlin, *The Museum*, 1949, and ann. reports of the world's chief M.

Musgrave, Samuel (1732-c. 1780), Eng. classical scholar and physician. He wrote *Exercitationes in Euripidem*, 1762, *Two Dissertations*, on 'Gk Mythology', and on 'Newton's Objections to the Chronology of the Olympiads', 1782, *Animal-versions in Sophoclem*, 1800, and works on medical subjects. M. helped edit Euripides (4 vols.), 1778. His notes on Sophocles were bought by Oxford Univ. after his death, and were included in an ed. of the tragedies pub. at Oxford in 1800. See Schweighäuser's ed. of Appian; *Gentleman's Magazine*, 1770; J. Nichols, *Literary Anecdotes*, 1781.

Musgrave, William (c. 1657-1721), physician and antiquary, studied at Oxford. He was secretary to the Royal Society (1685), and settled in Exeter (1691), practising as a physician. He wrote treatises on gout and medicine. His 3 antiquarian studies, *Julii Vitalis Epitaphium*, 1711, *Geta Britannicus*, 1716, and *Belgium Britannicum*, were reissued as *Antiquitates Britannico-Belgicae*, 1719. For these researches he was presented by George I (some say his son, the Prince of Wales) with a diamond ring on 6 Aug. 1720. See A. & Wood, *Athenae Oxon.* iv (Bliss ed.), and W. Munk, *Coll. of Phys. i.* (2nd ed.), 1878.

Mushroom, name commonly given to the larger capped fungi, but chiefly to edible fruit bodies of the Agaricaceae, of which *Pleurotus* (*Agaricus*) *campestris* is the common Field M., and *P. (Agaricus) hortensis* the cultivated M. of commerce, of which there are 2 distinct forms, a white and a brown. In appearance the cap is rounded when young, then convex, and finally flat, white, and smooth or brownish with darker scales; the stem is white with a torn volva girdling it; the gills are free, turning from white to pink, and then blackish brown on ageing. Field M.s appear in damp, warm weather, summer and autumn. Cultivated M.s are grown all the year round in prepared beds, which may be housed in dark sheds, cellars, caves, or buildings; requiring a temp. of about 60° F., reasonable humidity, and good ventilation, plus a good compost. Compost in the past has been preferably of stable manure from grain-fed healthy horses, carefully pre-rotted before use. In the face of increasing scarcity of stable manure, a synthetic compost of straw and chemicals has been evolved by the M. Research Association Ltd., Peterborough, England, and is in commercial use. Pure cultures have now replaced the old Brick spawn for inoculating M. beds. In Britain, most of the 40 million pounds produced commercially each year are grown in specially designed M. houses or glasshouses. See also **AGARICUS**; **CHAM-TERELLE**; **FUNGI**. See A. L. Kligman,

Handbook of Mushroom Culture, U.S.A., 1950; Ministry of Agriculture Bulletin 34: *Mushroom Growing*, 1950; F. C. Atkins, *Mushroom Growing To-day*, 1952; J. Ramsbottom, *Toadstools and Mushrooms*, 1954; *The Mushroom Grower's Bulletin*, monthly jour.

Music, although in its modern form the most artificial of the arts, is primarily the most universal and spontaneous. It differs from the other arts in that 'time,' both in the rhythmic basis of M. and also in the definite duration of any musical phrase or performance, is an essential factor. In this it contrasts sharply with painting and architecture, which depend on spatial values, and it lacks the representational element in poetry, although poetry, M., and the dance probably had a common origin in ritual. They still share the vital element of rhythm. Physically M. is allied to mathematical science, the 2 fundamental concords, the octave and the perfect fifth, being built up from the frequency-ratios 2 : 1 and 3 : 2 respectively. These facts were known in the 6th cent. BC to Pythagoras, who also defined the tonal position of the fourth.

M. in some form is probably as ancient and universal as speech; but in the general acceptance of the term, Gk M. is the radix from which its European development must be traced. Gk M. was, doubtless, largely influenced by Chaldean and Egyptian, by Indian and Chinese, such as it was; and sev. early Christian chants were derived from Jewish synagogue tunes. But no deep study of such influences is possible, although it is surmised that ample material would have been available if the Alexandrian library had been preserved. Musical intonation was an important feature of all Gk drama, and even the Homeric epics were declaimed to the accompaniment of a lyre. The term M. was held by the Greeks to signify any art over which the 9 Muses presided, and poetry and melody were combined in one art form as a matter of course, although harmony in the modern sense was unknown—a characteristic which still persists in M. uninfluenced by the European tradition. The Gk system was based on the tetrachord, a group of 4 notes derived from the 4 strings of the early lyre; the total span was a fourth, but 3 *genera* were recognised, whereby the 2 inner notes could be diatonic or chromatic or enharmonic (i.e. including quarter-tones). With the development of the lyre the span was increased to 2 octaves by the superimposition of 4 tetrachords; hence were derived the modes, 8-note scales whose character depended on the position of the *mesē*, the upper note of the second tetrachord, which acted as a kind of tonic. Each mode was associated with a particular mood, and had a moral quality. Thus the Dorian mode was regarded as military and masterful, the Lydian as effeminate. At first all M. was handed down orally, as folk M. has continued to be, but with such importance attaching to M. as a literary adjunct, although its possibilities as an absolute art were

unsuspected, it was not long before some method of definite systematisation and notation of sound was sought. The Greeks developed 2 such systems, one for vocal and one for instrumental M., based on the letters of the alphabet, which could be differently placed so that half- and quarter-tones could be recorded. Under the Romans the chromatic and enharmonic *genera* and the tetrachord basis of the system fell into disuse, and the whole tradition might have been lost but for the Christian Church. In the early days the congregation took a musical part in the service, and the M. naturally took over many Gk and Jewish elements (cf. the verbal survival of *Kyrie Eleison* and *Alleluia*). Control gradually passed to the priesthood, who regularised it in the form of plainsong and estab. the eccles. modes. These are derived from the Gk modes, with important differences; the Gk names were differently applied to them by the theorist Boethius (d. c. AD 524). The Church frowned on instrumental M., which was probably allied to the dance as closely as vocal music was to words, and at first there was no rhythmic independence owing to the melody being tied to the scansion values of classical poetry. The commonest method of notation was the system of *neumae*, but this served only to remind the singer of the approximate difference in pitch of successive notes in a melody he had already memorised, without expressing the exact intervals. It was not until the early 10th cent. that any definite progress in notation was made, although the literal code, in which Lat. characters had superseded the Greek, had been developed, and the modern 7-letter method began to be used in conjunction with the *neumae*. About the time of Huchald (d. 930), whose system of writing words in the spaces of a staff representing the strings of an instrument, useful in vocal M., did not survive him, a red line was drawn horizontally across a page to represent F; and the immediate addition of a green or yellow line above and parallel to the red, to give the locus of C, made possible the precise expression of any interval up to an octave. The present type of staff was reached in the 11th cent.; it consisted usually of 4 lines, although no number was definitely settled until the 16th cent., when a 4-line staff was restricted to plainsong, 5-line being used for other vocal M., and 6-line for organ and virginal. Signs F, C, and G were also written to their relative lines, thus originating the system of clefs. Bar divs. were introduced about 1450 to indicate accent; their use for rhythmic definition did not become general till the 16th and 17th cents. Many of these improvements have been attributed to Guido d'Arezzo (d. c. 1050), but probably he did no more than systematise the general progress of the art. We owe to him the familiar symbols of solmisation (*ut, re, mi*, etc.), based on the opening syllables of each line of a hymn to St John the Baptist.

By this time, aided by the progress in notation, M. had reached the stage of the

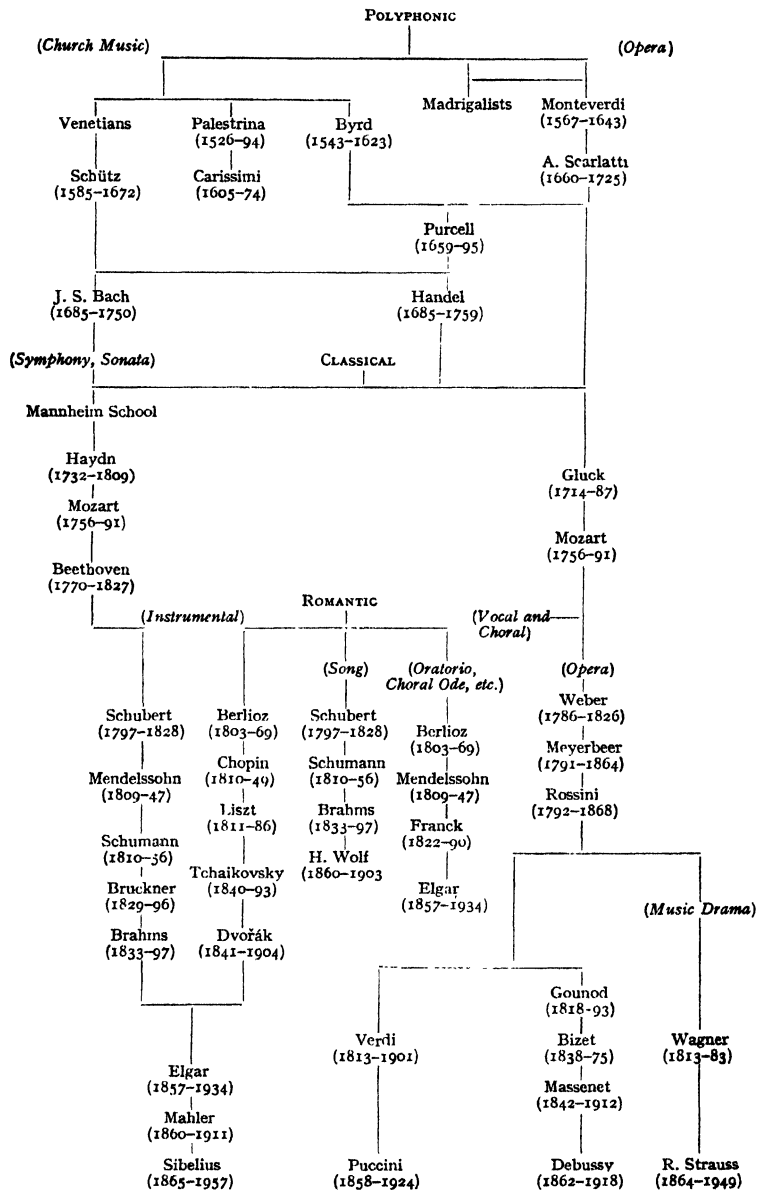

'descant,' or 'discantus' (see HARMONY) from which the whole art of counterpoint was evolved, although the Gk practice of 'magadisling' (i.e. singing in 2 parts, one an octave above the other) had been an attempt in the same direction. The *organum*, in which a series of fourths or fifths was added to a *canto fermo*, was the first step; its origins go back to the 9th cent. and may have been due to the difference of pitch in the voices. Further intervals, oblique and contrary motion, and a feeling for cadences were added by degrees, and the hexachord system was adopted as a scientific guide to teaching. This pointed towards the major scale, but such implications were regarded as *musica ficta* (the casual introduction of accidentals) and not followed to their conclusion. Composition at this time was an arbitrary process, governed by scientific rather than aesthetic rules; M. was classed with mathematics in the medieval univs. The 12th and 13th cents., sometimes called the Francoian period after the theorist Franco of Cologne, saw the development of the rhythmic modes, based on the old poetic metres, and further attempts to define consonance and dissonance. More than 2 independent parts were now allowed; the main voice was usually in the tenor, with the other parts embroidering above and below it. Among the new forms of vocal M. were the conductus, motet, rondel, and rota (or round), which introduced the principle of canonic imitation. The most famous example of a rota is *Sumer is iucumen in* (MS. c. 1240, Brit. Museum: see article in Grove's *Dictionary of Music*), a flowing 4-part canon over a brief 2-part refrain, also in canon. These early polyphonic problems gave rise to a considerable theoretical literature, chiefly written by monks.

Meanwhile secular M. had also changed: crude chants and folksongs had given place to the amatory and heroic songs of the minstrels (q.v.) of the 10th and 11th cents. During the 12th and 13th cents. the troubadours and trouvères in France, and the minnesinger and meistersinger in Germany, became prominent: many of them were of high rank, e.g. Count Wm of Poitiers (d. 1127) and Richard I of England (d. 1199). This movement was stimulated by contact with the E. through the Crusades, the spread of the chivalry ideal, and the growth of the vernacular languages. It was concerned with poetry as well as music, but had great musical influence owing to its rhythmic freshness and the strong folk element, which helped to loosen the old academic rules. The same period saw a great increase in instrumental M.; its notation was by means of tablatures based on the form of the instruments. The trouvère Adam de La Halle (d. c. 1287) wrote M. for a pastoral comedy and pointed the way to opera. The 14th cent. saw the introduction of a new method called *Ars nova*, in which the rhythmic modes were superseded, duple time was used as well as triple, and other new devices, such as faburden, were

added. The leading composer was Guillaume de Machaut (d. 1377).

The great polyphonic period began in the 15th cent. with the foundation of royal chapels, an enormous increase in technical resources, especially in imitative counterpoint, and the rise of national schools. In England Dunstable (d. 1453) achieved much greater smoothness of texture. The great Netherlands school, headed by Binchois (d. 1460), Dufay (d. 1474), and Okeghem (d. c. 1495), reached its height in Josquin des Prés (d. 1521). Later Netherlands composers founded schools in other countries, e.g. Willaert (d. 1562) and Cyprien de Rore (d. 1565) in Venice and Arcadelt (d. c. 1567) in Rome, where the tradition of polyphonic church M. reached its apex in the work of Palestrina (d. 1594) and the Spaniard Victoria (d. 1611). The greatest of the later Flemings, Lassus (d. 1594), was a prolific composer in all styles, sacred and secular. This period was marked by the gradual decline of the modal system and a much greater interest in the emotional use of harmony as against polyphonic devices for their own sake. A stimulus was also given to Ger. church M. by the Lutheran Reformation, which encouraged congregational singing and popularised the chorale. Eng. church composers of the period were Tye (d. 1573), Tallis (d. 1585), Byrd (d. 1623), and Gibbons (d. 1625). Meanwhile secular music, aided by the Renaissance and the discovery of printing, flowered rapidly in the Fr. *chanson* and the It. madrigal, which was a cross between the popular *frottola* or street song and the Flem. motet. Marenzio (d. 1599), Gesualdo (d. 1614), and Monteverdi (1567-1643) introduced new freedom and expressiveness into the madrigal, which was perfected in England in the works of Byrd, Gibbons, Morley (d. 1603), Weelkes (d. 1623), Wilbye (d. 1638), and Tomkins (d. 1656). The first to write important original M. for the organ (introduced from the E. in the 8th cent., but for long very primitive) was the Venetian Andrea Gabrieli (d. 1586), who developed the *ricercare* and *occata*. He was followed by Merulo (d. 1604), Sweelinck (d. 1621), and Frescobaldi (d. 1643), in whom the fugue approached mature form. Much early instrumental M. was simply transcribed from the motet, but dances were written for the lute and the popularity of the new domestic keyboard instruments gave rise to a true instrumental style, especially in England and Italy. It found expression in suites, variations, and primitive programme M. Fantasies for groups of viols were the ancestors of chamber M. An early master of orchestral M. was Giovanni Gabrieli (d. 1612), Andrea's nephew, who wrote antiphonal works for contrasted groups of instruments.

The next new forms, both originating in Italy about 1600, were opera and oratorio. Opera was an attempt to revive the Gk combination of M. and drama, and was also influenced by the madrigal; its first exponents were the Florentine Peri (d. 1633) and Caccini (d. 1618), but Monteverdi

was the first master (*see* OPERA). His influence on the hist. of M. was enormous. He introduced string tremolando and pizzicato, and his harmonic advances led to the final substitution of key for the modal system. The first opera house was opened at Venice in 1637, and a thriving tradition began. Oratorio, in part evolved from the incidental M. of the early miracle and morality plays, began in Rome with Cavalieri (*d.* 1602). At first it was staged like opera, but Carissimi (*d.* 1674) endeavoured to separate it by strengthening the choral element. In Germany Schütz (*d.* 1672) produced a new type by combining Venetian influence with old Ger. Passion M., while a flourishing school of keyboard composers arose in Froberger (*d.* 1667), Buxtehude (*d.* 1707), Reinken (*d.* 1722), and Pachelbel (*d.* 1706) for the organ, and Kuhnau (*d.* 1722) for the harpsichord. All these traditions were consummated in the work of J. S. Bach. Italy still led the field in other instrumental forms, especially for strings, thanks to the perfection of the violin by the craftsmen of N. Italy. The trio-sonata, and concerto were developed by Corelli (*d.* 1713) and Vivaldi (*d.* 1741), and the harpsichord sonata by Domenico Scarlatti (*d.* 1757). Meanwhile It. opera had overrun Europe, but only in France, where Lully (*d.* 1687) combined it with the ballet, was a national style founded. In England Purcell (*d.* 1695) showed high dramatic genius but estab. no tradition. It. opera was standardised by Alessandro Scarlatti (*d.* 1725), after whom it became too obedient, up to the time of Rossini at least, to the demands of singers, except in the hands of foreigners like Handel, Gluck, and Mozart (*see* OPERA).

The first half of the 18th cent. is dominated by the figures of Handel (1685-1759) and J. S. Bach (1685-1750). Handel's style was compounded of It. and Eng. elements, and his genius essentially dramatic, as shown in his Jewish oratorios even more than his 40 It. operas, although he used all the known forms. He combined unsurpassed lyric sweetness with massive choral effects on a greater scale than ever before. Bach's genius was religious and contemplative, introvert rather than extrovert; his Passions, church cantatas, and organ works are the summit of their kind. He was also the composer of much excellent violin and clavier M., and carried the new tonal polyphony to its utmost limits. Thanks largely to him a whole new world of keyboard M. was opened up by the general acceptance of 'equal temperament' (*see* TEMPERAMENT), which rendered possible the use of extreme sharp and flat keys and a greatly extended variety of modulations. But his full influence was delayed, since his greatest M. remained unknown for nearly a cent. In France his most important contemporaries were François Couperin (*d.* 1733) in keyboard M. and Rameau (*d.* 1764) in grand opera and ballet. It was in France too that Gluck (1714-87) completed his memorable reform of opera, designed to end the tyranny of singers, emphasise dramatic expression, and so

return to something like the principles of Monteverdi. The middle years of the cent. saw the rise of an important movement led by Johann Stamitz (*d.* 1757) at Mannheim, where the modern orchestra and the symphony were developed from beginnings in Italy, and sonata form, based on key contrast and a reaction from polyphony, began to come into its own. It was derived partly from the binary form of the old dance movements and partly from the operatic aria of Scarlatti and Handel. C. P. E. Bach (*d.* 1788) advanced the modern piano sonata by applying sonata form to the colour possibilities of the new instrument. Symphony, sonata, and string quartet were all perfected by Haydn (1732-1809), the first of the great Viennese classical composers, and further extended by Mozart (1756-1791), whose use of chromaticism introduced an almost romantic expressiveness, but who was also a master of counterpoint. He was the one composer to reach the highest rank in every musical form; his operas, remarkable for their subtle characterisation, both summed up the whole It. tradition and led by way of Ger. *Singspiel* to romantic opera. Judging by his experiments in harmony and 'colour,' and by the perfection to which he developed the new forms (including the concerto, which he made particularly his own), it has been suggested that, but for his premature death, he would have done much that Beethoven (1770-1827) was left to accomplish. But however much Beethoven's earliest M. may resemble Mozart's latest, his second and third period works, his sonatas, concertos, and chamber M., no less than his wonderful symphonies and overtures, opened up vast new ters. in the realm of individual and subjective expression. His last works, long misunderstood, looked far into the future.

If Beethoven is the point of transition from 'classical' to 'romantic' (the terms are unsatisfactory, but have a generally accepted significance) in instrumental M., the same must be said of Schubert (1797-1828) in song, and of C. M. von Weber (1786-1826) in opera. The Romantic Movement (q.v.) of the early 19th cent. was a general artistic reaction against 'academism' and formalistic narrowness; it appealed to the remote, violent, and mysterious, became connected with political and social ideals, and ended as a cult of the excessive. Romantic M. soon developed a strong literary content, and sought to express alien ideas of all kinds, often at the expense of formal balance. Beethoven influenced the whole of 19th-cent. M., but in many different ways. The classical tradition of sonata and symphony was followed (with deviations) by Mendelssohn (1809-47) and Brahms (1833-97). The leaders in piano M. were Chopin (1810-47) and Schumann (1810-56), whose attempts at the larger forms were less successful. The mantle of song passed from Schubert to Schumann, Brahms, and Wolf (1860-1903). The first great exponent of programme M. was Berlioz (1803-69), whose remarkably original

powers of melody, drama, and orchestration were not at first recognised. Liszt (1811-86), besides exploiting the virtuoso powers of the piano and making important harmonic innovations, evolved from the symphonic form of Beethoven, the colour of Berlioz, and certain elements in Schubert's instrumental works a new form, the 'symphonic poem,' in which he practised an elaborate method of theme transformation. This form has been cultivated by many later composers, most successfully by Richard Strauss (1864-1949). The central figures of the period in opera were Wagner (1813-83) and Verdi (1813-1901). Wagner, beginning as a composer of grand opera in the Meyerbeer manner, combined Beethoven's method of symphonic development, Liszt's theme transformation, and certain of Gluck's ideals in a vast new stage form, the M. drama, which he described and justified in numerous prose writings. It is peculiar to Wagner and has defied would-be successors, although the operas of Strauss approach it at some points. It is closer to the symphonic poem than to true opera, which it did not supersede. Indeed opera flourished throughout the cent., particularly in Italy and France, where the spectacular methods of Meyerbeer (1791-1864) were succeeded by the more lyrical style of Gounod (1818-93), Massenet (1842-1912), and others, and the revitalised *opéra-comique* of Bizet (1838-75). In Italy the traditional line led through Rossini (1792-1868), Donizetti (1797-1848), and Bellini (1801-1835) to Verdi, in whom it reached the height of musical and dramatic expressiveness. It then declined into crudity and shallowness in the hands of too many composers, but Puccini (1858-1924) showed a strong lyrical and dramatic gift.

Related to the Romantic Movement are the nationalist movements, which drew much of their strength from folksong. In Russia the movement began with Glinka (1803-57) and reached great distinction in the instrumental works of Balakirev (1837-1910) and Borodin (1833-87) and the operas of Mussorgsky (1839-1881) and Rimsky-Korsakov (1844-1908). Tchaikovsky (1840-93), who used all forms, was more influenced by the W. romantic tradition; his symphonies have a strong subjective element. In Scandinavia Grieg (1843-1907) showed a genius for the song and short piano piece, and Sibelius (1865-1957) for the symphony. In Bohemia Smetana (1824-84) founded a national opera, later enriched by Janáček (1854-1928), and Dvořák (1841-1904) enriched the classical forms. Later a lively Sp. school grew up under Albéniz (1860-1909), Granados (1867-1916), and Falla (1876-1946). The end of the cent. saw Austria upholding the symphonic tradition, with more dignity in Bruckner (1824-96) than in Mahler (1860-1911), and the rise of important new movements in France and England. Franck (1822-1890) late in life popularised cyclic form by applying Liszt's methods to the sonata, and the far-ranging harmonic experiments of Debussy (1862-1918) bore

fruit in 'impressionism.' Ravel (1875-1937) developed on similar lines with a personal harmonic idiom, and the exuberance of Chabrier (1841-94) and the harmonic subtlety of Fauré (1845-1924) also left their mark. In England Elgar (1857-1934) added a personal and national flavour to the classical tradition in large-scale choral and instrumental works, and Delius (1862-1934) adopted an intensely individual harmonic style. Holst (1874-1934) and Vaughan Williams (b. 1872) returned to folk M. and built up a style capable of mastering both traditional and modern forms on the largest scale.

The 20th cent. has seen a development in M. of revolutionary rapidity to which there have been 2 main contributing factors: first the break-up of the key system, largely due to the influence of Wagner and Debussy, and the search for freer forms, new rhythmic patterns, 'atonality' (the abolition of 'key'), polytonality, and harmonic systems built on the whole-tone, 12-note, and many other more intricate scales; secondly the rapid perfection of mechanised M., notably wireless, gramophone, and cinematograph reproduction. Two of the biggest influences in modern M. are Stravinsky (b. 1882), who has formed no definite 'style,' but has experimented in many new and daring rhythmic forms and 'tone-colours,' and Schoenberg (1874-1951), whose 12-note system, first adopted by Webern (1883-1945) and Berg (1885-1935), has formed a large school in many countries. Other important modern composers, apart from those mentioned above, are Hindemith (b. 1895) in Germany; Bartók (1881-1945) and Kodály (b. 1882) in Hungary; Honegger (1892-1955) and Milhaud (b. 1892) in France; Pizzetti (b. 1880) and Malipiero (b. 1882) in Italy; and in England and America Bax (1883-1953), Ireland (b. 1879), Bloch (b. 1880), Bliss (b. 1891), Copland (b. 1900), Rubbra (b. 1901), Walton (b. 1902), Berkeley (b. 1903), Barber (b. 1910), and Britten (b. 1913). In the period after the First World War the reaction against the excesses of romanticism took an extreme form, resulting (as in the other arts) in various forms of self-consciousness and exhibitionism, whereas after the Second World War new tendencies have been taken up with an earnestness which suggests that too many composers are taking themselves only too seriously. But it is too early as yet to assess them. An important present-day factor, the mechanisation of M., has brought knowledge and appreciation of M., especially classical M., to a vast hitherto uninterested public, and splendid performances of all important works can be heard through the media of wireless and the gramophone. The standard of criticism, and thus of performance, is rising, and the demand for new M., for instance in the cinema, can hardly fail to encourage the composer. Jazz (q.v.) M. is a conspicuous contemporary phenomenon throughout the U.S.A. and Europe, as a dance-form and for mechanical transmission. Primarily it is an exploitation of syncopated

rhythm, usually at the expense of other musical qualities, and it owes much to primitive Negro M. It is largely ephemeral, but may leave its mark on a few surviving works. A more significant phase of the popularisation of M. is the revival both in Europe and America of musical festivals and societies and the high standard of performance that distinguishes their concerts. *See also* articles on BRITISH, FRENCH, GERMAN, ITALIAN, and RUSSIAN MUSIC; HARMONY; OPERA; ROMANTIC MOVEMENT; SONG; SYMPHONY; etc.; and on the various composers.

Music, Schools of, see SCHOOLS OF MUSIC.

Music and Dancing Licences. Within the Metropolitan Police dist. (i.e. within 20 m. of the cities of London and Westminster, or in Middx) every house, room, garden, or other place used for public music or dancing must be licensed for that purpose by the co. council or co. bor. council within whose jurisdiction the place is situated. Elsewhere licences are required only in those towns where section 51 of the Public Health Act, 1890, has been adopted, in which cases the licences are granted by the magistrates. The mere occasional use of a room for music and dancing, or a temporary use for dancing on the occasion of a festival, does not, but a skating rink where music is played does, require a licence. The decided cases show that to require a licence there must be something habitual about the use of the place for public music or dancing, though using the place once a month only would probably be regarded as 'habitual.' The licensing authority have an absolute discretion to grant or refuse a licence, subject to the obligation to exercise the discretion in a judicial manner.

Music Halls. The 'music hall,' or 'variety theatre,' is a development of the 'saloon theatres,' which existed in London in 1830-40. These were attached to taverns, and were very popular among the middle and lower classes who liked to mix their dramatic amusements with smoking and light refreshments. They gave dramatic performances as well as

variety entertainments, but were restricted by the 'patent rights,' which were ultimately abolished through the efforts of a number of distinguished literary men, among whom were Charles Dickens, Sir Edward Bulwer-Lytton, and Sir Thomas Noon Talfourd. After this the saloons gradually improved in character, and the M. H. of to-day began to appear, the first being the Canterbury in Lambeth, which, under the direction of Charles Morton, cultivated the best class music; indeed 'An Operatic Selection' of Gounod's *Faust* was first performed in England here. Morton also opened the Oxford, and other halls soon followed, their popularity being assured by the cheap prices and physical comforts which they afforded. But the advance in the M. H. excited the jealousy of the theatre, and matters came to a crisis in 1865 when an ambitious ballet was produced at the Alhambra in Leicester Square. The Alhambra was prosecuted for infringing the Stage-play Act, and a long, unsatisfactory trial followed, with the result that the matter was taken up by Parliament, and the M. H. were granted the privilege of producing ballets, vaudevilles, pantomimes, and other light pieces. Some of the chief in the list of M. H. are the Coliseum, the London Hippodrome, the Pavilion, and the Palladium, and associated with them and older halls are the names of George Leybourne, Bessie Bellmore, Harry Champion, the Great Vance, Charles Coburn, Chirgwin the White-eyed Kaffir, Gus Elen, and Marie Lloyd. The advent of the cinema, and especially the development of sound films, seriously affected the prosperity of M. H., and many were converted into cinema houses, the Empire and the Tivoli in London being notable examples. At the present time the term 'music hall' is giving place to the more applicable name of 'variety theatre,' the programme of entertainment often taking the form of 'revue.' *See A. Hadden, The Story of the Music Hall, 1935; M. W. Disher, Winkles and Champagne, 1938; H. Scott, The Early Doors, 1947; C. D. Pulling, They Were Singing, 1952.*

MUSICAL BOX

Musical Box, instrument for producing music by mechanical means, little more than a toy with no great artistic scope or value. It was invented in the middle of the 18th cent. by the Swiss, who fitted minute plugs on a metal cylinder so arranged that they would strike separate

bars of steel and set them vibrating, and so produce different tones.

Musical Comedy, form of theatrical entertainment, developed from *opéra-bouffe*. It usually consists of a slight story interspersed at appropriate points by songs and dances. Musical plays of this type first found their outstanding popularity with the London productions of George Edwards (1852-1915) at Daly's Theatre and the Gaiety. Notable M. C.s include *The Shop Girl* (Ivan Caryll), which was produced in 1894 and ran for 2 years, *The Geisha*, *A Country Girl* (both by Lionel Monckton), *Sun Toy* (Sidney Jones), *The Belle of New York* (Gustav Kerker), *The Maid of the Mountains* (Harold Fraser-Simson), *Floradora* (Leslie Stuart), *Chu Chin Chow* (Frederic Norton), which had the second longest run in the hist. of the Brit. theatre, *The Chocolate Soldier* (Oscar Straus), and *The Merry Widow* (Franz Lehár). Outstanding names of the 1920's were Rudolf Friml (*Rose Marie* and *The Vagabond King*), Sigmund Romberg (*New Moon*, *The Student Prince*, and *The Desert Song*), Vincent Youmans (*No! No! Nanette!*), Jerome Kern (*Sally*, *Sunny*, *Show Boat*, and *Roberta*), and George Gershwin (*Lady, be Good*), all American; and Noel Coward (*Bitter Sweet*). The thirties saw *White Horse Inn* (Robert Stolz), the musicals of Ivor Novello (*Glamorous Night*, *Careless Rapture*, and *The Dancing Years*), and in America the rise of Cole Porter (*The Gay Divorcee*, *Anything Goes*, and, more recently, *Kiss Me Kate*). Outstanding names in the presentation of M. C. include C. B. Cochran (1872-1951) in London, and Florenz Ziegfeld (1867-1932) and Earl Carroll (1893-1948) in New York. After the Second World War a new school of Amer. musicals brought a freshness and vitality to M. C. Among its features were revolutionary, inventive choreography and more realistic characterisation. The first musical of this type was Rodgers' and Hammerstein's *Oklahoma!*. Subsequent productions included *Carousel*, *South Pacific*, *The King and I* (all by Rodgers and Hammerstein), *Annie Get your Gun* (Irving Berlin), and *Gypsy* and *Dolls* (Frank Loesser). The enormously successful Amer. M. C. *My Fair Lady* (Frederick Loewe) was based on G. B. Shaw's *Pygmalion*. Brit. musicals of this period have generally aimed at a more ingenuous appeal (e.g. Julian Slade's *Salad Days* and *Free as Air*); *The Boy Friend* (Sandy Wilson) was a gentle satire on the M. C.s of the 1920's.

Musical Glasses, see ARMONICA.

Musk (*Mimulus moschatus*), small perennial plant of the family Scrophulariaceae, with hairy leaves and bright yellow flowers. Some fine horticult. varieties have been introduced. These are best grown in pots trained on wire frames or in hanging baskets.

Musk, Artificial, substances known chemically as trinitro-dimethyl-tertiary-butylbenzene (*Musk Xylol*), dinitro-methyl-tertiary-butyl-anisole (*M. Ambrette*), tertiary-butyl-dinitro-dimethyl-acetophenone (*M. Ketone*), dinitro-

tertiary-butyl-isopropyl-toluene (*Moskene*), Heptamethyl-Indene-Ketone (*Phantolid*). They are used in perfumery as cheap substitutes for natural M., which they closely resemble in odour. They have remarkable fixing and blending properties. Synthetic reproductions of the odorous principle of natural M. are *Eraltolide* (pentadecanolid) and *Ambretolide* (lactone of hydroxy-hexadecenoic acid), possessing a strong and persistent M. odour. When used in traces as 'exalting' agents both render excellent services in finest perfumes and ambergris colognes. See also PERFUMERY.

MUSK

Musk Deer (*Moschus moschiferus*), native of the mountainous parts of central Asia, which yields the musk of commerce. It is a small animal about the size of a roe-deer, 20 in. in height, with large ears, long legs, and coarse, goat-like hair, which varies from a pale grey to a dark brown, spotted with tints of a lighter colour. It is of special interest to zoologists in that it possesses certain intermediate characters between the antelopes and the deer, and it is now placed in a special subfamily, Moschinae, of the order Cervidae (q.v.). It is unique among deer in possessing a gall bladder, which is found in most of the antelopes. Antlers and horns are absent in both sexes, but, like the muntjac, the male has the upper canine teeth developed into projecting tusks 3 in. or more long. It is a solitary animal, feeding on leaves and flowers of forest shrubs. It is abnormally hardy and sure-footed on the most dangerous ground, being much assisted by the specialised development of the hoofs. Musk occurs as an unctuous secretion in a gland beneath the skin of the abdomen of the adult male, the animals being captured and mercilessly killed by hunters. The freshly removed gland has a prevailing odour of uncured hide and the characteristic powerful and most tenacious musk odour develops on drying. The dried glands are known as 'pods' from which the dried secretion of reddish-brown to black colour is carefully removed and as 'musk grains' is one of

the most indispensable raw materials used in luxury perfumes in form of alcoholic tincture, traces of which fortify and fix the basic odour, giving it a wonderfully diffusive and subtle 'animal note.' The finest quality of musk pods in commerce is known as 'Tonquin Musk' coming from Tibet and the high mts of the adjoining Chinese provs. The odorous product in musk (1 to 2 per cent) is known as Muscone; it was first isolated in 1906 by Walbaum and identified in 1926 by Ruzicka as being 3-methyl-cyclopentadecanone.

Musk Ox, or Musk Sheep (*Ovibos moschatus*), animal which, as the generic name implies, has features in common with the sheep and the ox. It is about the size of domestic cattle, and is covered with a dense coat of very long brown hair. The horns of the bulls meet in the middle line of the forehead. The legs are short, but the feet have a large spread, with a footprint much like a reindeer's, and the animals are capable of some speed. They are social in habit, and are now confined to N.E. Canada, Greenland, and some of the neighbouring is., though, at a remote period, they have had a very extensive range, which included Britain. At some seasons of the year they exhale a strong odour of musk, and this pervades the flesh, although it is well flavoured.

Musk Plants. The odour of musk occurs in a number of plants, besides the common musk. The musk mallow (*Malva moschata*) emits the odour when rubbed, especially in hot weather. The musk stork's bill (*Erodium moschatum*) smells strongly of it if handled; but the moschatel (*Adoxa moschatellina*) diffuses it from all parts of the plant except when bruised. The musk thistle (*Cardinus nutans*) has a powerful musky scent. The musk orchis (*Herminium monorchis*) smells like musk at night. A melon (*Cucurbita moschata*), the musk rose, and the musk-wood (*Olearia argophylla*) are among many other plants, etc., which give rise to the odour.

Musk Rat, name given to a number of rodents, and also to one insectivore, which diffuse a musky odour. It most commonly indicates the musquash (*Fiber zibethicus*). Allied to the voles and beavers, the musquash is found in Alaska and Canada. It is specialised for an aquatic life, the toes being webbed, and the long, almost naked tail being scaly and flattened laterally. The head and body together measure about 12 in. Though inclined to be omnivorous, it is chiefly vegetarian, and stores up food for the winter by plastering it with mud into curious structures like haycocks. The musk is secreted by both sexes in a large gland in the groin.

Musk Sheep, see MUSK OX.

Muskegon, city, co. seat of M. co., Michigan, U.S.A., on Lake Michigan at mouth of M. Riv., in resort area 35 m. N.W. of Grand Rapids. It has oil wells and refineries and manufs. paper and leather products, aeroplane, automobile, and marine engines, billiard and pool tables, and tools. Pop. 48,400.

Muskegon Heights, city in M. co., SW. Michigan, U.S.A. It manufs. machinery. Pop. 18,825.

Musket, see FIREARMS.

Musketry, military term applied to that branch of work which deals with the theory and practice and regulations concerning small arms, the rifle, carbine, and revolver, and machine-guns (see FIREARMS). The training in the use of weapons is graded from recruit drill, through various range and field practices, to special competitions. The marksman badge, crossed rifles, is awarded for highest efficiency, the 'best shot' having a star in addition. Field practice is very varied, being the development of range practice towards the requirements of M. in actual warfare; it includes company, battalion, and squadron practice, and deals with the tactical use of small arms.

Musketry, School of, see SMALL ARMS SCHOOL.

Muskogean Language, div. of Amer. Indian languages, including Alibamu, Chickasaw, Choctaw, Creek, Natchez, and Seminole. See NORTH AMERICAN NATIVE LANGUAGES.

Muskogee, city and the co. seat of M. co., Oklahoma, U.S.A., 45 m. SE. of Tulsa. It is the centre of an agric. and stock-raising region, and yields natural gas and oil. Its manufs. include road machinery, oil-well equipment, feed, glass, iron, bricks, leather, canvas goods, clothing, furniture, brooms, mattresses, and truck, wagon, and trailer bodies. Pop. 37,289.

Muskoka, dist., riv., and lake of Ontario, Canada, on the E. of Georgian Bay. The first named has numerous lakes interlaced by streams, and is a popular resort for holiday-makers, summer cottagers, and anglers. Bracebridge is the cap. The riv. rises in the Nipissing dist. of Ontario, and flows in a south-westerly direction, through the lake, into Georgian Bay. The lake is situated in the middle of the dist. and communicates in the N. with Lake Rosseau.

Muslim Architecture and Art (otherwise known as Arab, Arabian, Islamic, Mahometan, Mohammedan, Moslem, Muhamadan, or Saracenic Art). 'Muslim,' an Arabic word, is the term now usually adopted by scholars to describe the architecture produced by the Arab followers of the religion of Islam—i.e. Muslims—in many parts of the E. hemisphere after the prophet Mohammad estab. Islam in Arabia in the year AD 622, which is the first year of the Muslim calendar. This brief statement explains all the alternative names mentioned above, except 'Saracenic' which is really a nickname, like 'Whig' or 'Tory' or 'Quaker,' and was introduced into English during the Middle Ages to describe the wild Arab warriors—'Saracens'—encountered by the Crusaders. 'Saracenic' was also applied by Wren (q.v.) to Gothic architecture; and modern scholarship recognises that his use of the term in that connection was not so absurd as it seemed to critics of a cent. ago, for many features of Gothic architecture (q.v.) are now

attributed to the contacts made by the Crusaders with 'Saracenic' architecture, though the term is now discarded. Muslim architecture has therefore some significance in the hist. of European Gothic, but is even more important because it has been practised for 13 cents. by a large part of the human race as far N. as Turkestan and Yugoslavia, as far W. as Spain and Morocco, as far E. as China and Indonesia, as far S. as Zanzibar and Nigeria. There is a mosque for Malayan Muslims in Cape Town, and one for Eng. Muslims at Woking.

When the Arab armies, composed of uneduc. and uncultured soldiers, swept westwards from Arabia to Spain and even into central France within a cent. from

building which had continued uninterrupted in Cairo since the 9th cent. (ii) *Turkish*, in which the great Byzantine church of S. Sophia at Constantinople influenced the design of all the large mosques subsequently built there. (iii) *North African* or 'Moorish,' comprising the modern countries of Tunis, Algeria, Morocco, and most of Spain (see SPANISH ARCHITECTURE). (iv) *Persian*, including modern Iraq, where the earlier brick-vaulted buildings of the Sassanids influenced mosque construction. (v) *Indian* (see INDIAN ARCHITECTURE). India was invaded from Persia by the Muslims in 1193, when the city of Delhi was founded. Some of the earlier mosques closely resemble Persian examples; but

THE COURT OF THE MYRTLES, THE ALHAMBRA, GRANADA

the foundation of Islam, and eastwards as far as the frontiers of India and China, they had no domestic architecture of their own, for they were nomads, and their only dwellings were black camel-hair tents such as the modern Bedouin still use. Their first mosques (see MOSQUE) were rude enclosures for prayer. In each country that they captured, they utilised the services of local architects and craftsmen to build their mosques and—as they became settled and prosperous—their palaces and tombs. Thus distinctive regional schools of M. A. and A. grew up, each influenced by the local tradition. Existing buildings were often despoiled to provide material for mosques, and occasionally old buildings were incorporated in their structure. The following are the 5 chief regions: (i) *Syro-Egyptian*, including Syria and Egypt. The finest mosques, etc., all in stone, are to be seen in Cairo. Many Rom. columns and capitals were used in the earliest mosques there. At Jerusalem the famous 'Dome of the Rock' shows Byzantine influence. In 1517 the Turks conquered Egypt and interrupted the magnificent sequence of

as Hindu craftsmen were employed, a curious medley of design resulted, culminating in the splendid mosques, tombs, and palaces built by the Mogul emperors during the 16th-17th cents., and constituting the 'Mogul' or 'Mughal' style. The mosque plan, with certain variations, was common to all the 5 regions, with its distinctive minarets. Domes were largely used, and the horse-shoe arch (see ARCH) became a distinctive feature everywhere. Ornamental lattices of stone, marble, wood, and stucco were also used in window openings in all these countries, where the glare of the sun discouraged the use of ordinary glazed windows. Marble inlay and paving were also freely employed; and in Persia, where bare brick walls were considered unsightly, the ancient craft of glazed tiling was revived, and spread into Syria and India.

All Muslim art is conventional in design, as the Muslim religion forbade the representation of animal or plant life or human portraiture. Some Muslim artists, however, broke away from this tradition, for leaves and flowers are to be

found in Persian designs. In miniature painting also and in illuminated MSS. plant, animal, and human forms appear, but never with the same freedom as, for instance, in Chinese paintings. The portrait in Muslim art is also conventionalised. Persian paintings are most notable for their combination of line and colour, while in the paintings of India it was as colourists that the Muslim artists most excelled. The flower design in Muslim ceramics derives from the early Persian period; the colours, design, and glaze of this pottery are extremely harmonious. Examples of Muslim art as applied to weapons and armour are found especially in Turkey and Persia. The Turkish helmets were cone-shaped and beautifully engraved with arabesque designs with gold and silver decorations. Owing to the religious restrictions laid upon the arts, calligraphy was always a great source of design.

See H. Saladin and G. Migeon, *Manuel d'Art Musulmane*, 1907; P. Brown, *Indian Painting under the Moguls*, 1924; M. S. Briggs, *Muhammadian Architecture in Egypt and Palestine*, 1924; E. Diez and H. Gluck, *Die Kunst des Islams*, 1925; T. W. Arnold, *Painting in Islam*, 1928; M. S. Dimand, *Handbook of Mohammedan Decorative Art*, 1930; V. Smith, *History of Fine Art in India and Ceylon*, 1930; K. A. C. Creswell, *Early Islamic Architecture*, 1932, *A Short Account of Early Muslim Architecture*, 1958; M. S. Briggs, chapters on Muslim architecture in T. W. Arnold, *The Legacy of Islam*, 1931, and in G. Garratt, *The Legacy of India*, 1937.

Muslin, fine cotton cloth, said to have been first made at Mosul (q.v.), a city of Mesopotamia. It resembles gauze in appearance, except that it is woven plain without any twisting of the warp threads on the weft. Some very fine specimens have been produced in India, the Arni M. of the Madras prov. and the Dacca M., made at Dacca, in Bengal, being especially famous. The material is now made in Europe and numerous varieties are produced. It is used for dresses, curtains, blinds, cushion-covers, etc.

Musorgski, M. P., see MUSSORGSKY.

Muspratt, James (1793-1856), Irish manufacturing chemist, and the founder of the Brit. alkali industry, b. Dublin. After service in the Peninsular war, and in the navy, he began the manuf. of chemical products for commercial purposes. Starting in Ireland with the production of potassium ferrocyanide, he moved to Liverpool, setting up a plant to produce sulphuric acid, and later sodium carbonate. Hydrochloric acid was recovered from the fumes by a process evolved by Wm Gossage. It was the beginning of the Brit. heavy chemical industry. His son, James Sheridan M. (1821-71), was also a distinguished chemist.

Musquash, see MUSK RAT.

Mussavat, Muslim democratic party in Russian Azerbaijan (see AZERBAIJAN), formed 1911-12 in Baku by a group of young intellectuals, many of whom had been closely associated with the local

Bolshevik organisation during the revolution of 1905 (q.v.). It was at first pan-Islamic and advanced no specific demands for the Azerbaijani people. As a pro-Turkish party M. had to suspend open political activity during the First World War. After the Feb. revolution (q.v.) in 1917 it was the dominant party among the Muslims in Transcaucasia (q.v.) and later in the Azerbaijani Rep.

Mussel, name for various forms of mollusc, but most commonly applied to the numerous widely distributed Mytilidae. The common M. (*Mytilus edulis*), which forms the familiar wedge-shaped shell, is very abundant in Brit. estuaries. While young the M.s are capable of moving

about with the aid of the small brown foot, but later they attach themselves to rocks and to one another by spinning a bundle of tough threads (*byssus*). Though they are even more liable than oysters to pollution, they are important articles of diet in many dists., but they are utilised in greater numbers as bait in deep-sea fisheries. The fresh-water M.s (Unionidae) are also numerous and widely distributed. The pearl M. occurs chiefly in Scottish rivers.

Mussel-picker, see OYSTER-CATCHER.

Musselburgh, tn and parl. burgh of Midlothian, Scotland, on the Firth of Forth, at the mouth of the Esk, 5 m. E. of Edinburgh, of which it has become practically a suburb. M. has extensive market gardens, and manufs. nets, twine, paper, wire, etc. Here is Loretto School (q.v.). The tn is celebrated for its golf links. Together with Craigentinny, Craigmillar, and Portobello, M. forms the burgh constituency of Edinburgh E. and returns 1 member to Parliament. Pop. 17,012.

Musset, Louis Charles Alfred de (1810-1857), Fr. poet, novelist, and playwright, b. Paris. In 1829 he met with great success, and at the same time with much hostile criticism, through his pub. of *Contes d'Espagne et d'Italie*. In 1830 his play, *La Nuit vénitienne*, was produced at the Odéon by Harel, but was not well

received. In 1832 he left the 'Cénacle,' the group of writers which had collected around the young Victor Hugo (q.v.) in about 1828, and which included Alfred de Vigny, Charles Nodier (q.v.), and others. In the following year he pub. *Un Spectacle dans un fauteuil*, which was so far successful that he was asked to contribute to the *Revue des deux mondes*. For this he wrote (in 1833) his fine tragical comedies, *André del Sarto* and *Les Caprices de Marianne*. His next contribution to the *Revue* was his famous poem *Rolla*, written also in 1833, at the beginning of his liaison with George Sand, whom he had met in the summer of that year. Later in the year

ALFRED DE MUSSET

he left with her for Italy, and returned alone shortly afterwards broken in health and in spirit. The worst side of his moral character was brought out by his sufferings. George Sand gave her account of the catastrophe in a novel, *Elle et lui*, 1859, to which de M. replied in his *Lui et elle*, 1860. The four *Nuits—de mai, de décembre, 1835, d'août, 1836, and d'octobre, 1837*—reflect the bitterness of soul and disillusionment which ensued on the breach with George Sand and the ending of the romantic dreams of ideal love which they had founded on that relationship. In 1835 he produced *Lucie, Le Chandelier, La Loi sur la presse*, and, more important, *Confession d'un enfant du siècle*, which is of great interest in revealing the poet's complex character. In 1838 he was appointed librarian of the Ministry of the Interior, and 2 years later his health began to give way. Meanwhile he had written *Lettre à Lamartine*, 1836, the comedy *Il ne faut jurer de rien*, 1836, *Un Caprice*, 1837, some of the *Nouvelles*, 1837, and the fragment *Le Poète déchu*, 1839. In 1840 he wrote *A trente ans*, and in the following year the spirited poem *Le*

Rhin allemand. His latter years were comparatively unproductive, his works including *Il faut qu'une porte soit ouverte ou fermée*, 1845, *Bettine*, 1849, and *Carmosine*, 1851. He was elected to the Academy in 1852, and d. of heart disease 5 years later. Alfred de M. was, above all, a lyricist, whose one dominant theme was love in its varied manifestations. All his work is markedly subjective. Beginning life as an enthusiast, he early experienced a sad disillusionment, owing chiefly to his unhappy liaison, and his later work is characterised by a melancholy which is preoccupied with the darker problems of life and ends by wooing a despair which sees in its bitter-sweet memories the only thing worth having experienced. Complete eds. of his works have been pub. by P. Lemerre, 1876; E. Biré, 1907-8; M. Allem, 1933-8; letters by L. Seché, 1907. See studies by C. F. Oliphant, 1890; L. Seché, 1907; E. Henriot, 1929; H. O. Sedgwick, 1932; M. Allem, 1940; also P. Gastinel, *Le Romantisme de Musset*, 1933, and P. van Tieghem, *Musset, l'homme et l'œuvre*, 1945.

Mussolini, Benito Amilcare Andrea (1883-1945), 'Duce' or dictator of Italy; b. Varano di Costa, by Dovia, com. of Predappio, prov. of Forlì; elder son of Alessandro Gaspare M., a blacksmith and Socialist agitator, and a devoutly Catholic mother. M. attended an elementary school at Predappio, and, later, the Salesian school at Faenza. He worked for a time at his father's smithy. He then completed his education at the Royal Normal School of Forlì, and, later, at the school for training elementary school-teachers, and was for a year a teacher at Gualteri, Reggio nell'Emilia. In 1902 he went to Switzerland, and worked as a mason, translated, starved, made revolutionary speeches, and was arrested at Lausanne for vagrancy, but was befriended by Socialist organisations. In June 1903 he was expelled from the canton of Berne for revolutionary activities, and later in that year the news of his mother's illness caused his return to Forlì. He returned to Italy and served in a Bersagliere regiment in 1905-6. At the end of his military service he took a post as a teacher of Fr. at Oneglia, near Genoa, and at the same time conducted atheistic propaganda in the local Socialist newspaper. In 1910 he founded *La lotta di classe* ('The Class Struggle'), a weekly paper, at Forlì, using it as a vehicle for extreme Socialist and anti-clerical views. He suffered imprisonment for his articles, but at the end of 1910 he became secretary to the Socialist Society at Trent, then an Austrian possession. He voiced his inherent irredentism in the Socialist paper *Il Popolo* and was banished by the Austrian authorities (Oct. 1911). He then ed. the Socialist paper of Milan, *Avanti!* Up to the First World War he had been an extreme Socialist, using extremism as a lever by which to dislodge the moderate Socialist leaders and secure place and office for himself. At the outbreak of the war he advocated neutrality, and his sudden conversion (helped, it has

been asserted, by Fr. gold) to intervention on the Allies' side resulted in his expulsion from the Socialist party at a congress in Milan (Nov. 1914).

His expulsion by the Socialist Congress at Milan was the turning-point in his career. His old associates abandoned him in disgust; but M. was now the powerful owner and editor of a paper, for on 15 Nov. he had founded *Il Popolo d'Italia*, and through this he vehemently advocated It. participation in the fighting. When Italy declared war (May 1915) M., who could have claimed exemption as an

tactics had reduced the country to such a state of tension that he felt ready to attempt his *coup d'état*. At a Fascist congress in Naples (24-6 Oct.) he declared that the Fascists would assume power by force. But he took care to leave the march on Rome to be organised and carried out by others, he himself travelling to Rome by sleeping-compartment. The marching columns met with no opposition whatever, and eventually fewer than a large div. actually approached the cap. (28 Oct.). But the bluff succeeded. Had the king agreed, the regular troops under Badoglio (q.v.) could have dispersed the Fascist march in a few minutes. In the result, however, the premier, Facta, resigned and M. formed a coalition ministry with himself as Prime Minister, foreign secretary, and minister of the interior. But though so far he followed a conventional policy, humouring both king and church, he took care to convert his illegal armed bands into the legal Fascist militia and thereafter incited them to a course of violence. The murder of Matteotti (q.v.), the Fascist gov.'s ablest critic, a few days after he had launched a brilliant attack in the Chamber on the Fascist chiefs temporarily threatened M.'s political future; but the danger passed, and subsequent events were to show that his party secretary Farinacci was quite prepared to continue gangster methods on a still more thorough scale. M. himself escaped 3 attempts at assassination about this time (1925), but gradually he succeeded in transforming Italy into a totalitarian state with himself as dictator. The chief instruments in this process were the secret police and propaganda. M.'s remedy for Italy's unstable economic condition was to follow the path of economic self-sufficiency which inevitably led him to seek colonial expansion and eventually to embark on his aggressive policy against Ethiopia. In the first years of his regime, however, the majority of the It. people were probably satisfied with him. Administration was more efficient, industry apparently prospered, an ambitious and ostentatious programme of public works was begun, and Italy began to be regarded as a great power abroad—an important point, for many Italians felt they had been somewhat cold-shouldered at Versailles.

He soon deemed it politic to forget his crude atheism and to follow a policy of conciliation towards the Church. Thus he made a gift of the very fine Chigi collection of books and MSS. to the Vatican; hence too the inclusion of the mass in public ceremonies and the restoration of the crucifix to the schools. M. even submitted privately to having his own marriage blessed by the Church. M. then embarked on a solution of the 50-year-old problem, the Rom. question, i.e. the problem of the relations between the State and the Vatican. The ensuing negotiation resulted in the Lateran Treaty and Concordat (Feb. 1929), by which the papacy gave up its claim to the former papal dominions, retaining unrestricted sovereignty over a small area of Rome

E.N.A.

BENITO MUSSOLINI

editor, volunteered as a private soldier in the 11th Bersaglieri regiment. His service ended in 1917 when he was severely injured in a firing exercise. In Sept. 1917 he resumed editorship of his paper, its chief use now being to combat pacifism, and for this purpose he collaborated with the Fasci di Resistenza, or 'Unions of Resistance,' organised for that specific purpose. With the war ended, the exceptional disorder that reigned in Italy favoured the growth of the strong counter-revolution M. had been preparing. He had now decided to form his own political group and this subsequently adopted the name Fasci Italiani di Combattimento, the term 'Fasci' being already in familiar use. Thus on 23 Mar. 1919 the Fascismo institution was founded; its activities, which were directed by M., are recorded under FASCISM. M. very soon dropped most of the original programme of the group; it was the blackshirts of d'Annunzio's *arditi* and their slogans, and also the gangster methods of their leader, that appealed so strongly to M., and he soon made these his own. By playing on the dangers of communism, M. soon acquired considerable passive, and some vital active, support from the It. industrialist class and from the self-employed middle classes. In spite of this his party only secured some 30 seats at the elections in 1921; but by Oct. 1922 his propaganda and shock

thenceforth known as the Vatican City and receiving compensation in a large amount in cash and securities. M.'s dominant motive in concluding these accords with Pius XI was to bring the Church within the orbit and, as far as possible, the control of the totalitarian state, to enlist the support of the strongest and oldest force in the country, and to win the applause of Catholics all over the world. For the Catholic religion itself he probably cared nothing.

To further his aggressive designs on Ethiopia, he replaced Grandi by his son-in-law, Count Ciano. He had gradually relegated his other rivals to obscurity. Thus de Vecchi was sent to the Dodecanese as governor. Balbo (q.v.) was conveniently removed before he could bring to maturity his project of granting Libya independence, and Badoglio was deprived of all influence in Fascist circles. M., always contemptuous of legislative assemblies and cabinet gov., not only assumed office as Prime Minister, but took over the 3 service ministries and the Ministry of the Interior, while putting the Foreign Office under the puppet, Ciano.

Thus Italy's policy became essentially that of M. himself; but, with the rise of Hitler in Germany, his path became beset with ever-increasing difficulties. Faced with the alternative of giving up his aggressive dreams or supporting Hitler, he paid the heavy price involved in the latter choice. This included the abandonment of It. influence in Austria, which had become almost a satrapy of Italy. There were angry meetings between the 2 dictators in 1934, and later, when Hitler seemed to be preparing to march on Austria, M. massed his troops on the Brenner Pass. Nothing decisive happened at that time, but in 1936 M.'s diplomatic position had weakened as a result of his Ethiopian policy, which had estranged both Great Britain and France. He had, however, successfully conquered Ethiopia for Italy, and so, in the eyes of his fellow countrymen, avenged the humiliation of Adowa, 40 years before. M. now joined Hitler in supplying Franco with arms and men against the Sp. Republicans and so became a member of the Axis (q.v.) and a partner in the anti-Comintern Pact (q.v.). When therefore in 1938 Hitler actually marched into Austria, M. held aloof and, in the following year, the Berlin-Rome Axis became the so-called 'pact of steel.' In June 1940, with France approaching military collapse and the prospect of Great Britain's isolation, he declared war against both, hoping, 'like a jackal' (Churchill's description), to secure a cheap reward in the appropriation of Tunis, Cannes, and other portions of Fr. ter. However, in the course of the next 2 years he found himself at war with both Russia and the U.S.A. as well as with Britain, while the jealousy and ambition of Hitler, who soon became master of Italy after the It. debacle in Libya and Greece, precluded any possibility of Fr. spoils for Italy.

With the loss of It. E. Africa M.'s prestige began to wane even more sharply

than before his visit to Salzburg, which involved sending It. troops to uphold Hitler in his anti-Communist crusade. The plight of Italy became aggravated in early 1943 with the threat of invasion. By the end of Mar. M. sought to strengthen his control by reorganising the party directorate and by demanding a personal pledge of loyalty from all party leaders. But with the fall of Tunisia the situation grew steadily worse. In Mar. Hitler demanded the aid of It. troops to relieve Ger. garrisons in France and the Balkans; but M. needed all his military strength at home now that he had lost one army in Africa, besides the better part of 10 divs. roughly handled on the Russian front. In July, with the allied invasion of Italy well under way, the It. military authorities called for massive Ger. aid as the only hope of saving the country. This new request drove Hitler to extreme recriminations against his fellow dictator, and the only course left to M. was to concentrate on defending the Po valley and to leave the rest of Italy to its fate. Soon after M.'s report to the Fascist Grand Council of the outcome of his meeting with Hitler, Grandi, with the support of Ciano, Bottai (an ex-minister of education), and de Bono, led a revolt against him, and a demand for M.'s resignation, expressed in Grandi's motion that the king be invited to assume command, was carried by 19 votes to 7. On 25 July M. was summoned to the royal palace, informed of his dismissal, and taken into custody as he left. His fall meant the end of the Fascist regime. The king took command of the army, Badoglio (q.v.) was entrusted with the formation of a new gov., and throughout Italy spontaneous demonstrations bore witness to the relief felt by the people at the losing of the Fascist bonds, a release as yet more apparent than real. M. was sev. times transferred from one place of detention to another and eventually to a clinic on the Campo Imperatore, near Aquila, in the Abruzzi Mts. It was from here that he was carried off in a daring raid by a strong Ger. parachute force. M. in Nazi hands became, as was no doubt intended by Hitler, a potential rallying point for the endangered Fascists, who had everything to lose from a change of regime or an allied victory. M. set up a Fascist rep. in the N. of Italy and early in the ensuing year (1944) Ciano was tried by a Fascist tribunal for his part in the overthrow of his father-in-law and shot. But gradually and inexorably, with the defeat of the Ger. armies in Italy, the partisans in the N. of Italy secured almost complete control of the situation, and M., now a sick man, tried to escape across the frontier into Switzerland. But he was betrayed to the partisans and arrested on 28 April 1945, and, together with some 12 members of his ex-Fascist Cabinet and his mistress, Clara Petacci, was executed by partisans, who carried the bodies of their victims to Milan for public display. It has been said that if M. sought a model for himself he could have found it in the character of the tyrant as delineated

by Plato or Savonarola, and that nearly everything in his movement was borrowed from d'Annunzio. Though neither a deep nor original thinker, he acquired a hold over the It. people by the guns of his illegal bodyguard, the support of the army chiefs, big industrialists, and land-owners, the most unscrupulous propaganda, and flamboyant oratory. As a political showman his only rival was Hitler. His personal vanity was almost boundless, yet he had intelligence, powers of leadership, and could, on occasions, show streaks of unexpected sensitivity. Though in the first years of his dictatorship he appeared to confer many material benefits on Italy, his policy, from about 1935 onwards, in foreign affairs was disastrous, and left his country materially devastated and spiritually exhausted.

There is a copious bibliography on M. and Fascism, and most books, being written either to extol or to condemn, must be read with reserve. See his *My Autobiography* (trans. by R. W. Child, 1928; G. Megaro, *Mussolini in the Making* (to 1914), 1928; A. de Ambris, *Mussolini: la leggenda e l'uomo*, 1930; H. Finer, *Mussolini's Italy*, 1935; Margherita Sarfatti, *The Life of Benito Mussolini* (with a preface by him; trans. by F. Whyte), 1936; J. A. R. Marriot, *Makers of Modern Italy*, 1937; Angelica Balabanoff, *My Life as a Rebel* (comments on M.'s days in Switzerland), 1938; G. Pini, *Official Life of Benito Mussolini* (trans. by L. Villari), 1939; I. Thomas, *Who Mussolini Is* (Oxford Pamphlets on World Affairs, No. 59), 1942; M. H. Macartney, *One Man Alone*, 1944, and *Memoirs of Mussolini, 1942-3*, 1946; P. Saperito (Eng. trans.), *The Fall of Mussolini*, 1948; M. Muggeridge (ed.), *Ciano's Diary*, 1947, and *Ciano's Diplomatic Papers*, 1948; R. Dombrowski, *Mussolini: Twilight and Fall*, 1956.

Mussooree, tn of Uttar Pradesh state, India, 130 m. NNW. of Rampur. Lying on the foothills below the Himalaya at about 6500 ft. M. is a very popular hot-weather resort. It is directly above Dehra Dun.

Mussorgsky, Modest Petrovich (1839-1881), Russian composer, b. Karevo, Pskov, was at first a guards officer. In 1857 he began to study music under Balakirev (q.v.) and in 1858 resigned his commission, becoming a civil servant. A sympathy with common folk led him to write realistic songs, following the inflections of their speech, and he endeavoured to do the same with his operatic characters, succeeding in completing one great operatic masterpiece, *Boris Godunov*, produced in 1874 and sev. times revised. All the others remained incomplete, but *The Marriage, Khovanshchina*, and *Sorochintsy Fair* are performable in ed. versions. His life became more and more poverty-stricken; he took to drink, and d. from a spinal disease. The influence of folk-music upon his work was strong, especially in about 70 songs, the best of which are works of genius for character and atmosphere. His other best-known works are *Night on the Bare Mountain*,

for orchestra, and the piano suite, *Pictures at an Exhibition*. See M. D. Calvocoressi (ed. by G. Abrahams), *Mussorgsky* (Master Musicians), 1946.

Mustapha Kemal, see ATATÜRK.

Mustard. The 2 M.s of importance are black M. (*Brassica* (*Sinapis*) *nigra*) and white M. (*B.* (*S.*) *alba*). The former is grown in Cams and adjoining cos. for the production of seeds, which are ground, and after removal of the dark-coloured testas are used as a condiment or are converted into M. oil. The brown or Indian M. (which is not cultivated in Britain) may be used for the same purpose. White M. is one of the quickest maturing crops grown in Great Britain and is commonly grown as a forage crop or green manure. The white

M. seedlings are commonly used in salads, and for the purpose should be sown 3 days after cress, with which M. is usually eaten.

Mustard Gas (dichloroethyl sulphide, $(CH_2Cl)_2S$, *Yperite*, *Yellow Cross*) was obtained by Richio, 1854, by the action of chlorine on ethyl sulphide. It was described by Guthrie, 1860, and prepared pure by Victor Meyer, 1886, by the action of ethylene chlorohydrin on sodium sulphide, followed by the action of hydrochloric acid. It was first used as a poison gas in the First World War by the Germans at Ypres, 12 July 1917. It was manuf. by the action of sulphur chloride, S_2Cl_2 , on ethylene at 30° C. It is a light, yellow, oily liquid boiling at 215° C., and solidifying at 14° C. It is a powerful vesicant (blister producer), and affects the eyes and respiratory tract after a period during which the effects are not obvious.

Mustique Island, Grenadines, see ST VINCENT.

Muswellbrook, tn on Hunter R., in New S. Wales, Australia, 179 m. NNW. of Sydney. There are good coal deposits being worked and cattle are raised. Pop. 5730.

Mut, Egyptian mother goddess *par excellence*, represented as a vulture, and spouse of Amon-Ra of Thebes. She perhaps derived from Nekhbet, the vulture

goddess of el Kab and guardian deity of a prehistoric kingdom of Upper Egypt.

Mutanabbi, Al-, Abu-'l-Tayyib Ahmed-ibn-Hosain (915-85), Arabic poet. He was the leading figure in a galaxy of Arabic men of letters who gathered at the court of Sayf ad-Dawla, at Aleppo, the N. Syrian school of poets. He developed the qasida form of poetry to its fullest, and had a great influence on the early development of Persian poetry as well. In the Arabic world he is regarded as one of the greatest poets, though European critics differ on this. His name (Al-M. = 'would-be prophet') recalls an early escapade when he claimed to be a prophet.

Mutation, inheritable change in a characteristic of a plant or animal, by means of which evolution and the formation of new species are considered to take place. New species may arise through a large M. changing the characters very considerably, or through a succession of smaller M.s. M. is considered to be due to changes in the genes (q.v.); it has been produced artificially by the action of X-rays, and other radiations, and by the chemicals colchicine and mustard oils. In nature, it is believed that cosmic rays (q.v.) are important agents. See EVOLUTION; GENETICS; HEREDITY; VARIATION.

Mutator, mercury-vapour converter, which can be used as rectifier (q.v.) or for converting d.c. into single- or 3-phase a.c., or single- into 3- or 6-phase a.c.

Mutina, see MODENA.

Mutiny, Indian, see INDIAN SUB-CONTINENT.

Mutiny Act. The first Mutiny Act, that of 1689, made it possible to keep a standing army in time of peace, not only by sanctioning its existence for the first time in England, but by providing for the punishment of mutiny and desertion with death, and empowering the Crown to commission courts-martial to deal with those offences in time of peace. From 1689 Parliament passed the Mutiny Act annually until 1831, when it was finally superseded and merged in the Army Act of that year, an Act which is also annually renewed. The Jacobite Rebellion of 1715 made it necessary to increase the stringency of the Crown's disciplinary powers, and accordingly the Mutiny Act of 1715 authorised the Crown to formulate Articles of War to regulate generally the forces in the U.K. in time of peace. Prior to that year the Crown could only issue such articles in times of war or rebellion. Among other things, the later Mutiny Acts provided for the punishment by courts-martial of persons guilty of embezzling military or naval stores. See Sir C. G. Robertson, *Select Statutes, Cases and Documents illustrating English Constitutional History, 1660-1832* (7th ed.), 1936.

Mutuhito (1852-1912), known as Meiji Tenno, 122nd Emperor of Japan, b. Kyoto. He succeeded his father Komei in Jan. 1867. Before he was crowned radical insurgents from the S. seized his person on 3 Jan. 1868, and so overthrew the power of the Shogun (q.v.). M. was sagacious and strong willed, and a fine soldier

and poet. The modernisation of Japan was his ruling ambition, and he travelled widely in the country to convince his people of its necessity. He enjoyed more esteem than any other Jap. emperor, and his death is regarded as the end of the Grand Era.

Mutterstadt, Ger. tn in the Land of Rhineland-Palatinate (q.v.), 40 m. S. by E. of Mainz (q.v.). Pop. 5000.

Mutton-bird, Australasian name for a shearwater or petrel used for food and valued for its oil and feathers. The sooty shearwater (*Puffinus griseus*) is the common M. of New Zealand and the short-tailed shearwater (*P. tenuirostris* or *brevicaudus*) that of Australia and Tasmania. The great-winged (*Pterodroma macroptera*), white-headed (*P. lessoni*), and Kermadec (*P. neglecta* or *phillipi*) petrels are also known as M.s. The origin of the name is uncertain. See W. B. Alexander, *Birds of the Ocean*, 1955, and W. R. B. Oliver, *New Zealand Birds*, 1955.

Muttra, see MATHURA.

Mutual Inductance, see COUPLED CIRCUITS.

Muyra Language, see SOUTH AMERICAN NATIVE LANGUAGES.

Muzaffargarh, tn of W. Pakistan, 20 m. SW. of Multan. It was here that Flora Annie Steel, the novelist, was an inspector of schools.

Muziano, Girolamo (1528-92), It. painter, b. Aquafredda, and studied under Romanus. It was not until 1550, when he went to Rome, that he began to be noticed. His most famous work is 'The Raising of Lazarus', which was finally placed in the Quirinal Palace. The large fortune which he left was used to aid in founding the Academy of St Luke at Rome, where he d.

Muztagh, see KARAKORAM.

M.V.D., Russian abbreviation for Ministry of Internal Affairs. For a short period in 1953 the ministry acquired great importance in the Soviet Union when it was fused after Stalin's death with the Ministry of State Security (see M.G.B.). In the struggle among Stalin's successors Beria (q.v.), who was the head of the M.V.D., used its apparatus to strengthen his own position. Soon after his downfall the security service was again separated from the M.V.D. and placed under the K.G.B. (q.v.).

Myal, quasi-religious movement of the slaves in Jamaica against the powers of Obeah (q.v.). The M. leader led dances by which a person harmed or killed by Obeah was restored to health. The M. leader was often in fact also an Obeah man, and the connection between them is not clear. See also POCOMANIA. See Martha Beckwith, *Black Roadways*, 1928.

Mycoelium, see FUNGI.

Mycenae, one of the oldest cities of ancient Greece, dating from at least the third millennium BC, was situated in a very strong position on the hill overlooking the N. extremity of the Argive plain. In 468 BC M. was dismantled by the people of its ancient enemy Argos, and was never rebuilt. In the time of Pausanias the

ruins consisted of a great part of the walls, with the so-called Lion Gate, the fountain called Perseia, and the 'beehive' tombs. The discoveries which have been made here between 1876 and the present day have greatly increased the knowledge of Aegean civilisation (q.v.). See H. Schliemann, *Mycenae*, 1878; M. P. Nilsson, *Homer and Mycenae*, 1933, and *Minoan-Mycenae Religions*, 1950; A. J. B. Wace, *Mycenae*, 1949; for an account of the language of the ancients Mycenaeans, see M. Ventris and J. Chadwick, *Documents in Mycenaean Greek*, 1956.

Mycenaeae Civilisation, see AEGEAN CIVILISATION.

Mycetozoa, see MYXOGASTRES.

Mycoderma, genus of fungi, some causing fermentation, such as *M. vini* in wines and *M. cerevisiae* in beer, forming a skin on the liquids. *M. aceti* of vinegar is now *Acetobacter aceti*.

Mycological Institute, see COMMONWEALTH MYCOLOGICAL INSTITUTE.

Mycology, branch of science for fungi. The Commonwealth Mycological Institute (q.v.) at Kew co-ordinates information on plant diseases with the work on insect pests of the Commonwealth Institute of Entomology (q.v.) and that of the various imperial agric. bureaux located at research stations. The Mycological Institute is now under the control of the executive council of the Commonwealth Agric. Bureaux.

Mycorrhiza, association or symbiosis between the root-cells of a plant and the mycelium of a soil fungi by which both are benefited. It is important in many plants, including orchids, heaths, conifers, and many other trees and plants. See M. C. Rayner, *Trees and Toadstools*, 1946, and M. C. Rayner and W. Neilson-Jones, *Problems of Tree Nutrition*, 1947.

Myddelton, Sir Hugh, see MIDDLETON.

Myelitis, inflammation of the spinal cord. The nature of the infection causing M. is not known, but it is probably most often due to a virus. There are 3 recognised forms: (1) *acute ascending M.*, rapidly progressive, febrile, and causing ascending paralysis and anaesthesia; (2) *disseminated M.*, widespread and affecting the nerve tissue of the brain in addition to that of the spinal cord; and (3) *transverse M.*, a lesion right across the spinal cord at a certain level characterised by paralysis and anaesthesia below the level of the lesion and loss of control of the sphincters.

Myers, Frederic William Henry (1843-1901), Eng. essayist, poet, and author, b. Keswick. M. was the leading spirit, with H. Siddgwick, R. Hodgson, R. Gurney, and F. Podmore, in founding the Society for Psychical Research in 1882. His main works include *Catholic Thoughts*, 1873, *Essays Classical and Modern*, 1883, *Phantasms of the Living*, 1886, *Science and a Future Life*, 1893, and the posthumous *Human Personality and its Survival of Bodily Death* (2 vols.), 1903.

Myitkyina: 1. Most northerly dist. of Upper Burma, Mandalay div., 10,640 sq. m. in area. Indawgyi Lake is in the SW.

The tn is the limit of navigation on the Irawadi, and the terminus of the railway running N. from Mandalay. It was lost to the Jap. invaders early in 1942. In Mar. 1944 it had become the immediate goal of the allied counter-offensive, their troops being by then firmly placed across the main routes by road and rail and riv. linking M. with its supply bases in the S. By the end of April Gen. Stilwell's forces were within 40 m. of M., though they met with tenacious Jap. resistance. On 17 May, after a forced march over 110 m. of mt and jungle in 20 days, an Amer. force under Gen. Merrill suddenly descended on the airfield 2 m. S. of M. and wrested it from the surprised defenders. The Japanese, however, still clung to M., and it was not until 3 Aug. that the tn was finally taken, following a siege of two and a half months. Pop. 70,000. See further under BURMA, SECOND WORLD WAR, CAMPAIGNS IN.

2. State cap. of the Kachin state, a constituent state of the Union of Burma, and also the H.Q. of the M. dist. Prin. products are rice and timber. There is also a large sugar factory at Namti in the M. dist.

Myjava, Czechoslovak tn in the region of Bratislava (q.v.). It has textile manufs. Pop. 9900.

Mykolayiv, see NIKOLAYEV.

Myiae, see MILAZZO.

Myllitta, Babylonian goddess in Babylon, mentioned only by Herodotus and probably a reference to Ishtar or Astarte, goddess of love.

Mylonite, rock formed by the grinding and shearing of the rocks of the earth's crust under the forces of intense earth movements. M.s occur in the NW. highlands of Scotland.

Myna, or **Grackle**, genus of birds of the starling tribe, having dark-brown plumage, with white markings on tail and wings.

Mynyddislwyn, urb. dist. of Monmouthshire, England, 13 m. from Newport and 7 m. from Pontypool. It is on the S. Wales coal-field, and has manufs of switchgear, confectionery, and furniture. Pop. 15,000.

Myogen, see MYOSINOGEN.

Myopia, or **Short-sight**, defect in vision due to a faulty structure of the eye. Parallel rays of light are brought to a focus in front of the retina owing to excessive length of the eye from the surface or the cornea and a too great convexity of the crystalline lens. Thus an indistinct image is thrown on the retina. This defect is corrected by the use of spectacles with concave lenses. The concavity of the lenses is adjusted so that parallel rays are focused on the retina as in ordinary vision. M. often has hereditary connections, and children of myopic parents should have regular examination of their eyes. See under REFRACTION, ERRORS OF.

Myosinogen, or **Myogen**. M. and paramyosinogen are the 2 soluble proteins present in muscle in the proportion of 4:1. They are of globulin nature and readily coagulate through heat. This

coagulation change is reversible during life, but at death an irreversible coagulation occurs (*rigor mortis*), which is only removed by the solution of the protein through the action of proteolytic enzymes.

Myosis, condition of the eye in which the pupil is abnormally contracted and lacks its power of accommodation. It may be produced by use of certain drugs, e.g. opium.

Myosotis, see FORGET-ME-NOT.

Myriapoda, class of arthropods which comprises the Chilopoda or centipedes and the Chilognatha (Diplopoda) or millipedes. The body is long and flattened or cylindrical, and the legs are numerous, though, of course, not so numerous as the popular names suggest. In their internal anatomy they resemble the Insecta, with which they have such other features in common as respiration by tracheal tubes and the possession of 2 antennae on the head, but the segmented body exhibits no distinction between the thorax and the abdomen, while wings are always absent. Their range is very extensive, and they live in dark places, as under stones, heaps of leaves, masonry, and the bark of trees. Some possess powers of luminosity. The centipedes are always flattened and are characterised by a single pair of legs to each segment, the first pair being capable of inflicting poisonous wounds; they are all carnivorous. Millipedes live on vegetation, and apparently have 2 pairs of legs attached to each segment, but the segments are not perfectly separated; the bodies are round. Some foreign species attain a length of sev. inches. See also ARTHROPODA.

Myrica, family Myricaceae, genus of shrubs or trees of temperate or sub-tropical regions; often fragrant, with unisexual flowers. *M. gale* is the Bog Myrtle of Britain; *M. cerifera*, the Wax M.; *M. californica* and *M. pensylvanica*, bayberries of N. America.

Myristica, tropical trees of the family Myristicaceae, yielding the nutmegs and mace of commerce, and oils and fats. *M. fragrans* yields the best nutmegs and mace, as well as an essential oil used in soap-making and perfumery. *M. officinalis*, of Java, Sumatra, and Celebes, yields nutmeg or mace butter, used in pharmacy. *M. cuba* of S. America is used for candle-wax.

Myrmidones, an Achæan race which inhabited Phthiotis in Thessaly. Their name is derived from an ancestor, begotten of Eurymedusa by Zeus in the form of an ant, or from the legend of the re-peopleing of Aegina with ants, changed by Zeus into men. In England the term M. is used for a ruthless subordinate, from the loyalty of the M. to Achilles. See *Iliad*, ii. 68 and Strabo, viii. 375; ix. 433.

Myron, Gk sculptor of the 5th cent. BC, b. Eleutheræe, on the borders of Boeotia and Attica. He worked almost exclusively in bronze, and was a late contemporary of Phedias (q.v.); he made statues of the athletes Timanthes (456) and Lycinus (448), excelling in the representation of movement. The 'Discobolus' at Rome is one of that city's most

important statues because it is not, like so many others, a Rom. copy of a Gk original, but if not the original work of M. is at least a very early Gk copy of it. There is a cast of a 'Discobolus' of his with the head put on wrongly in the Brit. Museum. See P. E. Arias, *Mirone*, 1940.

Myronides, Athenian general of the 5th cent. BC. In 459 he repulsed 2 Corinthian attacks on Megara, and by the victory of Oenophyta (456 BC) over the Spartans obtained the submission of Boeotia (except Thebes), Phocis, and Locris.

Myrrh, the aromatic gum-resin of *Anartium* (*Balsamodendron*) *myrrha*, tree of Arabia and Ethiopia; used in incense, for perfumery, and at one time in embalming.

Myrrhine Vases, see MURRHINE.

Myrrhis, Myrrh, or Sweet Cloely, small genus of umbelliferous perennial plants. *M. odorata*, a tall, aromatic plant with large tripinnate leaves and umbels of white flowers, is British, and was formerly much used as a pot herb and in salads. See MYRRH.

Myrtle, or *Myrtus*, genus of shrubs or trees with white fragrant axillary flowers and ornamental leaves, which are also fragrant. The common M. (*M. communis*) and its numerous varieties are hardy in mild sheltered positions. Its leaves are distilled to yield the perfume Eau d'ange.

Mysia, in anc't geography, was a dist. in the NW. of Asia Minor, peopled by the Mysi from Thrace. The N. portion was called M. Minor, the S. M. Major. The chief towns were Pergamum and Cyzicus.

Mysłowice, tn of Poland, in Katowice prov., on the Przemsza, 5 m. E. of Katowice (q.v.). It was in Germany until 1919. There are zinc- and coal-mines, and textile and chemical industries. Pop. 25,000.

Mysore: 1. State of India, enlarged since 1956 to include the whole of the Kanara country, and covering the former princely state of M. lying in the S. part of the Deccan plateau and along part of the W. Ghats, the Kanarese dists. of Bombay and Madras respectively lying along the W. coast, the Kanarese dists. of the old state of Hyderabad in the Deccan, and the hill state of Coorg. Most of the state is hilly or highland with an agreeable climate, save in the more arid regions obtained from Hyderabad; the coastal belt gets the full force of the SW. monsoon and a heavy rainfall.

History. In anc't times M. was ruled by the Kadamba dynasty mentioned by Ptolemy. It was part of the great empire of Vijayanagar through the Middle Ages. In 1610 the Wadiyar (chietain) of Mysore seized Seringapatam and estab. the Hindu dynasty of Mysore. Haidar Ali usurped the throne in the mid 18th cent., his son Tipu Sultan was defeated in the last M. war, and Purnaiya, the Brahmin minister of the usurpers, reorganised the state for the old Hindu dynasty till the heir came of age. He did this very ably, but misrule by Krishnaraja Wadiyar led to Brit. intervention in 1831. M. was restored to a new representative of the Wadiyars in

1881 and developed under able diwans (ministers) to become India's model state, in many respects ahead even of the Brit. provs. M. had a form of representative gov. even before 1947. After Indian independence, M. became a member state of the union with the maharaja as rajpramukh (governor of princely rank). In the reorganisation of 1956 the state was enlarged to meet the demand of the Kanarese-speaking peoples for their own state, the maharaja becoming its governor.

E.N.A.

BRAHMIN OF MYSORE READING THE
SACRED BOOKS

Development. State and private enterprise had done much for M. in the past. It produced rice and ragi, oilseeds, cotton, and other food crops; it had tea and coffee estates; and it was developing its quite considerable forest resources. It had a varied industrial development—textile works, silk filatures, tobacco factories, the main gold-field of India, engineering works, the first aircraft plant in India, iron and steel works at Bhadravati, manganese mines, and a promising electrical industry. It had pioneered hydro-electric development in India, especially rural electrification, by means of big schemes like Sivassamudram and the Jog Falls. M. and Bangalore were models of city planning and improvement. Independence has seen progress maintained. India's state telephone works are at Bangalore. The new dists. bring in wheat- and jowar-growing areas, a new gold industry from Hyderabad; most important, for the first time in modern times, a stretch of sea coast with promising ports at Karwar, Bhatkal, Mangalore, and Malpe, and good fisheries.

Culture. Kanarese is the language of the great mass of the people. There are 2 univs.: M. (estab. 1916, and having 44 affiliated colleges) and the Karnatak Univ., started in 1949 in the Kanarese dists. of Bombay.

Government. The governor acts through ministers responsible to an elected assembly of 208. There is also an upper house, the Legislative Council of 52 members. M. has 12 representatives in the Upper and 26 in the Lower House of India's parliament. The cap. is Bangalore (pop. 779,000). Other big towns are Mysore (pop. 244,000, see below), Hubli (pop. 130,000), Kolar Gold Fields (pop. 159,000), and Mangalore (pop. 117,000). Area 72,730 sq. m.; pop. 19,000,000.

2. Former cap. of the above state, situated 10 m. S.W. of Seringapatam. It is a city of no particular architectural distinction, but graciously laid out with wide streets and spacious buildings. Situated at 2500 ft. M. is dominated by a long, precipitous hill, Chamundi, rising to 3500 ft, the top being reached by a good motor road. Part way up is a colossal figure, hewn out of the solid rock, of Nandi, the sacred bull of Shiva, d. 1659. M. being well lit by electricity, the view of it from the top by night is striking. It has long been known for its magnificent processions and festivities at the ann. Dasara festival. In the maharaja's palace is a fine throne of figwood overlaid with ivory, gold, and silver in Hindu designs. The origin is uncertain. There is a univ. (1916), and a large sandal oil factory.

Mysore Thorn, see CAESALPINIA.

Mystagogue, person who in the Gk mystery religions supervised the preparation and instruction of those seeking initiation.

Mystery (Gk 'a secret'): 1. In Christian theology a truth which cannot be known by the human reason unaided by revelation, and which even when revealed transcends human comprehension, e.g. the Trinity, the Incarnation. The great M. of which St Paul speaks in Eph. 1 was the admission of the Gentiles to God's Israel, the Church—a divine purpose kept secret until Pentecost, though foretold in prophecy and in the teaching of Christ. The Christian Eucharist (q.v.) is frequently called the Holy Mysteries, partly because of its sacramental character, and partly because in the early Church the unbaptised were not fully admitted to it. This is a sense of the word M. akin to the second meaning.

2. A doctrine and its accompanying rites kept secret from all but the initiates and having a saving if not immortalising effect upon them.

3. It is necessary to distinguish M. in these 2 senses from that derived from Lat. *ministerium*, It. *mestiere*, a trade or craft, and more properly spelled 'mystery' (whence M. plays (q.v.), those acted by trade guilds).

Among the Babylonians scholars detect a M. rite in the second sense in the pantomimes which illustrated the myth of Tammuz and Ishtar. It is, however,

doubtful whether we have here a true M., since the doctrines inculcated by these rites were not themselves secret, and the rites purported to do no more than to solace the dead. The earliest M.s of which we have certain evidence, at least as early as 1875 bc, are those connected with the legend of Osiris. In Greece certain public cults had secret rites attached to them, such as the Arrephoric and Thesmophoric festivals at Athens. But the prin. Gk M.s were the Eleusinian and Adanian and the originally non-Hellenic Kabeiroi of Samothrace. These were local, whereas the more emotional and licentious Dionysiac and Orphic M.s were practised by societies which sprang up in various parts of the Hellenic world. In the 2nd cent. bc, on the break up of the Alexandrian Empire and the beginning of the Graeco-Rom. period, there was a revival of M. religions which exerted mutual influence upon one another. To this period belongs the cult of Mithras which appears to have made a particular appeal to the Rom. legions, who carried it with them wherever they went. The M. religions offered to their initiates salvation through communion with some saving deity. In Mithraism the initiate passed under a blood bath, streaming from a bull sacrificed overhead. Naturally little is known of initiatory rites; they included sacred lustrations and meals, but the attempt to detect any influence of them on Christian teaching or sacraments has failed. If there was influence, it seems to have been in the other direction. The initiation of a 'mystic' was followed by the enlightenment (*epopteia*) in which the doctrine was revealed by a solemn ritual which seems always to have included dancing. See F. Cumont, *Textes et monuments figurés relatifs aux mystères de Mithra*, 1896-9; R. Reitzenstein, *Die hellenischen Mysterienreligionen*, 1910; H. A. A. Kennedy, *St. Paul and the Mystery Religions*, 1913; J. Leplat, *Die Religion in der Umwelt der Urchristentums*, 1926; A. E. J. Rawlinson, *Essays Catholic and Critical*, 1920; O. Bauhofer, *Das Geheimnis der Zeiten*, 1935.

Mysticism (Gk *mysterion*, secret or hidden), belief in spiritual apprehensions of truths beyond the understanding, can hardly be said to be either a philosophy or a doctrine. It may be said to be a tendency in religious feeling, a temper, or an atmosphere. The starting point in M., and its goal, is that unity underlies diversity. So M. has been defined as an 'attitude of mind founded upon an intuitive or experienced conviction of unity, of oneness, of likeness in all things.' M. leads to a belief that all things are manifestations of the divine life, and that the spirit is the only eternal thing, and, further, since unity underlies all, man has some share of the nature of God, and through this God-like part of him can apprehend God; for as through the intellect we apprehend material things, so through the soul can we apprehend the spiritual. Reason is not a part of M. According to M. we can only know a thing spiritually by being it, and therefore

the aim of a mystic is to attain union with the divine, and life becomes one long aspiration, and reality or truth ever and ever deepens and expands. M. appears in Buddhism and Hinduism, and may be said to have arisen in Europe with Plato, although Plotinus, the founder of Neo-Platonism, was the first great European mystic. Then came the Christian mystics of the Middle Ages, headed by St Augustine and the Syrian monk who ascribed his work to Dionysius the Areopagite, and the great Irish philosopher, Scotus Erigena, who trans. Dionysius into Latin from the Greek. In the 12th and 13th cents. may be mentioned St Bernard of Clairvaux, Richard of St Victor, and St Bonaventura, and in the 14th cent. Richard Rolle, Walter Hilton, Julian of Norwich, John of Chur, and Thomas à Kempis. The Christian M. evolved by these was based on the adoptive sonship of God attained by man through Christ the God-man. Christian M. is thus a deeper realisation of this supernatural unity of man with God through Christ which is finally consummated in the beatific vision. Later we find Paracelsus, Bruno, Campanella, Boehme, Schelling, and Swedenborg. In England we have the Cambridge Platonists, including Henry More and John Smith, and later Wm Law and Blake. See also CARBALA; QUIETISM; ROSICRUCIANS; THEOSOPHY; and the articles on the various religions and persons mentioned above. See W. R. Inge, *Christian Mysticism*, 1899, 1948, *Studies of English Mystics*, 1906, and *Mysticism in Religion*, 1947; C. F. E. Spurgeon, *Mysticism in English Literature*, 1913; R. Nicholson, *Mysticism in Islam*, 1921; E. C. Butler, *Western Mysticism*, 1922; F. von Hügel, *The Mystical Element of Religion*, 1923; Evelyn Underhill, *Mysticism*, 1924, 1952, *The Mystic Way*, 1930; E. Brunner, *Die Mystik und das Wort*, 1924; J. H. Leuba, *Psychology of Religious Mysticism*, 1935; A. Hopkinson, *Mysticism Old and New*, 1946; T. Merton, *Ascent of Truth*, 1951.

Mytens, or Meytens, Daniel (1590-1642), Dutch portrait painter, b. The Hague, came to England and became portrait painter to Charles I. When Van Dyck was made the king's prin. portrait painter M. wished to go, but was prevailed upon by the king to stay until about 1630, when he returned to Holland. He painted portraits of many notable persons, including Charles I (in Buckingham Palace), the Duke of Portland, the Earl of Craven, etc.

My-tho, cap. of M. prov., and a port, situated on l. b. of the N. branch of the R. Mekong (q.v.) delta in Cochinchina (q.v.), 35 m. SSW. of Saigon. The prov. produces rice, coco-nuts, areca-nuts, betel, oranges, bananas, maize, tobacco, and sugar-cane.

Mythology (Gk *mythos*, logos: storytelling, or a rationale of stories): (1) imaginative traditions concerning the gods and other supernatural beings; (2) the study of these myths. M. is sometimes distinguished from legend as being entirely fictitious and imaginary, whereas legend is woven around an historical figure

or nucleus: e.g. the tale of Troy and the Arthurian romances are legend, not M. The dividing line, however, is hard to draw, for myth and legend are often closely interwoven (cf. Santa Claus), and behind the purest myth there often lurks prehistoric truth. Indeed to become established as a myth must first be widely accepted as true. The great myths are all deserving of respect if not reverence. They are poetic expressions of early man's profoundest intuitions about the universe and life. A M. indeed is to some extent a necessity as the background to a culture, and even to a reasonably satisfactory human life. Plato, while critically demolishing the ancient Hellenic M., declared that the philosopher would have to invent other truer myths to take its place, and himself essayed the task, e.g. in the *Timaeus*, the *Phaedo*, and the *Symposium*. Christianity (with Judaism), being an 'historical' religion, uniquely offers a *mythos* consisting of historical facts and events: but it too has its inspired M. of the poetic and theological and non-historical, non-factual kind, the stories of Creation, of Eden, of the Serpent, of the Trees of Knowledge and of Life, of the Rainbow, etc. M. then is not (as commonly supposed) confined to an early stage of society, for it still permeates our own, and that even in the form of non-Christian folklore, e.g. concerning fairies.

Plato was not the only one in ancient times to criticise the M. of his day. The theories of Euhemerus (q.v.) on the subject were radically destructive and are still influential in modern times. In 1825 K. O. Müller (in *Prolegomena zu einer wissenschaftlichen Mythologie*) explained M. as a disease of language, the names of the gods merely expressing natural phenomena. It was not until the late 19th cent. that serious and respectful attention began to be paid to the comparison and elucidation of the world's mythological riches. Lang and Frazer alike interpreted M. in terms of savage life and experience. W. Schmidt in his *Ursprung der Götteridee*, 'Origin and Growth of Religion', 1931, admirably reviews the various theories advanced to account for the origin of religion and its M.

Myth in primitive societies. Much anthropological work has been done on M. among primitive peoples, where it is clear that myths have an important social function as providing a *raison d'être* for the society and its institutions (e.g. the distinction between chiefs and commoners, or the possession of land or magical powers by certain families, etc.). In this light the historical truth or otherwise of a myth is irrelevant, and questions about such matters are based on a misconception of the true nature of M. Indeed modern myths in W. societies have the same function, as can be seen in the case of racialist M. in Nazi Germany and in S. Africa about the inferiority of Semitic or Negro peoples: M. provides a rationale for social behaviour without any necessary basis in scientific fact.

Classification of deities. The deities of

various M.s fall into well-defined classes. In all systems we have war-gods, water-gods, wind-gods, thunder- and lightning-gods, gods of agriculture and the chase, gods of death, and many other mythic conceptions. Many of the deities of certain systems combine 2 or more of these. We find war-gods who are also gods of agriculture, and wind-gods or thunder-gods who are gods of the chase. Deities of death often preside over agriculture; the seed arises from their subterranean domain.

Cosmogony. An important dept of M. deals with the primitive notion of the world and its creation, and the origin of man. The likeness between cosmological myths in all parts of the world is extraordinary, and cannot be accounted for by the theory of circulated or borrowed conceptions. See also COSMOGONY.

Celtic mythology can be gleaned from the remains of altars and images in France and England, and from the mythological tales of Wales and Ireland. Most of its gods, however, were tribal or local in character. In ancient Gaul we find Ogmios equated by the Romans with Mercury, and Borvo, Belenos, Grannos, and many more—all local gods—with Apollo. The martial Gauls had many warlike deities: Camulos, Albiorix, Caturix. Animal and nature gods abounded, like Mullo, a mule-god, Vintius, a wind-god. 'Corn-mothers' were numerous and local, e.g. Berecynthia of Autun. In myths of Ireland we find supernatural races, such as the Fomorians, Firbolgs, and Tuatha Dé Danann, which probably represent the pantheons of emigrant races. The most prominent Fomorians were Balor, a personification of the evil eye; Bres, the god of night, or perhaps of growth; and Donnán, a goddess of the depths of the earth. Of the Tuatha Dé Danann, 'the folk of the goddess Danu,' the principal deities are Dagda, the most important of all Irish gods, probably an earth or agricultural deity; Oengus, son of Dagda, a god of growth; Nuada 'of the Silver Hand,' perhaps a harvest god; Manannan, god of the seas; and Lug, the sun-god. The principal Celtic gods found in the Welsh *Mabinogi* and other myths were Llyr, god of the sea, and his sons, Bran and Manawyddan; Dôn, the equivalent of the Irish Danu; Gwydion, a Celtic Proteus; Arianrhod, an earth-goddess; and Gwynnion, a sort of Vulcan. In the Arthurian romances we find many mythological characters disguised.

Egyptian mythology shows us the primitive conceptions of totemism, animism, and the like still surviving but with superimposed upon them, the philosophical beliefs of a priestly class which has arrived at a higher theological capacity. Unable to impart their abstract beliefs to the ignorant, the priestly caste retained such of the early popular beliefs as seemed good to it, and employed them symbolically to inculcate higher religious thought. Herodotus explains that the apes and other animals kept in captivity by the Egyptian priests were in no wise regarded as idols, but as typifying the

multifarious attributes of deity. The gods of Egypt were arranged in triads. Egypt was subdivided into nomes or provinces, each of which possessed its triad of gods. Thus Osiris, Isis, and Horus (qq.v.) at one time presided over a nome, but later, because of their popularity, became national gods. The myth of Osiris, his birth, reign, and death, typifies the daily journey of the sun. His wife, Isis, and their son, Horus, lost all their original characteristics when interwoven with the Osiris myth. Nephthys (q.v.), sister to Isis, probably represents the sunset. She was wife to Set (q.v.), brother to Osiris and god of darkness, who finally triumphed over him. Wisdom was personified in the god Thoth (q.v.), called by the Greeks Hermes Trismegistos. Anubis (q.v.), or Anpu, god of the lower regions, and the patron of embalming, was figured with the head of a jackal. Bubastis (q.v.), the cat-headed, represented the heat of the sun. Besides these a large number of the kings of Egypt were deified. A vast and cumbersome ritual crystallised round this M., represented in the *Book of the Coming Forth by Day*, which deals with funerary practices. It is, in fact, a guide to the soul after death through Amenti, the sad underworld of the dead.

Myths of Greece and Rome may be considered together, as in many cases their deities are interchangeable. There is a well-defined pantheon ruled over by the sky-god, Zeus or Jupiter, who has supplanted an older generation of divine beings, and wields thunder and lightning. With his wife, Hera or Juno, he rules the other gods, many of whom are related to him. Hephaestus, the god of smiths, and Vulcan, the Rom. god of devouring flames, are the craftsmen or artificers—though Vulcan's surname Mulciber indicates rather a power of quelling conflagrations. Pallas Athene or Minerva presides over wisdom, but has also something of a martial character. Ares or Mars is the god of war. Aphrodite or Venus presides over love, and Hermes or Mercury acts as messenger between gods and men. Apollo is the god of song and art. Innumerable tales circle around these beings, tales which for beauty have never been equalled in any M. But the Greek mind speedily discerned the insubstantial nature of the system it had evolved, and early doubts were expressed concerning the existence of the gods. No M. ever reached such perfection or underwent such rapid collapse as that of Hellas. The M. of Rome, built by sterner and more conservative folk, held its own for a little longer, but it too crumbled speedily before the advance of monotheism. See individual articles on gods and myths.

Hindu mythology. The M. of the Aryan conquerors of India is polytheistic. The head of their pantheon is Brahma, whose leadership is frequently threatened by other powerful gods. The fullest account of the Hindu M. is to be found in the Vedic hymns. See HINDUISM.

Semitic mythology. In early Semitic M. polytheism displayed many of the features

of totemism and animism. There was also a widely distributed system of pillar worship, and each 'high place' and mt possessed its special deity or ba'al. The religions of Babylonia and Assyria were wildly polytheistic, including as they did gods which represented every attribute and phase of deity. In Babylonian myth we find a great triad, Anu, En-lil, and Ea, at strife with darker deities, Apsu, Tiamat, and Marduk. The title Bēl was given to all gods alike. Dagon was probably a corn god. One of the prin. Assyrian deities was Ishtar, the wife of Marduk and the goddess of love and fruitfulness. Ashur, the local god of the city of that name, became the head of the Assyrian pantheon, and the national god of war. There were many smaller gods of only local significance. See also ASTARTE; COSMOGONY; ISRAEL; TAMMUZ; and individual names.

Teutonic mythology placed at the head of its pantheon Odin, or Wotan, the All-Father, who presided over the destinies of both gods and men. He possessed all the characteristics of a sun and sky god. His consort, Frigg, typified the Scandinavian matron and housewife. Thor was god of thunder, the Scandinavian Vulcan. Tyr was the sword-god and god of war, Loki the mischievous god of evil, Balder the graceful god of light and summer, whose myth typified the death of that season. The Scandinavians imagined that the *aesir*, or gods, dwelt in Asgard, at the top of the world-tree, Yggdrasil. Round this tree coiled the great world-snake. At its roots dwelt Hel, the dark goddess of death. In Midgard dwelt the race of men. But in the Norse conception even Asgard and its deities would not endure for ever. On the contrary, before the eyes of the gods there ever loomed a day of doom, when after the battle of Ragnarök they and the powers of evil would mutually destroy each other, darkness and chaos prevail, and a new heaven and earth be born, free of all toil, pain, and sin, created by the Supreme Being, Alfadir ('All-Father'). See also BRUNHILDA; FREYJA; NIBELUNGENLIED; VALKYRIES; and other names given above.

Mytilini, or **Kastro**, name of one of the 3 dists. and also of its cap. in the is. of Lesbos. The latter is divided into Molyvo in the N., Calloni in the W., and Kastro in the E. M., or Kastro, the chief tn of this dist., is built in the shape of an amphitheatre surrounding a small hill surmounted by an anct. fortress. It was at first situated on an is. close to the E. coast of Lesbos, but as the tn grew the is. were joined by a causeway, and M. expanded along the coast. During the Peloponnesian war the tn revolted, and was besieged from 429 to 427; it was the scene of a battle between Callicrates and Conon in 405. Pompey raised M. to the status of a free community. Pop. 31,000.

Mytishchi, tn in the Moscow oblast of central Russia, industrial and residential suburb 12 m. N. of Moscow, with large engineering industry (lorries, underground coaches, laboratory equipment). The Moscow water works (built 1779) are here. Pop. (1956) 91,000 (17,000 in 1926).

Mytton Flags, series of rocks of Lower Ordovician age, occurring in Shropshire, England. They consist of thick shales or flags made of ashy material, with a few fossils, including trilobites. They are remarkable for their copious supply of zinc, lead, and barytes, and some of the mines were worked by the Romans in Britain.

Myxoedema, metabolic disease caused by a decrease in function of the thyroid gland. This gland, which lies in front of the windpipe, is one of the ductless glands. Its function is the secretion of the hormone thyroxin, which speeds up metabolism, growth, and mental activity. If the gland degenerates or is removed by operation a state of sluggish metabolism sets in, with depression of mental function. The body increases in bulk, and the subcutaneous tissue of the face and hands becomes infiltrated with a mucin-like sub-

stance, causing a swelling which does not pit on pressure. The mental processes become sluggish, the speech becomes halting, and there is marked loss of mental and physical energy. One of the characteristic symptoms is a total absence of sweating. M. is more common in women than men. The disease may run its course for many years with gradually increasing intellectual and physical incapacity. The connection of the disease with the loss of activity of the thyroid gland is demonstrated by the similarity of the symptoms to those of operative M., the existence of cases in which the thyroid gland is shown to be atrophied, and the fact that administration of thyroid extract causes a marked improvement.

Myxogastres, **Myxomycetes**, or **Mycozoa**, class of widely distributed organisms numbering some 400 species. Some of them were known by the middle of the 19th cent., and were understood to be fungi, but the spores on germination, instead of producing germ tubes, give rise to amoeboid bodies; these have the power of spontaneous movement, and combine in a solid mass or plasmodium or vegetative condition which remains buried in the matrix or host until it creeps to the surface and produces its spores in a position whence the wind will disperse them. Most M. are saprophytes, and some creep over and suffocate seedlings, but a few are parasitic on cultivated plants and trees, causing such destructive diseases as finger-and-toe, corky scab of potato, and crown gall. See FUNGI.

Myxomatosis, virus disease of rabbits, first known in 1898 when it almost wiped out the rabbits in a Montevideo laboratory. The symptoms are distinct, with marked swelling of the face and complete lethargy terminating in death. Early attempts to use M. as a method of eliminating rabbits were only partially successful, but one introduction in S.E. Australia spread rapidly, killing four-fifths of the rabbit pop. and, it is estimated, increasing rural production by £50,000,000. In 1952 a Fr. doctor introduced the disease to his estate, but it spread beyond these confines and by 1954 had covered most of France. M. first occurred in Britain in 1953, but whether this was owing to a deliberate or accidental introduction is not known. The disease spread rapidly and this was facilitated by farmers releasing infected rabbits on their own properties. In Australia and France mosquitoes spread the disease, but in Great Britain the rabbit flea is the only likely vector. Although most rabbits are killed those which escape become immune and breed freely; evidence of this is clear in Great Britain at the present time (1958), where, after an initial rapid fall in numbers, the rabbit pop. is steadily increasing again.

N

N, fourteenth letter of the Eng. alphabet, follows **M** in most alphabetic scripts. Also its shape closely followed that of the letter **M** (q.v.). In the **N.** Semitic, the early **Gk.**, **Lat.**, and **Etruscan** alphabets, which were written from right to left, **n** was written **∩**. Gradually it assumed the shape **N**, **N**. The **n** minuscule developed slightly later than the **m** minuscule (see **M**). The sound **N** is determined by the position of the tongue against the palate. **N**, in English, standing by itself, is alveolar, and is pronounced with the tongue against the teeth sockets by expelling the breath through the nose. It is palatal or guttural according to the following sound. Thus in *branch* it is a palatal, while before *g* and *k* (e.g. *bank*, *thing*) it is a nasal. **N** and **M** have often been interchanged in the Eng. language. For instance, **N** tends to become **M** finally and when followed by *b*, *p*, or *f*, as in *lime*, *Cambridge hemp*, and *comfort*, from O.E. *linden*, *Cantabrigge*, *haenep*, and late *Lat. confortare* respectively. On the other hand, a medial **N** may be derived from an **M**, as in *ant* (O.F. *amete*, M.E. *amet*, *amel*). **N** is often found in conjunction with **D**, the latter dental being used to clench the sound of the former. Thus **D** is frequently introduced between **N** and **L**, or **N** and **R**, as in *spindle* (O.E. *spinle*), *thunder* (O.E. *donor*). Finally, **D** is sometimes dropped (e.g. *woodvine*, O.E. *wudubinde*), and sometimes developed (e.g. *sound*, O.E. *sunu*). Initially, through popular etymology or careless pronunciation, **N** has been introduced in *nickname*, *neut*, etc. (O.E. *ēac + nama*, *esle*), and dropped in *orange*, *adder*, *apron*, etc. (M.E. *norange*, *nadder*, *naperon*). See **ALPHABET**.

Naarden, tn in the prov. of **N. Holland**, Netherlands, 12 m. SE. of Amsterdam. The old tn, adjoining the IJsselmeer (Zuider Zee), is fortified by wide ditches in a geometrical pattern of the Vauban type, constructed in 1692. Pop. 13,400.

Naas, chief tn and administrative centre of co. Kildare, Rep. of Ireland, 20 m. SW. of Dublin. **N.** was the anct seat of the kings of Leinster. The fashionable Punchestown racecourse is 3 m. to the SE. Pop. 3800.

Naba, see **NAHA**.

Nabadwip, see **NADIA**.

Nabataeae, or **Nabathae**, an Arab people who occupied the NW. corner of Arabia. They are mentioned in cuneiform inscriptions and in 312 BC defeated a Syrian army. At that time they were nomads. They monopolised the carrying trade and became a strong nation with their cap. at Petra (q.v.). By 100 BC their dominion stretched from Damascus to Medain Salih and down to the Red Sea with the port of Elath. They had difficulties with Rome, but then their king was recognised as a friend of the empire till the state was turned into a Rom. prov. in AD 106.

Certain outlying dists. continued an independent existence till about AD 200 when Palmyra seized what was left of their trade. For their inscriptions the **N.** used Aramaic in a script peculiar to themselves. The best-known god in the pantheon was Dhu-Shara (Dusares), who was identified with Dionysus, numerous dedications to whom in Aramaic and **Gk** have been found in Transjordan. See Jaussen and Savignac, *Mission archéologique en Arabie*, 1909-22, and J. Cantineau, *Le Nabatéen*, 1930-2.

Nabbes, Thomas (1605-41), dramatist, b. Worcs. Educ. at Oxford, he began his career as a dramatist about 1630, and his chief plays are *Hannibal* and *Scipio*, 1635, *Covent-Garden*, 1638, and *The Spring's Glory*, 1638, containing his best work. He also wrote a continuation of Knolles's *General Historie of the Turkes*. See works, ed. by A. H. Bullen, in *Old English Plays*, 1887.

Nabis, ruler of Sparta (207-192 BC). He usurped the throne and allied himself first with Philip of Macedon and later with Rome. In 201 BC he took Messene, but was driven out by Philopoemen in 193 BC. Later he ravaged the surrounding ter, and occupied Argos, but was driven out by the Corinthians. He was assassinated by some Aetolians.

Nabius, bn of Jordan, 33 m. N. of Jerusalem. It manufs. a special brand of soap containing olive oil. It is peculiar among Palestinian tns in having retained its more recent name in preference to its original name Shechem.

Shechem is associated with the earliest period of Jewish settlement, for here Abraham pitched his tent on entering Palestine, and set up the first altar to Jehovah on a spot still shown on Mt Ebal. It was to Shechem, which lies in the narrow valley separating Mt Ebal from Mt Gerizim, that Joshua led the Israelites after the miraculous passage of the Jordan. **N.** was and is the main centre of the Samaritans. It was captured by the crusaders under Tancred, and an important eccles. council was held here in the reign of Baldwin II. One of the best authenticated holy sites in Palestine is Jacob's Well, which lies just outside the E. end of the tn, below the vil. of Sychar. **N.** itself is long and narrow, and is traversed by 2 parallel *suaqs*, containing sev. mosques, which were formerly crusaders' or Byzantine churches. This part of the tn was severely damaged by earthquake in 1927 but has largely been rebuilt. The Great Mosque in the E. part of the tn was originally a basilica built by Justinian and was rebuilt by the crusaders. Many Jews were murdered here in the Arab revolt of 1929 and **N.** became a strong centre of Arab nationalism. Pop. about 25,000.

Nabob, corruption of the Hindūstāni *nawab*, originally used only as a title for

native Indian rulers, great officers of the Mogul's court, and governors of provs. The title was also used for the governors-general of the Brit. possessions. In the 18th cent. the title came to be used familiarly for any person who returned from a far country with great riches.

Nabopolassar (*Nabu-apal-usur*)—Nabu has guarded the son(ship)', first King of the Chaldean or Neo-Babylonian dynasty, reigned 626–605 bc. He successfully led the opposition to Assyria while administrator of the 'Sea-lands' and, on being chosen King of Babylon, gradually freed Babylonia of its control. He allied with the Medes to overthrow Nineveh (612) and Assyria and then warred against the Egyptians under Necho II. As an old man he entrusted the army to his son Nebuchadnezzar, who defeated the Egyptians at Carchemish in 605 bc. In Aug. of that year N. d., and his son hastily returned from Palestine to ascend the throne.

Nabu, biblical Nebo, Babylonian and Assyrian deity, the god of learning, wisdom and especially of writing, astronomy, and the sciences. His temple (*Ezida*—'The House of Knowledge') was a feature of prin. cities such as Babylon, Borsippa, Nineveh, and Nimrud. His symbol was an upright wedge on a pole, possibly an instrument for sighting the stars. His consort was Tashmetum.

Nabua, tn in the prov. of Camarines Sur, Luzon, Philippine Is., 19 m. SE. of Naga. Pop. 42,946.

Nachtigal, Gustav (1834–85), Ger. explorer, b. Kielstedt, near Stendal. In 1869 he set out from Tripoli on a mission from the King of Prussia to Bornu, visiting Tibesti and Borku, hitherto unvisited by Europeans, and, by way of Bagirmi, Wadai, and Kordofan, arrived unexpectedly at Khartoum in 1874. In *Sahara und Sudan*, 1879–89, he pub. an account of his travels. In 1882 he was appointed Ger. consul-general at Tunis. His mission to W. Africa in 1884 resulted in the annexation to Germany of Togoland and Cameroon.

Naerite, rare unsilicate mineral occurring in 4-sided prisms in metamorphic rocks, both schistose and granitic. It is friable in character, gleaming and pearly, consisting of greenish-white scaly plates, greasy to the touch. It comes under the species kaolinite, and is found in Wicklow in Ireland, and in N. America.

Naden, Constance Caroline Woodhill (1858–89), poetess, b. Edgbaston, Birmingham. She was much esteemed by Gladstone for her poems. Her works include *Songs and Sonnets of Springtime*, 1881, and *A Modern Apostle. The Elizir of Life, and other Poems*, 1887. Her complete poetical works were pub. in 1894. See W. R. Hughes, *Constance Naden: a Memoir*, 1890.

Nadezhdinsk, see SEROV.

Nadia, or **Nabadwip**, tn of W. Bengal, India, formerly situated on the Bhagirathi R., which has since altered its course. It was the bp. of a famous Hindu reformer, Chaitanya (1486–1527), and is a centre of Hindu pilgrimage.

Nadir Shah Afshar (**Nadir Quli**) (1688–1747), ruler of Persia, b. Khorasan. He drove out the Afghans from Persia, 1729, and restored Tahmasp II to his throne; N. deposed Tahmasp and became regent for his infant son Abbas III (1732). The latter d. in 1736, and N. was crowned. He is chiefly famous for his invasion of India. He defeated the Moghul army at the battle of Karnal, 1739, and sacked Delhi. See life by L. Lockhart, 1938.

Nadir (Arabic *nazir*), astronomical term denoting the point in the heavens which is directly beneath our feet as that directly overhead is called the zenith. In figurative language, the lowest point or lowest stage of depression.

Naestved, tn of SE. Zealand, Denmark, 45 m. SW. of Copenhagen. It is an important railway junction, and has large paper mills, textile works, potteries, and iron-works. Pop. 18,880.

Naevius, Gnaeus (c. 270–c. 201 BC), Rom. poet and dramatist, b. probably at Capua. He wrote numerous comedies and tragedies, mostly adapted from Gk originals but some on Rom. themes. N. was imprisoned in 206 for his attacks on Scipio and the Metelli; afterwards retired to Utica, where he d. His prin. work was an epic in Saturnian verse on the first Punic war; it influenced Ennius and was admired by Cicero. For surviving fragments see E. H. Warmington, *Remains of Old Latin*, II, Loeb Library, 1936.

Naevus, area of pigmentation, or mole; tumour of the skin composed almost entirely of enlarged blood vessels. A vascular N. may diminish in size of itself, in which case no treatment is necessary; or it may show a disposition to enlarge, thus constituting a possible danger through haemorrhage. The N. may be capillary, consisting of enlarged capillaries giving rise to a purplish mark known as 'port-wine stain'; it may be venous, consisting of enlarged veins, giving a bluish appearance; or arterial, when pulsation can be felt.

Nafa, see NAHA.

Nāga, name given to deified serpents in Hindu mythology; Sesha, the king of the snake world, is the sacred serpent of Vishnu (q.v.).

Nagapattanam, see NEGAPATAM.

Nagar, see HUNZA and NAGAR.

Nagarkot, see KANGRA.

Nagas (*naga*, snake), name of a non-Aryan group of peoples of E. Assam, alleged to be head-hunters, who live between the middle Brahmaputra and the Chindwin. At one time great virtues were ascribed to them. According to Indian mythology the N. are a race of demons descended from Kadin, the wife of the sage, Kashyapa. They have a jewel in their heads, giving them a sparkling appearance, and inhabit one of the 7 beautiful worlds which lie between this world and the hells. Their world is ruled over by 3 chiefs: Sesha, Vasuki, and Takshaka. It is recorded that their daughters often wedded with man (compare the habits of mermaids as exemplified in W. folklore). The old sage, Gange, one of the fathers of Indian astronomy,

was said to owe all his wisdom to the god Sasebo. See T. C. Hodson, *The Naga Tribes of Manipur*, 1911, and W. C. Smith, *The Ao Nagas*, 1926.

Nagasaki, city of Japan on the is. of Kyushu, at the head of a long bay which forms its natural harbour. It is situated at the W. extremity of the peninsula of Hizen, which forms the NW. portion of the is. of Kyushu. The harbour, one of the most beautiful in the world, is some 6 m. in width, and 3 or 4 m. in length. The hills surrounding the harbour are broken into long ridges and deep valleys, while the more fertile spots are terraced and under cultivation. Before its devastation in 1945, the W. shore was occupied by port facilities, shipbuilding and repair, and the E. shore by smaller shipyards, wharves, and dwellings. The main commercial and residential area of the city lay on the small plain near the head of the bay on its E. shore. From here the valley of the R. Urugami runs N. for sev. miles and a smaller valley branches NE. for 2 m.; the smaller valley was crowded with dwellings, huddled around narrow roads, market streets, and temple squares; the Urugami valley contained large steel, engineering, and armament works, together with smaller factories and a mass of workshops and workers' dwellings. These industries, controlled by the firm of Mitsubishi, plainly dominated Nagasaki, where everything which survived bore the stamp of a vast industrial slum. Early in 1945 some dispersal was begun to workshops set up for the purpose in tunnels and schools, and the latter, built of reinforced concrete, were among the few imposing buildings in Nagasaki. The city did, however, possess a fine complex of modern hospital and medical school buildings. Nagasaki was once a naval base, but its importance declined with the development of the base at Sasebo. In 1940 its pop. was 253,000, having risen slowly since 1930, but it had continued to rise during the Second World War, which gave new importance to its shipbuilding and to its production of torpedoes and other armaments. When the atomic bomb fell (9 Aug. 1945) the pop. was 260,000; 1½ sq. m. of the city were destroyed, and 24,000 people were killed; 30,000 were injured and many of these d. later. The centre of damage wrought by the atomic bomb was in the industrial area between the 2 large Mitsubishi ordnance plants in the Ukrami valley. Hence the harbour and the commercial area, 2 m. distant, escaped with minor damage, as also did the housing in the smaller valley screened by the intervening high ridge of hills (for which reasons the area of damage and with it the death roll were smaller than in Hiroshima, q.v.). The few previous attacks on Nagasaki had been aimed at the shipyards, so that most of the damage from them was outside the area of atomic bomb damage; but, as in Hiroshima, the initial blast damage done by the atomic bomb was followed by extensive fires. Nagasaki in 1946 presented the appearance of a city struck by a brief but tremendous hurricane, and the scale of

the disaster brought city life and industry virtually to a standstill.

A 50-ft tower now marks the spot where the bomb fell, and the devastated area, on which are playing-fields, is surrounded by 4000 new dwellings. In the dock area shipbuilding is again active and the residential areas bear little trace of the disaster. There is a plan to rebuild the city as a cultural centre. In 1956 it was extended beyond its pre-war limits, and had a pop. of 304,000. Apart from shipbuilding, it is also noted for its production of machine tools, tinned fish and fruits, and tortoise-shell work.

Nägeli, Karl Wilhelm von (1817-91), Swiss botanist, b. Kilchberg near Zürich. After studying botany at Geneva under Candolle he graduated at Zürich Univ., and was ultimately appointed prof.-extraordinary of that institution. In 1852 he was appointed to the chair of botany in the univ. of Freiburg-in-Breisgau, and in 1857 was promoted to Munich, where he remained as prof. until his death. He is famous for having proved, in 1862, by chemical analysis that protoplasm is nitrogenous and differs from other cell constituents. He is one of the fathers of biochemistry. One of his most notable discoveries was that of the antheridia and spermatozooids of ferns and of *Pihularia*. He wrote *Pflanzen-physiologische Untersuchungen* (with Cramer), *Die neuern Algensysteme*, and *Mechanisch-physiologische Theorie der Abstammungslehre*.

Nagorno-Karabakh Autonomous Oblast, see MOUNTAINOUS KARABAKH AUTONOMOUS OBLAST.

Nagoya, industrial and commercial city of Aichiken, Japan, lying at the head of the shallow Isenoumi Bay some 30 m. from Yokkaichi, 94 m. from Kyoto, and 235 m. from Tokyo. The seat of the prefectural gov., it was the fourth largest city of Japan before the Second World War. It is the hub of railways running NW. and W. to Gifu and beyond, NE. and SE. to Kofu and beyond, and along the coasts of Isenoumi Bay. Its old castle dated back to the early 17th cent., and in modern times it was used as a military depot; but it suffered irreparable damage in the Amer. air-raids. The religious buildings of N. included the Buddhist temple, Higashi Hongwanji. Twelve m. E. of N. is the adjoining city of Seto, famous for its porcelain works first set up here in the 13th cent., and containing the national ceramic experiment centre. N. was especially notable for its silk and cotton fabrics dyed so as to show spots in relief with radiating colours. Cloisonné enamelling in Japan had its beginnings in N. But little of the tn survived the Second World War: some 500 Amer. Superfortresses laid the city waste on 13 May 1945; and it was also hit on other dates. But it was reconstructed with amazing speed, and is again the most important city of central Japan. Its industries include porcelain, plywood, sewing-machines, watches, bicycles, cotton textiles, machine-tools, electric tools, and chemicals. Pop. (1956) 1,336,000.

Nagpur, city and cap. of Madhya Pradesh state, India. N. is mainly a city of comparatively recent construction, and the Fort, on the striking Sitabaldi Hill in the centre, dates only from 1818. The early hist. is obscure. As the state cap. N. has many fine public buildings. Politically it has become largely a Maharashtra centre. N. oranges are particularly sweet and juicy and are sold in large quantities to other parts of India.

Nagy, Imre (1886-1958), Hungarian politician. At first a Social Democrat, he joined the then illegal Communist party, and broadcast to Hungary from Russia during the Second World War, returning to Hungary with the Soviet Army in 1944. He succeeded Rakosi as premier in 1953, his regime being relatively liberal in character. In April 1955, however, he was dismissed, and subsequently expelled from the Communist party. He was readmitted to the party in Oct. 1956 and later the same month became Prime Minister again, after the outbreak of an anti-Russian revolution. Within 3 days he had recast his gov., dropping 15 Communists from it, and promising the withdrawal of Russian troops from Hungary. It appears that N. aimed at the estab. of an independent Hungary on Socialist but not rigidly Communist lines. Russian military intervention crushed the revolution, however. On 4 Nov. N. was displaced and took refuge in the Yugoslav Embassy. When he left this on guarantees of his personal safety he disappeared, apparently abducted by the Russians to Rumania. In June 1958 it was announced that he had been executed after a secret trial in Hungary.

Nagyikinda, see KIRINDA.

Nagykőrös, tn of Hungary, in Pest co., 47 mi. SE. of Budapest (q.v.). It is an agric. and wine-producing centre. Pop. 31,000.

Nagyszeben, see SIBIU.

Naha, Naba, Nafa, or Napa, seaport of Okinawaken, on Great Liukin Is., Japan. Sugar, cotton, and silks are exported, and there is manuf. of hats similar to the Panama straw. Pop. 65,200.

Nahuel Huapi, Lake, lake of S. Argentina, belonging to the same natural system as the Chilean Lakes (Todos Santos, Llanquihue, and others), from which it is not far separated. It has an area of 210 sq. m. and is more than 330 yds deep in some places. It stands 2500 ft above sea level in full view of the peaks of the Cordillera. Mt. Tronador commands the scene, and the blue waters of the lake, the mts, and the natural solitude contribute to the charm of a popular tourist area. San Carlos de Bariloche, one of its resorts, is a suitable H.Q. for anglers and others. The region has been a national park since 1934.

Nahum, minor prophet, described as an Ekkohtite. Tradition narrated by Jerome identifies N.'s vil. with one in Galilee which in Jerome's time was called by the name of Elkesi. The prophecy deals with the fall of Nineveh, which is described with great vigour and majesty. In ch. iii. 8-10 it is said of Nineveh that

she will be as little able to avoid destruction as was Thebes (No-amon), and from this reference one can say certainly that N. prophesied between 664 and 607 B.C. See Davidson, 'Nahum, Habakkuk, and Zephaniah,' in *Cambridge Bible*, 1896.

Nalads, see NYMPHS.

Naidu, Sarojini (Mrs) (1879-1949), Indian poet, feminist, and governor, b. at Hyderabad, daughter of a Bengali Brahmin educationist and principal of the Nizam's College, Hyderabad. She was educ. at Madras Univ., King's College, London, and Girton College, Cambridge. Her first work, *The Golden Threshold*, 1905, with preface by Arthur Symonds, is western in imagery and sentiment. Her second vol., *The Bird of Time*, with an introduction by Edmund Gosse (1914), also revealed her lyric powers. This was followed by another book of collected poems, entitled *The Broken Wing*, 1917. These too showed her mastery of metrical form, besides earning for her the title of 'the nightingale of India.' But thereafter she became too much engrossed in public affairs, and particularly the feminist movement, to devote her life to literature. She was the first Indian woman to occupy the chair of the National Congress (1925), Mrs Besant being the first woman to do so (1917). Later she toured America and Canada as a Congress propagandist and took part in Gandhi's non-co-operation cult. In 1931 she accompanied Gandhi as the sole representative of the Congress to the second session of the Round Table Conference. She was twice imprisoned for participating in the civil disobedience movement, and again in 1942, with other members of the Congress, for obstruction to the allied cause, being released on grounds of health in 1943. She took a prominent part in the long negotiations which resulted in the setting up of the independent dominions of India and Pakistan, and was appointed governor of the United Provs. For her efforts in relief work in Hyderabad in the floods of 1908 she was awarded the Kaiser-i-Hind gold medal. She did much to break down the barrier of *purdah*, which had so long been strictly observed in that city, and after partition her influence was a major factor in preventing communal riots.

Nail. Until a comparatively recent period almost every kind of N. was produced by hand labour: each N., however minute, was separately forged from a thin rod of iron, a process which is still followed in the production of wrought N.s, which possess certain advantages, for particular kinds of work, over those formed either by casting, or by cutting or stamping out of rolled sheet metal. For some purposes N.s formed by the much cheaper process of casting have been long used. Common cast N.s are, however, so clumsy and so brittle that they can only be used for a few coarse purposes as in plasterers' work, and in the nailing up of fruit trees. By the introduction of improvements in the manuf., however, a very useful kind of cast N. has been successfully introduced for certain descriptions of woodwork. It will bear far more bending than

ordinary wrought-iron at the expense of rigidity, such N.s being often nearly as soft as copper, and therefore quite unsuitable for use in hard woods. In the making of cut N.s, the N.s are cut from sheet-iron of suitable thickness, which is first reduced by cutting transversely into strips or ribands of a breadth equal to the intended length of the N.s. See also SCREWS, BOLTS, AND NUTS.

Nail, measure of land = $\frac{1}{4}$ yd = 2.25 in.

Nain, Le, Antoine (1588-1648), Louis (1593-1648), and Mathieu (1607-77), 3 brothers, Fr. painters, sons of a sergeant, and all b. at Laon and d. in Paris. After being taught the elements of art they went to Paris, where Antoine took pupils in 1628. They were all original members of the Fr. Academy, though little is known about their lives, while their works show no trace of the influences which prevailed when the academy was formed, as, for example, the preoccupation of Fr. taste with mythological allegories or the 'heroic deeds' of the monarch; and as their signature is rarely found and never accompanied by initials differentiation between the brothers is almost impossible. Although they were themselves French, their methods suggest Spain and their subjects Holland. These consist of familiar objects and incidents, such as tavern interiors, card-playing, domestic diversions. The genre pictures are said to have been painted by Louis and Antoine conjointly. Mathieu painted subjects for churches and also portraits—among the latter being Cinq-Mars, Marie de' Medici, Cardinal Mazarin, and Anne of Austria—but none has survived. Room XII of the Louvre is dominated by the brothers, the chief pictures there being 'Boys Playing Cards', 'The Forge', 'The Peasants' Noonday Meal', 'The Watering Place', and 'The Holy Manger'. In the Florence museum is 'The Adoration of the Shepherds'; in Valenciennes, 'Two Men Playing at Cards'; in Rouen, 'Rustic Interior'; and at Munich a striking picture of a painter at work on a woman's portrait. Their paintings are admirable in realism and in their effective contrasts of light and shade. There are also some fine drawings by the brothers in the Brit. Museum. Champfleury wrote 2 works on the brothers (1850, 1861). See also A. Valabregue, *Les Frères Le Nain*, 1904.

Nain: 1. Anct tn of Galilee, 26 m. SE. of Acre. Mention is made of this city in Luke vii. 11.

2. Station of the Moravians on the Labrador coast. Pop. 285.

Naini Tal, tn of Uttar Pradesh state, India, situated at 6500 ft in the foothills below the Himalayas. It is a popular hot-weather resort and was formerly the summer H.Q. of the then United Provs. There are magnificent views from the neighbourhood of the great snow hills, particularly Nanda Devi (25,645 ft).

Nainsook (Hindu *nain*, eye; *sukh*, delight; but the etymology is doubtful), thin muslin-like material of fine texture, with a soft finish, and either plain or striped. It is a kind of jaconet and was formerly made in India.

Nairn: 1. Maritime co. of NE. Scotland, bounded on the N. by the Moray Firth, and on its other sides by the cos. of Inverness and Moray. Salmon fishing is an important industry. Agriculture is carried on and there are large granite quarries. The Riv. N. runs through the co. in a beautiful valley, which presents particularly attractive and romantic scenery in the neighbourhood of Cawdor Castle, one of the residences of the Earl of Cawdor. Area 162 sq. m.; pop. 8500.

2. Royal (1124) burgh, and co. tn of N. It lies on the Moray Firth and has a harbour with pier and breakwater. Fishing and agriculture are the main industries. The good bathing and fine golf-courses have made it a favourite summer resort. Pop. 5000.

Nairne, Carolina Oliphant, Baroness (1766-1845), song-writer, b. Gask, Perthshire. She was called the 'Flower of Strathearn' on account of her striking beauty. She wrote songs under the pseudonym of 'Mrs Bogan of Bogan' or 'B.B.'. The most popular ones are 'The Laird o' Cockpen', 'Land o' the Leal', 'Callie-Herrin', 'Charlie is my Darling', 'Will ye no come back again', and numerous Jacobite songs. See G. Henderson, *Lady Nairne and her Songs*, 1905.

Nairobi, cap. of Kenya Colony and Protectorate (q.v.), and seat of the gov., standing at an altitude of 5453 ft above sea level, 330 m. from the coast. The climate is healthy, and at certain times of the year bracing. As becomes a thriving colony, N. is a city characterised by exhilarating expansion and development. It is the commercial centre of Kenya, surrounded by prosperous farming areas producing coffee, sisal, pyrethrum, dairy produce, and grain. The bulk of the retail trade is in the hands of Indians. The city has frequently been visited by Brit. royalty; social life and amenities are difficult to parallel anywhere in the colonies. N. received its charter as a city from the Duke of Gloucester in Mar. 1950. Pop. (1948) 118,976, of whom 10,830 were European, 41,810 Asian, and 64,910 African. (See illustration, p. 38.)

Naisus, see Nis.

Naivasha, tn of Kenya in the prov. of N., close to a lake of the same name, 50 m. from Nairobi. It is the centre of a prosperous European farming area. Lake N. (108 sq. m.) is famous for its flamingoes. White pop. (dist.) 746.

Najd, see NEJD.

Nakhichevan': 1. Autonomous rep. in Soviet Azerbaijan, formed in 1924, situated between the Persian frontier (Aras R.) and Armenia. It is very dry mountainous country with large salt deposits. Area 2100 sq. m.; pop. 129,000, mostly Azerbaijanis, with some Armenians. The chief occupations are irrigated agriculture (cotton, tobacco, grain), horticulture, and sheep raising; salt mining, cotton ginning, silk spinning, and fruit canning. (For hist. see AZERBAIJAN.)

2. Cap. and cultural centre of the above. There are food industries, including wine, and salt-mines are near by. The tn con-

tains 12th cent. architectural monuments. According to an Armenian legend it was founded by Noah, whose grave is said to be here; in the Middle Ages it was an important commercial centre. Pop. (1955) 21,000.

3. Nakhichevan'-on-Don, former tn founded in 1780 by Armenian colonists from the Crimea, and a lively commercial centre since the early 19th cent. Pop. (c. 1914) 71,000. It has been merged with Rostov-on-Don (q.v.).

Nakskov, port and largest tn on the is. of Lolland, Denmark, 82 m. SW. of

2. Cap. of the above oblast, 50 m. NE. of Kokand, in the Syr-Darya valley. It is a centre for sheep, hides, cotton, and fruit; coal-fields and naphtha beds are in the vicinity. Pop. 90,000.

Namaqua, Hottentot tribe inhabiting Namaqualand, S. Africa. Of all Hottentots they are by far the purest survivors, and are the only tribe to preserve not only the racial type but their own language. Khoi-Khoi is the name by which they call themselves. A dictionary of the N. language was pub. in Tindall in 1852.

E.N.A.

NAIROBI

Street scene showing Gilfillan House.

Copenhagen. It has the largest sugar refineries in Denmark. Pop. 16,600.

Nakuru, tn of Kenya, cap. of Rift valley prov., attractively situated on the shores of a rapidly diminishing soda lake. It is a centre of the Kenya Farmers' Association, and has a prosperous agric. community who produce wheat, maize, sisal, coffee, and cattle. A branch of the E. African Railways connects N. with Kisumu (134 m.). Pop. (1948 census) 17,625, of whom 1400 were Europeans and 8000 Asians.

Nal'chik, cap., economic and cultural centre of the Kabarda-Balkaz Auton. Rep. (see CIRCASSIANS) in N. Caucasus, 60 m. NW. of Ordzhonikidze. It has varied industry, a university (f. 1957), and is a health resort and tourist base. Pop. (1956) 72,000 (1926, 30,000). N. was founded in 1818 as a Russian fortress (abolished 1863).

Namangan: 1. Oblast (prov.) of the Uzbek S.S.R., in the NE. of the rep., bordering on the Kirgiz S.S.R.

Namaqualand: 1. Great, region of SW. Africa, is a desert land sparsely peopled by Hottentots, lying N. of the Orange R. Angra Pequena, on the coast, affords safe anchorage. The chief activity of the region is the rearing of cattle. Vast quantities of alluvial diamonds are found in N., but the diamondiferous areas are under strict gov. control. In the O'okiep dist. there are large deposits of copper.

2. Little, lies on the NW. of the Cape Prov. and S. of the Orange R. There are copper-mines at O'okiep (q.v.), but the region is barren and is covered with rugged volcanic looking mts. The chief tn is Springbok. The existence of copper in N. was known in the 17th cent., and rich ore was brought to Governor Van der Stel by natives in 1681. The supply has declined in recent years. The gravel beds near the mouth of the Orange R. up to Port Nolloth are diamond-bearing. Gold was discovered on the Richtersveld in 1934. Area 20,835 sq. m.

Namare, see MELK.

Nam-dinh, cap. of prov. of same name in Tonking (q.v.). Site of old citadel, and examination centre at which the triennial examinations organised by the Imperial Court were held until early in the 20th cent. There is a Sp. Rom-Catholic mission, founded in the 17th cent. N. has the largest cotton-spinning mills in Viet Nam, which produce cotton yarn, blankets, and miscellaneous cotton goods. Damaged during the 1945-54 war, they have now been taken over by the gov. of the Democratic Rep. of Viet Nam (see VIET NAM, DEMOCRATIC REPUBLIC) and have resumed production. No accurate pop. figures are available; there was a very large shift of pop. during 1954-5, and no subsequent census has been taken.

Name Day, day which is sacred to the saint whose name is borne by a person. The term is naturally used principally in Rom. Catholic countries.

Names, see NAMUR.

Names (O.E. *nama*; Ger. *Name*; cf. Lat. *nomen*, Gk *onoma*, title by which a person, place, thing, or class of persons, places, or things is known). **Place N.**, when scientifically studied, furnish information about the early inhab. and the state of their lands, changing modes and conditions of settlement, and alterations of geographical environment. Eng. place N. have much of pure Eng. origin, but there are important Celtic, Scandinavian, Lat., and Fr. elements. They thus embody the hist. of England, its conversion to Christianity, its antiquities and early defence, its institutions and social conditions, meeting-places, industries, and productions. Some riv. and stream names (Avon, Dee, Stour, Thames) are of Celtic origin, as are those of hills and forests (Brent, Malvern, Savernake). The great settlement of Danes which took place in the E. cos. from the end of the 9th cent. onward has led to the place N. of that dist. being largely derived from the Scandinavian. A common place-name termination in the Lines dist. is *-by*, the Norse for a vil. There are a vast number of Saxon place N. in England. Common and obvious suffixes are *-ham*, *-ton*, and *-ing*. Frequently the root of the name is that of the original possessors of the land, sometimes a tribe, sometimes a family, sometimes an individual, as in the case Anlaby (from Anlaf), Rowiston (from Hroif). Rom. place-name influence in Britain was primarily military. The Lat. *castra*, a camp, appears in many forms, either alone or as a suffix (e.g. Chester, Doncaster, Dorchester). Other N. are derived from prominent local features, even from trees, as in the cases of Ashby, Lyndhurst, Aldershot, Olney, and Bromley. The investigation of the original significance of place N. may be extremely difficult, requiring an accurate knowledge of philology; for in the course of ages assimilation, corruption, and popular attempts at etymological correction have often altered the N. almost beyond recognition.

Personal names are, in general, more easy to explain than are place N., though their hist. is more complex. Among uncivilised

as well as among civilised peoples the custom obtains of giving each child a name at or soon after its birth, though among uncivilised races the name is sometimes given during the mother's pregnancy. The N. are chosen from nature, from religion, or from some event showing the circumstances of the birth. This method of naming children is well shown in the early books of the O.T. The N. of the gods of the tribe frequently form part of the name. In a later stage of development the name loses its true meaning, and the assignation of the private name of the individual depends on purely arbitrary considerations. By the time of the empire, Rom. N. were already many in number, but 3 of them were of special importance. The first name was purely personal and belonged to the individual. It was known as the *praenomen*. Common Rom. *praenomina* were Gaius, Marcus, Titus, Quintus. Following this came the *nomen* (*gentile*) which belonged to all members of the *gens* and those connected with it or adopted into it. Among patrician *gentes* the *nomen* almost invariably ended in *-ius*. The *cognomen*, or surname, was the family name, and was generally derived from some personal quality or peculiarity, as in the cases of Naso, Torquatus, Lepidus, Longulus, or from geographical considerations, as in Sabinus and Calatinus. Thus, in the case of Gaius Julius Caesar, Gaius is the *praenomen*, Julius the *nomen*, and Caesar the *cognomen*. Of these N. either the first or the last might be used alone, the first 2 or the first and last might be used in combination, but it is interesting to note that the present popular designation, Julius Caesar, is the only one that would never have been used by the Romans themselves. In addition to these 3 N. a fourth was sometimes given, generally in recognition of some great deed or conquest. Thus it was by his exploits against Carthage that Scipio obtained his *agnomen*, or *cognomen secundum*, of Africanus. Similarly we have the additions Asiaticus and Creticus. When a man was adopted into another family he took all the 3 N. of his adopted father, and to these he added a second cognomen derived by the addition of *-anus* to his old *nomen*. Thus, when Gaius Octavius, grandson of Julia, the sister of Julius Caesar, was adopted by his great-uncle, he became known as Gaius Julius Caesar Octavianus. To these N. was added in 27 B.C. the honorific title of Augustus.

At the present day, in Christian countries, the child's personal name is known as its Christian or baptismal name, having generally been given on the occasion of its baptism. During the early Middle Ages a man had no name but this. In course of time the necessity for some further distinction arose, and a man was described according to his trade, his residence, his father's name, or some personal peculiarity. The historical novel has familiarised everyone with these various types of surname, and it is not difficult to trace them in Mod. E. The prefix *at* is very common, showing a

place of residence, as in the name Atwood, Atwell, Atfield. Many of the occupations which have provided us with surnames have now ceased to exist. Such are Dempster (judge), Scrivener (writer), Walker (fuller), etc. A very large number of N. are derived from the paternal Christian N., and in each country particular affixes are used. Thus, in England we have the common termination in -son or simply s. In Ireland we have the prefix O' or simply O. in Scotland and Ireland the prefixes Mac and Fitz (Fr. fils), in Wales the form Ap, of which the a frequently disappears (e.g. Price from Apithys). Surnames were very gradually introduced, and it is not until the 12th cent. that they begin to become hereditary. Before and frequently after this time the surname as well as the Christian name was peculiar to the individual. Now, however, it is an established custom that the children should invariably be known by the name of the father. On the occasion of a woman marrying, it is usual for her to take her husband's surname. 'N. of dignity' (i.e. peerage ranks, 'lord' or 'sir') are not accepted by the registrar-general unless right is shown to them. Surnames in Scotland were late in becoming fixed, and owing to the clan system are much fewer than in England. The branches of the clans and houses were distinguished by a third name, which now usually survives in the designation of the chiefs and chieftains of families, e.g. 'Mackintosh of Mackintosh', 'Cameron of Lochiel', and these, where ordinarily used, are legally regarded as part of the surname. Women in Scotland do not lose their maiden name on marriage but usually assume their husband's—including designation, if any—and are described by both (e.g. 'Mrs Margaret Gordon or Macdonald of Glenbracken') in legal deeds.

Change of name. In England N. may be changed by royal licence or by deed poll. The former is conducted by application through the College of Arms, and a deed poll is usually recorded there if the person concerned is entitled to bear arms. In Scotland the Lord Lyon King of Arms has jurisdiction in this matter, and application for royal licence is made through him, but the cheaper course (replacing the deed poll in England) is the Lord Lyon's certificate 'officially recognising' the party under his new name. See *Green's Encyclopedia of the Law of Scotland*, s.v. 'Name and Change of Name' (the only reliable or detailed treatise on the Scots law upon this subject), 1896-1904; C. I. E. Ewen, *A History of Surnames of the British Isles*, 1931; E. Ekwall, *Concise Oxford Dictionary of English Place-names*, 1947; H. G. Stokes, *English Place Names*, 1949; *Oxford Dictionary of English Christian Names*, 1950; A. H. Smith, *English Place Name Elements*, 2 parts, 1956; the co. surveys of the Eng. Place-Name Society.

Namier, Sir Lewis Bernstein (1888-), Brit. historian, educ. at Balliol College, Oxford. From 1931 to 1953 he was prof. of modern hist. at Manchester Univ. The

scope of his studies is very wide, but he is especially distinguished for his research on Hanoverian constitutional hist. which has revolutionised historical thought on this period, and for his writing on modern Europe. Pubs. include *The Structure of Politics at the Accession of George III*, 1929; *England in the Eye of the American Revolution*, 1930; *Europe in Decay*, 1936-1940, 1950; and *Personalities and Powers*, 1955. He was knighted in 1952.

Namnetes, or Nannetes, see NANTES.

Nampa, city of Canyon co., SW. Idaho, U.S.A., 20 m. W. of Boise on Boise R. It is the processing and shipping hub of an agric. and dairy area in Boise irrigation project; dairy products, flour, feed, beverages, and beet sugar are produced. It is the site of the Northwest Nazarene College. Pop. 16,185.

D. McLeish

Namur (Flem. Namen): 1. Prov. of Belgium, bounded on the N. by Brabant, E. by the provs. of Liège and Luxembourg, W. by Hainaut, and S. by France. The prin. rivs. are the Meuse, which entirely intersects the prov., the Sambre, and the Lesse. To the N. of the valleys of Sambre and Meuse this prov. forms part of the fertile Hesbaye plateau. To the S. it presents an alternation of fruitful valleys and low hilly tracts; but in some parts, where the heights constitute offshoots of the Ardennes, and are densely wooded, they attain an elevation up to about 1650 ft. Besides coal-mines Namur has important quarries of marble, slate, sandstone, and limestone. It has large steel, iron, and smelting works which are concentrated with the industries of glass and chemicals round the city of Namur and in the valley of the Sambre. Andenne (q.v.) is the chief place of the ceramic manufs. in the prov.

The old co. of Namur came in 1188 under Hainaut, and in 1263 under Flanders. In 1421 it was incorporated in

mighty Burgundy. In the 16th and 17th cents. it shared the historical fate of the S. Netherlands. In 1792 it came under France, was united again with Holland in 1815, and eventually became a Belgian prov. in 1830. Area 1413 sq. m.; pop. (1955) 364,125.

2. Cap. of the above prov., situated at the confluence of the Sambre with the Meuse, about 40 m. SE. of Brussels. The city is strongly fortified and is the seat of a bishop. Its most noticeable architectural monuments are the cathedral, rebuilt during 1750-72, the belfry of the 11th cent., and the restored citadel of the 18th cent., at present laid out as a park and containing a forestry museum. Namur is noted for its cutlery, its leather works, and its iron and brass foundries. Porcelain, pottery, glass, cement, chalk, and jam are also manuf. Namur is a very old tn and has many times been bombarded and besieged. It was captured by the Germans in Aug. 1914 and looted. Pop. (1955) 32,100.

The prov. and tn of Namur were under Ger. occupation between 1940 and 1944. The Amer. First Army, pouring across the Senne bridgeheads, began a spectacular drive on a three-corps front towards Namur, Liège, and the Ger. frontier (29 Aug.-4 Sept.). On the right of this front the 7th Corps crossed the Aisne on 29 Aug. and captured Namur and the Meuse crossings near Dinant on 4-5 Sept. (see WESTERN FRONT IN SECOND WORLD WAR).

Nana Sahib (1820-c. 1859). The last Mahratta peshwa, Bajee Rao (Raji Rao II), who was deposed in 1818, and pensioned, adopted Dhondoo Punt (Dandhu Panth), also called N. S. In 1853 Bajee Rao d., and N. S. claimed Bajee Rao's estate and pension, but the latter was refused. On the outbreak of the Indian mutiny (1857) he joined the rebels, and his name is commonly associated with the savagery at Cawnpore (1859), when men, women, and children were massacred. Ultimately he was attacked and took refuge in the jungles at the foot of the Himalaya, where he is supposed to have perished.

Nanaimo, city and coal-mining centre in Vancouver Is., Brit. Columbia, Canada, 74 m. NNW. of Victoria. Chief exports are coal, lumber, salmon, pulp and paper. Pop. 12,570.

Nanchang, cap. of Kiangsi prov., China, situated on the R. Kan, 175 m. SSE. of Hankow. It is a railway junction, and has an extensive porcelain trade. Rice, beans, linen, timber, paper, and tobacco are also traded in considerable bulk. In 1927, when Chiang Kai-shek started his purge of Communists, Chou En-lai, Ho Lung, and others revolted at N., and organised the first Red Army, which became the nucleus of the Chinese Liberation Army. Pop. 412,000.

Nancy, Fr. tn, cap. of the dept of Meurthe-et-Moselle, on the Meurthe and the Marne-Rhine canal. The former cap. of Lorraine (q.v.), N. was taken by France in 1633, was later lost, and finally became French in 1766. The anct part of the tn has narrow, irregular streets, while the modern

part has broad, open streets commanding a view of the surrounding hills. The centre of the tn has what is considered to be one of the finest collections of 18th-cent. buildings in France. N. has a univ. (founded 1572, transferred here 1797), and is the seat of a bishopric. The cathedral was begun in 1703 by J. H. Mansard (q.v.). The tn suffered damage in both world wars. It is an important railway centre, and has iron, salt, and sodium industries. There are numerous manufs., including machinery, textiles, glass, and pottery. Charles the Bold (q.v.) was killed here in 1477, and Isabey, Callot, St-Lambert, and Lyautey (qq.v.) were b. here. Pop. 124,800.

Nanda Devi (the Blessed Goddess), peak of 25,645 ft, one of the most beautiful in the world, situated in a lofty basin in Garhwal almost impossible of access except through the very deep, difficult Rishi Gorge. Longstaff reached the rim of the basin in 1906; further attempts by him and Rutledge and others failed to penetrate to the foot of the mt. E. Shipton and H. W. Tilman did so in 1934, but too late to make the ascent. The expedition of 1936 led by H. W. Tilman, with Graham Brown, Odell, Lloyd, Houston, Loomis, and others, was a triumph of unselfish co-operation, judgment, skill, and determination. Tilman and Odell reached the summit, which at that time was the highest in the world to be climbed. See R. E. Shipton, *Nanda Devi*, 1936, and H. W. Tilman, *The Ascent of Nanda Devi*, 1937.

Nandi, Nilo-Hamitic tribe of Kenya, living in the highlands to the W. of the Rift Valley. Traditionally pastoralists, to-day they are cultivators. They are closely related to the Masai (q.v.) and were great warriors. See G. W. B. Huntingford, *The Nandi of Kenya*, 1953.

Nanga Parbat, mt of Kashmir, W. Himalaya, S. of the Karakorum; height 26,620 ft. The first exploration was made in 1895 by A. F. Mummery, G. Hastings, and Norman Collie, when Mummery and 2 Ghurkhas lost their lives on the Dharma glacier. Six further attempts were all made by Ger. expeditions, and all by way of the Rakhiot glacier and the NE. ridge. The first two were led by Willy Merkl. In 1932 his party found the best route and climbed it to 22,800 ft; in 1934 they climbed to 25,750 ft, but were overtaken by blizzards in which Merkl, Welzenbach, Wieland, and 6 Sherpas lost their lives. The 1937 expedition, led by Karl Wien, was overwhelmed by an ice avalanche at Camp 4 on 15 June. All 16 climbers (7 Germans and 9 Sherpas) were killed. The 1938 expedition, led by Paul Bauer, reached 24,000 ft, when the break of the monsoon forced abandonment of the climb. The 1939 expedition, led by Peter Aufschnaiter, made an unsuccessful reconnaissance of the NW. face from the Dharma glacier. The 1953 expedition was a joint Ger.-Austrian venture organised by Dr Karl Herrligkoffer and led from the rear by Peter Aschenbrenner. On 3 July Hermann Buhl reached the summit after climbing 4400 ft alone from Camp 5. He

suffered benightment on the descent. His 40 hours' effort (without oxygen) was no less than heroic. See J. N. Collie, *Climbing on the Himalaya and other Mountain Ranges*, 1902; F. Bechtold, *Deutsche am Nanga Parbat. Der Angriff*, 1934, 1935, and *Nanga Parbat Adventure*, 1935; K. Herrligkoffer, *Nanga Parbat*, 1954.

Nankauri, see NICOBAR ISLANDS.

Nankeen, cotton cloth of a peculiar yellow shade, which was originally manuf. in Nanking (China), but which has been imitated in other countries.

Nanking, or **Kiangning**, anct. cap. of China, later the chief tn of the prov. of Kiangsu and the residence of the governors-general of 3 provs. (Kiangsu, Kiangsi, and Anhwei), is situated about 3 m. from the S. bank of the Yangtsekiang and about 100 m. from its mouth. About AD 1000 it was named Kiangnan, but in 1368 it received its present name, which means Southern Capital. The anct. palaces have almost entirely disappeared, and the only remarkable monuments of royalty that now remain are some sepulchral statues of gigantic size near an anct. cemetery, known as the Tomb of the Ming Emperors. N. manufs. satin and crape and the cotton cloth called after the city nankeen. Paper and ink are also produced. It was here that peace was concluded between England and China in 1842. In normal times its imports were chiefly cotton goods and metals, and its exports silk goods, frozen ducks, and skins. In 1909 the railway connecting it with Shanghai (192 m.) was completed, and Pukow on the opposite side of the riv. is the terminus of a line to Tientsin, opened in 1911. This railway caused a large increase in N.'s trade. The neighbourhood is marshy, which makes the climate unpleasant in the hot summer. It is the seat of the National N. Univ. and of many colleges. In 1928 N. was chosen to be the cap. of China in place of Peking. In the Chinese-Jap. conflict it was bombed and attacked by Jap. infantry in 1937. It fell to the Jap. invaders on 18 Dec. 1937. The Japanese in 1940 set up a puppet gov. there, but the Chinese embassies throughout the world formally disavowed it. The city was taken without a fight by the Communists on 23 April 1949, and since then has ceased to be China's cap. See further under CHINA, *History*. Pop. 807,000.

Nanning, or **Yungning**, Hsüenchow, cap. of Kwangsi, China, on the railway from China to Viet Nam, an important trading centre. Spices are its chief products. Pop. 240,000.

Nansen, **Fridtjof** (1861-1930), Norwegian explorer, scientist, and philanthropist; b. Store Frøen, near Oslo. His first voyage was made in the *Viking*, 1882; his second voyage was made to Greenland in 1888, when he and his companions, Otto Neumann Sverdrup, Capt. O. C. Dietrichson, and others, encountered many hardships in their first crossing of the ice sheet. The most remarkable of Nansen's adventures was his expedition in the *Fram* to the Arctic regions, 1893-6, where he deliberately allowed his vessel to drift with the sea ice as far N. as possible,

and then abandoned his ship to Sverdrup's care in order to push his way by sledge to lat. 86° 13' N. Nansen and Johansen then pushed S. across the ice, wintered in Zeniya Frantsa-Iosifa, and were picked up by the Jackson-Harmsworth expedition in 1896. Before the First World War he investigated sea temps., etc., between Ireland and Iceland, and made further oceanographic research beyond Spitsbergen. In 1917 he represented neutral Norway on a mission to the U.S.A. about food supplies. He was a prin. pillar of the League of Nations from its estab., being chief Norwegian representative. In 1921-3 he was chief inspirer and director of famine-relief work in Russia, working with Hoover. Officially thwarted in his attempt to induce the League to raise an international relief loan, he visited selected tns in N. Europe and raised £250,000 from the public in 6 weeks. He thus ignored official channels, collected a small staff of skilled administrators, and, in conjunction with Hoover and his Americans, fed 10,000,000 starving people. He was also high commissioner of the League of Nations for settlement of refugees, who were mostly White Russians and later on Greeks from Asia Minor. They were without a state or a recognised nationality, and Nansen provided them with a 'Nansen passport,' which was accepted by almost every gov. Lord Rector of St Andrews Univ. in 1926, he refused the premiership of Norway. At the time of his death he was intending to go N. once more - this time by airship. Among Eng. trans. of his writings are *The First Crossing of Greenland*, 1890, *Farthest North*, 1897, *In Northern Mists*, 1911, *Through Siberia*, 1914, and *Armenia and the Near East*, 1928. See lives by W. C. Brogger, 1896; E. S. Stanitt, 1930; J. Sørensen, 1932; E. E. Reynolds, 1932 and 1949; C. Tunney, 1933; Liv Nansen Høyer, 1957.

Nanshan (the S. Mts), name of a range of mts in central Asia between Tibet and the Gobi desert. It extends from SE. to NW. at an average height of over 13,000 ft. The whole system, like the Kuenlun, is older than the Tertiary period, and has large carboniferous beds. Marine formations have been found at a height of 18,000 ft above sea level.

Nanterre (anct. Nemptodurum, or Nemptodurum), Fr. tn in the dept of Seine, a NW. suburb of Paris, standing at the foot of Mont-Valérien. It has the shrine of St Geneviève (q.v.), patron saint of Paris, who was b. here. There are chemical and metal manufs. Pop. 41,900.

Nantes (anct. Namnetes, or Nannetes), seaport city of France, cap. of the dept of Loire-Inférieure, is situated on the r. b. of the Loire, 30 m. from its mouth. The tn contains many splendid buildings and is very picturesquely situated. It is the seat of a bishopric. N. is a busy port, and its industries include boat-building, oil-refining, and tanning, and the manuf. of soap, fertilisers, textiles, and metal goods. It has been an important tn in Breton hist. since the days of its commercial prosperity under the Romans.

Here the Edict of N. (q.v.) was signed in 1598 giving religious freedom to the Huguenots. The tn was badly damaged during the Second World War; it was liberated on 10 Aug. 1944, after the U.S. Army's rapid advance into Brittany. Pop. 200,300.

Nantes, Edict of, see EDICT OF NANTES.
Nanteuil, Robert (1623-78), Fr. engraver, b. Rheims. Settling in Paris he was appointed in 1658 designer and engraver to the king, with a pension. He ranks as the greatest of Fr. portrait engravers, working from life, modelling the face with great exactness, and using much resource in shading to give texture. Among his finest portraits are those of Mazarin, Pomponne de Bellièvre, Turenne, Jean Loret, and Anne of Austria. See life by E. Douvy, 1924.

Nantgarw, vil. of Glamorgan, Wales, in the Taft valley, 5 m. from Cardiff, giving its name to a hard paste porcelain produced here by Samuel Walker and his father-in-law Wm Billingsley in 1811. With the assistance of Wm Weston Young work continued until 1819 when Young bought the factory. Characteristic decorations were paintings of birds and flowers in bright colours. Pop. 1500.

Nantua, Fr. tn, cap. of an arron., in the dept of Ain, on the Nantua lake. It has a 12th-cent. church and a former abbey. There is a silk industry. Pop. 2800.

Nantucket, tn and co. seat of N. co., Massachusetts, U.S.A., on the is. of N. (46 sq. m.), 25 m. S. of Cape Cod Peninsula. It is chiefly important as a summer resort, and in the 19th cent. had a large whaling fishery. N. has an interesting hist. from the time of its first settlement by Thomas Macy in 1659. The old name of N. was Sherburne, the present name being given in 1695. Pop. 3400. See A. Starbuck, *History of Nantucket*, 1924.

Nantwich, mkt tn of Cheshire, England, 5 m. SW. of Crewe. An historic tn. N. has long been linked with the important and once thriving salt industry, and it is probable that the Romans came here for supplies from the brine springs. Almost the last stand against the Norman invaders was made at N. by the Earl of Mercia, and Domesday Book records that it was laid waste 'except one salt house.' Earl Hugh Lupus granted the barony of N. to Wm de Malbank, and the tn was renamed Wich (for salt) Malbank. The springs caused jealousy and warfare between Welsh and English; in the reign of Henry VII there were 300 salt works here, but by the reign of Elizabeth I the number was steadily declining. Competition had increased, and in the early 15th and late 16th cents. N. was largely destroyed by fire, and thrice decimated by plague between 1587 and 1604. To-day its extensive recreational facilities have made it an attractive inland health centre. Pop. 9034.

Nantyglo, tn of Monmouthshire, England, 7 m. WSW. of Abergavenny. It is part of the dist. of N. and Blaina; N. has rubber and boot industries, while coal is mined at Blaina. Pop. (N. and Blaina) 11,500.

Naos, in Gk architecture, the sanctuary of a temple.

Nap (card game), see NAPOLEON.

Napa, see NAHA.

Naphtha, term originally applied to the liquid hydrocarbons in the neighbourhood of the Caspian Sea (the *naphu* of the Assyrians and the naphtha of Dioscorides). The natural oils of other countries became included under the term, which has now been restricted to the mixture of low-boiling hydrocarbons obtained in the fractional distillation of petroleum, coal-tar, and shale oil. The paraffins are petroleum N.s., and olefines and paraffin are obtained from shale oil. Coal-tar N., collected up to 170° C., is a crude light oil which is redistilled fractionally for 'solvent N.', or 'burning N.', which consists of xylene, pseudocumene, etc. All these N.s. are volatile, highly inflammable liquids, with the odour of benzene, and are valued as burning oils and solvents for gums, resins, etc. Wood N. is crude wood-spirit, or methanol (q.v.).

Naphthadag, see POSTAGE STAMPS.

Naphthalene ($C_{10}H_8$), aromatic hydrocarbon which occurs in amounts varying from 3 to 10 per cent in high temp. coal tar (q.v.). It is obtained as 'crude drained N.' from the fraction of coal tar distilling between 200° and 230° C., from which it crystallises on cooling. It may be purified by washing with methanol, recrystallising from light creosote, centrifuging and washing with hot water, hot-pressing, fractional distillation or sublimation, or by a suitable combination of these processes. In this way is obtained whizzed N. (melting point, 76-78° C.), phthalic anhydride grade N. (melting point, 78° C. or above), pure N., or sublimed N. (chemically pure N. boils under atmospheric pressure at 217-96° C., melts at 80-27° C., and has a sp. gr. of 1.14 at 30° C. It is insoluble in water, readily soluble in ether, chloroform, or carbon disulphide, and moderately soluble in benzene.

Its main outlet is as a starting material for the production of phthalic anhydride by vapour phase oxidation over a vanadium oxide catalyst. Its more familiar use is as an insect repellent ('moth balls') and deodorant, and it is also an important starting material for the production of dyestuff intermediates. N. has the formula

and undergoes the normal substitution and addition reactions of aromatic hydrocarbons, yielding 2 classes of mono-substituted derivatives called α or β according to the position of the entering groups. It also forms a characteristic crystalline derivative with picric acid. Only traces of N. or its homologues are found in petroleum oils, but the amount can be materially increased by subjecting these oils to pyrolytic decomposition. The tars formed as by-products in the production of carburetted water gas can contain over 10 per cent of N.

Naphthionic Acid, member of the group of naphthylamine-sulphonic acids. It is used in the dye industry, while other members are employed in the synthesis of drugs to combat sleeping sickness and similar trypanosome diseases (e.g. in the drug known as Bayer 205).

Naphthol ($C_{10}H_7OH$). The 2 N.s (α and β or 1- and 2-) are monohydroxy-derivatives of naphthalene corresponding to the monohydric phenols, which they resemble in properties, and are used as dyestuff intermediates; α -N. (melting point, $95^\circ C.$; boiling point, $282^\circ C.$) is prepared from α -naphthylamine, and is a colourless crystalline substance with a faint smell, soluble in alcohol and ether, but sparingly soluble in hot water. The β variety (melting point, $122^\circ C.$; boiling point, $288^\circ C.$) is slightly soluble in water, its solution giving a green coloration to ferric chloride, while the α compound gives a violet coloration. It is appreciably soluble in caustic soda and is normally used in this solvent. See DYE.

Naphthylamine, or Amino-Naphthalene ($C_{10}H_7NH_2$), occurs in α and β (or 1- and 2-) modifications; α -N. is a colourless crystalline substance with a disgusting smell (melting point, $50^\circ C.$; boiling point, $300^\circ C.$), prepared by reducing α -nitronaphthalene. The β compound prepared from β -naphthol is odourless (melting point, $112^\circ C.$; boiling point, $288^\circ C.$). Both varieties and their derivatives were extensively employed in the manuf. of dyes. β -N. is not now used owing to its carcinogenic activity. See DYE.

Napier, Sir Charles (1786-1860), admiral, cousin of Sir Charles James N., b. near Falkirk. He entered the navy in 1800, and took part in the operations in the W. Indies in 1806-9. In 1813 he went to America on the expedition up the Potomac, and was put in command of the *Galatra* off Portugal, 1829. In 1833 he was asked to take command of the Portuguese fleet, with which he was victorious off Cape St Vincent. In the Syrian war of 1840 he stormed Sidon, and in 1854 was commander-in-chief in the Baltic against Russia. He twice sat in Parliament: for Marylebone (1842-6), and for Southwark (1855-60). See Maj.-Gen. E. Napier, *Life and Correspondence of Admiral Sir Charles Napier*, K.C.B., 1862.

Napier, Sir Charles James (1782-1853), general and statesman, b. London. He fought in the Irish rebellion, 1798, in Denmark, 1807, and was wounded and taken prisoner at Corunna, 1808. He returned to the Peninsula in 1811, took part in the expedition to Chesapeake, 1813, and after peace was signed became governor of Cephalonia, 1818. In 1841 N. was dispatched to India, and 2 years later won a great victory at Meeanee, by which he subdued the rulers of Sind. His administration was described by his brother, Sir W. P. F. Napier, 1851, who wrote his life, 1857. He himself wrote many books, chief of which were *Colonisation*, 1835, and *Defects, Civil and Military, of the Indian Government*, 1853.

Napier, Sir Francis, 9th Baron Napier,

1st Baron Ettrick of Ettrick (1819-98), diplomat, b. Thirlestane, Selkirkshire, and educ. at Trinity College, Cambridge. He began his career, in 1840, at Vienna and Constantinople, afterwards being sent to the U.S.A. and then to The Hague. From 1860 to 1864 he was ambas. at St Petersburg, and from 1864 to 1866 at Berlin. In 1866 he became governor of Madras. After a temporary appointment as Governor-General of India (1872) he returned to England. He was raised to the peerage in 1872.

Napier, John (1550-1617), mathematician, the inventor of logarithms, was b. Merchiston Castle, near Edinburgh, and educ. at the univ. of St Andrews and on the Continent. In *Mirifici Logarithmorum Canonis Descriptio*, 1614, he pub. his invention by which sines, tangents, etc., may be briefly calculated. Three years later he wrote *Rabdomologiae seu Numerationis per Virgulas libri duo*, describing an ingenious method of multiplying and dividing known as 'N.'s bones,' or 'rods.'

NAPIER'S BONES

Napier's bones. N. devised a simple system of multiplication by means of rods known as 'N.'s bones.' The way in which they were used is illustrated by the accompanying figure showing the 'bones' arranged for the multiplication of the number 85723. Each of these bones consists of the multiplication table from 1 to 9 for the particular number at its head. The digits are engraved below the diagonal in each square and the tens above it. The strip numbered from 1 to 9 is placed on the left in the position shown. As an example we may multiply 85723 by 5. Beginning at the extreme right of the row opposite 5, we write down the numbers in order, adding the number above the diagonal to the one below the diagonal in the column to the left of it. We thus obtain the answer 428615. In order to multiply 85723 by 7624 (say), the above process is repeated for each number

in the multiplier and the answer is obtained by appropriate addition thus:

342892
171446
514338

See lives by the Earl of Buchan, 1787, and by M. Napier, 1839, and an article by W. R. Macdonald in the *Dictionary of National Biography*.

Napier, Sir William Francis Patrick (1785-1860), soldier and historian, younger brother of Sir Charles James N., b. Colbridge, near Dublin. He joined an Irish regiment in 1800, and subsequently fought in Denmark (1807) and in the Peninsula (1808). His *History of the War in the Peninsula* (6 vols.), 1823-40, is a classic. His other works are *History of the Conquest of Sicily*, 1845, *History of Sir Charles Napier's Administration of Sicily*, 1851, and *The Life and Opinions of General Sir C. J. Napier*, 1857. See life by Lord Aberdare, 1862.

Napier of Magdala, Robert Cornelius Napier, 1st Baron (1810-90), Brit. soldier, b. Colombo, Ceylon. He served with distinction through the 2 Sikh wars, was present at the relief of Lucknow, and afterwards defeated Tantia Topi on the plains of Jaora Alipur. In 1868 he was put in command of the Abyssinian expedition, and on account of his brilliant services at the storming of Magdala was created a peer. Subsequently he was appointed commander-in-chief of the forces of India (1870), governor of Gibraltar (1876-82), and constable of the Tower (1886). He was made field-marshal in 1883. See memoir by R. MacLagan; also H. D. Napier, *Field Marshal Lord Napier of Magdala*, 1927.

Napier, seaport and winter resort on the E. coast of North Is., New Zealand, on Hawke's Bay, 200 m. N.E. of Wellington by rail. It has a good harbour, Port Ahuriri, protected by a breakwater. Large quantities of wool, meat, pelts, fruit, and canned foods are exported. N., the third largest export port, was badly damaged by the Hunters Bay earthquake, 1931. Large industrial and residential areas are being developed. Pop. 27,492.

Napier's Bones, see **NAPIER, JOHN**.

Naples (It. Napoli): 1. Prov. of Italy, in W. Campania (q.v.). It has a long coastline on the Tyrrhenian Sea (q.v.), including that of the Bay of N. (q.v.). The prov. is generally low-lying, but has a mt range in the S. and other isolated mts (see *Vesuvius*). It is very fertile, and the inhab. are hard-working and frugal. Olives, vines, cereals, hemp, cotton, and chestnuts are produced. The prin. tns include N., Portici, Castellammare di Stabia, Sorrento, and Pozzuoli (qq.v.). Area 452 sq. m.; pop. 2,186,000.

2. (Ger. *Neapel*; anct. *Parthenope*, *Neapolis*) Third city of Italy, cap. of the prov. of N., and chief tn of Campania, 118 m. S.E. of Rome (q.v.). It is famous for the beauty of its situation on the Bay

of N. (q.v.), is a busy seaport, and is the H.Q. of one of the It. naval defence zones. Originally a colony of Cumae (q.v.), N. became allied to Rome in 326 B.C. Under the empire it was a fashionable resort on account of its climate and Gk culture. Virgil (q.v.) composed the *Georgics* here. After the fall of the W. empire the city came under the influence of the Goths (q.v.), but was captured for the Byzantine Empire (q.v.) by Belisarius (q.v.) in 536. It was taken by Totila (q.v.) in 542, and was recovered for the Byzantines by Narses (q.v.) in 553. Later it was an independent duchy, which in 1139 came under Norman rule. Under Charles I (q.v.) of N. and Sicily it became cap. of the kingdom of the Two Sicilies (see *SICILY*). In 1495 Charles VIII (q.v.) of France took N., but was quickly forced to abandon it and from 1504 until the War of the Sp. Succession (see *SPAIN, History*) it was held by Spain. In 1713 it came into the hands of Austria. In 1734 Charles of Parma (later Charles III (q.v.) of Spain) gained N. and Sicily for the Bourbon family, and estab. himself as King of the Two Sicilies. The Bourbon dynasty lasted until the entry of Garibaldi into N. in 1860, except for two periods: a few months in 1799 when the French created the 'Parthenopean Rep.' (q.v.); and 1806-14 when first Joseph Bonaparte and then Murat (qq.v.) held the kingship. During the Second World War, N., because of its importance as a port and as a railway and industrial centre, was subjected to heavy allied air attack, and great damage was done. By the beginning of Sept. 1943 the city had been practically isolated by the bombing of the key railway junctions surrounding it, and on 9 Sept., the day after the announcement of the It. armistice, the Allies landed at Salerno (see *SALERNO BEACHHEAD*), within striking distance of N. On 22 Sept. the Allies broke through at Nocera Inferiore and took Castellammare, thus opening the way for a drive along the coastal road towards N. and an advance on the right wing northward towards Benevento. On 30 Sept. the road junction of Avellino, on the right, was taken, and on the following day N. fell to the Allies (see *ITALIAN FRONT, SECOND WORLD WAR CAMPAIGNS OF*). Built on volcanic slopes, N. is overlooked by a 14th-16th-cent. fortress on the spur of Sant'Elmo (815 ft); also here is the baroque Certosa di San Martino, which now houses a museum. The main part of the city lies to the E. of the spur, as does the harbour. Near to the harbour is the vast royal palace (17th-19th cents.), the 18th-cent. San Carlo opera-house, and the fine Castel Nuovo, once the seat of the medieval kings and the Sp. viceroys. The archiepiscopal cathedral of San Gennaro (13th-20th cents.) has a neo-Gothic facade; it contains many treasures. There are over 200 other churches, some of them of great interest; many of these were damaged during the Second World War, and works of art contained in them, including paintings by Titian and Caravaggio, were destroyed. N. has a univ.

(1924), a library (housed in the royal palace) which has 1,400,000 vols. and valuable incunabula, and a museum with a magnificent collection of treasures from Herculaneum and Pompeii (qq.v.). The port of N. is one of the most important on the Mediterranean, and has a large passenger and commercial traffic; the prin. exports are wine, fruit, olive-oil, foodstuffs, and building materials. There are shipbuilding, engineering, chemical, textile, glass, paper, and foodstuff industries. Pop. 1,027,800. See C. E. Clements, *Naples, the City of Parthenope, and its Environs*, 1894; A. Norway, *Naples, Past and Present*, 1901; E. Lemonon, *Naples*, 1910; C. Headlam, *The Story of Naples*, 1927; B. Croce, *Storia del Regno di Napoli*,

King of Italy in 1861. See ITALY, History.

Napo Pastaza, prov. of E. Ecuador, combined with Santiago Zamora to form the Región Oriental, with an area of 219,095 sq. m. and a pop. of 295,200. The cap. of N. P. is Tena. Balsa wood is produced.

Napoleon I (Bonaparte) (1769-1821), emperor of the French, was b. Ajaccio, in Corsica. (For details of his family see the article BONAPARTE.) His father, who had at first supported the Paolists, was now on good terms with the French, and was able to obtain for N. a place at the king's expense in the school at Brienne. Here he was entered as a pupil in 1779. His school days do not seem to have been very happy. He did not show any very

Naples, Bay of, inlet of the Tyrrhenian Sea (q.v.) in Italy. It is a fine, deep, semicircular sweep of some 50 m. from the ls. of Ischia (q.v.) round to that of Capri (q.v.). The bay is famous for its beauty, has a low promontory in the N., a mountainous one in the S., and is overlooked by Vesuvius (q.v.). The chief tns are Naples, Castellammare, and Sorrento (qq.v.).

Naples, Kingdom of, existed from 1138 to 1860. For a time it was ruled by the sovereign of Sicily. In the 16th cent. it became a possession of the kings of Aragon and Spain, having previously been ruled in turns by the Hohenstaufens and the Angevins. In 1713 it passed to Austria under Charles VI. It was ruled by members of the Bourbon family between 1738 and 1806 and again between 1814 and 1860. After the liberation of Italy by Garibaldi it became part of the Sardinian kingdom (1860), which latter kingdom ceased to have a separate existence when Victor Emmanuel was crowned

striking ability, but was proficient in mathematics besides showing steady application to his studies generally. In particular, he spent a good deal of his time in reading hist.

In 1784 he went as a cadet to the military school at Paris, and here he studied with greater zest, since he wished to enter the artillery, and was anxious for the time to come when he would be able to begin rebuilding the family fortunes. In 1785 he was gazetted to a regiment of artillery at Valence, and in Jan. of the following year he commenced his duties as a lieutenant. The death of his father had left him at the head of the family, and during the years which followed the beginning of his military career he spent his furloughs in Corsica. In 1792 he exceeded his leave to support Gen. Paoli. By now he had become an active sympathiser with the revolutionaries in France. In 1793 his break with the Paolists led him to take refuge in France. He left his mother and sisters in Marseilles, but went to Paris himself to find employment. Although by his prolonged absence he had theoretically forfeited his position in the army, the

revolutionary party could not afford to lose its trained officers, and so N. was reinstated and received arrears of pay. He was known, too, to be a good artillery officer and was given the rank of lieutenant-colonel in 1793 and sent to Toulon, which was holding out against the Convention and being supported by an Eng. fleet under Hood. At this time the fortunes of the rep. were at a very low ebb. In addition to wars with hostile external powers, France had also to fight reaction from within. The royalists at Toulon had admitted the English and the Spaniards, and N. was called in to help

year N. married Josephine (q.v.), widow of the Viscount de Beauharnais, who had lost his life during the Reign of Terror; and received the command of the army of Italy (Jan. 1796).

The opening of the It. campaign marks a new era in the hist. of the rep. Hitherto the wars had been fought by the French for what they considered were the principles of the revolution; now all that was to cease, and the armies were given a material incentive in the prospect of spoil and plunder. Thus N. was able to strengthen his position at the cap., to which he sent huge sums of money and priceless gifts which he had exacted, not as plunder, but as the natural spoils of the conqueror. His It. campaign is in many respects his most brilliant. It was noted for his dashy energy and the untiring manner in which all attacks were carried out. Features of the whole campaign were rapidity and accuracy. N. fostered a spirit of revolution in the northern It. states. That spirit was to help him in his campaigns, and later in the war, when, threatened by an overwhelming Austrian army, he was able to depend upon the help of an It. legion. Slowly but surely he drove back the Austrians and Piedmontese. From the neighbourhood of Savona he drove them back across the Adda, and finally, after the victory at Arcola, across the line of the Adige. The Austrians having thus been hopelessly defeated, the northern It. states formed the Cisalpine Rep. During this period N. was the servant of the Directory, but the spoils of Italy gave France and the Directory a new idea of warfare, a warfare that paid for itself and had enough left to supply magnificent presents to the rep.; and in proportion to the plunder so did the favour of N. grow. He was able to a very great extent to act independently of the Directory, to make his own terms, to set up his own forms of gov., to depose and to treat with the princes of the lands conquered.

N., together with his ever-victorious army, now continued his war against the Austrians, driving them back to Leoben, where negotiations for peace were opened. But within France the gov. was again threatened by royalist elements, and the Directory called upon N. for help once more. The Tuilleries were surrounded, the suspected representatives were arrested, the power of the Directory was saved. N. in doing this had strengthened his own position, and had gone one step further towards empire. The Austrians no longer held back, the treaty of Campo Formio was signed, Lombardy was added to the Cisalpine Rep., and Venetia was handed over to Austria. N. could now pursue the plans which he had always had of a campaign in the E.

Almost immediately after the signing of the treaty, N. returned to Paris. So clearly had he shown his power that the Directory was concerned with one thing only, and that was to get him away again as soon as possible. He was placed in command of the army originally intended for the invasion of England, but he

NAPOLEON AS FIRST CONSUL
Part of Isabey's celebrated portrait.

the besieging forces. Here he laid the foundations of his military reputation. He introduced new methods of artillery attack, and was ultimately mainly responsible for the withdrawal of the hostile fleets and the recapture of the tn. He was made a general of a brigade at the end of 1793, and appointed to the command of the artillery of the army of Italy in the following year. Subsequently he fell into disgrace, was recalled to Paris, arrested, and his name struck off the army roll. But he was soon released.

N.'s chance came with the Parisian insurrection of Sept. 1795. The Paris mob, angered by the work and methods of the Convention, determined to get rid of it. The Convention, liable to be attacked at any moment by the National Guard, entrusted its defence to Barras (q.v.), and he chose as one of his chief subordinates the recently disgraced N. N.'s artillerymen commanded all approaches to the Tuilleries, and their fire swept the streets. N.'s famous 'whiff of grapeshot' really prepared the way for the empire of 1804. The immediate result of the crushing of this rising was the imposition of a new constitution, the First Directory, which was still, however, essentially democratic, but which prepared the way for the ultimate changes which led to the foundation of the empire. In the next

himself had resolved to go to Egypt. Why he was so intent on Egypt does not seem altogether clear, but affords a glimpse of his character, as a visionary of boundless aspiration. The Directory fell in with his plans (May 1798). He just escaped Nelson in the Mediterranean, captured Malta, then in the possession of the Knights of St John, and sailed to Aboukir Bay. He landed his troops and marched against the Mamelukes, whom he defeated. Then came the news of Nelson's crushing victory over the Fr. fleet at the battle of the Nile (1 Aug. 1798) and N. determined to attempt an invasion of

the power into the hands of three consuls, the first consul, N., being the head of the state, with practically all the power, the other two being mere figureheads.

N.'s personal rule meant the end of the factional gov. which had weakened the country during recent years; and his popularity was enormous. He acted swiftly and effectively. The insurrections in the country were immediately put down, and overtures of peace held out to Austria and England; the first impression was to be of a N. aiming at peace for his country, not universal empire. Next he determined upon a campaign which should bring glory to his name, and thus add to the security of his tenure of power. The campaign against the Austrians ended with the battle of Marengo, which the Austrians, after virtually gaining victory, lost owing to the magnificent cavalry charges of Kellerman. Hohenlinden, a victory of Moreau, followed. Then came the treaties of Lunéville (1801) and Amiens (1802), and also the concordat with Rome. Between the election of N. as first consul and his election as first consul for life many of the old civil institutions of France were restored and numerous internal administrative reforms were made, which both increased gov. efficiency and consolidated N.'s hold on affairs. N. had estab. his power in France by virtually dictating peace to the world; now he was to become the sole ruler of France. In Aug. 1802, as a reward for the peace, N. was created first consul for life.

Then, the objects of peace having been accomplished, N. was again anxious for war. His aggressions in Europe soon led to the resumption of hostilities with England, and he thereupon seized Hanover and prepared the way for the policy of aggression which he was about to adopt towards Prussia. In 1804 he declared himself emperor of the French. His gigantic preparations for the invasion of England were finally abandoned after the battle of Trafalgar (1805), but his policy of aggression had made possible another coalition, and having struck his camp at Boulogne, just before Trafalgar, he was soon to shake Europe by his land victories against Austria and Prussia. Violating the neutrality of Prussia, he overwhelmed the Austrians at Ulm and marched into Vienna (1805). The Austrians and Russians, impatient of delay, and not waiting for reinforcements from their Prussian allies, were struck down at Austerlitz (1805). These two blows estab. the empire of N., overthrew the ant. Holy Rom. Empire, and estab. the confederacy of the Rhine under Napoleonic influence. Peace negotiations were broached but failed. Prussia, stung by her contemptuous treatment by N., appealed to arms, but was crushed and disheartened by the terrible blows of Jena and Auerstadt. Again at Eylau (Feb. 1807) and at Friedland, in the same year, he routed the combined Prussians and Russians, and the Tsar Alexander was compelled to sign the peace of Tilsit. Prussia was broken and dismembered. The continental system by which N. sought to conquer Britain

THE EMPRESS JOSEPHINE

Syria—whether he actually contemplated invasion of India, in imitation of Alexander the Great, will never be exactly known—and to return to Europe via the *terre* of the sultan. His campaign in Syria was successful until he reached Acre; this, chiefly owing to Sir Sidney Smith, he failed to take, and he returned to Egypt.

Here news of internal events in France made him decide to go to Paris at once, and in Oct. 1799 he landed in the S. of France, having left his army in Egypt in command of Kléber. The war in Europe was gradually going against the French, the work of the It. campaign of N. had been wellnigh undone by the second coalition, and the Directory was tottering to its fall. N.'s moment had come. The news of his defeats in the Middle E. was not yet known in France, and his journey to Paris was in the nature of a triumphal progress. He was popular and he was fawned upon by all the chief men of the state. Yet for a moment he hesitated, and his actual *coup d'état* might have failed had it not been for his brother Lucien, the president of the Council. He it was who kept the plot in view even when N. had been unnerved, and brought the soldiers to his aid. The Directory was overthrown, and a new constitution gave

was now in full force. He himself was the dictator of Europe, the conqueror of the Hapsburgs, the equal of the ancient line of emperors.

He had reached the height of his power. Thereafter the progress of his decline is to be traced in three facts: first, the attempted annexation of Spain; secondly, the invasion of Russia; thirdly, the rising of the powers of Germany against him. In 1808 he compelled the Sp. king to abdicate and placed his brother Joseph on the Sp. throne. This led to war with Spain, a war in which the national spirit of the Spaniards was aided by the arms of England, and which for the rest of the period occupied a fair proportion of the Fr. troops. The defeat and capitulation of Dupont at Baylen and of Junot at Cintra mark the beginning of the end of N.'s

The allies, with troops numbering 500,000 men, now turned to face N., the morale of whose army was by this time low. The allies held their own, now inflicting a defeat, now sustaining one, until the great contest at Leipzig, which crushed N. and drove him back across the Rhine. The Rhine Confederacy was dissolved. The negotiations for peace which were opened almost immediately after this failed, and the allies invaded France. In spite of a contest full of genius, in spite of many victories, slowly but surely N. was driven back. The Austrians, Russians, and Prussians were all advancing and closing round Paris, while Wellington was gradually approaching the city from the S., having cleared the French from Spain. In these circumstances N. surrendered and, after attempting useless negotiations,

THE RESIDENCE OF NAPOLEON AT ST HELENA

From an old print.

ascendancy. But he was yet to win many remarkable victories. The Austrians were defeated at Ratisbon and then at Wagram, and in 1809 peace was again signed, but the fact that the terms were prejudicial to Russia sowed the seeds of further trouble. In 1810 N., having divorced Josephine who had given him no heir for his empire, married the archduchess Marie Louise of Austria, and a son was born in the following year, to whom the title of King of Rome was given. The economic difficulties caused by N.'s attempt to exclude Brit. goods from Europe still further exasperated Russia, and in 1812 N. decided to invade her. But the N. of the Russian campaign was not the N. of the early days of the cent. His army reached Vilna. He hesitated and then went on. He defeated the Russians at Smolensk; again he hesitated, yet again he went on, and reached Moscow, where he stayed until Oct., the tn being in the meantime burned by the Russians. It was then that he resolved to retreat from Moscow, and although the retreat was indeed carried out, five-sixths of the army he had taken with him perished. The next move was a virtual coalition of all nations against N. Russia and Prussia, then most of the Ger. states, and finally Austria were in alliance.

abdicated (1814). He retired to Elba, being given the sovereignty of that is., and the Bourbons, in the person of Louis XVIII, were restored to the throne of France.

But the long wars had left Europe in a very unsettled state, and the name N. still held great appeal in France. Early in 1815 N. escaped from Elba and landed in France. He was enthusiastically received and the Bourbons fled. Europe declared war against him, but only Prussia and England were ready to meet him. N. determined to strike, and to strike quickly, to separate the armies and defeat them in detail. He defeated Blücher at Ligny, but Blücher had a preconcerted plan with Wellington, and while Wellington fell back on Waterloo, Blücher pushed on to come up with him as soon as possible, and Grouchy, dispatched by N. to keep Blücher back, fought only with the rearguard of the Prussian Army. Wellington held the field at Waterloo until the arrival of the Prussians, and the French were swept away in headlong rout. (For a full description of this famous battle see under WATERLOO.) N. then fled to Paris, where for the second time he abdicated. He attempted to escape to the U.S.A., but finding this impossible, on 15 July

he surrendered to Capt. Maitland of the *Bellerophon* at Rochefort. He was sent in Oct. 1815 to St Helena, where he spent the rest of his life in exile, dying there on 5 May 1821 of cancer of the stomach.

The period of N.'s stay in St Helena is one of great interest, for during it were laid the foundations of a Napoleonic legend, on which N. III was to raise himself to the throne. It was, in a sense, N.'s last campaign. The immediate object was a personal one, escape from the Is. by one means or another. The vigilance of Sir Hudson Lowe, who arrived as governor of the Is. in April 1816, thwarted all attempts, and for this reason, amongst others, N.'s bitterness against him was intense.

N.'s intellectual brilliance and military genius are undisputed; but his character was marred by overweening vanity; he had nothing but contempt for the ordinary citizen on whom he ultimately relied for the fulfilment of all his ambitions. He was at heart a cynic—cynical of mankind, cynical of religion—and his ruthlessness extended to the most personal details of his life.

His career ultimately weakened France: yet even in modern times it is his military glories and administrative reforms which are most remembered, and the final defeats and the resultant chaos tend to be pushed into the background. Even during his lifetime, while he was dying in St Helena, the Napoleonic legend took root and flourished. It was to weaken France for the next half-cent.; for many whom the reaction of the restoration antagonised, many who felt dissatisfied with the bourgeois monarchy of Louis Philippe, turned to the mirage of N, the liberator, and gave their support to his nephew, Louis N. (N. III), who was clear-sighted enough to see its tremendous value and to adopt the legend himself. Before him it had influenced the young Duke of Reichstadt, son of N. and Marie Louise, passing his adolescent years in the Austrian court. The exalted view of his father which he gained from N.'s memoirs fired his ambition to return to the throne of France. During his short life there were endless Bonapartist conspiracies centred around his person, and Metternich considered him, with justification, a standing menace to European peace. See B. E. O'Meara, *Napoleon in Exile*, 1822; J. G. Lockhart, *Napoleon Buonaparte*, 1829; Lord Rosebery, *Napoleon, the Last Phase* (from deportation to death), 1901; H. A. L. Napoleon II (1811-32), son of N. I by his marriage with Marie Louise of Austria, b. Paris. His father created him King of Rome. N. I abdicated in his favour, 1814, but no attempt was made to establish his claims, and he was educ. in Austria. The Austrian emperor made him Duke of Reichstadt in 1818. Always delicate in health, he was kept under constant watch by the Austrian authorities because of his position as N.'s heir (he was known as N. II by the imperialists, although he never reigned and was never crowned). His life was lonely and frustrated; his mother showed no interest in him after 1814 until he lay dying, and he was the centre of numerous abortive imperialist plots. Rostand's *L'Aiglon*, 1900, is a dramatised and romanticised version of his life. See also F. Masson, *Napoleon et son fils*, 1922, and Dormer Creston, *In Search of Two Characters*, 1945, 1947.

Napoleon III (Charles Louis Napoleon Bonaparte), generally known, before his assumption of imperial status, as Louis Napoleon (1808-73), Emperor of the French, third son of Louis Bonaparte (brother of N. I), b. Paris. His mother was Hortense Beauharnais, the step-daughter of the emperor. He was brought up principally in Switzerland. In 1832, by the death of the first N.'s only son, the Duke of Reichstadt, he became the head of the family, both his elder brothers being now dead. During the next few years he pub. a good deal of literature, dealing principally with his political ideas and fostering the Napoleonic legend. During the reign of Louis Philippe, taking advantage of the disturbed state of France, he made two attempts to seize power. The first, in 1836, was easily repressed, and he was deported to America; the second, in 1840, when he landed at Boulogne from Britain, ended in his being condemned to life imprisonment in Ham fortress. There he continued his writings, and added to his already large output of Bonapartist literature. After just over five years' imprisonment he managed to escape, and returned to London. By this time the pamphlets he had written were

bearing fruit: his supporters in France were now very numerous. Taking advantage of the revolution of 1848 he hurried back to France, where he had been elected as a deputy in the Constituent Assembly. Having taken his seat, he almost immediately resigned, but was again elected for five different constituencies. Encouraged by this, he determined to stand as a candidate for the presidency, and was elected by a majority of five to one over his opponent, Cavaignac. Although N. had taken the oath of allegiance to the rep., he soon showed his true intentions. He rapidly assumed the control of the army, practically every post of importance was given to his own nominees, and finally, in Dec. 1851, he dissolved the Assembly by force and brought about his famous *coup d'état*. His popularity was now enormous. He was first elected president for 10 years; and then, Dec. 1852, assumed the title of emperor. Posing as the candidate and representative of the people, and personally highly cultured and humane, his inept handling of national and international policies soon forced him to develop into a despot, who gagged the press and repressed personal liberty. In 1853 he married the Countess Eugénie de Montijo (see EUGÉNIE).

His foreign policy occasionally showed strokes of brilliance. For example, his allegedly benevolent interference in It. affairs led to the annexation of Nice and Savoy by France; but his attempt to impose a monarch on the Mexicans led to a tragedy which dealt a permanently damaging blow to his personal reputation. By 1865 it became apparent that his influence was on the wane. At home the extravagance and decadence of the court caused bitter anger among a working-class now beginning to feel acutely the economic burdens of the new industrial age. N. turned to a more liberal policy, but it was too late. In 1870, becoming aware that his main support, the army, was beginning to fall away in its allegiance, he made a last attempt to rally it. He interfered in the question of the Sp. succession, for which a prince of the house of Hohenzollern was a candidate, and although the Prussians withdrew their prince, events led on to declaration of war. N. was completely unaware of the feeble state of his army. When he declared war he was firmly convinced that the French would easily gain Berlin, but 300,000 Frenchmen were opposed by 500,000 Prussians, and N. never crossed the Rhine. He was crushed at Saarbrücken, at Weissenburg, and at Metz, and finally came the crowning defeat at Sedan. On 2 Sept., the day after the battle, N. surrendered to the Prussian king, and was kept a prisoner until the end of the war. In the meantime his wife had retired to Chislehurst in Kent, where in 1871 she was joined by N., who d. there nearly two years later.

N. possessed intelligence and ability: a highly successful intriguer (as events up to 1852 show), he lacked consistent powers of statesmanship. His fundamental intolerance and indecisiveness generally pre-

vented his better conceived plans from reaching fruition: he was, in the last resort, driven to opportunism, and lacked the nerve or drive to sustain a policy on this basis. His most influential publs. were *Réveries politiques*, 1832, and *Idées napoléoniennes*, 1839. See H. A. L. Fisher, *Bonapartism*, 1908; F. A. Simpson, *The Rise of Louis Napoleon*, 1909, and *Louis Napoleon and the Recovery of France*, 1923; O. Aubry, *Le Second Empire* (with bibliography), 1938; A. Guérard, *Napoleon III*, 1946; F. C. Palm, *England and Napoleon III*, 1949; J. M. Thompson, *Louis Napoleon and the Second Empire*, 1954.

Napoleon, Eugène Louis (1856-79), only see BONAPARTE, Lucien Bonaparte.

Napoleon, Prince Lucien (1775-1840), see BONAPARTE, LUCIEN BONAPARTE.

Napoleon, obsolete Fr. gold coin of the value of 20 francs (nominally 15s. 10d. Eng. money), with a portrait of Napoleon stamped on it.

Napoleon, or more commonly 'Nap,' a card game. Probably the element of chance easily predominates over the skill required, for which reason the game may well be included under the category of gambling contests. The ordinary form of the game consists in dealing 5 cards to each of a number of players (as many as 10 can play), the object being to make as many tricks as possible, each playing against each, or only combining for the sake of defeating the player who has obtained the lead by making the highest call. The first card the latter plays decides trumps. Tricks are made by putting down the highest card in each round, it being imperative to follow suit if possible; if not the player may, if he can, trump the led suit. There is nothing very complicated in the game. Betting is usually level money all round, at some agreed sum per trick, very often a penny or halfpenny—hence the term 'penny nap.' Generally, if a player wins after 'going nap,' i.e. calling all 5 tricks, the other players pay him 10 counters or pennies, or other unit adopted, i.e. double stakes. If he loses, however, he forfeits only 5, probably as a consolation for a bold risk. There are variations of the game, one of the most popular being 'Misery.' Here there may or may not be trumps according to arrangements among the players, but as a rule there are no trumps. The *misère* hand is that held by the player who undertakes to lose all 5 tricks, the remaining players of course endeavouring to force tricks upon him.

Napoléon-Vendée, see ROCHE-SUR-YON, LA.

Napoleona Imperialis, see BELVISIA.

Napoléonville, see PONTIVY.

Napoli, see NAPLES.

Nara, anc. city of Naraken, Japan. It was the cap. of Japan from AD 710 to 784, one of the golden ages of Jap. hist. The city contains numerous temples, shrines, and other works of art; round about are the remains of the previous era. The most famous buildings in N. are the Todaiji temple (743), Shosoin Imperial Storehouse (756), Kasuga shrine (c. 709),

Shin Yakushiji temple (747), Toshodaiji temple (759), Yakushiji temple (698), and Kofukuji temple (c. 710). In the suburbs is Horyuji temple (607), the oldest surviving building in Japan and the oldest wooden building in the world. N. has a small cotton industry, but its income is derived mostly from tourists. Pop. 119,000.

Naracoorte, business centre of rich pastoral and dairying dist., 239 m. SE. of Adelaide, S. Australia. N. is a railway junction on Adelaide-Mt Gambier and N.-Kingston lines. N. caves, 7 m. from the tn. are a well-known tourist attraction, consisting of a group of deep limestone caverns with stalactite and stalagmite formations. N. has a large dist. hospital. Pop. 3000.

Narasinha, in Hindu mythology the fourth *avatar* of Vishnu, the reincarnation of the god in the form of man in order to put to death Hiranya-Kashipa, King of the Daityas, who was oppressing mankind.

Narbada, or **Nerbudda**, riv. of India, rising in Madhya Pradesh state, flowing in a generally WSW. direction till it falls into the Gulf of Cambay, 28 m. W. of Broach. Length 750 m. Navigation is impeded by rocks and shallows.

Narbo Martius, see **NARBONNE**.

Narbonne (Rom. **Narbo Martius**), Fr. tn cap. of an arron., in the dept of Aude. It was the cap. of Provincia (see **PROVENCE**), and was taken by the Visigoths (see **under** **GOTHs**), the Franks, and the Saracens (q.v.). Once a port, its harbour has now disappeared. It was an archbishopric from the 4th to the 18th cents., but its notable 13th-cent. cathedral has never been completed. There are many other fine buildings. It was the bp. of the Rom. emperors Carus, Carinus, and Numerianus (q.v.). It is known for its wines and honey, and has distilleries and potteries. Pop. 30,000. See R. Rey, *L'Art polique du Midi de la France*, 1934.

Narbrough, or **Narborough**, Sir John (1640-88), admiral, b. Norfolk. In 1670 he conducted an expedition through the Straits of Magellan. In 1674 he commanded another expedition to the Mediterranean, and was successful in destroying sev. Algerian and Tripolitan pirate ships. His last expedition was that to the W. Indies in 1687, and while superintending the recovery of a treasure ship (off St Domingo) he was attacked by fever and d.

Narceia, or **Narceine** ($C_{25}H_{37}O_5N$), narcotic poison prepared from opium (q.v.) bases. It is the most powerful narcotic of all the opium alkaloids. Practically insoluble in cold water, soluble in alcohol and hot water, insoluble in ether. Yields narcotic acid in oxidation with potassium permanganate. It is decomposed by the stronger and concentrated acids. It is formed from narcotine (q.v.) by treating the methiodide with aqueous caustic soda.

Narcissus, Gk youth famous for his beauty. He was beloved by many, including the nymph Echo (q.v.), but rejecting all their advances was punished by the gods, who made him pine away for love of his own image, reflected in a pool. He was changed into the flower which

bears his name. **Narcissism**, a term used by psycho-analysts, means excessive love and admiration of oneself.

Narcissus, family **Amaryllidaceae**, a genus of hardy bulbous plants of Europe, N. Africa, and W. Asia, much cultivated for their beautiful flowers, which are usually white or yellow, with tubular perianth and spreading segments, and a conspicuous corona, with 6 stamens growing from the tube, and inferior ovary; leaves are linear. Varieties are numerous, and horticulturally N. are divided into 11 divs.: 1. Trumpet N.; 2. Large-cupped N.; 3. Small-cupped N.; 4. Double N.; 5. Triandrus N.; 6. Cyclamineus N.; 7. Jonquilla N.; 8. Tazetta N.; 9. Poeticus N.; 10. Species, wild forms, and hybrids; 11. Miscellaneous N., not in the foregoing divs. *N. pseudo-narcissus* is native to Britain, but variable. Garden culture consists of planting the bulbs as early as possible, in well-drained loam, setting about twice their diameter in depth in the soil, with a little bonemeal, but no animal manure. Many N. can be forced, especially if subjected to a pre-cooling treatment to give earliness.

Narcissus Fly, or **Merodon equestris**, dipterous fly, giving rise to larvae which do very serious damage to N. bulbs. It appears between May and July, and lays its eggs between the leaves and on the ground. The fly is somewhat like a bee, about $\frac{1}{2}$ in. long and with variable stripes of red, yellow, or white, and with a black band across the thorax, but is distinguished by its two-winged character and the absence of the long black antennae found in all bees. The flies are best caught with a net when they settle for egg-laying, or can be trapped with saucers of treacle or honey. Newly bought bulbs should be carefully examined so that all infested bulbs can be lifted and destroyed. The occurrence of the pest must be notified to the Ministry of Agriculture.

Narcotic Poisons, see **POISONS**.

Narcotics, drugs which produce stupor if the dose is increased beyond a certain limit. The most important narcotic is opium. The opium alkaloids, alcohol, belladonna, henbane, Indian hemp, and chloral, all have a primary stimulating effect, but are poisonous in excess. Owing to their power of inducing sleep, some are called hypnotics (q.v.) or soporifics (e.g. sulphonal), while others which alleviate pain are called anodynes (e.g. antipyrin).

Narcotine, alkaloid occurring in opium (q.v.). The other important alkaloids in opium are morphine (see **MORPHIA**), papaverine, codeine, and thebaine.

Naroylene, see **ACETYLENE**.

Nardi, Jacopo (1476-1563), It. historian, b. Florence. In 1527 he was sent as an ambas. to Venice. His work entitled *Storia della Città di Firenze dell' anno 1494-1631*, pub. in 1582 (and a second ed. in 1584), forms a sequel to that of Machiavelli.

Nardo, It. tn in Apulia (q.v.), 14 m. SSW. of Lecce (q.v.). It has a 15th-cent. cathedral, and there are textile manufs. Pop. (com.) 26,000.

Nardostachys, or **Nard**, family Valerianaceae, genus of Indian perennial herbs, of which *N. italicus* has basal, long leaves and rose-purple flowers in very dense cymes in terminal panicles. The rootstock is thick, short, and very fragrant, and the source of spikenard, the aromatic unguent of the ancients; also used in medicine. The plant is hardy for Brit. gardens.

Narenta, see NERETVA.

Nares, Sir George Strong (1831-1915), Scottish admiral and explorer, b. Aberdeen. In 1852 he was a member of Sir Edward Belcher's expedition in search of Sir John Franklin. In 1867 he was captain of H.M.S. *Challenger*, the first steamship to cross the Antarctic Circle. From dredging operations it was inferred that there was a continent in the far S. From 1875 to 1876 Nares led a Brit. naval expedition in H.M.S. *Alert* and *Discovery* to the polar basin. The *Alert* wintered off N. Elsmere Is., having met impenetrable ice in lat. 82° 27' N. in Robeson Channel. Sir A. H. Markham and A. C. C. Parr led a sledge party from the ship to lat. 83° 20' N. Nares wintered in the *Discovery* at lat. 81° 44' N. Nares did valuable hydrographical work on Mediterranean currents and on the equatorial current, and received the founder's medal of the Royal Geographical Society, 1877, and the gold medal of the Geographical Society, Paris, 1874. He pub. sev. works on his explorations. See his *Narrative of a Voyage to the Polar Sea during 1875-6*, 1878, and A. H. Markham, *The Great Frozen Sea*, 1894.

Narev, **Battles of the**, fought in 1915, the riv. forming the line of the Russian defence of Warsaw against Hindenburg's advance. The fighting extended over the period June-Aug., Warsaw falling in Aug. 1915. See also WORLD WAR, FIRST.

Nariño, dept of SW. Colombia, with the Pacific Ocean to the W. and Ecuador to the S. Stock-raising is important, gold is mined, and cereals, cocoa, rice, potatoes, and sugar are grown. There are manufs. of footwear and Panama hats, which latter are exported from Tumaco. There is a univ. at Pasto, the cap. Area 11,540 sq. m.; pop. 599,680.

Narni, It. tn in Umbria (q.v.), in the Nera valley, 7 m. SW. of Terni (q.v.). It has a cathedral (partly 12th cent.), a 14th-cent. castle, and a 13th-cent. tn hall. There are Rom. remains near by, and mineral springs. The tn is surrounded by olive groves. Pop. (tn) 6300; (com.) 21,100.

Naro, see NERETVA.

Narocz, **Battle of Lake**. Lake N. is in Lithuania, situated about 60-70 m. NE. of Vilna. In the autumn of 1915 the Germans and Austrians forced back the Russians along the whole of the E. front, and in the region of the lake the line ran practically due N. and S. To relieve the pressure of the Germans on the W. front, who were then making some progress at Verdun (q.v.), it was arranged to create a diversion on the E. front, and an advance in this region was designed. All available Russian resources were duly concentrated

and the battle opened at dawn on 18 Mar. Once the Germans had recovered from their surprise they resisted every Russian advance. The battle eventually petered out about 27 Mar., owing to the exhaustion of the Russians.

Narragansett Bay, inlet on the SE. of Rhode Is., U.S.A. It is 30 m. long and 3 to 12 m. wide. It encloses a number of is., the largest of which is Rhode Is. See RHODE ISLAND.

Narragansett Pier, summer resort, 9 m. W. of Newport, Rhode Is., U.S.A.

Narrandera, tn on Murrumbidgee R., in New S. Wales, Australia, 360 m. SE. of Sydney. It is in the centre of the rich agric. and pastoral div. of the Riverina. Pop. 4540.

Narrows, The, very short strait, about 3 m. long, 1 m. wide, 8 m. S. of New York, between Brooklyn on the E. and Staten Is. on the W. It forms one of the prin. entrances to New York harbour.

Narses (c. 472-568), Byzantine general and statesman. He was an Armenian by birth, and a eunuch. In 538 he was sent to Italy to act with Belisarius (q.v.) against the Goths. He quarrelled with the general and was recalled in 539, but on the recall of Belisarius, N. was reappointed to the command in Italy, and at a fierce engagement at Tagina defeated the Goths, and killed their king, Totila. In 553 he defeated Teja at Sarno (q.v.) and took Rome. He was made exarch of Italy, fixed his court at Ravenna, and, until the death of Justinian in 565, administered the affairs of Italy with ability and vigour. At the accession of Justin he was accused of extortion and dismissed. After this he was accused of intriguing with Alboin, King of the Lombards, for a new invasion of Italy, but his participation was never proved, as he d. at Rome in 568 before the Lombard invasion. See also GOTHs and JUSTINIANUS.

Narthex, in architecture, the W. porch of an early Christian basilican church; for the use of women, penitents, and others who were not allowed to enter the church itself.

Narva, seaport in Estonia, half way along the Tallinn-Leningrad railway. It has a large textile industry (since the 19th cent.), and a big hydro-electric station is under construction. There are many architectural monuments of the 14th-19th cents. Founded by the Danes in 1223, it became Livonian in 1347, Swedish in 1581, and Russian in 1704. It has been an important commercial centre since the 14th cent. The Russians were defeated here by Charles XII of Sweden in 1700. N. was occupied by the Germans in 1918 and 1941-4. Pop. (1956) 21,000.

Narvaez, Pánfilo de (c. 1480-1528), Sp. soldier, b. Valladolid. He went to America, and from 1512 was under Velázquez in command of an auxiliary force in the conquest of Cuba. In 1520 he was sent to supersede and punish Cortés, but was defeated at Cempoalla and deserted by his army. Having returned to Spain he was appointed governor of Florida in 1526, but was drowned in 1528.

Narvaez, Ramón María, Duke of

Valencia (1800-68), Sp. general and statesman, b. Loja, Granada. N. entered the army in 1815, and later served against the Carlists. He opposed Espartero, and was forced to flee to France c. 1839, where he was afterwards joined by Queen Christina. He started a revolution in her favour and entered Madrid, 1843; the same year he declared the majority of Isabella II and became lieutenant-general of Spain. He was created duke and Prime Minister, 1844-6; ambas. at Paris, 1847; head of the ministry, 1847-51, 1856-7, and 1864-5.

Narvik, seaport of Nordland co., Norway, on the Ofoten Fjord. N. owes its

animal is from 10 to 16 ft long. It has a grey back, mottled with black, the under parts being much lighter, but also spotted. It has a blunt short head, no dorsal fin and very small flippers, but is very active and a rapid swimmer. It is peculiar to the Arctic Ocean, though it occasionally strays as far S. as Brit. seas. The oil is valuable and the flesh edible.

Nar'yan-Mar, tn and seaport in the Archangel oblast of N. Russia, cap. of the Nenets (q.v.) National Dist., on the R. Pechora. Pop. (1956) 11,000, mostly Russian.

Narym, swampy forested area in the N. of Tomsk oblast (W. Siberia), traversed

THE BATTLE OF NASEBY, 14 JUNE 1645

rise to the construction of the Ofoten railway, completed in 1903, and is the port for the shipping of iron ore. On 13 April 1940 a Brit. flotilla forced its way into N. Fjord and sank 4 Ger. destroyers. A combined force made up of Norwegians, Poles, French, and British made a strong attack on the Ger. garrison at N., which was captured on 28 May, but on 10 June the allied forces left. N. was destroyed but was rebuilt after the Second World War. New quays can take ships of up to 25,000 tons. In 1955 9 million tons of iron ore were shipped from N. Pop. 11,000. See also NAVAL OPERATIONS IN SECOND WORLD WAR AND NORWAY AND DENMARK, GERMAN INVASION OF (1940).

Narwhal, or Sea Unicorn (*Monodon monoceros*), cetacean, allied to the dolphins and porpoises. The male has one, almost invariably the left, of the teeth or tusks in the upper jaw extraordinarily developed into a spirally furrowed horn of pure ivory from 6 to 10 ft long. This is the longest tooth found in the Mammalia. The adult

by the Ob'. It covers about 100,000 sq. m. Pop. (1935) 145,000, mostly Russians, engaged in lumbering, hunting, and fishing. It has been an area of banishment since the 1860's.

Nascent State. Gases in the free state usually consist of molecules containing 2 or more atoms. These atoms are held together by a force of attraction which, in general, must be overcome before chemical action can be effected. Therefore gases that have just been liberated from combination, before the atoms have had time to combine into molecules, are more active chemically than after combination into molecules. Chemists use the term 'nascent state' to describe the condition of substances which so act at the instant of their liberation from combination. Ordinary nitrogen will not unite with hydrogen, but if a solution of a compound of nitrogen be poured into a flask in which hydrogen is being generated, ammonia will be formed. The peculiar behaviour of 'nascent' gases varies according to the reactions in which they are

formed, and thus is not solely due to their being in the atomic state.

Nascimento, Francisco Manoel do (1734-1819), Portuguese poet and miscellaneous writer, b. Lisbon. He was compelled to flee from Portugal to escape the Inquisition, and d. at Versailles. In compliance with the literary fashion of his day, he wrote under the Arcadian pseudonym 'Filinto Elísio,' though far from ever having been a member of the so-called Arcadians N. founded a school of rivals, named Filintists. His graceful lyrics and prose enriched the language, resisted foreign intrusions, and preserved national traditions. His influence in thereby reviving letters in his country was considerable, yet not so great as that of the less original Manuel de Bocage (q.v.). N. was especially famous for his lyrics, in which he succeeded in combining the classical purity of Horace's form with the new ideas and ideals of the Enlightenment. Among his works are romantic *contos* or scenes of Portuguese life. He is also remembered for his patriotic odes, notably *To Neptune speaking to the Portuguese* and *To the Liberty and Independence of the United States*.

Naseby, par. and vil. of Northants, England, 7 m. SSW. of Market Harborough. Near here was fought the famous battle which practically decided the issue of the Civil war on 14 June 1645. Prince Rupert commanded the right wing of the Royalist cavalry and, as usual, routed the forces opposed to him, who were led by Ireton. The king, in charge of the centre, was on the point of overpowering Fairfax, who was in command of the new model army of 14,000 foot and 7000 horse, when Cromwell, having put to flight the left wing of the Royalist army, hastened to the assistance of his chief. This movement decided the battle, especially as Rupert had lost his advantage by pursuing the fugitives too far. The Royalists were totally routed, the king's baggage taken, and his letters to the queen and to the Irish rebels, which showed that while negotiating with the Parliament he had no intention of coming to terms, were pub.

Nash, Frederic Ogden (1902-), Amer. poet, b. Ilye, New York state. He was educ. at St George's School, Rhode Is., and at Harvard. After working for some time as a bond salesman, he joined the staff of a firm of publishers, and in 1931 pub. 2 vols. of verse, *Hurd Lines* and *Free Wheeling*, which attracted attention by uniting a vein of inspired nonsense with a substratum of sound philosophy, at the same time using a complete freedom of scansion and far-fetched rhymes reminiscent of the most fanciful clerihews. In 1931 Nash married and settled in Baltimore; he had 2 daughters, Ltnell and Isabel, to whom a number of his poems are addressed. His books of verse include *The Face is Familiar*, 1942, *Good Intentions*, 1943, *Versus*, 1949, *Family Reunion*, 1951, *The Private Dining Room*, 1953, *Many Long Years Ago*, 1954, and *You Can't Get There From Here*, 1957.

Nash, John (1752-1835), architect, b.

London, the most prominent figure in 'Regency' architecture; trained by Sir Robert Taylor. Started as a speculative builder, then began practice as an architect about 1782 in Wales, where his first works were at Hereford and Carmarthen jails and at St David's Cathedral. He moved to London about 1796 and created a large country house practice with Humphrey Repton, the landscape gardener. Examples of their work are Southgate Grove and Sundridge Park. Nash then became the intimate friend and architect of the Prince Regent, afterwards George IV. His later work includes the

Jack Scheerboom

CUMBERLAND TERRACE, ONE OF THE NASH TERRACES AROUND REGENT'S PARK, LONDON

lay-out of Regent's Park, Park Village, Regent Street, and Carlton House Terrace. He remodelled Carlton House and Buckingham Palace, and the Pavilion at Brighton; also designed Highgate Archway, the Haymarket Theatre, the United Services Club, and All Souls Church, Langham Place. See biography by J. Summerson, 1953.

Nash, John Northcote (1893-), artist, second son of W. H. Nash, b. London; he was educ. at Wellington College, and joined the Artists' Rifles in 1916. He served in France, 1916-18, and was commissioned to paint war pictures for the Imperial War Museum. It is as an illustrator and wood-engraver that he is chiefly known. See his *Poisonous Plants*, engraved in wood (1927), and his illustrated eds. of Swift's *Directions to Servants*, 1925; Ovid's *Elegies*, 1925; Spenser's *Shepherdess*

Calendar, 1930; and others. See also J. Summerson, *John Nash* (2nd ed.), 1950.

Nash, Paul (1889-1946), painter, known especially for landscapes and water-colours, b. London. He was educ. at St Paul's School and the Slade School. In 1917 he was one of the official artists on the W. front. His work was exhibited at the Leicester Galleries in 1918 and in 1924. A painter of the Post-Impressionist school, he passed through various phases, and from about 1930 showed the influence of Surrealism in imaginative landscape. Though taught at the Slade School he had little in common with the orthodoxy of that institution. It was in 1911-12 that his water-colours began to attract attention at the New Eng. Art Club. His war pictures, poignant expressions in art of the desolation of the W. front, won instant popularity. One of the most striking is his 'Inverness Copse.' He was official war artist to the Air Ministry, 1940; to the Ministry of Information, 1941. He was engraver and designer as well as painter. Pub.: *Places, Prose Poems, and Wood Engravings*, 1922. See A. Burton, *Paul Nash*, 1955. His autobiography *Outline* was pub. in 1949. See Margot Eates, *Paul Nash Memorial Volume*.

Nash, Richard, or 'Beau Nash' (1674-1762), dandy, b. Swansea and educ. at Carmarthen Grammar School and Jesus College, Oxford, where he remained only a short time. Later he was given an ensign's commission, but soon left the army and then entered the Inner Temple, but never took up the law as a profession. A zest for pleasure and gaming drew him, in 1705, to Bath and thenceforth he made his living by gambling, and was noted for his extravagance. At Bath he estab. the first assembly-room, became the recognised autocrat of the tn, and was admired for his manners and taste, his sobriquet of 'Beau Nash' being an allusion to his foppery, his name having become proverbial in that connection. See life by Goldsmith, 1762, and L. Melville, *Bath under Beau Nash*, 1908.

Nash, or Nashe, Thomas (1567-1601), satirist, critic, and playwright, b. Lowestoft. He graduated at Cambridge in 1586. His first pub. was an acrid review of recent literature prefixed to Greene's *Menaphon*, which he discussed at greater length in *The Anatomie of Absurditie*, 1589. After this he was engaged in the Marprelate controversy for a time, and in 1592 pub. *Pierre Pennelesse, his Supplication to the Diuell* as a reply to the savage denunciations of Richard Harvey. These were followed by *Strange News*, 1592; *Christes Teares over Jerusalem*, 1593, like Greene's pamphlets a picture of loose life in London, with the same kind of dubious contrition and denunciation of immorality; *The Terrors of the Night*, 1594, the theme of which is ghosts and superstitions, notable for the praise of Daniel's 'Delia'; *The Unfortunate Traveler, or the Life of Jack Wilson*, 1594, the best novel of adventure in England before Defoe's. Besides these he pub. *Have with you to Saffron Walden*, 1596, an onslaught on Gabriel Harvey; *The Isle*

of Dogs, 1597, a comedy in which he attacked the current abuses in the state, and for which he suffered imprisonment in the Fleet; *Lenten Stuffe*, 1599, an amusing description of Yarmouth; *Summer's Last Will and Testament*, a comedy, 1600. His works were ed. in 5 vols. by R. B. McKerrow, 1904-10.

Nash, Walter (1882-), New Zealand statesman; b. Kidderminster. He went to New Zealand in 1909. He was elected to the National Executive of the New Zealand Labour Party in 1919. After unsuccessfully contesting the Hutt seat in 1925 and 1928, he became M.P. in 1929

The High Commissioner for New Zealand
WALTER NASH

and has represented Hutt since that date. Minister of finance in the first Labour gov. of 1935 and deputy Prime Minister after 1940, he retained these offices until the party's defeat at the general election of 1949. He represented New Zealand in Washington during the Second World War and strongly supported Brit. policy. On the death of Peter Fraser in 1950 he became leader of the opposition. A key man in the campaign which brought the party to power, he conducted some delicate negotiations with the City of London, which showed no great enthusiasm for the nationalisation and social security aspects of the Labour gov.'s programme. N.'s interest in international affairs is shown by the long list of overseas conferences he attended before and after attaining office. At the general election in Nov. 1957 the Labour party was returned to power and N. became Prime Minister. His writings include *New Zealand: A Working Democracy*, 1944.

Nashua, co. seat of Hillsboro co., New

Hampshire, U.S.A., on the Merrimack R., 14½ m. from Manchester. There are manufs. of sheetings, paper products, tools, machinery, shoes, textiles, and hardware and wood products; it is a trade centre, with some farming. It was settled in 1655. Pop. 34,660.

Nashville, cap. of Tennessee, and co. seat of Davidson co., U.S.A., on the Cumberland R., 195 m. N.E. of Memphis. It is a great railway and commercial centre, with extensive trade in cotton and tobacco, and manufs. of cotton, silk rayon, hardwood flooring, fertiliser, flour, oil, paper, woollen goods, leather, etc. Printing and publishing are important industries, and it has a large lumber market. It is also the seat of many educational institutions, including Vanderbilt Univ., N. Univ., Fisk Univ., Meharry Medical College, the George Peabody College for Teachers, the Scarritt College for Christian Workers, Trevecca Nazarene College, Tennessee Agric. and Industrial State Teachers' College, the Andrew Jackson Univ., the David Lipscomb College, the Ward-Belmont School, and the School of Social Work. Here in 1864 the Federals defeated the Confederates (see **NASHVILLE, BATTLE OF**). N. was founded in 1780, incorporated as a tn in 1784, chartered as a city in 1806, and made the cap. of the state in 1843. Pop. 174,307.

Nashville, Battle of, in the Amer. Civil War, a victory for the Federal forces under Gen. Thomas against the Confederates under Gen. Hood. In Nov. 1864 Thomas was garrisoned in the tn of N., Tennessee, which had been surrendered to the Federals in Feb. 1862, and with his army of 50,000 men he faced the advance of Hood's superior force. A preliminary engagement took place at Franklin, where Gen. Schofield succeeded in retarding Hood's advance. On 15 Dec. 1864 Thomas advanced and succeeded in outflanking Hood on the left. This movement he followed up by a general attack which turned Hood's defeat into a rout. Hood's army was depleted of half its numbers and driven back across the R. Tennessee. The pursuit continued for 13 days as far as Lexington, Alabama, although impeded by floods. The B. of N. was one of the most decisive in the course of the civil war. See W. B. Wood and J. E. Edmonds, *Civil War in the United States*, 1937.

Näsijärvi, long narrow lake of SE. Finland, N. of Tampere (Tammerfors). It is connected via Kokemäki R. to the seaport of Porv; its area is 101 sq. m., and in parts it reaches a depth of over 300 ft.

Nasik, tn of Bombay state, India, situated 2000 ft up in hills 120 m. N.E. of Bombay. It is a favourite hot-weather resort. Here are situated the gov. of India currency press and security press. N. is a holy place for Hindus, being close to the source of the sacred R. Godavari, and is much frequented by pilgrims.

Nasir-ed-Deen (Nasir Uddin), Mohammed Ibn Hassan (c. 1200-c. 1276), Persian astronomer, b. Toos in Khorassan and appointed superintendent of an observatory at Azerbaijan. He wrote the

Ilchanic Tables, somewhat resembling those of Ptolemy.

Nasir ud-Din (1829-96), Shah of Persia (1848-96). Through the influence of his mother, a princess of the Qajar family, he became governor of Azerbaijan and heir apparent in place of his elder brothers. His succession to the throne was strongly opposed, particularly by the Babis (see **BAHA'Í**), but he wreaked savage vengeance on them. He signed a treaty of friendship with Russia and so remained neutral during the Crimean War. In 1856 he seized Herat, but evacuated it after a Brit. force landed in S. Persia, a treaty of peace being signed in Paris (Mar. 1857). He is famous as the first shah to visit Europe, which he did on 3 occasions with a sumptuous retinue. Various concessions were granted by N. to foreign nationals, including a tobacco monopoly to a Brit. subject in 1891, which aroused great opposition and was finally abrogated (see *PERSIA, History*). N. was assassinated on 1 May 1896. He was succeeded by his son, Muzaffar ud-Din.

Nasira, see **NAZARETH**.

Nasmyth, David (1799-1839), originator of tn and city missions, b. Glasgow. In 1813 he became secretary to the Glasgow Youths' Bible Association and devoted himself to religious work, and in 1821-1828 was assistant-secretary to no fewer than 23 charitable societies. He founded the Glasgow City Mission in 1826, the Local Missionary Society for Ireland, the London City Mission, and the Brit. and Foreign Mission, besides about 32 in the U.S.A. and Canada.

Nasmyth, Alexander (1758-1840), portrait and landscape painter, b. Edinburgh. He was a pupil of Allan Ramsay. In 1778 he estab. himself in Edinburgh as a portrait painter, and had Robert Burns among his sitters. Ultimately he confined himself to landscape painting, although much of his time was occupied in teaching, and in 1822 he pub. 16 views of places described in the Waverley novels. He was a member of the original Society of Scottish Artists, and an associate of the Royal Institution. See J. Nasmyth, *Autobiography*, 1883.

Nasmyth, James (1808-90), engineer, the son of Alexander N., and brother of Peter. In 1834 he started business for himself at Manchester, subsequently establishing the Bridgewater foundry at Patricroft, where he invented the steam hammer. It was afterwards adopted by the Admiralty, N. having taken out a patent in 1842. He also invented a nut-shaping machine, a flexible shaft for driving small drills, and a hydraulic punching-machine; he was the first to observe, in 1860, a mottled appearance of the sun's surface called 'willow leaves' or 'rice grains.' He pub. *Remarks on Tools and Machinery*, 1858, and *The Moon considered as a Planet, a World, and a Satellite*, in conjunction with James Carpenter, 1874. See his autobiography (ed. S. Smiles), 1883.

Nasmyth, Peter, commonly known as **Patrick (1787-1831)**, landscape painter, b. Edinburgh. His landscapes won for

him the name of 'the Eng. Hobbema.' The reputation of his works has greatly increased since his death; indeed one was sold at Christie's for 1300 guineas in 1892. Some of his paintings are 'Haslemere,' 'Turner's Hill, East Grinstead,' 'Cottage in Hyde Park,' 'A Country Road,' 'A Cascade,' 'Sir Philip Sydney's Oak, Penrhurst,' and 'View of St Albans.'

Naso, see OVID.

Nassau: 1. Former Ger. duchy, which was incorporated in 1866 in the Prussian prov. of Hesse-N. (see HESSEN). It lay E. of the Rhine and N. of the Main (qq.v.). The dist. is heavily wooded, and is known for its wine (see RHEINGAU), and for its numerous spas, notably Wiesbaden and Ems (sq.v.). The area of the duchy was 1830 sq. m. See ORANGE, HOUSE OF.

2. Cap. of the Bahamas (q.v.), formerly called New Providence, situated in the E. of the is. of New Providence. It has an international airport and is the main harbour of the Bahamas. Pop. (estimated, 1955) 25,000.

3. Uninhabited is. of N. Cook Group, belonging to people of Pukapuka, who visit it to gather nuts for copra; 40 tons were produced in 1954.

Nasser, or **Nasir**, **Gamal Abd al-** (1918-), Egyptian soldier and politician, educ. at El Masria Secondary School, Cairo, and the Military Academy, Cairo. He served in the war of 1948 against Israel, and in 1952 was one of the leaders of the *coup d'état* of July which resulted in the abdication of King Farouk. From 1952-4 N. was deputy Prime Minister, and minister of the interior under Neguib (q.v.) in 1954. N. ousted Neguib from office (Dec. 1954) and ruled Egypt as head of a military junta. N. subsequently became Prime Minister, and later president of Egypt. On 26 July 1956 N. nationalised the Suez Canal (q.v.) and announced that revenues from it would be used for financing the Aswan High Dam project. Under his aggressive and opportunist leadership Egypt became the leader of Arab nationalism, though by 1958 the surviving Middle E. Arab monarchies had largely broken away from N.'s influence. By this time, however, the union of Egypt and Syria as the United Arab Rep. (q.v.) had brought N. considerable prestige in his own country. He became first president of the United Arab Rep. and has recently attempted to make himself the spokesman of all the (non-European) African states, being a violent critic of colonialism in Africa. See also EGYPT, *Modern History*.

Nasturtium, popular name for *Tropaeolum majus* and *minus* (q.v.).

Natal, original prov. of the Union of S. Africa, lies in the SE. portion of the continent, and is bounded on the E. by the Indian Ocean. The prov. has an estimated area of 35,284 sq. m. Zululand (10,425 sq. m.) was annexed to Natal in 1897, and the N. dists. of Vryheid, Utrecht, and part of Wakkerstroom, which formerly formed part of the Transvaal, were added to Natal ter. in 1903. The seaboard of Natal is 360 m. in length, and has only one bay of

importance, that of Durban. The country rises inland in a succession of terraces from the low and sandy coast, culminating in the heights of the Drakensberg, whose highest peak is Mont aux Sources (over 11,000 ft.). Majuba Mt (7000 ft) lies SW. of the pass of Laing's Nek, which leads into Transvaal ter. The country is watered by the Tugela, Buffalo, Klip, Mool, and other rivers, which are useful for irrigation purposes, although useless for navigation. There are no fewer than 35 distinct rivers running into the Indian Ocean. The climate is subtropical on the coast but somewhat colder inland. The cooler or winter half of the year is considered as beginning in April and ending in Sept., the average number of rainy days being 13. Malaria in a mild form is present on the coast lands of old Natal, becoming more severe in Zululand and as one proceeds northwards along the coast. The rainfall at Durban is about 39½ in. and at Pietermaritzburg about 30 in., the greater part of which falls during the summer months, May, June, and July being comparatively dry. The prevailing wind is SE. in the summer months, as at the Cape of Good Hope. Occasionally the sirocco, or hot wind, from the NW. is felt. Heat which might otherwise be oppressive is generally tempered by the sudden thunderstorms so frequent in Natal during the hot months. The leading crops for export are sugar, maize, and wattle bark; other crops include lucerne, sweet potatoes, peas, pumpkins, and vegetables. Cotton and tobacco are also grown. The prov. is rich in mineral wealth, and asbestos, copper ore, fireclay, gold, graphite, gypsum, iron ore, lead and silver ore, nitre, oil shale, limestone, and marble, manganese ore, mica, nickel ore, and tin ore are found. Coal is mined in the Klip R., Vryheid, and Utrecht dists.

The wild animals still found include the leopard, panther, jackal, hyaena, wild cat, hippopotamus, crocodile, and sev. species of antelope, but the larger animals are gradually disappearing. There are many varieties of snakes, including the python. The birds, many of them of brilliant plumage, but mostly songless, include the vulture, eagle, secretary bird, parrot, and flamingo. The Giants' Castle Game Reserve (50,000 ac.) is situated in the Estcourt dist. in the Drakensberg Mts. It contains eland, blebok, red hartbeest, and numerous species of small game, and birds. The Natal National Park, although not essentially a game reserve, exists for the preservation of the natural flora and fauna of the Berg. It is 10,000 ac. in extent, is 65 m. from Ladysmith, and embraces some of the finest scenery in the Drakensberg Mts. The fisheries of Natal are notable. The prin. classes of edible fish found are red and silver bream, bass, rock cod, barracudas, and steenbras. Whaling operations begin in May and end in Oct., the species of cetaceae captured being sperm, humpback, finner, etc. Porpoise and dolphin abound all the year round on the coast. Rod and line salt-water angling on the coast is

popular and well organised. All fishing in Natal is administered under the Natal Fisheries Ordinance of 1910 by the Natal Fisheries Advisory Board. The cap. is Pietermaritzburg (q.v.). Durban (q.v.) is the prin. harbour not only for Natal but for the S.E. coast. Other important tns are Dundee, Ladysmith, and Newcastle (q.v.). Pop. (1951): Whites, 274,240; non-Whites, 2,141,078.

Administration. By the South Africa Act, 1909, which constituted the Union of

maritzburg. N. has 346 primary schools for Europeans, and 45 secondary and intermediate, all supported entirely or partly by gov. funds. For non-European children, there are 954 native schools, 137 Asiatic, and 34 other coloured schools, state and state-aided. There are, besides, technical colleges, a school for the training of teachers, and a school of physical culture.

Religion. The Christian pop. consists of members of the Church of England

South African Railways and Harbours

PIETERMARITZBURG: THE MAIN SHOPPING CENTRE

S. Africa, inaugurated in 1910 by the Duke of Connaught, Natal sends 8 members to the Union Senate and 17 members to the House of Assembly. It has an elected prov. council with a minimum of 25 members. These 25 elect 4 members to act with the administrator as the executive. The administrator is chosen by the governor-general of the Union in Council. He holds office for 5 years. The gov. of Zululand is in the hands of a prov. council and an administrator, appointed by the governor-general. Its executive consists of 4 members. There is a native High Court in Natal, with 5 judges to deal with peculiarly native cases.

Education. With the exception of higher and vocational education, which is under the control of the Union gov., education comes under the prov. administration. A univ. college is at Pieter-

maritzburg. N. has 346 primary schools for Europeans, and 45 secondary and intermediate, all supported entirely or partly by gov. funds. For non-European children, there are 954 native schools, 137 Asiatic, and 34 other coloured schools, state and state-aided. There are, besides, technical colleges, a school for the training of teachers, and a school of physical culture.

History. Vasco da Gama is reputed to have passed what is now Durban on Christmas Day, 1497, naming the country Terra Natalis, after the natal day of Christ; evidence, however, points to the fact that it was Pondoland which da Gama discovered. With the exception of the purchase of the Bay of Natal by the Dutch in 1685, arising out of the adventures of Van der Stel's expedition, the hist. of European settlement in Natal commences at the close of the first quarter of the last cent.; and prior to 1823 only a few ships had touched on the coast for wood and water. In 1823 Lt Farewell landed in the bay, and later one Fynn was sent overland to obtain a grant of ter. from Chaka, the formidable

paramount chief of the Zulus. Permission to settle was obtained from Chaka, but Chaka was assassinated in 1828 by Dingaan, his half-brother, whose followers were hostile to the white settlers and their native allies. Matters were not settled until 1831, when Fynn was recognised as the 'great chief of the Natal Kaffirs.' In 1835 Dingaan granted a concession of land to Capt. Gardiner, who formed a Brit. colony at Durban. In 1837 the Boers, trekking N. from Cape Colony, first entered Natal, and having crushed the Zulus at Blood R., Dec. 1838, attempted to establish a rep., and in 1840 the flag of the Dutch rep. of 'Natalia' was in fact actually hoisted on the shores of the bay and was followed by a proclamation taking possession of all land between the Tugela and Black Umfolozi R.s. The Brit. Gov. refused to acknowledge the independence of the new state, and in 1842 a small force was sent to drive the Boers out, but was repulsed. One of the settlers, Richard King, however, rode through the Boer lines a distance of 600 m. to Grahamstown and so secured relief. On 8 Aug. 1843 Natal was finally proclaimed a Brit. colony (annexed to Cape Colony) and the Boers moved westwards to the Transvaal. In 1856 Natal was declared an independent colony. In 1879 Cetewayo, King of the Zulus, was defeated and captured, and in 1897 Zululand was annexed to Natal. In 1881 the Transvaal Boers invaded the country and defeated the Brit. at Majuba Hill (q.v.). In the war of 1899-1902 Natal was the scene of some of the fiercest fighting: Eludlaagte, Glencoe, Ladysmith, and the second battle of Majuba Hill. After the war Utrecht, Vryheid, and part of Wakkerstroom were added to Natal. In 1906 there was a formidable Zulu rising along the Tugela R., which was suppressed with great loss to the natives. In 1907 there was another outbreak which ended in the arrest of Dinizulu (d. 1913). On 31 May 1910 the colony of Natal was merged in the Union of S. Africa, becoming an original prov. of the Union. See H. Brooks, *Natal*, 1876; J. Ingram, *Natalia*, 1897; R. Russell, *The Garden Colony; the Story of Natal and its Neighbours*, 1910; A. T. Bryant, *Olden Times in Zululand and Natal*, 1929; C. Mackeurtan, *Cradle Days in Natal*, 1930; C. Fuller, *Louis Trichard's Trek across the Drakensberg*, 1837-8, 1932; M. Nathan, *The Voortrekkers*, 1937; A. F. Hattersley, *Annals of Natal*, 1936-40; volumes of Natal Regional Survey, such as *Archaeology and Natural Resources of Natal*, 1951; T. V. Bulpin, *To the Shores of Natal*, 1954.

Natal, tn and seaport of Brazil, cap. of the state of Rio Grande do Norte. It stands on the r. b. of the Potengi R., 80 m. from Paraíba and 260 m. SE. of Fortaleza. Exports sugar and cotton, as well as salt, carnauba wax, and hides. Its industries are cotton spinning and weaving and salt-refining. There are rail connections with Pernambuco, Macaé, and Paraíba. There is a large airport, used by transatlantic air services, 8 m. from the city. Pop. 100,000.

Natal, Port, name of the first settlement at Natal lagoon (1824), S. Africa, later named Durban (q.v.).

'**Natal Mercury**,' S. African daily newspaper, estab. 1852, and pub. in Durban, with a wide influence throughout Natal and Zululand and circulating in other provs. It is independent and strictly non-party, emphasising democratic principles in political affairs. Associated with it is the *South African Woman's Weekly*.

'**Natal Witness**,' independent S. African prov. newspaper, with 3 eds. daily, estab. in 1846, pub. in Pietermaritzburg, cap. of Natal prov. It is the oldest newspaper pub. in Natal and appeals to all members of the public.

Natchez, port of entry and co. seat of Adams co., Mississipp. U.S.A., 145 m. (direct) NNW. of New Orleans. Cotton is the chief industry, and there is shipping trade in cotton. There are also candy factories, canning factories, and a lumbering industry. The Jefferson Military College is at N. There are sev. fine churches. Its old name under the French was Fort Rosalie and it remained a Fr. military and trading post till the Seven Years War, when it came into Eng. possession under the name of Fort Panmure. It was a bone of contention between the Americans and Spaniards in the late 18th cent., when the former were seeking outlets for their W. products, the Spaniards refusing to surrender it on the plea that England's title, under which the Americans claimed it, was defective. It was in Sp. occupation from 1779 to 1798; in 1798 it became the cap. of the new ter. of Mississippi, but in 1820 the cap. was removed to Jackson. Pop. 22,700.

Natchez, tribe of N. Amer. Indians, whose original ter. extended along the Gulf of Mexico. They had a monarchical gov., with an aristocratic sun caste; on the death of a member of the caste kin and companions were killed to accompany him to the world of spirits. In 1700 they were about 4000, but were almost exterminated by the French; to-day their language and culture are extinct.

Nathan: 1. Trusted prophetic adviser of King David. He rebuked the latter, for his adultery with Bathsheba and murder of Uriah, by means of the parable of the 'one ewe lamb' (2 Sam. xii).

2. Name of probably the third son born to David by Bathsheba (2 Sam. v). The right of succession to David passed to Salathiel, the descendant of N., referred to in Zech. xii. N. thus appears as an ancestor of Our Lord (Luke iii., 31).

Nathan, George Jean (1882-1958), Amer. dramatic critic, b. Fort Wayne, Indiana. He was educ. at Cornell Univ., New York state, and the univ. of Bologna in Italy. He served at various times on the editorial staff of the *New York Herald* and as dramatic critic of various pubs., including *Harper's Weekly*, *Smart Set*, and the *American Mercury*, the latter of which he founded with H. L. Mencken. In his critical work he is often mordant and always independent. Among his pub. works are *Bottoms Up*, 1917, *The Popular Theatre*, 1918, *Comedians All*, 1919, *The*

New American Credo, 1927, *Art of the Night*, 1928, *Testament of a Critic*, 1931, *The Avon Flows*, 1937, *The Morning after the First Night*, 1938, *Encyclopaedia of the Theatre*, 1940, *The Entertainment of a Nation*, 1942, *Since Ibsen*, 1943, and an ann. theatre book (since 1942). It became known after his death that he was received into the Rom. Catholic Church in 1957.

Nathan, Robert (1894-), Amer. novelist, b. New York City. He was educ. at Harvard Univ. Most of his novels, like *Autumn*, 1921, *Youth Grows Old*, 1922, *The Puppet Master*, 1923, and *The Fiddler in Barly*, 1926, are distinguished by their note of gentle wistfulness and a mellow style. In *Jonah*, 1925, pub. in England as *The Son of Amittai*, an adaptation of the biblical story, he struck a new note of irony. This was reinforced in his *There is Another Heaven*, 1929, the story of a converted Jew's experience in a very Protestant heaven. His other works include *One More Spring*, 1933, *Road of Ages*, 1935, *Winter in April*, 1938, *Portrait of Jennie*, 1940, *They Went on Together*, 1941, *The Sea-gull Cry*, 1942, *But Gently Day*, 1943, and *Mr Whittle and the Morning Star*, 1947. *A Cedar Bor*, 1929, *Winter Tide*, 1940, and *Darkening Meadows*, 1945, are vols. of verse.

Natick, tn of Massachusetts, U.S.A., in Middx co., 16 m. WSW. of Boston. Manufs. include boots and shoes, mince-meat, and metal products. There are canned goods factories, boxes and corrugated paper are manuf., and fruit farming is important. Pop. 19,938.

National Anthems. Patriotic hymns, to be sung at public ceremonies and on similar occasions, are of comparatively recent date. The Brit. *God save the Queen* (q.v.) is the earliest example and has been adopted (and adapted) by other countries, including Switzerland (*Hust du, mein Vaterland*), Germany (*Heil dir im Siegerkranz*), and Denmark, while in the U.S.A. the air is sung to *My Country, 'tis of thee*, by Samuel Smith.

Other N. A. are:

Abyssinia, see ETHIOPIA.

Albania: *Rreth Fla mu rit te per bash-kau*, poet and composer unknown.

Argentina: *Oid, mortales, el grito sagrado Libertad*; words by Vicente López y Planes (1813); tune by José Blas Parera, revised by Juan P. Esnaola.

Armenia: words by Sarmen; tune by Khatchaturian (1945).

Australia: *Advance, Australia fair* (broadcast, but not actually adopted as a national anthem); words by P. Dodd McCormick (before 1916); tune by W. W. Francis.

Austria (Imperial): *Gott erhalte Franz den (or unsern) Kaiser*; words by L. Haschka; tune by J. Haydn (1797). (Republican): *Oesterreichische Bundes-hymne*, 'Sei gesegnet ohne Ende'; words also by L. Haschka; tune as above. (Republican, 1920-9): *Deutsch-Oesterreich, du herrliches Land, wir lieben dich*; words by K. Renner; tune by Kienzl (1920). (Nazi): *Lied der Jugend*, 'Ihr Jungen schliesst die Reihen gut'; words and tune

by H. Leopoldi (c. 1933). From 1946. *Land der Berge, Land am Strome*, tune by Mozart; words by P. Preradovic.

Bavaria: *Bayern, mein Heimalland*; words by F. Beck; tune by F. Lachner (1848); also *Gott mit dir, du Land der Bayern*; words by M. Ochsner; tune by F. M. Kunz.

Belgian Congo, see CONGO.

Belgium: *La Brabançonne*, 'Qu'il aurait dit de l'arbitraire' (now 'Après des siècles d'esclavage'); words by Jenneval (1830); tune by F. van Campenhout (L. A. II. Dechez, 1830). (Flemish): *De Vlaamsche Leeuw*; words by H. van Peene; tune by K. Miry.

Bolivia: *Bolivianos, el hado propicio*; words by Ignacio de Sanjinés; tune by B. Vincenti.

Brazil: *Ouviram do Ipiranga as margens placidas*; words by J. O. Duque Estrada; tune by F. Manoel da Silva. (Earlier): *Sêja um pallio luz*; words by M. Albuquerque; tune by L. Miguez.

Bulgaria: *Shoumi Maritza*; words by Marachev; tune by G. Sehek. (Since 1946): *Bulgaria mila*, words and tune by var. authors.

Burma: *Naing-gan-daw-Thachin*, a revision of the *Doh-Ba-Ma* song composed by M. B. Saya Tin in 1930 and finally amended by the Constituent Assembly in 1947.

Canada: *The Maple Leaf for ever*, 'In days of yore, from Britain's shore'; words and tune by A. Muir (1867). (Fr.) *O Canada: terre de nos aïeux*; words by A. B. Routhier (1880); tune by C. Lavallée (adapted from the priests' march in Mozart's *Magic Flute*).

Chile: *Dulce patria*, 'Ha cesado la lancha sangrienta'; words by E. Lillo (1847); tune by Carnicer (1828).

China: *Tsung-kueh hung li juh dechou tian*; author of words and composer of tune unknown (1912). (Democratio): *The Song of Kuomintang*; words by Sun Yat-sen; tune by Ch'eng Mao-yun (1928). (Communist): tune only, temp.

Colombia: *Oh! Gloria inmarcescible*, 'Cesó la horrible noche'; words by R. Núñez; tune by O. Sindici (c. 1905).

Congo (Belgian): *Vers l'aventur: Naar wijden zijd*, 'Le siècle marche'; 'De tijd spoedt heen'; words by G. Th. Anthems; tune by Gevaert (1908).

Costa Rica: *Noble patria, tu hermosa bandera*; words by J. M. Zeledón; tune by M. M. Gutiérrez (1851), in use from 1853.

Cuba: *Himno Bayamés*, 'Al combate corra bayameses'; words and tune by P. Figueredo (1868).

Czechoslovakia: Combination of *Kde domov můj*; words by J. K. Tyl; tune by Skroup (1834); and *Nad Tatrou sa blýska*; words by J. Matúška (1844); tune traditional (first officially used 1919).

Denmark: *Kong Kristian stod ved højen mast*; words by J. Ewald; tune by J. E. Hartmann (from opera *Fiskerne*, 1780); also *Der er et yndigt land*; words by A. Oehlenschläger; tune by H. E. Krøyer (19th cent.); and *Dengang jeg drog afsted*; words by F. Faber; tune by J. O. E. Horneman (19th cent.).

Dominican Rep.: *Quisqueyanos valientes, alcemos*; words by E. Prud'homme; tune by J. Reyes (1900).

Ecuador: *Salve! Oh patria, mil veces*, 'Indignados tus hijos del yugo'; words by J. L. Mera; tune by A. Neumann (1866).

Egypt: (march) *Ila ni an bë au da to samil na kam*; author of words unknown; tune possibly by Verdi.

Eire, see IRELAND, REPUBLIC OF.

England, see above.

Estonia: *Mu isamaa, mu õnn ja rõõn*; words by J. Jannsen (1865); tune by Pacius (1848).

Ethiopia: *Etiopia hoy, des yibalish*; words by a group of Ethiopian scholars (1930); tune by M. K. Nalbadiau (1925).

Finland: *Maamme*, 'Oi maamme suomi synnyiumaa'; words by J. L. Runeberg (originally in Swedish), 1843; tune by Pacius, as for Estonia. A second tune by Pacius was also adopted.

France: *La Marseillaise*, 'Allons, enfants de la patrie'; words and tune by Rouget de Lisle (1792).

Germany (Imperial): *Heil dir im Siegerkranz*; words by H. Harries (1790), adapted by B. G. Schumacher, 1793; tune as for Great Britain; also, after 1870, *Die Wacht am Rhein*, 'Es braust ein Ruf wie Donnerschall'; words by M. Schneckenburger (1840); tune by C. Wilhelm (1864). (Republican): *Deutschland, Deutschland über alles*; words by H. A. Hoffmann von Fallersleben (1841); tune by J. Haydn, as for Austria. New words, 'Einigkeit und Recht und Freiheit' adopted in 1950. (Nazi): *Horst Wessel Lied*, 'Die Fahne hoch, die Reihen dicht geschlossen'; words by Horst Wessel; the tune may have been adapted from a Bohemian comic song; in use 1933-45.

Greece: *Se monizo apo ten kapsi tu spatia ten tromere*; words by D. Solomos (1824); tune by N. Mántzaros; in use since 1863.

Guatemala: *Guatemala feliz*; words by J. J. Palma; tune by R. Alvarez Oralle; in use from 1896.

Haiti: *La Dessalinène*, 'Pour le pays, pour les ancêtres'; words by J. Lhérisson; tune by N. Geffard (1903).

Hawaii: *Hawaii pono*; author of words and tune unknown, but possibly by Kalakaua, King of Hawaii (c. 1880).

Holkar's Dominions, see INDORE.

Holland: *Wilhelmus van Nassouwe*; words by Philip van Marnix (c. 1570); composer of tune unknown (first pub. 1626); also *Wien Neerlands bloed in d' aderen vloeit*; words by H. Tollens; tune by J. Wilms (1815).

Honduras: *Compatriotas, de Honduras los fueros*; words by A. C. Coello; tune by C. Hartling.

Hungary: *Himnusz*, 'Ysten áldd meg a Magyar'; words by F. Kölcsey (1823); tune by F. Erkel (1845); usually followed by *Sózsal*, 'Házának rendületlenül légy híve oh magyar'; words by M. Vörösmarty (1836); tune by B. Egressy (1844).

Iceland: *O Guð vors land*; words by M. Jochumsson (1874); tune by S. Sveinbjörnsson.

India: *Jana Gana Mana* by Rabindranath Tagore. In addition, *Bande*

Matram by Bankin Chandra Chatterjee is honoured as a national song.

Indore: *Prubho prarth ana parisa amuchi*; author of words unknown; tune by Jad.

Iran, see PERSIA.

Iraq: *Royal Salute* (march); no words; tune by A. R. Murray.

Ireland, Irep. of: *A Soldier's Song*; words by P. Kearney; music by P. Kearney and P. Heaney (c. 1910).

Israel: *Hatikwa* (Hope); words by Naftali Herz Imber, in 1878. The song was first called *Hatikvenu*. Only 8 years later Imber called it *Hatikwa* in his collection *Barkai* (Jerusalem, 1886). There are 2 views as to the melody and composer. According to the one, the tune was taken from *Ma Vlaust* (My Country), a cycle of 6 symphonic poems by the Czech composer Smetana. According to the other, it had been composed by a Sephardic Jew, Henry Busato (or Itussotto), on the basis of the liturgical music of *Hallel* (Psalm 117).

Italy: *La murria reale*; no words, tune by G. Gabetti (1831). (Sung in S. Italy): *Inno di Garibaldi*, 'All' armi, all' armi, si scopron le tombe'; words by L. Mercantini; tune by A. Oliveri (1838). (Fascist): *La Giovinezza*, 'Sù, compagni in forti schiere'; words by M. Maumi; tune by G. Castaldo after G. Blane (1921). (Rep.): *Inno di Mameli*, 'Fratelli d'Italia'; words by G. Mameli; tune by M. Novara (1847).

Japan: *Kimigayo*; the words are from the 9th cent.; tune by Hayashi Hirokani, revised by F. Eckert (1880).

Jewish, see ISRAEL.

Jugoslavia, see YUGOSLAVIA.

Latvia: *Dievs, svētī Latviju*; words and tune by K. Buiumans.

Lebanon: *Kulla nā lil watan*; words by R. Nachleh; tune by M. El-Murr (1926).

Liberia: *Salve, Liberia, Salve*; words by President Warner; tune by O. Luca (1860).

Liechtenstein: *Oberst am deutschen Rhein lehnet sich Liechtenstein*; words by H. H. Jauch (1850); tune as for Great Britain.

Lithuania: *Lietuva leivynė mūsų*; words and tune by V. Kudirkia (1918).

Luxembourg: *Ons Hémec'h*, 'Wô d' Uolzécht d'urêch d'Wisen zët'; words by M. Lentz (1859); tune by J. A. Zinnen.

Malta: *T'ghira lil Málta*, 'Int sabha, Málta tana'; words by G. A. Vassalla; the tune is a Bersaglieri song adapted (20th cent.). (After 1912): 'Lil din l'art Helwa'; words by C. Psaila; tune by R. Samut.

Mexico: *Mexicanos, al grito guerra*; words by F. G. Bocanegra; tune by J. Nunó (1854).

Montenegro: words by J. Soundechitch; composer of tune unknown; also *Onam, onamo! za brda ona*; words by Prince Nikola (1867); tune by Davorin Jenko.

New Zealand: *God save the Queen*; (National Song): *God defend New Zealand*; words by T. Bracken; tune by J. J. Woods.

Newfoundland: *When sun rays crown thy pine-clad hills*; words by Sir Charles Cavendish Boyle; tune by Sir Hubert

Parry. (This does not displace *God save the Queen*.)

Nicaragua: *Hermosa soberana*; words by Blas Villatas; tune by A. Cousin. (After 1917): words by S. I. Mayorga; composer of tune unknown.

Norway: *Ja, vi elsker dette landet*; words by Bjørnson; tune by Nordraak (1859).

Orange Free State: *Hef, Burgers, 't lied der vrijheid aan*; words and tune by Hamelberg.

Pakistan: No decision regarding a national anthem for the dominion has been made.

Panama: *Alcanzamos por fin la victoria*; words by Gerónimo de la Osa; tune by S. Jorge (1903).

Paraguay: *Paraguayos, República ó muerte*; words by F. Acuña de Figueroa; tune by F. Dupey.

Persia: *Shāhanshān—a mā Zandah bādā*; words by S. Afsar; tune by N. Moghaddam (c. 1934).

Peru: *Somos libres, seámos lo siempre*; words by José de la Torre Ugarte; tune by J. B. Alcedo (1821).

Philippine Is.: *Tierra adorada (Marcha nacional filipina)*; words by J. Palma; tune by J. Felipe (c. 1898).

Poland: *Jeszcze Polska nie zginela*; words by J. Wybicki; tune wrongly attributed to M. K. Ogiński (1795), newly harmonised by K. Sikorski (1948).

Portugal (Royal): *O patria, O rei, O povo*; words and tune by Pedro I of Brazil, formerly Pedro IV of Portugal (1822). (Republican): *Heróis do mar*; words by Lopez de Mendonça (1890); tune by A. Keil; used since 1910.

Prussia: *Borussia*; words by G. R. Dunccker; tune by Spontini (1818); also *Ich bin ein Preusse*; words by B. Thiersch; tune by A. H. Neithardt (1826).

Rumania (Royal): *Trăiască Regele în pace și onor*; words by V. Alexandri; tune by E. A. Hübner (1861). (Republican): *Te slăvim România*, 1951.

Russia (Imperial): *Bozhe Tsarya khrani*; words by W. A. Zhukovsky (1833); tune by Lvov (1833). (Soviet to 1944): *L'Internationale*, 'Debout, les damnés de la terre'; words by E. Pottier (trans. into Russian last in 1932); tune by P. Degeyter. (Soviet after 1944): *Gymn Sovetskogo Soюза*; words by S. Mikhalkov and I. Registan; tune by A. V. Alexandrov (c. 1942).

Salvador: *Saludemos la patria orgullosa*; words by J. J. Cañas; tune by J. Aberte.

Scotland: *Scots wha ha'e wi' Wallace bled*; words by R. Burns (1793); tune traditional.

Serbia: *Srpska Himna*, 'Bože pravde, ti što spase'; words by J. Djordjević; tune by D. Jenko (1872).

Siam: *Taurasoen Barami*; source of words and tune unknown.

S. Africa (Union): *Die Stem van Suid-Afrika*; words by J. C. Langehove; tune by M. L. Villiers (1938).

Spain (Royal): *Marcha real*; no words; tune by an unknown. Ger. composer (1770); also *Hymno de Riego* (c. 1860); author of words unknown; tune by

Huerta. (Republican): *Marcha grandera*, adapted, and Ger. Nazi and It. Fascist songs also used.

Sweden: *Du gamla, du fria, du fjällhöga Nord*; words by R. Dybeck; tune traditional (1844).

Switzerland: *Rufet du, mein Vaterland*; words by J. H. Wyss (1811), with Fr. and It. trans.; tune as for Great Britain; also *Schweizerpsalm*, 'Trittst im Morgenrot daher'; words by L. Widmer; tune by Josef (Father Alberik) Zwyssig (1841).

Transvaal: *Kentjij dut volk vol heldenmoed*; words and tune by Catherine Félicie van Rees.

Tunisia: *Marche beylicale*; no words; tune by an It. composer (1881-3), adapted by Sidi-Sadock.

Turkey: *İstiklâl marşı* (March of Independence); words by M. A. Ersoy; tune by Ç. Z. Ungör.

Uruguay: *Orientales, la patria ó la tumba!*; words and tune by J. Coppetti. U.S.A.: *The Star-spangled Banner*, 'Oh, say, can you see, by the dawn's early light!'; words by F. Scott Key (1814); tune by J. Stafford Smith; officially adopted 1831; earlier *Hail Columbia*; words by J. Hopkinson; tune by Fyfe (c. 1800).

U.S.S.R., see RUSSIA.

Venezuela: *Gloria al bravo pueblo*; words by V. Salas; tune by J. Landaeza (after 1810).

Wales: *Mae hen wlad fy nhadau (Land of my Fathers)*; words by E. James, English by J. Owen; tune by J. James.

Westphalia: *Ihr mögt den Rhein, den stolzen, preisen*; words by E. Ritterhans; tune by J. Peters (1868).

Württemberg: *Preisend mit viel schönen Reden*; words by J. Kerner (1826); tune traditional.

Yugoslavia: A compound of the Serbian hymn *Bože pravde* (see SERBIA); the Croatian hymn *Lijepa naša domovino*; words by A. Mihanović; tune by Lichtenegger; and the Slovene hymn *Naprej zastava Slav*; words by S. Jenko; tune by D. Jenko.

Zanzibar: National march for military band by Sir Donald Francis Tovey.

National Art-Collections Fund (incorporated by royal charter), The Wallace Collection, Manchester Square, London, W.1. Founded in 1903 to organise public opinion and secure works of art of all times to enrich the museums and galleries of the Brit. Commonwealth. The society has raised over £750,000 for the purchase of works of art. It has acquired by gift, bequest, or purchase many thousands of such works for presentation to public museums and galleries, including pictures, drawings, lithographs, etchings, and engravings of almost every period and school, MSS. and illustrated books, porcelain and pottery, both of the E. and of the W., armour, coins and medals, enamels, bronzes, silver and other metal work, jewellery, ivories, furniture, lace, embroidery and textiles, statues, and other objects of plastic art. Its achievements were reflected in a remarkable exhibition at the National Gallery in 1946 of works it had saved for the nation. Membership is open to all. Each member makes a

minimum ann. contribution of 1 guinea and receives various privileges from museums and galleries, opportunities of visiting private collections not otherwise open to the public, and an illustrated ann. report. Management: committees and secretary.

National Assembly, first of the Fr. revolutionary assemblies, lasting from 1789 to 1791; since its chief work was the formation of a constitution, it is often called the Constituent Assembly.

National Assistance Act (1948). Fundamental purpose of this Act was to achieve the final replacement of the poor law by entirely new services founded on recent conceptions of social welfare. Under the Act a National Assistance Board administers a state scheme of financial aid for all persons in need who fall outside the national insurance scheme (*see* NATIONAL INSURANCE ACT (1946)), or whose requirements are not wholly met from that or any other source. The cost of this service falls on the Exchequer. Provision is made for a local gov. welfare service, of which an important feature is the provision of residential accommodation for old and infirm people and others who require care and attention. Residential hostels, when built, will be open to all, irrespective of means, and they will provide accommodation in return for payment. Sick persons who need hospital treatment are the responsibility of the national health service. (*See also* NATIONAL HEALTH SERVICE.) The local authority welfare service also extends to the blind and other handicapped persons.

The only qualification for national assistance is the need according to general standards prescribed in regulations requiring parl. approval. Any person aged 16 years or over who is in need may apply for assistance, and where need is estab. the assistance will provide for any dependants as well as the applicant. Discretionary power is given to deal with special cases. There is no household means test. Resources as well as requirements of applicants and their wives are considered jointly. No account is taken of the income of earning sons and daughters, but they will be deemed to be making a reasonable contribution towards rent and other household expenses. Directions about treatment of capital in the Act are that the first £375 of War Savings shall be ignored. Capital not so disregarded will also be ignored if it is less than £50. If it amounts to £50 or over, but not more than £400, it will reduce the weekly assistance by 6d. for the first £75, and 6d. for each further complete £25. Assistance is not generally payable if capital exceeds £400. Applications will be dealt with by local officers of the board. There is a right of appeal. A condition of assistance may be registration for employment, and persons who neglect or refuse to maintain themselves or their dependants may be refused assistance unless they attend a course of training or instruction or enter a re-estab. centre. Re-estab. centres may also be used for vagrants. Local authorities are also obliged to provide and

maintain temporary accommodation for vagrants in reception centres. It is a responsibility of the National Assistance Board to make provision whereby persons without a settled way of living may be influenced to lead a more settled life. . . .

The second group of services are under the local authority, and include residential accommodation for the aged, the infirm, and others, with special welfare services for handicapped persons. These services are entrusted to co. and co. bor. councils in England and Wales and co. councils and large burghs in Scotland. The residential accommodation, board, lodging, and attendance is intended for all who cannot wholly look after themselves. It includes amenities such as hot and cold water and laundry services. The local authority fixes a standard charge which those who can afford it will pay in full. By the National Assistance (Charges for Accommodation) Regulations, 1955-8, those who cannot afford it will pay according to their resources and commitments, subject always to a minimum of 40s. a week, and everyone is assumed to need 10s. a week pocket money.

Persons with less than 50s. a week will be referred to the National Assistance Board to have their income made up to this sum. Local authorities are also empowered to extend to the deaf, the dumb, and the crippled the same welfare services which are provided for the blind. The authorities may arrange for voluntary organisations to act as their agents in providing residential accommodation and specialised welfare services. The Act requires the registration of private institutions for the care of the old and disabled, and local authorities are empowered to inspect and withhold registration in unsatisfactory cases. Liability for maintenance which formerly rested on a wide range of relatives is reduced by the Act to a simple liability of a man to maintain his wife and children and a woman to maintain her husband and children.

Between 1 April 1956 and 31 Mar. 1957 the number of cases currently receiving N. A. under the Act was 1,699,000 (to the nearest thousand), and the amount paid in grants for the year ending 31 Mar. 1957 was some £112,242,000. The National Assistance (Determination of Need) Amendment Regulations, 1957, came into operation on 27 Jan. 1958; these revised the ordinary scale of payments in respect of requirements other than rent. *See also* POOR LAW, HISTORY OF.

National Association of Boys' Clubs, *see* BOYS' CLUBS.

National Association of Mixed Clubs and Girls' Clubs, *see* MIXED CLUBS AND GIRLS' CLUBS.

National Bank of Australasia, estab. in 1858, acquired the undertakings of the Colonial Bank of Australasia in 1918 and of the Bank of Queensland in 1922. Head office, Melbourne.

National Bank of Egypt, The, founded by Sir Ernest Cassel, and incorporated by

khedivial decree, 1898, acquired the Egyptian business of Lloyds Bank in 1926. In 1939 an agreement was reached for a new charter for 40 years until 1979 and constituting the bank as the central bank for Egypt. Head office in Cairo.

National Bank of India, estab. in Calcutta, 1863, and registered in London on 23 Mar. 1866. The head office is in London.

National Bank of Mexico, estab. in Mexico, 1881, as Banco Nacional Mexicano; name changed in 1884. In 1934 new statutes were adopted in accordance with the new banking law. Head office, Mexico. The bank directly controls Pan-Amer. Trust Co. (incorporated in the State of New York).

National Bank of Scotland Limited, The, was estab. in Edinburgh in 1825 as the result of the amalgamation of 3 distinct banking ventures projected in the previous year. When business commenced the paid-up capital was £500,000 and early in the bank's list, a comprehensive branch system was decided upon. In 1831 the bank obtained a charter of incorporation. Two years later it took over the Commercial Banking Co. of Aberdeen, and in 1836 the Perth Union Bank was absorbed. A branch was opened in London in 1864, a step later followed by the other Scottish banking companies. An important event occurred in 1918 when Lloyds Bank Ltd acquired a controlling interest by the purchase from the holders of almost the whole of the capital stock of the bank.

National Bolshevism, a post-1917 Russian political trend whose adherents, without being Communist, hold that the Bolsheviks are the only party capable of providing effective gov. in Russia and of defending Russian national interests. In the 1920's N. B. found its expression in the Change of Landmarks movement, both in Russia and among Russian *émigrés*. Later it became a major element in Stalinism (q.v.) and was particularly strong during the Second World War. Among leading representatives of N. B. were Gen. Brusilov and the writer, A. N. Tolstoy.

National Book League, non-profit-making cultural society, founded in 1944 as the successor of the National Book Council begun in 1924. The N. B. L.'s object is to promote the wider use and enjoyment of books, and most of its members are drawn from the general public, with many educationists, writers, and members of the book trade belonging to it and supporting it strongly. Among its corporate members are a large number of schools and education authorities, most of Great Britain's public libraries and many commercial organisations, and there are overseas members in more than 70 countries. The N. B. L.'s activities cover every aspect of books, primarily from the reader's point of view, and also touch on the problems of authorship and book production.

Examples of the league's normal activities are its frequent London and

travelling exhibitions, among the most important of which are the travelling school library exhibition, which is used by education authorities to inform their teachers, and the exhibitions of Brit. book design and international book design; a jour., *Books*, pub. 8 times a year; a book information bureau which answers queries of every kind about books; work for the wider use of books in industry; and work with the armed forces of the Crown. N. B. L. pubs. include book lists, readers' guides, and other aids, both for the general reader and for the advanced student. The London H.Q. are at 7 Albemarle St. W.1, with exhibition galleries, members' rooms, a library of 'books about books and authors,' and a restaurant. The N. B. L. ann. lecture was inaugurated in 1943 when Dr Wm Temple delivered it; among recent lecturers have been Prof. G. M. Trevelyan, T. S. Eliot, Bertrand Russell, John Masfield, and Sir Norman Birckett.

National Central Library, London, was founded in 1916 as the Central Library for Students. In 1930 it was reconstituted as the N. C. L. and in 1931 was incorporated under royal charter. Its original purpose, that of providing books for organised classes for adult education, has since been extended so that it is now the recognised national centre for the loan, between libraries of all kinds both within Great Britain and abroad, of books for study which cannot be obtained in any other way. It also houses the Brit. National Book Centre for the allocation of duplicate and 'unwanted' books to suitable libraries, including war-damaged collections, at home and abroad. The library lends, from its own stock, books on many subjects, with certain notable exceptions, such as books which are available at the local library, works of fiction, and the set text-books required for examinations. In addition, it is in a position to obtain on loan from other libraries a very large percentage of those books which it is unable to supply from its own shelves. Serving the N. C. L. are all the public and many special and college libraries organised in regions. It has, in this way, access to about 21 million vols. as well as many thousand sets of periodicals. The library is maintained by a Treasury grant and by other voluntary grants and subscriptions. Books can be borrowed only through a local library. See also LIBRARIES (LIBRARY CO-OPERATION).

National Coal Board, see COAL MINES, NATIONALISATION OF.

National Convention, revolutionary assembly of France, consisting of 749 members chosen by universal manhood suffrage, which on 22 Sept. 1792 supplanted the legislative assembly, proclaimed the rep., and condemned Louis XVI to the guillotine. In spite of its internal dissensions it succeeded in suppressing the Royalists in La Vendée and in the S., notwithstanding the rest of Europe leagued against it, not only in the field, but in diplomacy. It laid the foundation of sev. modern Fr. institutions,

and dissolved itself in favour of a directory of five on 26 Oct. 1795.

National Debt, *see* PUBLIC DEBT.

National Dental Service. Provision is made under the National Health Service (q.v.) Act, 1946, for treatment by dentists who join the service. Any dentist may at his option take part in the service or not. Of some 10,000 dentists in general practice in England and Wales the number in the N. D. S. in 1956 was 9924. Dentists joining the service are in contract with the local executive councils for their respective areas. Local dental committees have been set up by the profession and are responsible for the appointment of 3 members for each executive council as well as for maintaining contact between the dental profession and the executive councils.

Lists of dentists taking part in the service are available in post offices and executive council offices. There is no need to register with a dentist. Patients are free to choose a dentist just as the dentist is free to accept them or not. When it began the N. D. S. provided, free of charge, all forms of treatment necessary for the restoration of dental fitness, and all repairs and replacements which were not due to carelessness. In 1951, however, charges in part towards the cost of dentures were introduced, and in 1952 a charge towards the cost of treatment was also introduced. Examination remained free. The charge for treatment is the cost of that treatment up to £1. The charges for dentures are as follows: 1 to 3 teeth on one denture, £2; 4 to 8 teeth on one denture, £2 5s.; over 8 teeth on one denture, £2 10s. The maximum charge on 2 dentures is £4 5s. Treatment for expectant mothers and children is still provided free under the local authority dental service. Treatment falls into 2 main divs.—that which may be carried out without prior authority, and that which requires the prior authority of the Dental Estimates Board, consisting of a dental chairman, 6 dental members, and 2 lay members appointed by the minister of health. Treatment not needing prior authority includes all normal conservative treatment—i.e. prophylaxis, fillings and root treatment, extractions for the relief of pain or extractions not necessitating replacements by dentures (including any necessary anaesthetic), and ordinary denture repairs. X-ray examinations for diagnosis and certain other treatment may likewise be carried out at once, subject to a limitation of cost. Treatment needing prior authority includes the removal of teeth otherwise than above, the provision of dentures, extensive and prolonged treatment of the gums, gold fillings, inlays, crowns, special appliances, and oral surgery.

Where a dentist gives treatment in his own surgery, he is paid on a prescribed scale of fees based on items of treatment carried out by him. Apart from the patient's contribution payment is made by the executive council with whom the dentist is in contract. The scale of fees is based on the recommendations of the

Spens Committee (pub. May 1948). The main recommendations are these: (1) If there were sufficient dentists in relation to the demand for their services to secure a spread of incomes comparable to that in 1938, arrangements should be made to ensure that, between 35 and 54 years of age, three-quarters of those dentists should receive net incomes of over £850 a year, one-half should receive incomes of over £1100, and one-quarter incomes of over £1400. These amounts are related to 1938 value in money; the Spens Committee left it to others to translate them into 1948 values. (2) Until there are sufficient dentists to secure such a spread of incomes, a single-handed dentist using all appropriate assistance and working efficiently for 1500 hours a year at the chair-side, together with the hours necessarily spent outside the surgery, should receive a net income of £1600 (1938 values of money). Extra remuneration may be earned by experienced dentists under partnership agreements with junior partners or by employing salaried assistants; by dentists able to work more than 1500 chair-side hours a year without loss of efficiency; by dentists with special skill and experience acting as part-time consultants or specialists; and by dentists practising in especially unattractive areas. Under regulations made in 1949 any dentist earning more than a gross income of £4800 a year had his earnings above this amount cut by half. This restriction was removed after a few months and was replaced by an all-round 20 per cent reduction in the scale of fees. Another cut of 10 per cent on this scale was made in May 1950. This latter cut was removed in May 1955. Dentists in the N. D. S. and hospital dental officers received a 5 per cent increase in remuneration in May 1957.

National Emblems. The most familiar of N. E. are the flowers that have come to be identified with different countries. The rose has been England's flower since the 15th cent., when the land was divided by warring factions, the Yorkists choosing the white rose for their badge and the Lancastrians the red. The Scottish emblem of the thistle is said to date from the 8th cent., when a Dan. night assault on Stirling Castle was foiled because one of the attackers cried out as he trod on one. The lock is said to have been adopted as the emblem of Wales in Cadwallon's time, when the Welsh wore leeks in their caps to distinguish them from the Saxon invaders. St Patrick is credited with making Ireland's emblem the shamrock, which he used to illustrate the principle of the Trinity. The lily (fleur-de-lis) is the emblem of France, and the maple leaf of Canada.

There are also animal emblems, such as the Brit. lion, the Welsh dragon, and the Russian bear. The eagle has been the emblem of a number of countries. The U.S.A. chose the white-headed eagle, depicted with outspread wings and hence sometimes termed the spread-eagle. Austria, Prussia, and Russia have all used the eagle, usually the 2-headed eagle first

adopted by Charlemagne to symbolise the 2 main regions of his empire, and later taken to signify the union of the E. and W. empires. In addition there are accepted national personalities, John Bull standing for England, Uncle Sam for the U.S.A.

National Film Archive, official film archive of Great Britain for the permanent preservation of films and film records of all kinds. Films are chosen for preservation by a selection committee on two grounds: either their significance in the hist. of the film as a form of art and entertainment, or their value as historical records of events, manners, scientific discoveries, etc. The library is dependent on the voluntary co-operation of the film industry in presenting films, and does not enjoy the privilege of statutory deposit which the Brit. Museum, for example, has in respect of books. Research into the best technical methods of film preservation, and the cataloguing and indexing of its material, are two of the library's most important functions. It is associated with the Brit. Film Institute's distribution library, through which many of the most important films in the archive can be borrowed by schools, film societies, and other non-commercial educational bodies. The archive is a dept of the Brit. Film Institute (q.v.) and a certain portion of the Institute's Treasury grant is allocated to its work.

National Gallery, The, London, contains the most important collection of pictures in the U.K. The building was erected in the classic style from designs by Wilkins, 1832-8, opened in 1838, and enlarged in 1860, 1876 (when a new wing was added by Barry at a cost of £80,000), and 1886; it stands on the N. side of Trafalgar Square. The nucleus of the collection was 38 pictures of John Julius Angerstein (d. 1823), a wealthy merchant of Russian extraction; his collection, one of the most famous in England, had been formed with the aid of his close friend, Sir Thomas Lawrence. At the suggestion of George IV this collection was purchased in 1824 by Parliament for £57,000, but, there being no place in which to exhibit the pictures, Angerstein's house was bought for the purpose. The Angerstein collection included the Hogarth series, 'Marriage à la Mode,' 1745; Wilkie's 'Village Festival,' 1811; 3 Claudes; Titian's 'Venus and Adonis,' 1554. The largest painting in the collection was Sebastiano del Piombo's 'Raising of Lazarus,' 1517-1519, and among other pictures acquired soon afterwards were Titian's 'Bacchus and Ariadne,' purchased in 1826; Annibale Carracci's 'Christ appearing to Peter,' 1626; Correggio's 'Vierge au Panier,' 1825; Reynolds's 'Holy Family'; Gainsborough's 'Market Cart'—these last two being presented by the Brit. Institution; Gainsborough's 'Watering Place'; and Copley's 'Death of Chatham.' Constable's 'Cornfield' was acquired in 1837 through a committee of friends and admirers of the painter. A considerable sum is voted annually by Parliament for augmenting the number of pictures, and

famous bequests include those of Beaumont (1826), Carr (1831), Olney (1837), Farnborough (1838), Vernon (1847), J. M. Turner (1850), Bell (1859), Peel (1871), Wynn Ellis (1876), Layard (1916), Salting (1916), Ludwig Mond (1924). The gallery is particularly rich in its masters and contains some of the best work of Raphael, Correggio, and Paolo Veronese. There are many important pictures of the early Siennese school, notably of Ugolino da Siena, and an exceptionally fine collection of pictures by the leading 15th-cent. painters, as Lippo Lippi, Signorelli, Uccello ('The Rout of San Romano'), Pollaiuolo ('Martyrdom of S. Sebastian'), and Pisano ('The Vision of St Eustace'). In the Venetian school the gallery is almost unrivalled with many of the outstanding works of Giovanni Bellini, Cima's 'Ecce Homo', Crivelli's 'Madonna and Child enthroned, surrounded by Saints', Lorenzo Lotto's 'Lucretia' (bought by the National Art-Collections Fund (q.v.) in 1927), Tiepolo's 'Finding of Moses', Tintoretto's 'The Origin of the Milky Way', and 'Vincenzo Morosini' (purchased through the National Art-Collections Fund and presented in commemoration of the National Gallery centenary, 1924), Titian's 'Venus and Adonis', 'Bacchus and Ariadne', 'Christ and the Magdalen'; Noli me tangere, Paolo Veronese's 'Adoration of the Magi', and 'The Family of Darius before Alexander' (bought from Count V. Pisani in 1857 for £13,650). Canaletto and Guardi are handsomely represented with their views of Venice. Of the painters of the Umbrian school, Perugino is represented by the triptych 'The Madonna adoring the Child,' part of the altar-piece commissioned c. 1496 for the Certosa, Pavia; Piero della Francesca by 'The Baptism of Christ' and other panels; Raphael by 7 pictures, among them being 'S. Catherine of Alexandria', 'Vision of a Knight', 'Madonna, Child, and S. John', 'The Crucifixion'—a very early work (c. 1502) strongly influenced by Perugino (bequeathed to the gallery in 1924)—and the world-famous 'Ansidei Madonna,' purchased from the Duke of Marlborough in 1885 for £70,000. The Parma school is represented by Parmigiano's 'Vision of S. Jerome,' and by sev. pictures of Correggio, including the very famous 'Mercury instructing Cupid before Venus' (purchased from the Londonderry collection, 1834). The earlier school of Bologna is represented by the 'Pietà' of Francia and the later by the 'Ecce Homo' and 'Adoration' of Guido and the work of Annibale Carracci, notably 'Erminia takes refuge with the Shepherds.' The gallery's one painting by Leonardo da Vinci is 'The Virgin of the Rocks,' of which there is an earlier version in the Louvre. The picture was purchased from the Earl of Suffolk in 1880. There are 2 pictures by Michelangelo — 'The Entombment,' painted, apparently, c. 1495, and first recognised as by Michelangelo by Cornelius and Overbeck. It was bought from R. Macpherson, London, in 1868. The other picture is the 'Madonna and Child, S. John,

and Angels,' painted c. 1494 and perhaps the artist's earliest picture. It was purchased from Labouchère's executors in 1870. Among the most notable Ger. pictures are 'St Veronica' by Wm of Cologne, and Albrecht Dürer's 'The Painter's Father' (purchased 1904) and 'Portrait of a Senator.' The 'Duchess of Milan' by Holbein (the Younger) was purchased for the nation by the National Art-Collections Fund in 1909 from the Duke of Norfolk for £50,000. The same artist's 'The Ambassadors' was bought in 1890 from the Earl of Radnor with the aid of gifts from Lord Rothschild and Lord Iveagh.

The collection is rich in fine examples of early Flem. painting, notably the 'Arnolfini Marriage' by Jan van Eyck, while the 'Magdalen reading' by Rogier van der Weyden, the 'Exhumation of St Hubert' by Dierick Bouts, and 'The Adoration of the Kings' by Mabuse (Jan Gossart) are admirable examples of the work of these painters. 'The Adoration of the Kings' by Pieter Brueghel was acquired through the National Art-Collections Fund and other funds in 1921. Equally well represented are the later Flem. painters: Rubens by some 30 or more pictures, including 'The Rape of the Sabinas,' 'Peace and War,' 'Triumph of Julius Caesar,' Susanna Fourment (known as 'Le Chapeau de Paille'), 'The Triumph of Silenus,' the 'Judgment of Paris,' bought in 1844, and the great landscape 'Château de Steen,' presented by Sir George Beaumont, 1826. Van Dyck is represented by many works, notably his 'Charles I,' which cost £17,500, and 'Lady and Child' (acquired in 1914). There is an equally full collection of great Dutch masters' paintings: Cuyp, with sev. pictures, mostly landscapes and riv. scenes; Frans Hals, portraits; Gerard van Honthorst, notably his 'Christ before Pilate'; Ostade, with 'The Alchemist,' 'Courtship,' and 'Man with a Jug'; Jan Steen, with 'The Music Master' and 'Skittle Players'; Vermeer of Delft, with 'Lady standing at the Virginals' and 'Lady seated at the Virginals.' There is a score of pictures of Rembrandt, notably 'The Philosopher,' 'Portrait of an Old Woman,' 'Adoration of the Shepherds,' 'Descent from the Cross,' 'The Woman taken in Adultery,' 'A Jew Merchant,' 'Portrait of Himself' (as an old man), 'Portrait of Margaretta Trip' (bought in 1899, a second picture of the same title being acquired in 1941), and 'Diana bathing.' Ruysdael's pictures include 'The Shore at Scheveningen' and sev. acquired through the Salting bequest. There are also sev. notable paintings by Ter Borch or Terburg, including 'The Guitar Lesson,' 'The Peace of Münster,' and 'Portrait of a Gentleman.' Of the Antwerp school, David Teniers the Younger is well represented by many pictures, which include 'An Old Woman Peeling a Pear,' 'Teniers's Château at Perck,' and 'The Village Fête.' Of the school of Amsterdam Hobbema is conspicuous with 'View of Middleharnis.'

Among the pictures of the Fr. school

are sev. landscapes by Claude (of Lorraine), notably 'Landscape: Death of Procris' and the great 'Seaports'—'Embarkation of the Queen of Sheba' and 'Embarkation of S. Ursula'; Nicolas Poussin is represented by 8 pictures, including 'Adoration of the Shepherds' (from the Victoria and Albert Museum in exchange for other works, 1895), 'Bacchanalian Festival,' and 'Bacchanalian Dance'; Chardin, by 'La Fontaine' and 'The Lesson'; Puvis de Chavannes, by 'Summer'; and Manet, by 'Soldier examining the Lock of his Rifle' (acquired 1918). Of the Sp. school the gallery possesses excellent portraits of Philip IV of Spain by Velazquez and another of that king hunting wild boar. 'The House of Martha' (of the first or Sevillian period) and the 'Venus and Cupid,' known as the 'Rokeby Venus,' in the possession of Olivárez in 1682, later in that of Godoy, and eventually acquired by the National Art-Collections Fund in 1906 for £45,000, are also by the Sp. master. The pictures of Murillo are not outstanding examples, but mention may be made of 'The Immaculate Conception' and 'St John the Baptist,' both acquired in 1924 by bequests. El Greco is adequately represented by 'The Agony in the Garden' and 'Christ driving the Traders from the Temple.' The 'Kneeling Friar' of Zurbaran is a specimen of that painter's work which is not rivalled either in or out of Spain, and also in the gallery are his 'A Franciscan' and 'A Lady as S. Margaret.'

The gallery is, naturally, very well provided with pictures by all the famous Brit. artists, but only a few representative works can be mentioned here: Constable, 'The Cornfield, or Country Lane,' 'The Hay-wain,' 'Flatford Mill,' and many other pictures from the Henry Vaughan and Salting bequests of 1900 and 1910 respectively; John Crome, 'Mousehold Heath'; Gainsborough, 'Mrs Siddons,' 'The Painter's Daughters,' 'Ralph Schomberg,' 'Sir William Blackstone,' and nearly a score of others; Sir Thomas Lawrence, 'Queen Charlotte' (acquired 1927); Millais, 'Ophelia'; Reynolds, 'The Graces, decorating Hymen' (bequeathed 1837), 'The Holy Family,' 'Self Portrait' (from the Peel collection), 'George, Third Duke of Marlborough and his Family,' 'Catherine, Lady Bampfylde,' and many others; Romney, 'Lady Hamilton'—a popular picture—'The Beaumont Family,' and 'Lady and Child'; and Whistler, with 2 nocturnes and the 'Little White Girl.' There is a large collection of Turner's works acquired through the Turner bequest. The popular favourites include 'Dido building Carthage,' 'The Sun rising through Vapour' (these two the artist stipulated to be hung near the Claudes), 'Ulysses deriding Polyphemus,' 'The Fighting Temeraire,' 'Venice: the Bridge of Sighs,' and 'Yacht Racing in the Solent.'

Acquisitions of this cent. include the following pictures: Gerard Ter Borch, 'Portrait of a Lady' (bequeathed by Sir

Otto Beit, 1931); Jan Liss, 'Judith and Holofernes' (presented 1931); a portrait of Dr Johnson, described as 'from the studio of Sir Joshua Reynolds' (presented in 1930); and 'The Children of R. R. Graham, Esq.' by Hogarth (presented through the National Art-Collections Fund, 1934). The National Art-Collections Fund, by securing the Rokeby Velazquez, the Norfolk Holbein, and since then the 'Madonna and Child with Angels' of Masaccio (1916) and Tintoretto's 'Morosini' (1924), has taken the

schier, 'Portrait of a Lady' (1935); Ingres, 'Madame Moitessier seated' (1936); Alfred Sisley, 'A Landscape in Spring' (1936); Raeburn, 'Pringle Fraser' (portrait of a young man) (1937); D. G. Rossetti, 'The Girlhood of Mary Virgin' (1937); Filippino Lippi, 'Moses causes Water to flow from the Rock' (1937); Richard Wilson, 'The Thames near Marble Hill, Twickenham' (1937); Piero di Cosimo, 'The Battle of the Centaurs and the Lapiths' (panel) (1937); Dogas, 'Combing the Hair' (1937); Peter de Wint, 'Har-

THE NATIONAL GALLERY, LONDON

Mirrorpic

foremost place amongst the private benefactors to the gallery. Other acquisitions through this fund include Titian, 'The Vendramin Family in adoration before a Reliquary of the True Cross' (1929); Richard Wilson, 'On Hounslow Heath' (1929); the 'Wilton Diptych' (1929); and Rubens, 'The Watering Place' (1936). Purchases or gifts in the decade immediately preceding the Second World War include Canaletto, 'Regatta on the Grand Canal, Venice' (bequeathed by Lord Revelstoke, 1929); Reynolds, 'Self Portrait' (bequeathed 1930); Gerard van Honthorst, 'S. Sebastian' (1930); Salvatore Rosa, 'Portrait of the Painter' (presented by the 6th Marquess of Lansdowne, 1933); Hoppner, portrait of 'Rt Hon. Charles Long' (1934); Corot, 'Study of a Woman' (1934); Gainsborough, 'John, Tenth Viscount Kilmorey' (1934); Bernardo Cavallino, 'Purification of the Temple' (1935); J. S. Cotman, 'Seashore with Boats' (1935); Constable, 'Hadleigh Castle' (1935); Caspar Net-

vesters' (1937); Raffaellino del Garbo, 'Virgin and Child with Two Angels' and 'Virgin and Child with the Magdalen and S. Catherine of Alexandria' (1937); 4 panels ascribed to Giorgione (1937); Van Dyck, 'The Virgin and Child adored by the Abbé Scaglia' (1938); David Cox, 'The Welsh Funeral, Bettws-y-Coed' (1938). (See supplementary catalogue of the National Gallery, pub. 1939.)

Among other and more recent acquisitions may be mentioned the following: Géricault, 'Horse frightened by Lightning' (acquired 1938); Rembrandt, 'Flora' (1938); Zoffany, 'Mrs Oswald' (1938); Reynolds, 'Admiral Kingemill' (1939); Lorenzo Monaco, 'Legend of St Benedict' (1940); Metsu, 'Lady drawing' (1940); Dosso Dossi, 'Bacchanalian Scene' (1941); Niccolò dell'Abate, 'Landscape, with the Legend of Eurydice' (1941); Hogarth, 'The Staymaker' (1942); Pannini, 'Interior of St Peter's' (1942); Titian, 'Catherine Cornaro' (1942); Dutch 17th cent., 'Three Music-making Children'

(1943); 'The Visitation,' ascribed to Philippe de Champaigne (1944); Giovanni di Paolo, 'Four Scenes from Life of John Baptist' (purchased from executors of J. Pierpont Morgan, 1944); Venetian 16th cent., 'Landscape with Mythological Scene' (1944); Nicolas Poussin, 'Annunciation' (1944); 'Virgin and Child with Angels,' ascribed to Benozzo Gozzoli (1945); Greuze, 'Mme Gléon' (1945); Largillierre, 'Monsieur Forest' (1945); Tiepolo, 'Deposition' (1945); Romney, 'Lady Hamilton,' his second portrait of her (1945); Dürer, 'Virgin and Child' (1945); J. F. Millet, 'Landscape with Storm' (1945); Portuguese school, 'Marriage of St Catherine' (1945); ascribed to Sp. 18th cent., 'Old Man holding Bottle' (1945); Nicolas Poussin, 'Worship of Golden Calf' (1945); Flem. 17th cent., 'Portrait of Man in Black' (1945); Reynolds, 'Landscape' (presented by the National Art-Collections Fund, 1945); Mantegna, 'Imperator Mundi' (final part of Mond bequest, 1946; the Melunine 'Triptych,' and a Rembrandt, both from Chatsworth.

Since then further works have been acquired, the most important of which are Nicolas Poussin, 'Landscape with a Snake,' Murillo, 'Christ at the Pool of Bethesda,' and 'Self Portrait'; Masolino, 'St. Jerome and John the Baptist'; Hobbema, 'The Herring-Packers' Tower, Amsterdam'; Cézanne, 'La Vieille au Chapelet'; Wilson, 'Holt Bridge, River Dee' and 'The Dee Valley'; Gainsborough, 'The Morning Walk.'

In 1930 the National Gallery was extended by the opening of new rooms for the exhibition of the work of the early It. masters, the cost being borne by Sir Joseph Duveen. Before the Second World War there were about 2000 pictures at the National Gallery. Of these not more than about 850 were hung on exhibition; but the remainder were accessible at any time to anyone who inquired of the head attendant. After the war only about 250 were exhibited (1946); but when the 2 larger galleries were reopened and other accommodation restored, about 400 were on view. When an adjoining site became vacant in 1958, the question of an extension was discussed. See Sir C. Holmes, *The National Gallery* (1. *Italian Schools*; 2. *Netherlands, Germany, and Spain*; 3. *France and England*), 1923-7; Sir C. Holmes and C. H. Collins Baker, *The Making of the National Gallery*, 1924; Sir K. Clark, *One Hundred Details from Pictures in the National Gallery*, 1938, and *More Details*, 1941; revised N. G. Catalogues of individual schools of painting by Martin Davies and others, 1946 to date; Sir Philip Hendy, *The National Gallery, London*, 1955; *The National Gallery, 1938-1954* (official pub.), 1955.

National Geographic Society, formed in the U.S.A. in 1888 by Gardiner Greene Hubbard, who held the presidency until his death in 1897. Existing for the 'increase and diffusion of geographic knowledge,' the N. G. S., in collaboration with the gov. and other public bodies, has

sponsored many expeditions. Amongst them were the Peary expedition to the N. Pole, the Byrd expeditions to the N. and S. Poles, and the Beebe expedition of 1934, 'man's deepest plunge' into the Atlantic, as well as expeditions into Peru, China, and New Mexico. The society's maps were extensively used by Brit. and Amer. military and naval authorities during the Second World War. From 1899 to 1954 the *National Geographic Magazine* was produced under the editorship of Gilbert Grosvenor, who was also president of the society from 1920 to 1954. It had a monthly circulation in 1956 of 2,200,000, one-sixth of it in Canada and abroad. The N. G. S. is not to be confused with the Amer. Geographical Society, U.S.A., counterpart of the Royal Geographical Society.

National Government (Great Britain), name given to the gov. which replaced the second Labour gov. in Aug. 1931, and which was made up of ministers drawn from all 3 political parties, with Ramsay MacDonald as Premier. The N. G. was formed to carry out a policy of retrenchment of expenditure so as not only to provide for the needs of the budget, but also to restore foreign confidence in the financial stability of Great Britain. The Cabinet comprised 10 members—4 Conservatives (Stanley Baldwin, Neville Chamberlain, Sir Samuel Hoare, and Sir Philip Cunliffe-Lister), 4 Labour (Ramsay MacDonald, Lord Sankey, Philip Snowden, and J. H. Thomas), and 2 Liberals (Earl of Reading and Sir Herbert Samuel). Arthur Henderson, who had been foreign secretary in the Labour gov., became leader of the Opposition. The newly formed Cabinet was to continue in office until means were provided to balance the budget and the crisis passed, when a general election would take place. When confidence in the pound had been restored at home and abroad (Oct.) the N. G. appealed to the nation, asking for a 'doctor's mandate' to do whatever was necessary to secure financial and economic stability. The N. G. obtained the record majority of nearly 500—the Labour opposition being almost wiped out. The gov. was, in effect, a Conservative gov., though MacDonald remained its Prime Minister until 1935. In Nov. 1935 a second so-called 'N.' G. was returned, again with a very large majority. The gov. remained nominally a N. G. until 1940, when it was reconstituted under Winston Churchill as a Coalition gov., including a number of leading Labour and Liberal members, which was more truly 'national' than the so-called N. G. it replaced.

National Grid, Brit. system of map-reference instituted after a recommendation by the Davidson Departmental Committee of 1935-8. From the central meridian are laid out squares with sides at right angles and parallel to it respectively, which are multiples of the international metre. Thus there can be found for every point a map reference peculiar to itself consisting of the rectangular co-ordinates of the point measured

eastwards and northwards. The kilometre reference consists of 2 letters showing the square with 100 km. sides followed by 2 pairs of figures showing the square with 1 km. sides, e.g. SU/2666. The initial point from which measurements are made has been arbitrarily fixed at a point to the SW. of the Scilly Is. The scale of the map does not affect the reference, though since with the larger scales more digits can be included, greater accuracy is thereby achieved. A sheet line system related to the grid links the various scales by allowing the smaller to be used as indexes to the larger. The N. G. system has proved of very great value in many fields of activity: in local gov., for keeping records and statistics, for describing sites, for police work, and so on. The War Office have replaced their military grid by the N. G.

National Guard, name given to an armed force of citizens organised for local defence. The term is applied particularly to the Fr. *garde bourgeoise*, which was enrolled at the time of the revolution. The National Assembly proclaimed in 1790 the principle of a compulsory and universal service, to which all qualified citizens belonged, and membership of which was in most cases a necessary corollary of the full rights of citizenship. The N. G. was not abolished until 1872. Local forces in Spain, Italy, etc., and organised militia in all parts of the U.S.A., are also called N. G.s. See also MILITIA.

National Health Service. This was inaugurated on 5 July 1948, under the National Health Service Act (1946), 'to promote the establishment in England and Wales of a comprehensive health service designed to secure improvement in the mental and physical health of the people . . . and the prevention, diagnosis, and treatment of illness.' Separate Acts provide for Scotland and N. Ireland. The scheme was evolved from proposals pub. in a White Paper in 1944. Everyone is entitled to use the service and no insurance qualification is necessary. The main heads: (1) General Medical and Dental Services, Pharmaceutical Services, Supplementary Ophthalmic Service; (2) Hospital and Consultant Service; (3) Local Health Authority Services.

1. **GENERAL MEDICAL SERVICES**. Regional executive councils, whose members serve in a voluntary capacity, are responsible for the organisation of the family doctor service, the dental, pharmaceutical, and supplementary ophthalmic services. All doctors are entitled to take part in the family doctor service and about 19,500 do so in England and Wales alone. By doing so they are not precluded from also having private fee-paying patients. General practitioners are paid on a capitation basis (see below). Everyone over 16 years of age may choose his or her own doctor. People away from home can be treated by another doctor as 'temporary residents.' Any doctor who joined the service by 5 July 1948 was free to continue practising where he was, but doctors joining the service subsequently must first obtain

permission from the Medical Practices Committee; such permission is given unless the number of doctors in the area concerned is already considered to be sufficient. Doctors may prescribe for their patients all drugs necessary for treatment and a certain number of surgical appliances. Hearing aids are provided free to those needing them. Drugs and medicines were formerly free, but in June 1952 a charge of 1s. was made in respect of each prescription form made out by the family doctor except in certain cases of hardship, and in Dec. 1956 this was amended to 1s. an item instead of 1s. a form. Almost all chemists in the country have joined the service.

Dental Service. Like doctors, dentists are free to take part in the service or not, as they wish; about 97 per cent have done so. Patients do not need to register with a particular dentist for the dental service, as is the case with the family doctor service. Instead of a capitation fee the dentist receives payment for each item of treatment. All normal conservative treatment can be carried out by the dentist without prior approval, but such approval is required before treatment involving the removal of teeth necessitating replacement by dentures, provision of dentures, gold fillings, and other expensive forms of treatment. In May 1951 charges towards the cost of dentures were introduced, and in June 1952 a charge of £1, or the full cost of treatment if less than £1, was put into force, patients under 21 years of age and necessitous persons being exempt (see NATIONAL DENTAL SERVICE).

Working in the **Supplementary Ophthalmic Service** are (a) ophthalmic medical practitioners, doctors who test sight and prescribe glasses; (b) dispensing opticians, who test sight, prescribe glasses, and supply them; and (c) dispensing opticians, who do not test sight but supply supply glasses to prescription. The first time a patient requires ophthalmic attention within the service (even if already wearing glasses) he must obtain from his doctor a form certifying that he needs a sight test. There is complete freedom of choice as to whom he may consult for this purpose. Formerly there were no charges except where a patient chose a more expensive spectacle frame than one of the standard frames approved for the service, or asked for special lenses when such were not essential. Since May 1952 charges to patients of 10s. for each lens plus the actual cost of the frames have been in force, with exemption for necessitous persons; children's glasses in the standard type of frame are free.

2. **HOSPITAL AND CONSULTANT SERVICE**. On 5 July 1948 most voluntary and municipal hospitals (including mental hospitals, mental deficiency institutions, convalescent homes, and certain clinics) passed into the ownership of the minister of health. A few hospitals, mostly those being run by religious orders, were not taken over; these are termed 'disclaimed hospitals.' The hospital service includes general and special hospitals, specialist

opinions and treatment, convalescent treatment, and all forms of specialised therapy. Hospitals are organised by regional hospital boards and day-to-day administration is carried out by hospital management committees (usually responsible for a group of closely related hospitals). The teaching hospitals, however, are outside the immediate responsibility of regional boards and are administered by boards of governors. Specialists and consultants who take part in the service hold whole-time or part-time hospital appointments. They, and resident hospital medical officers, are paid a salary (see HOSPITAL).

3. LOCAL HEALTH AUTHORITY SERVICES are the responsibility of the local health authorities, i.e. co. councils and co. bor. councils. They provide such services as midwifery, antenatal, postnatal, and child welfare clinics (see MATERNITY AND CHILD WELFARE), health visiting, home nursing, ambulances, local mental health services, vaccination, immunisation, and domestic help on health grounds. All but the last are free, but since 1952 local health authorities are empowered to make charges for the use of day nurseries. They may also make approved arrangements for the prevention of illness and the care and after-care of the sick. This may include the provision of special foods and special accommodation for invalids and convalescents, and the making of grants to voluntary organisations doing work of this kind.

Remuneration of the doctor. The main payments come from a central pool, based on the number of doctors taking part in the service and amounting at present to £50,000,000 annually. A capitation fee is paid to the doctor in respect of each patient on his list; at present this is 17s. per head per annum. The maximum number of patients which a general practitioner may accept on his list is 3500 if single-handed; 4500 for a member of a partnership provided the average for the partnership is not above 3500, and in addition 2000 in respect of the employment of a permanent assistant. There is an additional payment of 10s. per annum for every patient from 501 to 1500 on the doctor's list. An initial practice allowance is payable to doctors setting up in practice single-handed; this is £600 in the first year, £450 in the second year, and £200 in the third year. Other provisions include mileage payments for visiting distant patients on the doctor's list, payments for the treatment of temporary patients, payments to encourage doctors to practise in unpopular areas, maternity, vaccination, and immunisation fees. Practitioners who were in practice before the commencement of the service in 1948 are not entitled to sell the goodwill of their practice, but are entitled to compensation for the loss of this right. Such compensation is not normally payable until the doctor dies or retires; meanwhile he receives interest at 2½ per cent on the unpaid compensation money. A superannuation service is also available for doctors in the service.

Efficient service. The Act provides for special tribunals to investigate cases where it is claimed that the continued inclusion of any doctor, dentist, chemist, or optician in the lists drawn up by the executive councils would be prejudicial to the efficiency of the service. The tribunal has a legal chairman appointed by the Lord Chancellor and includes a member of the same profession as the person whose case is being investigated and one other, the latter two being appointed by the minister of health.

About 50 million persons are covered by the service in Great Britain and N. Ireland and the ann. expenditure is approximately £500 million. For N. H. S. contributions see NATIONAL INSURANCE ACT (1946). See C. Hill and J. Woodcock, *The National Health Service, 1949*; the special number of the *Practitioner*, 1949; J. S. Ross, *The National Health Service in Great Britain*, 1952.

National Ideology, see IDEOLOGY.

National Insurance Act (1946) gives legislative form to the all-embracing scheme of social insurance which first took shape in the Beveridge Report of 1942 and was developed in the White Paper pub. in Sept. 1944 (see SOCIAL INSURANCE). The Act provides payment by way of unemployment, sickness, and maternity benefit; retirement pension; widow's benefit; guardian's allowance; and death grant. It repeals all existing enactments relating to unemployment insurance, national health insurance, widows' and orphans' and old age contributory pensions, and non-contributory pensions; and it provides for payments towards the cost of the National Health Service (q.v.). The main benefits and grants payable were revised in the National Insurance (No. 2) Act, 1957, and are as follows:

Sickness and unemployment: 50s. with 30s. for a dependant and 15s. for first child and 7s. for each other child.

Retirement pensions: 50s., except where the pension is payable to a woman by virtue of her husband's insurance and he is alive.

Widow's allowance: 70s. (for 13 weeks following death of husband) with 20s. for first child and 12s. for each other child.

Widowed mother's allowance: 70s., plus 12s. for each child after the first.

Widow's pension: 50s.

Guardian's allowance: 27s. 6d.

Maternity allowance: 50s. (for 18 weeks).

Maternity grant: £12 10s.

Home confinement grant: £5.

Death grant for adults: £25.

The main contribution rates defined in the National Insurance (No. 2) Act, 1957, and the National Health Service Contributions Act, 1958, are set out in the tables on p. 73.

Generally contributions are paid by means of stamps on a single insurance card. For an employed person the stamp covers industrial injuries insurance as well as insurance under this Act, and the responsibility for paying contributions rests on the employer, but he can deduct the employee's share from his wages,

Combined National Insurance and National Health contribution rates as from 7 July 1958, including industrial injuries contributions.

MAIN RATES OF COMBINED WEEKLY CONTRIBUTIONS

Class 1. Employed Persons				
Men		Women		
	Age 18 or over	Age under 18	Age 18 or over	Age under 18
<i>Paid by employee</i>	9s. 11d.	5s. 5d.	8s. 0d.	4s. 8d.
<i>Paid by employer</i>	8s. 3d.	4s. 11d.	6s. 9d.	4s. 0d.
<i>Total</i>	18s. 2d.	10s. 4d.	14s. 9d.	8s. 8d.

Class 2. Self-employed Persons			
Men		Women	
Age 18 or over	Age under 18	Age 18 or over	Age under 18
12s. 0d.	6s. 9d.	10s. 0d.	5s. 11d.

Class 3. Non-employed Persons			
Men		Women	
Age 18 or over	Age under 18	Age 18 or over	Age under 18
9s. 7d.	5s. 5d.	7s. 7d.	4s. 6d.

EXCHEQUER SUPPLEMENT

Description of person by or in respect of whom contribution is paid	Amount of Supplement			
	For contribution as employed person	For employer's contribution	For contribution as self-employed person	For contribution as non-employed person
	s. d.	s. d.	s. d.	s. d.
<i>Men over the age of 18</i>	1 3	1 2	3 3	2 6
<i>Women over the age of 18</i>	1 0	1 0	2 0	2 0
<i>Boys under the age of 18</i>	8	8	1 10½	1 5
<i>Girls under the age of 18</i>	7	7	1 7	1 1

provided the deduction is made on the day the wages are paid. Exemptions from payment of contributions apply to persons who are unemployed or incapable of work, and also to other classes of persons such as married women, widows, and self-employed and non-employed persons whose income does not exceed £156 per annum. There are also special provisions relating to students, unpaid apprentices, and persons coming into the country from abroad.

The central administrative body which administers the Act is the Ministry of Pensions and National Insurance, which has regional and local offices throughout the country.

Contribution conditions. For unemployment or for sickness benefit: (a) 26 contributions (for unemployment these must be Class I, and for sickness, Class I or Class II) paid between entry into insurance and

the day for which benefit is claimed; and (b) not less than 50 contributions (as above) paid or credited in respect of the last complete contribution year before the beginning of the benefit year. For maternity grant: not less than 26 contributions (Class I, II, or III) paid between entry into insurance and day of confinement and not less than 26 paid or credited in respect of the last complete contribution year before confinement. For maternity allowance: not less than 50 Class I or II contributions paid by or credited to claimant in respect of the 52 weeks immediately preceding the 13th week before the expected week of confinement and, of those contributions, not less than 26 to be Class I or Class II contributions actually paid. Widows' benefit or retirement pension: not less than 156 contributions paid in the period between entry

into insurance and the date of reaching pensionable age or death under that age, and a yearly average of contributions paid or credited of not less than 50. For death grant: not less than 26 contributions paid or credited between 5 July 1948 and deceased's death or date of attaining pensionable age, if earlier. Also, not less than 45 contributions paid or credited in the last complete contribution year or a yearly average of 54 contributions paid or credited.

Sickness and unemployment benefit. Employed persons can qualify for either; self-employed persons for sickness benefit only.

Rates. Sickness benefit or unemployment benefit for a man or single woman over 18 is 50s. weekly. Unemployment benefit for a married woman over 18 is 50s. weekly. Sickness benefit for a married woman over 18 is 50s. weekly.

Increase of benefit (i.e. sickness, unemployment, or maternity allowance) for wife or adult dependant is 30s. weekly.

Increase of benefit for children is 15s. for first child and 7s. for each additional child.

A married woman over 18 receives the same rate as a single woman if she is supporting an invalid husband, or if she is not living with her husband and cannot obtain any financial help from him.

Duration of benefit. During the same spell of absence from work an insured person can draw: (a) sickness benefit without limitation of period if he has paid at least 156 contributions at any time; (b) 180 days of unemployment benefit, together with additional days of benefit, assessed on his record of contributions and benefit. Two spells of absence from work count as one if not separated by more than 13 weeks. When an insured person has exhausted his right to benefit of either kind he can requalify for that benefit when he has paid 13 more contributions. Contributions must be Class I for unemployment benefit and Class I or II for sickness benefit. Disqualifications: refusing an offer of suitable employment; in the case of sickness benefit, failing to comply with rules of behaviour. Claims for benefit must be made promptly to avoid penalty imposed by regulations.

Maternity benefits. For a confinement a woman will receive a *maternity grant* of £12 10s. for each child born at the confinement, on her husband's insurance or on her own. *Home confinement grant* of £5 may also be payable for confinements at home or (in certain circumstances) in hospital. For a woman who ordinarily follows a gainful occupation there is in addition a maternity allowance of 50s. weekly for 18 weeks beginning with the eleventh week before the expected week of confinement provided she abstains from work.

Widows' benefits. A widow will qualify on her husband's insurance for an allowance of 70s. weekly for 13 weeks, with increases of 20s. for the first child and 12s. for each other child. Thereafter she will receive a widowed mother's

allowance of 70s. weekly, with increases of 12s. for each child other than the first. (Widowed mother's allowance (personal) of 40s. weekly is payable to a widow having a young person under 18—not at school or an apprentice—living with her or maintained by her to the extent of 16s. 6d. per week.) If she is over 40 when this allowance ceases and 3 years have elapsed since the date of her marriage, she will qualify for a widow's pension of 50s. per week. A widow who is left without any children of school age will receive a widow's pension of 50s. after the period of her widow's allowance, if she had reached the age of 50 when her husband died, provided that 3 years had elapsed since the date of her marriage. If, by reason of mental or physical infirmity, a widow is incapable of self-support at the time when her widow's allowance ceases, she will receive sickness benefit of 50s. so long as she is incapable of self-support. A widow whose husband had qualified for retirement pension before his death will receive the ordinary widow's benefits as above specified, if she is then under 60. If she is over 60, any retirement pension which she is already receiving will be raised to the single person's rate.

Reduction on account of earnings:

(a) Widow's pension: 6d. deducted for each complete 1s. of earnings between 50s. and 70s., and 1s. deducted for each complete 1s. over 70s.

(b) Widowed mother's allowance: 6d. deducted for each complete 1s. of earnings between 60s. and 80s. and 1s. deducted for each complete 1s. over 80s.; but the allowance cannot be reduced by more than 50s. however much she earns.

Guardian's allowances. Where the parents (including step-parents) of a child are dead, and one at least of them was insured under the scheme estab. by this Act, anyone who has the child in his family will qualify for a guardian's allowance of 27s. 6d. a week. There is statutory power to extend the allowance to cover certain cases excluded from the previous scheme.

Retirement pensions. An insured person who (a) has reached pension age (65 for a man and 60 for a woman); (b) has retired from regular employment; and (c) has paid the prescribed number of contributions will receive a retirement pension for life at the rate of 50s. a week. Men aged 70 and over, and women aged 65 and over, do not have to satisfy condition (b). Where a man aged 65 to 70, or a woman aged 60 to 65, does any work after having qualified and having been paid pension, 6d. is deducted for each complete 1s. of earnings between 50s. and 70s. and 1s. deducted for each complete 1s. over 70s. Where the insured person postpones his retirement beyond pension age, his pension, when he qualifies for it, will be increased by 1s. 6d. for every 25 contributions in the 5 years after pensionable age. *Wives:* If a pensioner has a wife under the age of 60, either living with him or mainly maintained by him, he will get an extra 30s. a week for her, provided she is

not gainfully occupied. When a man qualifies for pension, his wife, if she has reached 60, will be entitled to a separate pension on his insurance. The basic rate for the pension will be 30s. a week, but it will be increased by 1s. a week for every 25 contributions the husband pays after he has reached 65 and she has reached 60. A wife insured in her own right can draw retirement pension on her own insurance, even though her husband has not retired. *Widows:* A widow will qualify on her late husband's insurance for a retirement pension of 50s. a week if, immediately before reaching 60, she was drawing one or other of the various widow's benefits under this Act.

Non-contributory pensions. Anyone who had reached 55 years of age when the new pensions under this Act began to be paid will qualify, subject to his means, for a non-contributory pension on reaching 70, if he or she is not qualified for a retirement pension.

Death grant. This grant is payable for the expenses connected with the death of an insured person or with the death of his wife, or child, or widow. Where the insured person is a woman a grant is payable on the death of her husband or child. The grant is £25 for an adult; £18 15s. for a child aged 6 to 18; £12 10s. for a child aged 3 to 6; £7 10s. for a child under 3.

Income and expenditure. Actual expenditure on benefits in 1954-5 financial year and estimated expenditure in 1959-1960, 1969-70, and 1979-80 (amounts in £ millions):

Benefits	1954-5	1959-60	1969-70	1979-80
Retirement pensions	348	430	558	665
Widow's benefits and guardian's allowances	32	37	38	34
Unemployment benefit	16	59	62	61
Sickness benefit	84	95	104	102
Maternity benefits	13	12	12	12
Death grant	3	4	7	11
Cost of administration	26	28	29	30
Totals	522	665	810	915

Income of the National Insurance Fund in 1954-5 was as follows (amounts in £ millions):

Contributions by employers and insured persons	489
Exchequer supplement	71
Interest on investments of National Insurance Fund and National Insurance (Reserve) Fund	52
Total	612

National Insurance (Industrial Injuries) Act, 1946, see WORKMEN'S COMPENSATION.

National Liberal Club provides a central, convenient, and inexpensive club in London for Liberals and their friends throughout the kingdom. It was opened in 1887, is pleasantly situated on the Thames Embankment near Charing Cross station, and houses the Gladstone Library of 40,000 books, mainly political and sociological.

National Maritime Museum, Greenwich, London, founded by Sir Geoffrey Callender

and estab. by Act of Parliament in 1934. The museum buildings include the Queen's House designed by Inigo Jones (completed in 1635) (see GREENWICH). The collection gives a conspectus of the maritime hist. of Britain, in part by exhibits showing the development of the sciences of ship-building and navigation, nautical books, charts, instruments, etc., and in part by marine paintings, portraits, and contemporary ship models of considerable artistic interest.

National Parks. The term national park is variously used in different countries. The accepted definition in Great Britain, drafted by the late John Dower in his report on N. P. (1945, Cmd 6628), reads: 'An extensive area of beautiful and relatively wild country in which, for the nation's benefit and by appropriate national decision and action, (a) the characteristic landscape beauty is strictly preserved, (b) access and facilities for public open-air enjoyment are amply provided, (c) wild life and buildings and places of architectural and historic interest are suitably protected, while (d) established farming use is effectively maintained.'

Under the National Parks and Access to the Countryside Act, 1949, the N. P. Commission was set up with powers to designate N. P. and areas of outstanding natural beauty in England and Wales, to guide the administration of N. P. by the park planning authorities, to propose long-distance footpath routes, to assert the claims of amenity in places where natural

beauty is endangered, and to provide information services. Ten N. P. were designated from 1951 onwards, and by 1957 all had been confirmed by the minister of housing and local gov. These are Peak Dist., 542 sq. m.; Lake Dist., 860 sq. m.; Snowdonia, 845 sq. m.; Dartmoor, 365 sq. m.; Pembrokeshire Coast, 225 sq. m.; N. Yorks Moors, 553 sq. m.; Yorks Dales, 680 sq. m.; Exmoor, 265 sq. m.; Northumberland, 398 sq. m.; and Brocon Beacons, 515 sq. m.

Administration. The N. P. are administered by planning boards or committees,

or joint advisory committees, representing one or more co. planning authorities, with a minority of members (normally one-third) appointed upon the recommendation of the minister after consulting the N. P. Commission. Their powers are exercised under the Town and Country Planning Acts (*see* TOWN AND COUNTRY PLANNING), and the National Parks Act, with a special direction under the National Parks Act to have regard to the needs of agriculture and forestry, and additional powers to provide accommodation, meals, camping sites, and parking grounds for visitors. They may acquire lands for these purposes, improve waterways, and co. or co. bor. councils may restrict road traffic. The National Parks Act enables the gov. to make grants for these and other purposes and for preserving and enhancing beauty in the parks.

Nature reserves, etc. The National Parks Act also empowers the Nature Conservancy, and local planning authorities in consultation with the conservancy, to declare areas as nature reserves, and gives powers for their control and management.

The N. P. Commission may designate areas of outstanding natural beauty; up to July 1958 five areas has been designated and confirmed: the Gower Peninsula, Llyn, the Quantock Hills, the Surrey Hills, and the Northumberland Coast. Areas had also been proposed in Cornwall, Dorset, Devon, Cannock Chase, Shropshire Hills, Malvern Hills, and the Sussex Downs. It was intended to add half a dozen areas a year.

Long-distance routes. Between 1951 and 1955 five long-distance footpaths were proposed and approved: the Pennine Way, 250 m.; two Cornish coast paths, 135 m. and 133 m.; Pembrokeshire coast path, 150 m.; and Offa's Dyke, 168 m. Others are planned for coasts in Devon, Somerset, Dorset, Yorks, and for the S. Downs and Welsh Highlands. By 1958 rights of way were available for the greater part of the first five routes, but for certain portions negotiations were still proceeding.

Despite the progress achieved, enthusiasts urge that much has still to be done for users of the paths and N. P. Some farmers and lovers of quiet places, on the other hand, stress the damage done by inconsiderate visitors, and plead for more education of the public in behaviour. To achieve this the commission run a continuing campaign based on the *country code*.

National parks abroad. Many other countries have national and state parks and nature reserves, often of huge extent and nationally owned as well as controlled, and some reserved wholly from development. The world's first, Yellowstone Park in U.S.A. (1872), is over 3000 sq. m.; some other famous U.S. reserves are the Yosemite, Glacier, Grand Canyon, Mt Rainier, Sequoia, and Rocky Mt Parks. The U.S. Federal Parks alone extend to 34,000 sq. m. and are visited by 50 million annually. Canada also has immense mt parks, among them Banff (1885), Kootenay, Glacier, Yoho, Mt Revelstoke, and the Selkirk; Jasper, the largest, is of 4200 sq. m. Argentina's

largest, the Nahuel Huapi Park, has 3000 sq. m. In S. Africa the greatest are the Kruger National Park, of 8000 sq. m., and the Kalahari Gemsbok game reserve of 3000 sq. m. Kenya, the Belgian Congo, and other parts of central Africa have vast mt and wild life reserves. Japan's 19 N. P. (7000 sq. m.), 14 nature reserves (1600 sq. m.), and historic 'national gardens' are visited by 40 million a year. Soviet Russia's 40 nature reserves (5600 sq. m.) are devoted mainly to scientific and educational purposes. Spain puts its accent on mt parks for tourists, and on

hunting and fishing interests; the Netherlands on natural reserves for recreation; Poland on its great mt and forest parks; Turkey on forests; and Belgium on small reserves of distinctive geological and biological character. There are also N. P. or reserves in Germany, Italy, Sweden, and Switzerland. The Australian states and New Zealand have many N. P. The Rep. of Ireland owns a state park in Killarney and a number of state fisheries. Scotland has as yet (1958) no N. P., but the Forestry Commission has declared certain areas to be 'National Forest Parks.' *See Town and Country Planning*, Aug. 1956 (National Parks issue); *Report of Committee on National Parks* (England and Wales) (Cmd 7121), 1947; Ditto (for Scotland), 1947; *Annual Reports of National Parks Commission*, 1950 on; *Annual Reports of Nature Conservancy*, 1952 on; also R. N. Hutchins, *National Parks and Access to the Countryside Act*, 1949, and

Norman Browning, *National Parks and Access to the Countryside*, 1950.

National Physical Laboratory, opened in 1900, managed by an executive committee and general board, but under the ultimate control of the Royal Society, with the object of assisting industries, research, etc. It is now a research estab. of the dept of Scientific and Industrial Research at Teddington, Middx. There are 9 main divs.: (1) Physics; (2) Light; (3) Electricity; (4) Control Mechanisms and Electronics; (5) Metrology; (6) Mathematics; (7) Aerodynamics; (8) Metallurgy; (9) Ship. A list of all papers pub. by the laboratory on the results of researches is issued quarterly. See SCIENTIFIC AND INDUSTRIAL RESEARCH.

National Playing Fields Association, founded 1925. Aims and objects: (1) To secure adequate public playing fields for the present and future needs of all sections of the community. (2) To secure properly equipped playgrounds for the use of children. (3) To co-operate in saving threatened recreational facilities. (4) To act as a centre of advice for local authorities and interested persons on all matters connected with the acquisition, lay-out, and use of grounds set apart for the playing of games. (5) To encourage local authorities to make the fullest use of their powers when preparing town-planning schemes to ensure that ample open spaces are secured, and that when slum clearance schemes are initiated children's playgrounds shall be provided. (6) To encourage physical recreation, and to ensure that the fullest use is made of all recreation grounds. (7) To encourage the training and appointment of play leaders and coaches. (8) To encourage all members of the community to make the right use of leisure hours. The Duke of Edinburgh is president of the N.P.F.A.

National Portrait Gallery, London, first of its kind and unrivalled in the world, was founded in 1856, estab. at S. Kensington in 1869, and finally moved to the present building to the N.E. of the National Gallery in 1898. A much-needed extension was made possible in 1931 through the generosity of Lord (then Sir Joseph) Duveen. Its chief feature is the collection of portraits of Brit. historical characters, the upper rooms containing portraits, arranged chronologically, of the sovereigns from Richard II. Chaucer, Shakespeare, Cromwell, and the 2 Pretenders; while the lower rooms contain portraits of celebrated statesmen, divines, writers, artists, and others. Among its treasures may be mentioned the 'Chandos' portrait of Shakespeare, and among its later acquisitions (1945) the series of 'Kit-Cat' portraits of famous Augustans painted by Kneller. There are specimens of Van Dyck, Reynolds, Gainsborough, Romney, Raeburn, Lawrence, and G. F. Watts. Photographs are not included, but the National Photographic Record (1917 to date) is housed in the same building. There is an admirable catalogue by the first director, Sir George Scharf, K.C.B. (1820-95), with more recent revisions, and a supplement pub. in 1954. For the

Scottish National Portrait Gallery see EDINBURGH.

National Provincial Bank Ltd, one of the 'big five' Brit. joint-stock banks, estab. in 1833, the first branch being opened at Gloucester in 1834. On 10 Jan. 1866 the bank started to do banking business in London, and sacrificed, by this step, its right to issue its own notes. In 1874 the institution was registered as an unlimited company under the Companies Acts, but on 8 April 1880 it was decided to register the bank as a limited liability company. In 1918 amalgamations were made with the Union of London and Smiths Bank and the Bradford Dist. Bank. In the following year the Sheffield Banking Company was also absorbed and sev. other banks have been taken over since the First World War. The head office of the bank is at 15 Bishopsgate, London, E.C.2.

National Register, census of Great Britain, taken on 15 Aug. 1915 and 29 Sept. 1939 to facilitate the best use of manpower in war-time and operated in conjunction with food rationing.

National Research Development Corporation was set up by the Development of Inventions Act which was passed 30 July 1948. An object of the Act is to secure to Brit. industry the benefits of inventions and discoveries by Brit. scientists. The corporation's functions are (a) to secure, where the public interest requires it, the development or exploitation of inventions resulting from research by gov. and other publicly financed organisations, and any other inventions which it considers are not being sufficiently developed or exploited; and (b) to accept, acquire, and hold rights in inventions (including new processes and techniques) and to grant or dispose of such rights for consideration or otherwise. The corporation, which in its work must comply with the general directions of the Board of Trade, has no special powers of acquiring patents, i.e. it cannot compel private firms owning patents to sell them, and inventors are in the same legal relations to it as to any other third party. The Board of Trade may advance to the corporation (within 10 years of its estab.) up to £5,000,000 for working capital. The corporation may borrow temporarily up to £250,000 for general or specific purposes, whilst if it is asked by a gov. dept. in the public interest, to carry out a project which results in a loss, the latter may be recouped out of public funds.

National Rifle Association, founded in 1860, and incorporated by royal charter in 1890, to encourage rifle shooting in the queen's dominions. From 1860 to 1889 meetings were held at Wimbledon, after which they were held at Bisley. The first shot at the first meeting at Wimbledon was fired by Queen Victoria from a Whitworth muzzle-loading rifle. The competitions at Bisley attract marksmen from all parts of the world. For particulars as to prizes, range, etc., see RIFLE SHOOTING. The offices of the association are at Bisley Camp, Brookwood, Woking, Surrey.

National Savings Certificates, first issued in Feb. 1916, to raise money for the First World War, since when there have been sev. later issues and one conversion issue. The first issue was at the cost price of 15s. 6d. each certificate, with a maturity value of 26s. after 10 years and interest at 1d. a month after the tenth year; the price of the other issues was 16s., excepting the sixth and seventh which were 15s., and the period 10 years for the second, third, conversion, and sixth and seventh issues, 11 years for the fourth issue, and 12 years for the fifth issue. Maturity values were, for the first and second issues, 26s., 24s. for the third issue, conversion issue, 24s., fourth and fifth issues, 23s., sixth issue, 20s., seventh issue, 20s. 6d., and eighth issue, 13s.

The amount remaining (principal plus interest) increased only very slowly after the Second World War from £1900 m. in 1946 to £2400 m. in 1955. During this period personal income increased by some two-thirds. The rate of interest on N. S. C. followed prevailing rates of interest when the bank rate was raised in 1951. But the rate of interest is probably not a dominant factor influencing the amount invested; the more important ones are security of capital value and liquidity. In a period of inflation, capital values were not secure and liquidity was a source of weakness, since N. S. C. were encashed more readily than other less liquid forms of investment.

National Security Council, U.S.A., estab. by the National Security Act of 1947, and amended by the National Security Act Amendments of 1949 and the Mutual Security Act of 1951. Its purpose is to advise the president concerning the integration of domestic, foreign, and military policies relating to the national security, so as to secure more efficient co-operation between the military services and the other depts and agencies of the gov. on matters involving the national security. The council is composed of the president, vice-president, secretary of state, secretary of defence, director of the foreign operations administration, and director of the office of defence mobilisation. The Central Intelligence Agency is under the direction of the council, and the operations co-ordinating board also reports to the council.

National Socialism, Ger. nationalist movement led by Adolf Hitler (q.v.). Hitler's party was founded at Munich by Drexler in 1919 as the Ger. Labour party and renamed the National Socialist Ger. Labour party by Hitler. In 1920 the party adopted a programme the chief aims of which included the union of all Germans, abrogation of the Versailles treaty, persons of Aryan blood only to be members of the nation, foreign nationals to be excluded from Germany, nationalisation of trusts, substitution of Ger. for Rom. law, nationalist education, and improvement of the nation's physique. Mainly the nationalist, as distinct from the Socialist, slogans were fulfilled, and from the year 1933, when Hitler came to power, no attempt at systematic socialism in

the traditional sense was made, though economic initiative and control passed entirely to the State, not out of regard for Socialist theory but in furtherance of the policy of rearmament. The Nazi (q.v.) party, the sole lawful political association in Germany, was based on the leadership principle and the party members had no rights in relation to the conduct of policy, which was the exclusive function of the 'Führer.' Subsidiary organisations of the party of a compulsory character were the Ger. Labour Front, comprising all employees, and the *Hilferjugend* (Hitler Youth), and the party also organised its own military forces, the S.A. (*Sturm-ableitung* or storm troops) and S.S. (*Schutzstaffel*, protective squadron). After the S.A. purge of 30 June 1934 the S.S. or *elite* assumed greater importance in the party system. A party congress was generally held at Nuremberg every year. The original basis of the party lay in the lower middle class, which the Nazis promised to save from the ruin threatened by big business and the economic crisis; but while the small trader's business increased, he suffered from heavy taxation and price control, while, later, 'superfluous' small shops and businesses were closed down altogether and the idea of saving the most needy section of the middle class was soon abandoned.

See further under **HITLER**.

National Sporting Club, club for gentlemen interested in sporting and theatrical matters. It was started in 1891, and was long noted as the scene of the princely contests, both amateur and professional, in the boxing world. After the Second World War the club ceased to exist.

National Stud, Brit. state-sponsored racehorse breeding farm, founded by Lord Waverley in 1916 as a private stud, and presented by him to the nation. Its first centre was at Kildare, Rep. of Ireland, but in Oct. 1943 it was moved to Gillingham in Dorset. The N. S. is one of the princely centres of the bloodstock industry, and the finest possible racehorses are bred for both the home and foreign markets. Stamina and speed are carefully studied, and only horses with a long record of racing successes are kept for breeding. A stallion at the N. S., being national property can be used by any owner with a mare good enough to be mated with him, and the stud fee is appreciably lower than on a good private stud farm. Nominations to the more popular stallions are decided by ballot. The queen leases horses from the N. S. and pays the gov. one-third of any stake money she wins. Although nominally a non-profit-making concern, the N. S. shows an accumulated profit of £195,000 since its foundation.

National Theatre (Britain). N. T.s have existed for many years in other European countries than Britain. The movement for a N. T. in Britain is a comparatively recent development, and the first plans for a N. T. to be built by public subscription were laid by Harley Granville-Barker (q.v.) and Wm Archer (q.v.) in 1903.

Seven years later this scheme was combined with another already in existence, to provide a national memorial to Shakespeare. The appeal then launched by the Shakespeare Memorial N. T. Committee attracted many distinguished supporters. The largest contribution was that of Sir Carl Meyer, who gave £70,000 towards the cost of building a theatre which it was hoped to open in 1916 in the tercentenary of Shakespeare's death, but this was prevented by the outbreak of war in 1914. In 1937 a site of one acre near the Victoria and Albert Museum was purchased. After the Second World War it was decided that the N. T. should be erected in a more central locality. The L.C.C. offered to exchange a site on the S. bank of the Thames for the site in S. Kensington and also to provide approaches and roadways to the centre. The Joint Council of the N. T. and the Old Vic then had at its disposal about £70,000, but it was estimated that a worthy memorial theatre would cost about £1,000,000. This sum being outside the range of the Joint Council, it was decided to ask Parliament to underwrite the project. The gov. accordingly introduced a 2-clause Bill to that effect (1949). The first clause provided that the Treasury might make a contribution not exceeding £1,000,000 towards erecting and equipping the theatre, and the second made provision for the appointment of trustees. The architects' plans provided for a building containing 2 theatres: one seating 1200 people and the other about 500. It was also intended by the gov. to organise N. T. tours throughout the country and overseas. The proposed N. T. is not to be looked upon solely as a memorial to Shakespeare, especially in view of the memorial theatre at Stratford-on-Avon; but rather as the first of a chain of living theatres throughout the country.

National Trust. The N. T. acquires lands and houses of historic or architectural interest to ensure their preservation. Founded in 1895 by Octavia Hill, Sir Robert Hunter, and Canon Rawnsley, its status was confirmed by the National Trust Act, 1907, and later Acts of 1919, 1937, and 1939 confirmed and increased its powers. Land or buildings given or bequeathed to the N. T., together with any endowment, are exempt from death duties; properties can only be accepted if they are self-supporting or accompanied by an endowment to make them so. Under the 'country house' scheme it is possible for donors or their descendants to continue to live in the house they have given to the N. T. The N. T. is administered by a president and a council of 50, partly elected and partly appointed by various representative bodies. There are 9 voluntary committees meeting regularly at the head office of the N. T. to deal with particular spheres of work, and over 100 local committees. The Trust is independent of the State and is not a gov. dept. It is a charity dependent on voluntary support and its main sources of revenue are endowments, legacies, donations, and members' subscriptions. Membership of

the N. T. is open to anyone; there is also a corporate membership scheme for companies and firms.

Many types of land and property are preserved by the N. T. One of its finest houses is Knole, in Kent, a combination of country home, Renaissance mansion, eccles. palace, and feudal manor house, given in 1946 by Lord Sackville. There are also Little Moreton, Cheshire, a fine specimen of 16th-cent. half-timbered work, Montacute in Somerset, Blickling Hall in Norfolk, with an estate of 4500 ac., and others. Castles include Bodiam (c. 1386), Tattershall (c. 1440), and Lindisfarne (1550). There are nearly 20 pre-Rom. and Rom. antiquities, including Chedworth Rom. villa and Hadrian's Wall; Lacock Abbey is a fine example of medieval architecture. Whole vils. have been placed under the Trust's care: the Holnicote estate alone includes Selworthy, Allerford, Bossington, and Luccombe. Tenants are found for more than 500 farms. Many miles of coast of England, Wales, and Ulster are owned or protected. There are mts such as Scafell Pike, moorlands such as the 12,240 ac. Holnicote estate, and valleys such as the 1250 ac. Dolmelynllyn estate on the Ffestiniog road. Ornithological reserves include the Farnes Is. (Northumberland) purchased in 1924 by public subscription, the Calf of Man, and Wicken and Burwell Fens. In 1949 the N. T. undertook the care of gardens alone accepted on their merits, and a joint committee with the Royal Horticult. Society was set up for this purpose. The first garden so accepted was Hildote in Glos, and others now include Sheffield Park and Nymans in Sussex, and Mt Stewart and Rowallane in N. Ireland. Bridges are also preserved, such as Stainforth Bridge in Yorks, Easing in Surrey, and sev. packhorse bridges in Somerset. The largest single estate belonging to the Trust is that of Penrhyn. It extends to 40,000 ac. and was given in 1951 by the Treasury who had accepted it in lieu of death duties. The H.Q. of the N. T. are at 42 Queen Anne's Gate, London, S.W.1; there is a separate N. T. for Scotland, and similar bodies have been instituted in other countries, including Rep. of Ireland, Belgium, U.S.A., Australia, and New Zealand.

National Union of Mineworkers, The. founded Jan. 1945 by the amalgamation of the trade unions previously affiliated with the Miners' Federation of Great Britain. This federation of coal miners' unions was estab. in 1888 with a membership of 36,000, and its political power received an impetus from Fr. ideas before the First World War, though the leaders of the great coal strike of 1912 were not syndicalist. Before the First World War the Federation's programme was nationalisation and state administration of mines, but after that war it was changed to a demand for national ownership coupled with democratic control by the workers. This programme of guild socialism was in fact presented before the Sankey Commission in 1919. Present-day membership totals over 669,000.

National Union of Teachers (N.U.T.), official organisation of the members of the teaching profession engaged in state-provided primary and secondary schools and Institutes of further education; it may be termed the teachers' trade union. It was formed in 1870 and its chief objectives are: (1) To associate and unite the teachers of the kingdom of England and Wales. (2) To provide means for the co-operation of teachers and the expression of their collective opinion upon matters affecting the interests of education and the teaching profession. (3) To improve the conditions of education in this country, to obtain the estab. of a national system of education, and to secure for all public elementary schools adequate financial assistance and accommodation. (4) To afford to the Ministry of Education and

In the 1930's the growing philosophy of state control of economic affairs contributed to the success of collectivist propaganda. So also did the rapidity of Britain's progress towards 'rationalisation,' and a series of war-time or pre-war reports, e.g. the Sankey Commission Minority Report on coal-mining, the Royal Commission on Transport, the McGowan and Heyworth reports on electricity and gas. The State assumed control of the mines and the railways in both the world wars. The Labour Gov.'s Coal Mines Act of 1930 provided for price and output regulation to sustain the existing pattern of production. When the Labour party returned to power in 1945 it carried through a chain of N. measures in 9 Acts of Parliament within four and a half years:

	<i>Royal Assent</i>	<i>Testing Date</i>
1. Bank of England	14 Feb. 1946	1 Mar. 1946
2. Civil Aviation	1 Aug. 1946	1 Aug. 1946
3. Coal	12 July 1946	1 Jan. 1947
4. Cable and Wireless (undertaken by Post Office)	6 Nov. 1946	1 Jan. 1947
5. Transport	6 Aug. 1947	1 Jan. 1948
6. Land Development Rights (Town and Country Planning Act)	6 Aug. 1947	1 July 1948
7. Electricity	13 Aug. 1947	1 April 1949
8. Gas	30 July 1948	1 May 1949
9. Iron and Steel	24 Nov. 1949	15 Feb. 1951

other public or private organisations in connection with education the advice of the association. (5) To secure the effective representation of educational interests in Parliament. (6) To watch the working of the various Acts of Parliament in connection with education, and to secure the removal of abuses. (7) To raise the status of the teaching profession, and to open the highest posts in the education service of the country, including the inspectorate of schools, to the best equipped members of the union. The present membership is 225,000, being approximately 80 per cent of the total number of teachers. The offices are at Hamilton House, Mabledon Place, W.C.1. See *The Yearly Handbook and Account of the Conference Proceedings*.

Nationalisation. The estab. of the Post Office Savings Bank by Gladstone in 1861 is generally hailed as the first N. measure in Great Britain. The N. technique is essential to the institution of State ownership and to public control of the means of production, distribution, and exchange. At its Southport conference in 1934 the Labour party declared for 'public ownership and control of the primary industries and services,' and listed for subsequent N. banking and credit, transport, water, coal, electricity, gas, agriculture, iron and steel, shipping, shipbuilding, engineering, textiles, chemicals, and insurance. Herbert Morrison urged persistence with such a programme 'until within a reasonable time we are substantially masters of the economic fabric of the community and the means of production and distribution.' Official Labour party policy had resisted, hitherto, the confiscation of private property.

The salient provisions of some representative post-war N. measures were:

Bank of England Act. (1) The whole stock of the Bank of England, hitherto owned by 17,000 private stockholders (of whom 10,000 owned less than £500 each), was taken over by the Treasury, with powers, in consultation with the governor, to give directions to the bank. (2) The court of governors was reduced from a deputy-governor and 24 directors to a deputy-governor and 16 directors, all appointed by the Crown. 'The Bank of England is already very largely a department of the Treasury,' commented Lord Pethick-Lawrence, 'and its nationalisation will not make a pennyworth of difference to the bulk of the people. . . .'

Civil Aviation Act. This was based on the Labour Gov.'s White Paper of 1945 (Cmd. 6712) and the war-time Conservative-dominated Coalition Gov.'s White Paper of 1944 (Cmd. 6605). It brought all regular air transport services under national ownership and control, ended nearly all competition, furnished state finance for the 3 corporations, and authorised the minister to tell them what aircraft to employ, and where. A consolidating measure followed in 1949.

Coal Nationalisation Act. This made 8 divs. of the country's 8 coal-producing regions, each with a divisional board appointed by the National Coal Board, with each div. broken into 49 areas, each with an average of 20 collieries. National Coal Board members comprised specialists in production, labour relations, finance, marketing, etc. This project reinforced the war-time coal control of the Ministry of Fuel and Power with its 12-section regional structure. Two

industries—road transport and iron and steel—have been nationalised and then denationalised.

Earlier transport legislation comprised: (1) the Railways Act, 1921, the first U.K. experiment in 'rationalisation'; (2) the Road Transport Act, 1930, which forbade the provision of passenger road transport except by road service licence-holders (Labour); (3) the London Passenger Transport Act, initiated by the Labour Gov. in 1931, which became law under the National Gov. in 1933 and gave legislative sanction to 100 per cent monopoly; (4) the Road and Rail Traffic Act, 1933, which extended licensed semi-monopoly from road passenger traffic to road haulage. The Transport Act, 1947, created the Brit. Transport Commission, with chairman and 4 to 8 members to be appointed by the minister, estab. 5 public authorities (executives), railway, docks and inland waterways, road transport, London transport, and hotels, and interpreted the railway executive as a 3-tiered structure, with regions akin to the former railway companies. The Transport Act of May 1953, the denationalisation measure, restored the principle that alternative forms of transport should be 'co-ordinated' by consumers' choice, and arranged for the sale to private enterprise of the road haulage undertaking of the Brit. Transport Commission.

The movement for iron and steel N. dates from 'rationalisation' measures in 1932 and 1934, the Import Duties Act, the 33½ per cent duties on iron and steel imports (contingent upon 'reorganisation'), and the relationship between the Import Duties Advisory Committee and the Brit. Iron and Steel Federation (which fixed prices and controlled competition). The terms of the Iron and Steel Nationalisation Act, 1949, were that the securities of the firms either working 50,000 tons or more of iron ore or producing 20,000 tons or more of pig-iron or 20,000 tons or more of ingot steel or hot-rolled steel each year should be transferred (with subsidiaries) to a new corporation with the powers of a holding company over its nationalised subsidiaries. The Conservative Gov. unscrambled the 1949 Act with its own denationalisation measure, the Iron and Steel Act, 1953, but retained a large proportion of the 1949 machinery in order to establish an independent Iron and Steel Board, entrusted with the duty of fixing maximum prices and of supervising the industry's supply of raw materials. Proposals have been advanced from time to time for the N. of the land. They have made little headway.

In the early 1950's the Labour party showed symptoms of disappointment or even disillusion with N., and by the late 1950's N. had almost disappeared from Labour policy statements. It was replaced by proposals for acquiring ownership of (part of) the controlling shares of large companies ('N. by the back door').

Chester, *The Future of Nationalisation*, 1953; Select Committee on Nationalised Industries, *Special Report*, 1955.

Nationalism, spirit of nationality, the predominant feature of the modern state system and, in the language of political thought to-day, the antithesis of internationalism. In an age when political ideas and doctrines have become the staple of current conversation, N. has occupied the forefront of discussions of foreign affairs as one of the idea-forces in the contemporary world. N. is not to be confused with racialism, for many races may be incorporated in one nation-state, though racialism was the strongest element in the particular type of N. preached by Hitler. N. was the inevitable sequel to the growth of the nation-state out of feudalism and the medieval conception of sovereignty as developed by Machiavelli, Hobbes, Locke, and Rousseau. N. is a commonplace to-day, because it is natural that a politically compact people, speaking the same language and sharing the same historical traditions and social customs or creed, should be united as a sovereign independent nation. It is only with the growth of the modern spirit of nationality that the complex problem of the national state arises. Neither religion, language, territory, tradition, nor economic interests can claim monopoly or even predominance in the growth of N. Unity of language is a strong factor but by no means decisive; Soviet Russia contains hundreds of different languages. Conversely a common language did not prevent the separation of the Amer. colonies from England. Unity of religion may have formed the national character of the Spaniards or the Scots, but the great religious split between Protestants and Catholics has failed to prevent national unification in Germany. Unity of economic interest has more often than not been ignored in favour of more irrational considerations—the hist. of the peace treaties of 1919 shows an almost uninterrupted record of N. cutting across economic ties. Perhaps the most prevalent influence is community of hist., tradition, and culture, difficult to define in general terms, but altogether exercising an immensely powerful influence. Certainly patriotism may be the dominant note with individual political thinkers, as illustrated by Mazzini's stirring address to his fellow countrymen (1859) to take up arms against their foreign masters. In the early 19th cent. N. was a revolutionary force, deriving its impetus from a sense of tyranny among many peoples who were far from enjoying political freedom. This revolutionary force was most strikingly exemplified in France, under the inspiration of the teaching of Rousseau. This teaching spread to other nations of Europe, and within a cent. the spirit of nationality produced an independent Greece, Belgium,

Serbia, Norway, Italy, and Germany. N. has become an articulate force throughout the world; thus the consciousness of nationality was only awakened among the Chinese by the labours of Sun Yat-sen, though in his *Three Principles of the People*, 1924, he speaks of his country's 'lost nationalism, the revival of which is the divine mission of its four hundred million people.' Under this revolutionary influence the peoples of the European countries became conscious of nationality for the first time in their hist., with all its implications, the chief of which was that patriotic men of the same nation should be brothers-in-arms ready to defend their liberties and traditions, their customs or way of life, against the tyrant, and their hearths and homes against the external aggressor. N. has yielded impressive results in political democracy, inspiring great deeds, stimulating art and literature, and promoting popular education. But it was employed too often to emphasise to citizens what was peculiar in tradition and achievements to their own nation, rather than what mankind shared by way of common heritage. It emphasised the exclusiveness of each state and it encouraged selfishness in a new and national form. It brought nations which had not yet achieved complete unity and independence, like the Poles, the Irish, and the Czechs, into conflict with more fortunate nations; while in the fortunate nations it induced a selfish intolerance which led to the oppression of dissident minorities and to the forcible imposition of their own civilisation arbitrarily upon those whom they regarded as 'inferior' races. Yet N. had an important mission in the world by marking the final conflict and end of 2 forces which are the worst enemies of civil freedom—the absolute monarchy and the revolution. Ideally N. should have led, not retrogressively to 18th-cent. indifferent cosmopolitanism, but towards 20th-cent. internationalism, to a federation of all the free nations of the world for mutual co-operation and support. It was the tragedy of N. that on the eve of the First World War it had not led to this goal; on the contrary, it was the major predisposing cause of that war. N. was no less a decisive factor in bringing about the Second World War. Ger. N. became so aggressive that it sought to interfere in the affairs of other states wherever there were minorities of Germans. Everywhere in the 20th cent. the spirit of nationality operated to reinforce the anarchy both of international politics and of international economics. Conversely N. in the U.S.A., whose public opinion has a profound effect on policy the world over, was so narrowly involved in what may be called the Amer. way of life as to stress isolationism and to turn away from internationalism even at the cost of security. A most important development of N. in Germany, Japan, and the other newer states was the economic activity of the state, in which theories of a planned economy acquired force from protective tariffs as an integral factor of political strategy. In modern

Germany this has been especially exemplified by the malign activities of the I. G. Farben Trust in exploiting, or in aiming at the exploitation of, the whole continent of Europe; but a development so directly in conflict with the individualism of liberal political theory, far from being a highly modern one, has its inspiration in the economic doctrines of Johann Gottlieb Fichte, Adam Müller, and Friedrich List. The emergence of Japan as a national state affords striking parallels to that of Germany in spite of the very different racial, historical, and social background, the nobility, feudal leaders, and merchants creating a modern state which rested on very similar foundations to those of the Germany of Hitler. If in the older national states (Britain, U.S.A.) political authority and economic interests did not co-operate in a common plan, the exigencies of war have resulted in assimilating their relative position closely to that of the totalitarian states. In modern conditions, when improving communications have made the world one economic system, N. has outlived its day. It has a place only as a means of emphasising the need for freedom for national cultures. Beyond that it has no place in an age when the need is for the nations to co-operate in economic organisation and exchange, scientific research, and in combating disease. See B. Russell, *Freedom and Organisation*, 1814–1914, 1934; J. Huxley and A. Haddon, *We Europeans*, 1935; H. Laski, *The State in Theory and Practice*, 1935; L. C. Robbins, *Economic Planning and International Order*, 1937; *Nationalism*, by study group of Royal Institute of International Affairs, 1939; A. Zimmern (ed.), *Modern Political Doctrines*, 1939; E. H. Carr, *The Future of Nations and The Twenty Years' Crisis*, 1939; W. Röpke, *International Economic Disintegration*, 1942; W. Friedmann, *The Crisis of the National State*, 1943; H. M. Chadwick, *The Nationalities of Europe and the Growth of National Ideologies*, 1945; B. C. Shafer, *Nationalism: Myth and Reality*, 1955.

Nationalist Party (Irish), Irish political movement for Home Rule (q.v.) which became an important force in the Brit. House of Commons in the late seventies of last cent. under Parnell (q.v.). When the Liberals and Conservatives were of almost equal strength the Nationalist vote was of vital importance. John Redmond (q.v.) succeeded Parnell as the party's leader in 1890. It became defunct in 1918 on the rise of Sinn Féin (q.v.).

Nationality Act, British (1948). This Act, which was enacted on 30 July 1948, replaces the British Nationality and Status of Aliens Act of 1914 as the basis of the law of Brit. citizenship. Every person who, under this Act, is a citizen of the U.K. and colonies, or who is or becomes a citizen of Canada, Australia, New Zealand, the Union of S. Africa, India, Pakistan, S. Rhodesia, and Ceylon, shall by virtue of that citizenship have the status of a Brit. subject. Every such person having such status has the choice of being known as a Brit. subject or as

a common citizen of the commonwealth, both expressions having the same meaning (this proviso was made because some might not wish to be called Brit. subjects, e.g. Fr. Canadians or Indians or Sinhalese). The Act provides a new method of giving effect to the principle that the people of each self-governing country within the Brit. Commonwealth have both a particular status as citizens of their own country and a common status as members of the commonwealth. Under a common clause accepted by all the commonwealth countries (except the Rep. of Ireland, q.v.) all persons recognised as Brit. subjects in any part of the commonwealth are recognised as such throughout the whole of it. To preserve the principle of complete unity of status, there is a single citizenship, governed by identical conditions and applicable without distinction to the peoples of the U.K. and Brit. colonies. The permanent provisions governing the acquisition of citizenship of the U.K. and colonies are based on the principles previously governing the acquisition of Brit. nationality under the Act of 1914. The first generation *b.* in another commonwealth country of a father *b.* in the U.K. or colonies is a citizen of the U.K. and colonies, but not the second generation. Citizens of the U.K. and colonies who acquire citizenship of other commonwealth countries (i.e. possessing 'dual citizenship') may, if they wish, denounce their citizenship of the U.K. and colonies. Citizens of the Rep. of Ireland cease to be Brit. subjects, though Rep. of Ireland citizens in the U.K. at the time the Act was passed continue to have all the rights and obligations of Brit. subjects, and all Rep. of Ireland citizens are treated under Brit. law in the same way as Brit. subjects and not as aliens. The Act removes women's disabilities as regards nationality, and for nationality purposes married women are placed in the position of single women. From the date when the Act became law, women citizens of the U.K. and colonies do not, as theretofore, lose their citizenship on marriage to aliens, and may only divest themselves of it by a formal act of renunciation. Women married to aliens when the Act was passed had their nationality restored, becoming citizens of the U.K. and colonies or of some other commonwealth country. Alien women marrying citizens of the U.K. and colonies no longer automatically acquire citizenship on marriage, but if they desire may apply for registration, to be granted in the home secretary's discretion. Women citizens of other commonwealth countries on becoming citizens of the U.K. and colonies do not automatically acquire their husband's citizenship, but may claim it as of right, whether or not they are resident in the U.K. or colonies.

In April 1949 Eire (S. Ireland) became, by her own action, a rep. and left the commonwealth. But, in fulfilment of the Brit. Prime Minister's promise that S. Irishmen would not be treated as foreigners in the U.K., in spite of their country's unilateral action in declaring

her independence of Crown and commonwealth, the U.K. Parliament in May introduced the Ireland Bill, one purpose of which was to confirm citizens of the new rep. in all the rights which they held in the U.K. while the Rep. of Ireland was still a member of the commonwealth. The effect of the Bill is that inhab. of the Rep. of Ireland can claim to remain Brit. subjects or, if they prefer, be citizens of the Rep. of Ireland and still reside in the U.K. on the same conditions as in the past. A new clause was inserted in the Bill as the result of an amendment by the Lords to which the gov. agreed. It made clear that, whatever might be the position under the Rep. of Ireland, a person *b.* in S. Ireland of a S. Irish father, who was domiciled in N. Ireland on 6 Dec. 1922, and who had not acquired the Rep. of Ireland citizenship by residing permanently in S. Ireland on or after 10 April 1935, or by registering as a Rep. of Ireland citizen, did not cease to be a Brit. subject on 1 Jan. 1949, and became on that date a U.K. citizen unless he was a citizen or potential citizen of some other commonwealth country. But the special status thus accorded to Irish citizens by this Bill involves questions in international law and international relationships which are not within the competence of the Brit. Parliament to settle, and indeed they remain to be answered.

Nativity, name for Christmas, celebrating the birth of Jesus Christ on 25 Dec. The N. of the Blessed Virgin Mary is celebrated on 8 Sept.; this festival was formally appointed to be observed by the Synod of Salzburg in AD 800, but had in reality been celebrated since about 690. The N. of St John the Baptist is celebrated on 24 June. For the various usages in connection with the N. of Christ, see CHRISTMAS. In astrology N. has the same meaning as horoscope.

N.A.T.O., see under NORTH ATLANTIC TREATY.

Natrolite, zeolite, secondary product after minerals of the nepheline group, is found in the basalts of Ireland and Scotland, Auvergne, etc. It has the composition $\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 3\text{SiO}_2 \cdot 2\text{H}_2\text{O}$, is white or yellowish-red in colour and usually transparent (sp. gr. 2.2, hardness 5.5). Fuses in the candle flame, and gelatinises with acids, silica being liberated.

Natron, naturally occurring sodium sesquicarbonate, $\text{Na}_2\text{CO}_3 \cdot \text{NaHCO}_3 \cdot 2\text{H}_2\text{O}$, formed by the gradual drying up of soda lakes. Deposits occur in many regions, notably near Lake Magadi in Kenya, in Mexico, Venezuela, Hungary, and the U.S.A. The **N. Lakes** are a group of lakes, some 8 in number, situated in the Wady Atrun or N. Valley, Libyan Desert, Egypt, 60 m. WNW. of Cairo. The locality is also noted for 4 monasteries, from whose libraries many valuable MSS. have been added to European collections.

Natterjack, or Rush Toad (*Bufo calamita*), found in N. and W. Europe, and Britain. It is smaller than the common toad, with shortened hind limbs and short, almost webless toes; it is yellowish-brown, with a yellow line down the back. It

moves by walking or by short runs instead of hopping. The male has a vocal throat sac which, when distended, is larger than the head. The eggs are laid in the water and the tadpoles are extremely small.

Natural (in music), term applied to any uninflected note (i.e. notes on the white keys of the piano). The normal key, which begins on C, is constructed on N.s. The sign ♯ is used to cancel a preceding sharp or flat.

Natural Gas. In some parts of the world gases of different composition are found associated with rocks of varying geological age. They are usually confined under pressure, and boring serves to free them from their site. The gases often consist of a mixture of hydrocarbons of the methane series in which the first member, methane, predominates. But there may be present ethane, propane, butanes, pentanes, hexanes, etc., as well as nitrogen, carbon dioxide, and sometimes helium and other rare gases. Occasionally hydrogen sulphide is present in fair amounts. These N. G.s are frequently associated with oils. About 95 per cent of the world production of N. G.s comes from the U.S.A., whilst Canada is responsible for the larger proportion of the remaining 5 per cent. The gases are commonly carried for hundreds of miles in pipes and are employed for heating purposes, domestic and industrial. The calorific value is high (unless a high percentage of nitrogen is present), being in the region of 1000 B.Th.U. per cub. ft. In addition to this, N. G. has been put to useful advantage in the making of many valuable organic products such as methyl chloride, alcohol, etc., in the driving of gas engines (q.v.). In Utah, Colorado, and at Medicine Hat in Alberta there occurs a N. G. which is comparatively rich in helium, and by a process of fractionation all the other gases present are liquefied, whilst the helium is pumped off and purified as far as possible. This is the source of the helium employed in science and industry. The origin of this gas is probably radioactive transformations which have taken place in the past.

To some extent N. G. is found in coal-mines, when it gives rise to the dreaded firedamp. The mixture of the gas with air is apt to be a very explosive one, and as it has neither any particular colour nor smell it can only be detected by special means (see DAVY LAMP). Again the N. G. sometimes takes the form of carbon dioxide mainly. This, in virtue of its high density compared with that of air, is inclined to collect in pockets.

Natural History, term which originally meant the systematic study of all natural objects, animal, vegetable, and mineral, and thus included all sciences, such as biology, geology, chem., etc. With increasing knowledge and the growth of specialisation, such a term by its very vagueness became unsuitable in many cases. Subsequently it became restricted to the biological sciences, and then to field studies of animals and plants, where it has recently been supplanted by ecology (q.v.). The name is now falling into

desuetude, but survives in such titles as the Museum of N. H., or, to give it its true title, the Brit. Museum (N. H.). See *Biology, History*.

Natural History Museum, see BRITISH MUSEUM.

Natural Order of Plants, system of classification of the members of the vegetable kingdom according to the natural affinities of their structural and essential characters. Individual plants, identical in their constant characters, belong to a *species*; related species to a *genus*; related genera to a *family* (formerly termed natural order); related families to an *order*; related orders to a *class*; and related classes to a *division*. Intermediate categories are denoted by the prefix *sub* (e.g. subgenus).

Natural Philosophy, term denoting science as a whole, or that branch of it usually called physics at the present day. The philosophy of the ancients included the study of natural phenomena and hypotheses regarding their relations. As knowledge progressed, there was a tendency to subdivide science into various spheres. In the course of differentiation, the term natural philosophy was retained for the science of the physical properties of bodies. See also HEAT; LIGHT; MAGNETISM; PHYSICS; SOUND. See Sir M. Whittaker, *From Euclid to Eddington*, 1949.

Natural Theology deals with such knowledge of God as may be attained by the human reason without the aid of divine revelation. The Eng. classical defence of N. T. is Wm Paley's *Evidences of Christianity*, 1794. The aim of N. T. is to prove that God exists and to evolve such a notion of God as is attainable by pure human reasoning. This it strives to do from 6 main arguments: (1) That of general consent. The universal belief of mankind has more than a subjective value; it bears witness to a law impressed in our nature. (2) The cosmological argument, which, taking the world as the effect, argues *a posteriori* to a first cause. (3) The teleological argument, or argument from design, stated by Paley in his first chapter, where he makes the well-known comparison of the world to a watch. (4) The ontological argument, which we owe to St Anselm, which bases belief on the statement that 'that must exist than which no greater can be conceived.' It is developed at length in his *Proslogion*. The argument of St Anselm is generally discarded. (5) The argument from man's moral sense; and (6) the argument from design in hist. Aquinas elaborated (2) and (3) into his 5 proofs of the existence of God, as the first mover, the first efficient cause, the necessary and independent being behind all contingent things, as the supreme good which is the source of every perfection, and as the ultimate designer of a designed universe. From each and all of these attributes he deduced the idea of God as simple, spiritual, autonomous Being, infinite and perfect, transcending the created universe. See F. C. Copleston, *Aquinas*, 1955.

Naturalisation, see **ALIEN**.

Naturalism, philosophical term which has borne different meanings according to its use. At present it generally denotes the antithesis of Idealism (q.v.), and is akin to, though differing slightly from, materialism and pantheism. In theology it is the denial of the supernatural system of sanctifying grace.

'**Nature**,' weekly periodical, estab. in Nov. 1869. In leading articles and notes it directs attention to the impact of scientific advances on human affairs. It also includes articles on new scientific work, full accounts of new discoveries, reviews of notable books and papers, and accounts of noteworthy meetings.

Nature Printing, name of a process of obtaining plates or engravings by means of impressions taken from the actual objects, and by printing from these impressions. This process can only be used in connection with objects which have flat surfaces, such as lace, and dried plants. The result is obtained by placing the object between 2 plates, one of copper and another of lead, and by pressing the plates by means of a pair of rollers. The impression thus produced on the leaden plate may be used if only a few copies are needed, but if a large number are required a facsimile of it may be obtained on copper by the electrotype process. A more direct method, called *Hay Printing*, is to place a piece of wood just under type-high on a hand press. Ink a copper plate, lay the grass or leaf on the inked plate, and cover with a sheet of clean waste paper. Place a sheet of rubber over all and close the press. Give a hard squeeze with plenty of dwell. Lift the inked copper plate off the wooden block, substituting a clean sheet of copper on which place the paper to be printed. Lift off the rubber sheet from the inked pad, peel off the waste sheet, and with tweezers lift the object from the inked plate and lay it inked side down on the printing paper. Add a sheet of waste, then the rubber pad and print. Remove the rubber and waste sheets by lifting the object from the paper.

Nature Study, frequently a subject in the curriculum of a school, especially primary schools. The study of nature rather than of books has, however, long been argued by educational reformers. Claims for N. S. have been based on philosophical and pedagogical grounds. The first reflect the 17th-cent. interest in science and methods of acquiring knowledge. Pedagogically, N. S. emphasises the importance of things rather than words, observations rather than rote learning, and is held to provide opportunities for children to learn through having their interest aroused in their natural environment. In practice, N. S. has been identified with the study of plants and the habits of animals. Many primary schools have nature tables where collections from nature are exhibited. The vocational interest of N. S. has been developed in some schools through gardening, and by the keeping of small livestock, like poultry and bees. The theory which lies behind the practice of N. S. is

still widely held in educational circles throughout the world.

Nature Worship assumes various forms. Usually the powers of nature are personified and made the object of adoration (see **ANIMISM**; **FETTERISM**; **MYTHOLOGY**; **TOTEMISM**). Fertility cults are often important (see **PHALLUS**). The sun and moon and stars have been worshipped (see **ASTROLOGY**), and still are among some peoples. So too with rivers, water, and mts; sometimes the thing itself is adored, sometimes a spirit embodied in it. See also **MOON**; **PAGANISM**; **PANTHEISM**; **SUN WORSHIP**. See Sir J. G. Frazer, *The Golden Bough* (3rd ed.), 1907-15, and *The Worship of Nature*, vol. 1, 1926, and W. Schmidt, *Origin and Growth of Religion*, 1931.

Naucratis, Gk trading settlement in Egypt, near modern Nebireh, and approached anciently by the Canopic mouth of the Nile. It was discovered in 1884 by Petrie, and identified by inscriptions and much early Gk pottery. Traces of the sev. temples mentioned by Herodotus were found. N. was probably originally a Milesian colony founded in the 7th cent. BC. Its zenith was in the 6th cent., and it was still important in Ptolemaic times.

Naudé, Gabriel (1600-53), Fr. scholar and librarian, b. Paris. He studied medicine at Paris and Padua, and was physician to Louis XIII. In 1628 he took charge of Cardinal Bagnio's library, and in 1641 was librarian to Cardinal Barberini and later to Queen Christina of Sweden. His book *Advis pour dresser une bibliothèque* (2nd ed., 1644), was the first to consider the methodical arrangement of a library. In 1653 he was requested by Mazarin to come and help him to re-form his library, which N. had helped to collect, and was on his way when he d. at Abbeville.

Nauen, Ger. tn in the dist. of Potsdam, 15 m. NNW. of Potsdam (q.v.). It has engineering and food-stuff industries, and formerly had a radio station. Pop. 13,000.

Naugatuck, tn coextensive with Naugatuck bor. in New Haven co., Connecticut, U.S.A., situated below Waterbury. It is a rubber centre; it manufs. chemicals, glass, plastics, wire goods, jute and cotton fibre products, machinery, and tools. Charles Goodyear estab. a rubber factory here in 1843. Pop. 15,300.

Nauheim, Bad, Ger. spa in the *Land of Hessen* (q.v.), at the E. end of the Taunus Mts (q.v.), 28 m. NE. of Wiesbaden. It has thermal saline springs, and there are medical research institutes. Pop. 14,000.

Naumachia (Gk *naumachia*, from *naus* - ship; *machē*, a battle), the name which the Romans gave to the mimic sea-fights which were waged as a spectacle, and also to the scene of the combats. The latter took place sometimes in the Circus Maximus, water being introduced sufficient to float ships. The first N. on record represented an engagement between the Tyrian and Egyptian fleets, and was given by Julius Caesar in 46 BC in the Campus Martius. The custom of

exhibiting naumachiae was not confined to Rome, as we find arrangements for flooding the amphitheatre at Capua and Nîmes. The combatants fought as in the gladiatorial games, no quarter being given; gladiators or condemned criminals were employed.

Naumburg, Ger. tn in the dist. of Halle, on the Saxonian Saale (q.v.), 25 m. S.W. of Halle (q.v.). It once belonged to the Hansatic League (q.v.) and has a fine 13th-14th-cent. cathedral. It has a wine trade and engineering industries. Pop. 40,000.

Naunton, Sir Robert (1563-1635), statesman and author, b. Alderton, Suffolk. Educ. at Trinity College, Cambridge, he became public orator to the univ. He was made master of requests by James VI and I in 1603, and after holding other political offices was appointed secretary of state in 1618. He wrote *Fragmenta Regalia, or Observations on the Late Q. Elizabeth*, her *Times and Favorites*, 1641. See ed. by J. Caulfield, 1814, with N.'s memoirs.

Nauplion, or Anapli, tn and seaport, cap. of dept of Argolis and Corinth, Greece, at the N. extremity of the Gulf of Argos or Nauplion, and 7 m. S.E. of the tn of Argos. In the 13th cent. it was occupied by the Venetians, and was taken by the Turks in 1540. From 1824 to 1834 it was the cap. of Greece. The roadstead is one of the best in Greece, having deep water and good shelter. Pop. 8500.

Nauplius, King of Euboea and father of Palamedes. To avenge the death of his son, whom the Greeks had killed during the siege of Troy, he watched for their return, and as they approached the coast of Euboea wrecked them by lighting torches on the dangerous promontory of Caphareus.

Nauplius, unsegmented larvae of the lower crustacea with a single frontal eye. See CRUSTACEA.

Nauru Island, is. in the Pacific Ocean, situated in 166° E. long. and 26° S. lat., administered under mandate by Great Britain, Australia, and New Zealand. In Nov. 1947 the U.N. general assembly brought N. I. within the U.N.'s trusteeship system, with the govs. of Australia, New Zealand, and the U.K. as joint administering authority. Valuable phosphate deposits were discovered in 1900 and developed by the Pacific Phosphate Co. In 1919 these interests were bought up by the mandatory govs. The revenue in 1938 was £30,000. The is. was bombed by Jap. planes on 10 and 12 Dec. 1941, and occupied in Aug. 1942, until the Jap. surrendered in Sept. 1945. Area 8 sq. m.; pop. 2700, of whom 200 are Europeans.

Nausea, sense of sickness at the stomach, a desire to vomit. The word is derived from the Gk *naus*, a ship, and is therefore especially associated with sea-sickness. The condition is, however, brought about by many varied affections of the nerves and digestive organs, and is a symptom of many diseases.

Nausicaa, beautiful daughter of Alcinous, King of the Phaeacians, and his

queen Arete, noted for her simplicity, modesty, and gentleness. One day while she played ball on the shore with her maidens, the shipwrecked Ulysses suddenly appeared, striking terror into all but N., who took him to her father. See *Odyssey*, vi.

Nautch Girl (Hindu *nach*, dance), Indian professional dancing girl. Many are attached to temples where they perform sacred dances in bejewelled dresses; others are hired to entertain guests at private secular dances, i.e. nautches in the strict sense. The dance consists of posturing and slow steps, each part of the body being used to express emotion.

'Nautical Almanac' gives the spherical co-ordinates of the moon for every hour, and of the sun, planets, chief stars, and also the rectangular co-ordinates of the sun, for every day of the year (those of the stars change so little that 10-day intervals suffice), time of occultations, of sunrise and sunset, moonrise and moonset, of eclipses, and scores of other matters essential to the astronomer. It is pub. annually at least a year in advance and collaboration between the N. A. office and other similar institutions in different countries is essential, owing to the magnitude of the work involved in making the necessary calculations. It was first produced in 1766 for 1767, and was the responsibility of the Astronomer Royal until 1832 when it was pub. by order of the Board of Admiralty.

Nautical Surveying, see HYDROGRAPHIC SURVEYING.

Nautiloids, fossil cephalopod molluscs with straight or coiled chambered shells, and gently curved transverse septa. They range from Upper Cambrian to Recent times. *Nautilus*, which is tetrabranchiate, is the only living representative.

NAUTILUS POMPILIUS

A, swimming; B, shell in section;
C, crawling.

Nautilus, name given to 2 distinct Cephalopods, but the pearly N. is generally indicated, the paper N. being referred to the quite distinct genus *Argonauta*. The genus N. inhabits the Indo-Pacific Ocean

and differs from all other living Cephalopods in having 4 gills instead of 2, whence it is placed in a separate order (Tetrabranchia) of its class. Of over 30 genera of that order it is the only surviving genus. It differs, too, in having a number of small retractile feelers instead of arms with suckers and hooks, and in having an external chambered shell. The shell is pearly within, and has a regularly convoluted form, the last whorl being equal to all the others. The chambers or cells are perforated towards the centre by a slender tube or syphon. The number of partitions in the cell indicates the periods of growth, a new outer chamber being added as the capacity of the previous one is outgrown. The total number of compartments is often about 30. Externally the shell is covered with a calcareous layer and is brown in colour and marked by dark bands 'like a tortoise-shell cut.' The shell yields a fine mother-of-pearl, which is used for inlaying. The N. frequents the sea bottoms, where, with its foot, it can make fairly rapid progress. It lives chiefly on molluscs and small crustaceans, and is sometimes taken in lobster pots and hoop nets. Like other members of its class, it occasionally swims backwards on the surface by propelling spouts from the syphon, the head and tentacles being projected out of the shell; but the rise is probably involuntary and caused by storms. The animal appears to be much exposed to the attacks of various enemies, having no operculum, and being but feebly attached to the shell, and it is a Cephalopod which lacks the power of discharging an ink-like fluid to darken the water to escape from its enemies. On the Nicobar coast of India its flesh is salted and dried.

Navaho, most important tribe of the S. div. of the Athabaskan stock of the N. Amer. Indians. They acquired sheep from the Spaniards, and after wars with the U.S.A., in 1863 Col. 'Kit' Carson killed their sheep and took most of the tribe prisoners; later they settled to a sheep-rearing life in New Mexico and Arizona; their blankets are famous. They number about 45,000. See C. Kluckhohn and D. Leighton, *The Navaho*, 1947.

Naval Air Arm, title given in 1946 to the air component of the R.N., previously known as the Fleet Air Arm (q.v.). The N. A. A., or naval aviation, comprises from one-quarter to one-third of the total strength of the R.N.

Naval and Military Research Societies. Probably the best known of these is the Royal United Service Institution, with its imposing home in Whitehall. There are among others the Institute of Royal Engineers at Chatham; the Royal Artillery Institution at Woolwich, and the Institution of Naval Architects; the Society for Army Historical Research; the Society of Nautical Research; and the Navy Records Society. Most of these bodies issue quarterly magazines: *The Journal of the Royal United Service Institution*, *The Royal Engineers' Journal*, *The Journal of the Royal Artillery*, *The Mariner's Mirror*, *The Journal of the*

Society of Nautical Research, and *The Journal of the Society for Historical Research* (estab. soon after the First World War) are all well-known productions which deal with naval and military subjects of current or historical interest. The Navy Records Society has no periodical, but issues rare and hitherto unpublished records of the navy in vol. form, dealing with special events or important persons.

Naval Cadet, see NAVAL EDUCATION.

Naval Colleges, Royal, see NAVAL EDUCATION.

Naval Discipline Acts define the offences and procedure of naval law. The first comprehensive code was drawn up by command of Richard Cœur de Lion in 1194 after his return from the third crusade. This code was known as the Naval Laws of Oléron from the is. in which the code was drawn up and sealed. It became the virtual basis of the sea laws of 1530 drawn up by order of King Henry VIII, of which naval discipline forms a large part. The Act which is now in force is the Act of 1884, which amended the Act of 1866. This Act defines the constitution of the court-martial which tries naval offences, and regulates its personnel according to the rank of the person charged. The Act also defines the limit of locality for naval law. It was revised in 1957. See COURTS-MARTIAL.

Naval Education, for officers, is given at: (1) The Royal Naval College, Dartmouth, through which officers are normally admitted to the R.N. Under the new scheme, estab. in 1956, competitive examinations, held near the candidate's own school, make an initial selection, and admissions are finally decided by a full day's test of character, aptitude, and intelligence. There is free board and lodging, parents paying for uniform and personal expenses according to their means. (2) The Royal Naval Engineering College, Keyham, for officers specialising in engineering. A course lasts 4 years and midshipmen join the college on completion of their cadet training. New classes join in Jan. and Sept. each year and training qualifies officers for service afloat in the engineering branch. (3) At sea by instructor and technical officers. (4) The Technical Schools of Gunner, Torpedo, Navigation, etc., at Portsmouth, and, to a smaller extent, at other dockyard ports, where all executive sub-lieutenants must qualify for lieutenant. Technical schools also provide courses for specialists and other officers. (5) The Royal Naval College, Greenwich, estab. in 1873 for the education of naval officers. Also includes the Naval Staff College, the Naval War Courses, the School of Naval Architects, and Women's Royal Naval Service Officers' Training Course. Instruction is given to naval and marine officers in all branches at all stages of their career in theoretical and scientific study bearing on their profession. The Royal Naval College is commanded by an admiral or vice-admiral (president) assisted by an administrative and professorial staff. The president also has direct control of the Naval War Courses, where

both senior and junior officers study the higher strategy of war. The Naval Staff College is commanded by a captain R.N. (director). Officers from the army and R.A.F. also attend the Naval Staff and War Colleges. (6) Other estabs. such as the Tactical Joint Anti-Submarine, Signal Schools, Royal Naval Air Stations, etc. All R.N. educational estabs. are open to officers of the dominion navies and those of India and Pakistan. Officers of foreign navies may also attend for special courses. For men and boys—at boys' training

estabs. such as H.M.S. *Ganges* (Shotley), H.M.S. *St Vincent* (Gosport), at R.N. barracks, in the training squadron, and at technical schools. At sea general education is carried out by instructor officers and schoolmasters. R.N. vocational training to give men an opportunity to improve their prospects of employment on return to civil life is carried out mainly by lectures at the naval depôts and at municipal training colleges, etc.

Naval Expenditure. The real beginning of the expenditure of a fair proportion of the public funds on the upkeep of the navy dates back to the time of Cromwell. Previously the navy, such as it was, had been supported chiefly by special grants and by ship money, a tax which is supposed to date back to the time of Alfred the Great. By the end of the Napoleonic

war (1815) the expenditure had reached the then colossal figure of £23,500,000. During the peace years which followed it remained evenly at about £7,500,000; this naturally increased during the Crimean War, when the figure again crept up to about £20 million. In the financial year ending Mar. 1914 the total amount voted for the navy was £45,075,000. Between the end of the First World War and 1935 various naval treaties kept N. E. within reasonable limits, and it did not much exceed £50 million. In 1935-6 expenditure was £60,050,000, a low figure in view of the fact that Germany was now free to build up to a higher ratio to Brit. construction and that scientific development in armaments involved ever-increasing expense. The chief factor in enhancing Brit. N. E. was the refusal of Japan and Germany to remain bound by any treaty limitations whatever. In 1938-9 the total was £113,810,000 and, in view of the menacing international situation, Great Britain contemplated adopting the 'escalator' clause (allowing building over the 35,000-ton limit) of the London Treaty, owing particularly to Jap. construction. In the year 1939-40 the figure rose to £149,399,000, 50 ships being added in the previous year and 60 more in the year 1939, all this construction being directed against Germany. In 1940-1 the total amount of N. E. rose sharply to £384,162,000, construction being limited only by the building capacity of the shipbuilding yards. This figure continued to rise and in 1943-1944 reached £690,563,761. On conclusion of the Second World War it naturally fell, and in 1948-9 dropped to £153 million. In the following year, however, it began to rise again to £189,250,000, owing mainly to improvements in naval and civilian emoluments, exhaustion of war stocks, and higher prices. With prices still rising, with the necessity to replace obsolescent equipment and to meet the advance of science by supplying the fleet with the latest devices (all more complicated and expensive), it is inevitable that N. E. remains high; but it is being reduced in accordance with the new defence plan for Britain announced in the White Paper pub. on 4 April 1957. The net total of the navy estimates, 1957-8, was £2316 million, nearly £33 million less than the previous year. Under the new defence plan the strength of just over 120,000 in April 1957 will be reduced by the end of 1962 to below 100,000.

Naval Gunnery. The gun was the main weapon of the navies of the world from the time of its invention up to the Second World War, when aircraft were first used extensively in naval warfare. A basic problem of N. G. has always been that the ship provides a platform which is moving and unstable owing to the motion of the sea, and much technical skill and ingenuity have been directed to the solution of that problem. The naval gun of to-day, which is controlled by equipment that allows for the speed and course both of the firing ship and its target, and which is directed

by radar and fired automatically, is a most accurate weapon. Although aircraft were widely used by navies in the Second World War to attack ships and shore targets, and for defence against aerial attack, N. G. played an equal if not predominant role in all the aspects of the war at sea. All ships had to be ready to defend themselves by gun-fire from aerial attack. Ships destroyed by naval gun-fire included the *Hood*, *Bismarck*, and *Scharnhorst*, while allied battleships and smaller ships provided valuable gun-fire support to allied invading armies in Europe, N. Africa, and the Far E., by sustained and accurate bombardment of enemy shore targets. The roles of the gun and of aircraft in naval warfare are essentially complementary, but both weapons are certain to be replaced, to a degree as yet unknown, by the guided missile.

Naval Manœuvres. see NAVY AND NAVIES and STRATEGY AND TACTICS.

Naval Operations in Second World War. *Blockade of Germany.* The naval side of the war was opened by the Germans sinking by torpedo the 13,000-ton Atlantic liner, *Athenia*, on 4 Sept. 1939. This was the first Ger. submarine attack on the high seas and the ship, which was carrying 1400 passengers, was sunk without warning about 250 m. W. of Donegal; 128 persons lost their lives. As soon as war broke out the Brit. Gov. indefinitely suspended all their obligations under the London Naval Treaty, 1936, and the agreements of 1937 with the U.S.S.R., thereby giving Britain a free hand in building ships of any tonnage and armament whatsoever. The blockade of Germany was begun at once, though the war was quite well advanced before some of the more glaring loopholes in the blockade were plugged. While Italy remained neutral great quantities of oil and other essential commodities found their way through that country into Germany while, again, until Ger. exports were stopped, as a reprisal for the laying of magnetic mines, the blockade was defective in that it allowed Germany to exploit the various terrified 'neutrals.' Ger. merchant ships were soon being steadily driven from the seas in spite of the use of every artifice and every expedient of concealment to avoid capture. At the outbreak the total tonnage of Ger. ships at sea or in neutral or allied ports (excepting the Baltic) was about 1,105,000 tons. Practically all that shipping had been cleared off the seas by the second week of the war. Some was captured, some scuttled, and much of it interned. It was at once evident that Germany was prosecuting an unrestricted submarine campaign as violent as that on which her navy embarked in 1917, and that her submarine commanders had been given orders to sink all ships at sight and without warning. As time went on it became obvious that Germany's only hope of counteracting Britain's command of the seas was to sink, by fair means or foul, as great a total tonnage as possible. Early in the war only a certain measure of

success attended the R.N.'s operations against enemy submarines and it was fortunate that the menace did not at first approach the magnitude it assumed in the First World War. In Nov. 1939, after much mysterious talk about using 'a terrible secret weapon,' Germany tried the device of sowing the seas with magnetic mines dropped from aeroplanes or laid by submarine. But very soon one of these mines fell on swampy land on the E. coast so that its secrets were disclosed, with the result that ships were fitted with a defensive device called the 'degaussing' girdle (the gauss is a unit of magnetic flux) which had the effect of demagnetising or depolarising the ship. No less than 120,000 tons of Brit. merchant shipping were lost in the first fortnight of the war, while only 30,000 were lost in the second fortnight. In the ensuing period the total varied considerably, rising perhaps to as much as 70,000 tons Brit. and neutral. It was impossible, very early in the war, to apply the convoy system while so many of the ships were afloat on the high seas, but when it was applied its results were no less decisive than in the First World War. But however well devised and applied, these and other counteractive measures could hardly prevent occasional very serious losses at the hands of a powerful, determined, and resourceful foe.

Loss of 'Courageous' and 'Royal Oak.' On 17 Sept. 1939 the aircraft carrier *Courageous* (22,500 tons) was torpedoed and sunk, and of the total complement of 1202 officers and men, 515 lives were lost, including the commander. Grand-Adm. Raeder at about this time stated that if Brit. merchantmen were armed this would provoke counter-measures; but Churchill, then First Lord of the Admiralty, retorted that very soon the whole mercantile marine of the empire would be armed and, as time was to prove, their crews repeatedly defended themselves with success, often bringing down attacking seaplanes or bombers. Despite the menace from the air, vastly more developed than in the previous war, the navy's command of the seas enabled some 158,000 Brit. soldiers to be transported to France within 5 weeks from the outbreak of war—as compared with 148,000 men in 6 weeks in the First World War. More devious routes were taken than in 1914 and the ships had to carry a much greater load of guns, tanks, and mechanised material. Early in Oct. there was considerable intensification of the U-boat campaign against Scandinavian shipping and it was evident that the Ger. Gov. was not to be deterred by any considerations of neutrality where it was to their advantage to ignore them; and, at this time, the Ger. Gov. also announced that as Ger. submarines had been attacked by Brit. merchant ships every vessel of the Brit. mercantile navy would be regarded as a warship. This was a change of policy and was soon followed by the sinking of freighters off the coast of Brazil by an armed raider—probably the *Graf Spee* whose operations off the S. Amer. coast had been reported by the naval authorities at Durban. The

most serious loss sustained by the navy in the early days of the war was that of the *Royal Oak* on 14 Oct. in Scapa Flow, a few hours after 2 U-boats had been destroyed by depth charges S. of Ireland. The *Royal Oak*, a battleship of the *Royal Sovereign* class (29,150 tons), laid down in 1914, had recently undergone extensive repairs and had only been recommissioned in June 1939. After it had been revealed that the anchorage was not proof against the attack of a U-boat on the surface or half submerged at high water, steps were at once taken to obviate a recurrence.

German war on neutrals. The list of sunken cargo vessels was always a long one and the circumstances in which ships were torpedoed were frequently the theme of bitter comment by neutral ministers, who still seemed to labour under the impression that the Ger. Gov. would observe the accepted code of international usage. Thus there was an outcry in the U.S.A. on the Ger. seizure, on 15 Oct. 1939, of the Amer. *City of Flint* (5000 tons), carrying conditional contraband, in the Atlantic by the pocket battleship *Deutschland*, whose captain put a prize crew on board which took her to Murnansk. Later the vessel was released by the Soviet Gov. flying the swastika and was sighted by Brit. naval forces in Norwegian territorial waters. Fearful of Brit. action the Norwegians then interned the Ger. crew and restored the ship to her own crew. As regards the Brit. mercantile losses through the U-boat campaign, while no more than 1½ per cent of Brit. tonnage which was afloat at the beginning of the war had been lost at the end of a couple of months, the corresponding figure for the Ger. submarine service was 30 per cent. Moreover, by rebuilding, the net gain to the Brit. tonnage was considerable. Furthermore over 10 million tons of cargo were brought into Britain in the first 8 weeks of war and less than 250,000 lost; but over 40,000 tons consigned to Germany had been captured. Another severe Brit. loss occurred on 23 Nov. 1939, when the armed merchant cruiser *Rawalpindi* (16,687 tons) was sunk off Iceland. She was part of the N. patrol by which the contraband control of Ger. trade was enforced. In the face of overwhelming odds she engaged the Ger. battleship *Deutschland*, which was accompanied by another warship, maintaining the fight with her 6-in. guns until the whole ship was ablaze and sank with her flag flying, 39 officers and 226 men being lost. At this time 2 Ger. pocket battleships and probably one other cruiser were at large in the N. and S. Atlantic or near Madagascar. But already the Brit. Gov. had nearly 1 million tons of warships of all classes under construction and the number of hunting craft in home waters was trebled between 31 Aug. and 30 Nov. and was still being augmented.

Battle of the River Plate—'Altmark' affair. The most dramatic event at sea was now in process of enactment, when the Ger. pocket battleship *Admiral Graf Spee*, which had been operating in the Atlantic Ocean as a commerce raider since

the outbreak, was intercepted and attacked on 13 Dec. by the Brit. cruisers *Exeter* (8300 tons), *Achilles* (New Zealand ship, 7000 tons), and *Ajax* (7000 tons) off the coast of Uruguay, and, after a running fight lasting 14 hrs, was driven into the port of Montevideo, severely battered, with 36 of her crew dead and 60 wounded. The battleship, which was completed in 1936, was armed with six 11-in. guns and eight 5.9-in. guns, while her armament was superior to the combined power of all three Brit. cruisers, whose heaviest guns were only 8 in. The Brit. ships showed superior speed and manoeuvring and by using smoke screens boldly brought the enemy ship within range of their guns. The *Exeter* dropped out of the battle after suffering a number of hits, and proceeded to the Falklands for repair, while *Ajax* and *Achilles* kept up the pursuit. The *Graf Spee*, after endeavouring by one excuse or another to remain in Montevideo, was forced out of the harbour. Her captain, Langsdorff, was faced with the choice of submitting to internment or coming out to resume the fight with the Brit. cruisers which were watching outside the harbour for her. She came out, but not to fight, for she was scuttled in the fairway by her captain, who then took his own life. Yet all that awaited the battleship was *Ajax* and *Achilles* and the 8-in. cruiser *Cumberland*, which last-named had arrived to take the place of the damaged *Exeter*. The Ger. ship had on board 62 survivors of 9 Brit. merchant ships which had been previously sunk by her. These prisoners were released after the ship had put in to Montevideo, having been cooped up in the ship during the battle. The *Exeter*, which had led the attack, suffered a loss of 64 killed and 21 wounded and at the end only one 8-in. gun remained in action and that could only be fired by hand. The whole action was worthy to rank with the finest exploits of the R.N., and Henry Harwood, the commander of the squadron, was knighted and promoted to rear-admiral. The wreck of the *Graf Spee* was eventually sold to a Uruguayan dealer for £10,000. Over 300 other Brit. seamen, made prisoner from vessels sunk by the battleship before her destruction, were all this time aboard the Ger. vessel *Altmark*, which had been armed as an auxiliary ship. This ship had succeeded in escaping across the Atlantic and reaching the protection of Norwegian territorial waters which her captain proposed to use in order to convey the Brit. prisoners in triumph to Germany. But Brit. aircraft located the *Altmark* on 15 Feb. 1940, and she was intercepted by the Brit. destroyer *Intrepid* after having entered Josing Fjord in the hope of evading the Brit. warships. Orders were given by the Brit. Admiralty to enter neutral waters, search for the *Altmark*, and rescue any prisoners on board. Two Norwegian gunboats were at the mouth of the fjord. Captain Vian in command of H.M.S. *Cossack* offered to place a joint British-Norwegian guard on the *Altmark* and to escort her to Bergen for an investigation according to international law.

The offer was declined by the Norwegians, who declared that the *Altmark* was unarmed and that nothing was known of any prisoners on board. On these assurances the Brit. destroyers withdrew; but, after dark, on receipt of further Admiralty orders, the *Cossack* re-entered the fjord. The gunboats still refused to co-operate. The *Altmark* then tried to ram the *Cossack*, but ran aground and was boarded from the destroyer. After a short fight in which sev. Germans were killed or wounded, the *Altmark* was overpowered and the Brit. prisoners, numbering 299, discovered and released, part of the Ger. boat's crew surrendering while

civilian, use and were all armed with 'Asdics' (anti-submarine device), the depth charge, and the gun. The Germans broke every rule accepted by the world for regulating mine warfare. Besides this they committed outrages upon fishing fleets, small unarmed merchant vessels, and upon lightships, and in order to counteract these methods thousands of guns were issued to the Brit. merchant and fishing fleets. Neutrals came to accept the Ger. illegalities and atrocities as part of the ordinary day-to-day conditions of war. Early in 1940 a number of Ger. merchant vessels tried to escape from neutral ports, but were either seized by

THE END OF THE 'ADMIRAL GRAF SPEE'

others fled across the ice to the shore. This must be one of the most dramatic rescues in the hist. of sea warfare. The unfortunate prisoners had been confined below and battered down ever since the battle of 13 Dec. and had been subjected to brutal treatment by the *Altmark*'s notorious captain.

German illegalities. By the end of 1939 the Germans had lost 9 out of the 57 U-boats with which they started the war, and probably less than 10 fresh submarines came into action in that period. Thus the enemy probably ended the year with about 58 U-boats, of which 20 were required for training, and the number operating at any one time possibly did not exceed 10. Allied losses were substantial, and great preparations were made to cope with the full scale of attack which was to come later. Britain began the war with a very modest number of destroyers, and by the middle of 1940 some 28 had been sunk, the number being balanced by the acquisition of new boats. The hundreds of other small craft, which supplemented the destroyers, were boats converted from

Brit. ships or followed the customary Ger. policy of scuttling themselves, relying on Brit. gallantry to save their crews.

German losses in Norwegian waters. In April 1940 the Germans sustained heavy losses during the invasion of Norway, whose territorial waters their warships and merchantment, or troopships disguised as merchantment, were using with impunity. Once the Brit. Gov. laid mines in these waters, but when the actual invasion of Norway followed, the Brit. fleet had already been decoyed northward to Narvik while the Ger. troopships and troop-carrying planes crossed the Skagerrak and landed the invading forces. Earlier in these operations off Norway the Brit. destroyer *Glow-worm* was lost in N. waters. Off Narvik (9 April) the *Renown* sighted, amid snowstorms, the *Scharnhorst* in the dim distance and opened fire. She hit the Ger. ship's forward structure at 18,000 yds range, but the *Hipper* threw a smoke screen across the tracks of the *Scharnhorst* and she escaped. Five Brit. destroyers under Capt. Warburton-Lee (awarded the V.C. posthumously) on the

same day gained a victory at Narvik over a number of Ger. destroyers, sinking 3. The Ger. Navy, as a result of the operations between 7 and 11 April, lost 4 cruisers or one-half of their pre-war strength in this class of ship, a number of destroyers, sev. U-boats, and numerous store-ships and transports. Again, at Narvik, 2 days after Warburton-Lee's action, the *Waspide*, accompanied by a strong force of destroyers, and led by Vice-Adm. Whitworth, advanced up Narvik Fjord and sank 4 Ger. destroyers in Narvik Bay. Three others, which fled up a narrow inlet behind Narvik tn, were pursued and also destroyed. It was evident that in order to achieve the conquest of Norway the Germans were prepared to gamble with their navy. It is equally evident that had the Brit. Gov. realised that the invasion of Norway was intended, the R.N. might have sunk most of the rest of the Ger. Navy in the S. waters of Scandinavia. The Ger. invasion having proved entirely successful, the Allies laid a new minefield in the Cattegat and Baltic, so as to complete the blocking of all Germany's coastline both in the N. Sea and the Baltic as well as that of Dan. and Norwegian waters. On 14 April the pocket battleship *Admiral Scheer* was torpedoed by a Brit. submarine but not sunk. In the succeeding days Brit. submarines sank numerous Ger. supply ships and transports, notably off Narvik. In the 3 weeks from 7 April to 20 April there was intense naval activity in these waters, as is indicated by the losses on both sides. The Germans had 2 capital ships damaged, 3 and possibly 4 cruisers sunk, as well as the 7 destroyers lost in the Narvik actions, 30 transports and store-ships sunk, scuttled, or set on fire, with the loss of thousands of lives, and another 10 transports or store-ships were struck by torpedo and probably sunk. The R.N. lost 4 destroyers, 3 submarines, 1 sloop, and 5 trawlers; 5 other warships were damaged by air attack and 1 store-ship was sunk by a U-boat. From these figures it will be seen that the strength and efficiency of the R.N. were but little affected, but the damage to the Ger. Navy was so substantial as to alter the balance of naval power and to permit an important redistribution of the main allied fleets—a most valuable result in view of the fact that Italy was soon to declare war against the Allies.

In this period occurred the invasion of Holland when the bulk of the Dutch Navy, serving in European waters, succeeded in making their way to Brit. ports—like the Polish ships—to co-operate with the R.N. for the remainder of the war. These included 5 cruisers and a considerable destroyer and submarine force. The next exploit, in order of time, of the R.N., was the co-operation of the fleet with the R.A.F. in the evacuation of the Brit. expeditionary force from Dunkirk. (See under WESTERN FRONT IN SECOND WORLD WAR.) During the naval operations in connection with the withdrawal of the allied forces from Narvik,

the aircraft carrier *Glorious*, sister ship of the *Courageous*, was lost, together with 2 1350-ton destroyers, both the *Scharnhorst* and *Gneisenau* taking part in the action involving their loss. By now naval operations had been in progress against the Italians in the Mediterranean and very soon a number of their submarines were sunk by submarines or bombers; but the R.N. found it difficult to lure the It. fleet from its bases.

British attack on French fleet. By the terms of the Franco-Ger. armistice Fr. naval forces were to be demobilised, and had the Brit. Gov. taken no action the whole of the Fr. Navy would have passed into Ger. and It. hands for use against Britain. Under Churchill's lead the Cabinet decided on drastic action. The Fr. ships already in Portsmouth and Plymouth were at once taken under Brit. control. They comprised 2 battleships, 2 light cruisers, some submarines, 8 destroyers, and 200 small mine-sweeping and anti-submarine craft. But at Alexandria, where lay another Fr. fleet, the situation was more difficult, and it was only after some days that agreement was reached to demilitarise the ships. Had the Fr. commander disagreed his ships would have been sunk. Things were still more critical at Oran in N. Africa where lay a large Fr. fleet, including the finest of their battleships. At Oran and Mers-el-Kebir were the *Dunkerque* and *Strasbourg*—two of the most modern battleships in the world—2 other battleships, including the *Bretagne*, sev. light cruisers, and a number of destroyers, submarines, and other vessels. Adm. Somerville demanded that this fleet should either continue the fight against Germany and Italy, or sail with reduced crews to a Brit. port or to the W. Indies, or, if these alternatives proved unacceptable, that the Fr. commander should within 6 hrs sink his ships, failing which the Brit. admiral would use the necessary force to prevent the ships from falling into enemy hands. The parleys continued all day, but Adm. Gensoul, cowed by orders from Wiesbaden, rejected all alternatives. Before darkness fell Adm. Somerville opened fire on the Fr. fleet, which was protected by heavy shore batteries. The action lasted for only 10 min. and was followed by strong attacks from Brit. naval aircraft. The *Strasbourg* made off for Toulon, but was put out of action for a long time by Brit. torpedo attack. The *Dunkerque* was driven ashore, severely damaged, and attacked again later so as to ensure her virtual loss to the enemy, but eventually she too reached Toulon. The *Bretagne* was sunk, together with 2 destroyers. Heavy fire was directed on the Brit. ships but without damage. The It. fleet kept prudently out of the way. The net result of this tragic action was that of the 8 capital ships which France possessed at the time of the armistice between Pétain and Hitler practically all were prevented from being used by Germany against Britain. There was, of course, a furious outburst in Germany, for the action at Oran went far to redress what might have

been a serious adverse balance against Britain's naval power. A few days later (8 July) Brit. ships at Dakar, Fr. Senegal, took action against the *Richelieu*, the newly completed Fr. battleship. Terms having been refused, a Brit. naval officer dropped depth charges astern so as to damage the propeller and steering gear, and later aircraft attacked the ship with torpedoes.

'*Arandora Star*'—'*Bartolomeo Colleoni*.' In the same month (July) the Blue Star liner *Arandora Star* (15,500 tons), carrying 1500 Ger. and It. internees to Canada, was torpedoed and sunk by a U-boat in the Atlantic, about 1000 survivors being landed in Scotland. On 19 July H.M.A.S. *Sydney* (6850 tons), accompanied by a smaller destroyer force, won further laurels for dominion naval forces by sinking the It. cruiser *Bartolomeo Colleoni* (5069 tons) in the Mediterranean. The It. ship, with another cruiser, sped for her base, and being one of the fastest ships in the world's navies ought to have escaped. But accurate fire from the *Sydney* reduced her speed and enabled the destroyers to complete her destruction. In this month, too, a U-boat torpedoed and sank the *Meknes*, a Fr. merchant ship, off Portland, which was carrying 1280 Fr. naval officers and ratings for repatriation from England. There were only 400 survivors.

British Mercantile Marine losses.—The '*Jervis Bay*.' While the enemy's attention was almost exclusively devoted to the invasion of the N. neutrals, the losses of Brit. and allied merchant shipping sank to very low figures; but from then onwards the curve of destruction rose sharply, for the anti-U-boat craft employed on convoy escorts were progressively depleted. Hence it was all the more valuable to the allied cause to receive from the U.S.A. in Sept. some 50 old destroyers in return for the lease of defence bases in Brit. Atlantic ter. (W. Indies and Newfoundland). But the toll of losses continued to rise until, in Oct., it reached just over 400,000 tons, of which 300,000 tons were Brit. The losses then declined and averaged some 68,000 tons a week for the whole year. Their further substantial diminution, however, remained one of the chief problems facing the Brit. forces, especially as it was clear that the Ger. Gov. were bending their energies throughout the winter months to the construction of a great many more U-boats, in order to offset the advantage which Britain was obviously going to obtain from Roosevelt's Lease-and-Lend Bill by sinking cargoes of planes, guns, and tanks coming over the Atlantic. One of the Ger. pocket battleships at large in the Atlantic made an attack on 5 Nov. on some 38 ships in convoy, but all save 5 of them escaped, the immunity of the remainder being due to the gallant action of the armed merchantman *Jervis Bay* (Capt. E. S. Fogarty Fegan), which was accompanying the convoy and which, despite its greatly inferior armament, gave battle to the enemy against overwhelming odds and was of course, sunk. Fegan

went down with his ship and was posthumously awarded the V.C.

In the Mediterranean, where the collapse of France had left the Brit. Mediterranean fleet substantially inferior to the It. fleet, the balance was soon to be redressed in dramatic fashion. Brit. convoys and squadrons had continued to sail the sea at will, and every contact between the 2 navies ended with the precipitate retirement of the faster It. force. Engagements on various dates between June and Oct. had, however, already rather seriously reduced the It. Navy, when on 11 Nov., between Italy and Albania, a Brit. cruiser force came up with an It. convoy of 4 ships escorted by 2 destroyers. One was sunk, 2 set on fire, and one of the escort damaged before she could retire under the smoke screen she had put up for her own protection. The same night Fleet Air Arm aircraft, despite heavy anti-aircraft defences and balloon barrages, delivered a daring attack on the main It. fleet lying in Taranto. The new It. battleship *Littorio* and 2 of the *Cavour* class battleships were damaged so that they had to be beached to prevent their sinking, one of the latter so seriously that she was later abandoned. Two cruisers in the inner harbours were also damaged. The bulk of the fleet left the port, which till then had been its chief base, a few days later. At one stroke the It. battle fleet had been reduced from superiority over Cunningham's fleet to inferiority, even on paper. This was evident not long afterwards when the remnant of the It. fleet, consisting of the *Vittorio Veneto*—the other big new battleship—and a large number of cruisers and destroyers, on 27 Nov. encountered a Brit. force under Somerville—whose flagship was the *Renown*—S. of Sardinia. Once again the action took the form of a chase in which the Brit. ships naturally became strung out, the *Renown* leaving her heavier consorts far behind. But the It. ships were not to be caught and retired under smoke screens to the fortified port of Cagliari. That Adm. Cunningham's freedom of action was now greatly enhanced was shown decisively during the battle of the W. Desert, when his ships heavily bombarded It. positions at Bardia and Tobruk and elsewhere on the coast of Cyrenaica and thereby made an essential contribution to the hurricane Brit. victory (see AFRICA, NORTH, SECOND WORLD WAR, CAMPAIGNS IN). By this time, however, the hard-pressed Italians were receiving military aid from Germany in the form of bomber aircraft, which were based on Sicily. A major sea and air action was fought in the central Mediterranean on 10 Jan. 1941, when escorting ships of a convoy, passing through the Sicilian Channel and laden with much material assistance for Greece, were attacked by Ger. bombers. Two It. destroyers had been encountered earlier in the morning; one fled to safety, the other, heavily outgunned, fought courageously until she went down with all hands. Shortly after noon the new aircraft carrier *Illustrious* (23,000 tons) was heavily attacked by 15 Junkers dive-bombers of

the Luftwaffe, assisted by It. aircraft. The ship, though suffering damage and casualties, arrived safely in port, where she was repaired. The 9100-ton cruiser *Southampton* was also hit, and had to be abandoned. The Ger. and It. dive-bombers were heavily engaged by Brit. naval aircraft and 12 enemy planes were destroyed. The convoy emerged safely from the action and reached its destination. In the early morning of 9 Feb. ships of Force 'H' under Vice-Adm. Sir James Somerville, consisting of the battle-cruiser *Renown* and the battleship *Malaya*, the aircraft carrier *Ark Royal*, and the cruiser *Sheffield*, accompanied by light forces, bombarded military targets in Genoa, firing over 300 tons of shells into the port.

Lofoten Islands raid. The reality of sea-power and the value of the element of surprise in its operation were well exemplified on 4 Mar. when 10 enemy merchant vessels and an armed trawler were sunk and over 200 Germans taken prisoner, together with a number of Norwegian traitors, in a naval raid on the Lofoten Is. The main object of the raid, which was successfully accomplished, was to destroy the plant used for the production of fish oil for explosives, the whole of the output of which was absorbed by the Ger. masters of the is.

Material aid came from the U.S. Gov. in the spring of 1941 with the arrival in Brit. waters of 55 U.S. Navy submarine chasers and 18 mosquito torpedo-boats to join the Brit. Navy in hunting down the Ger. U-boats. These were the first of 99 U.S. warships scheduled for transfer to the Brit. Navy under Lease-Lend. Other ships included in the transfer were 17 over-age destroyers and 9 over-age submarines.

Battle of Cape Matapan. On 28 Mar. was fought an important naval battle in the Mediterranean when, some 100 m. to the SW. of Cape Matapan, Adm. Cunningham destroyed 3 heavy It. cruisers and 2 large destroyers, while another destroyer and a new battleship of the *Littorio* class sustained serious damage. The sole Brit. loss was that of one aircraft and its crew of two (see MATAPAN, BATTLE OF CAPE).

Battle of the Atlantic—operations between April 1941 and 20 June 1942. For several nights in the spring Brit. bombers made repeated attacks on the 2 Ger. battle-cruisers *Scharnhorst* and *Gneisenau*, which were sheltering in Brest harbour. Brit. planes repeatedly bombed the 2 ships, it being highly important to do everything practicable to reduce the great losses that were being sustained in what was called the battle of the Atlantic. Until the U.S.A. came into the war (Dec. 1941) the burden imposed on the R.N. was heavy in the extreme, for though Amer. ships conveyed supplies over part of the distance from Amer. ports it was some time before the protection was adequate enough to relieve the Brit. fleet from tasks which precluded action wheresoever Ger. or It. ships of war might be encountered. Even though Roosevelt had extended the 'combat zones' to the Mediterranean (June 1940) this protection could not in the

nature of things compensate Britain for the loss of the Fr. fleet. Yet even in the Mediterranean the R.N. was always on the alert. Thus on 21 April units of the Mediterranean fleet carried out a 45-min. bombardment of Tripoli, without either casualties or damage to the Brit. ships. In May, during the battle for Crete, the navy was engaged in most hazardous operations, their losses (3 cruisers, 1 anti-aircraft cruiser, and 6 destroyers) demonstrating the inability of surface ships to defend themselves in narrow waters unless they held the mastery of the air. The great event, however, of this time was the naval action which began off Greenland and ended some 400 m. off Brest, resulting in the sinking of the *Hood* and of the Ger. battleship *Bismarck*, 27 May (see further 'BISMARCK', 'TIC' and 'HOOD', 'THE'). About the same time the monitor *Terror* (7200 tons) and the equally famous gunboat *Ladybird* (625 tons) were lost in Ger. air attacks off the Libyan coast, both putting up a most spirited resistance before going down before overwhelming fire (see AFRICA, NORTH, SECOND WORLD WAR, CAMPAIGNS IN). The main event in June was the sinking by a Brit. submarine of the *Gorizia* (It. cruiser of 10,000 tons), the last of her class.

Italian naval attack on Malta. The first naval attack on Malta was made by a swarm of E-boats on 26 July. After an all-night bombing raid the It. E-boats were discovered off the is. at dawn. Brit. aeroplanes at once attacked, showering bombs on the intruders, while the Valletta coastal batteries opened an intense fire. The R.A.F. destroyed 4 E-boats, while the coast defences accounted for 5 more. It then appeared that the E-boats were acting as a cover for small torpedo-carrying craft, which tried to break into the harbour. Eight of them were blown up and none succeeded in entering the harbour.

Enemy losses up to August 1941. It may be noted that at this date the Admiralty estimated the enemy merchant shipping losses since the beginning of the war, by capture, scuttling, and sinking, at 4,007,000 tons (including 51 ships of 200,000 tons sunk by the Russians), this total being made up as follows: German, 2,321,000; Italian, 1,533,000; Finnish, 34,000; other ships in enemy control, 119,000. Also, from the outbreak of war up to Aug. 1941, 1118 enemy aircraft had been destroyed or damaged by ships' gunfire and naval aircraft, 537 being shot down into the sea and 581 damaged (203 believed destroyed). Of the 537 definitely destroyed, 348 fell to the guns of the fleet, 122 to naval aircraft, 55 to merchant ships, and 12 to allied warships.

Convoy battles in the Mediterranean.—The *'Ark Royal'* and *'Cossack'* sunk.—H.M.A.S. *'Sydney'* lost. In the Mediterranean again on 27-8 Sept. an important Brit. convoy beat off persistent attacks from the air. One merchant ship was damaged and had to be sunk. H.M.S. *Nelson* was hit by a torpedo but was not impaired. Thirteen enemy planes were

destroyed by Swordfish aircraft from the *Ark Royal* and by naval gunfire. On 8 Nov. an enemy convoy of 8 supply ships escorted by destroyers was sighted S. of Taranto by a Maryland aircraft, and a patrolling Brit. force under Capt. Agnew intercepted the convoy the following day, by which time it had been joined by 2 more merchant vessels and 2 more destroyers. Despite this disparity the Brit. force gave battle. Nine of the 10 supply ships were sunk and the tenth, a tanker, became a total loss, while 2 Lt. destroyers were sunk and 2 seriously damaged. In this month too were lost the destroyer *Cossack*, famous for the rescue of Brit. prisoners from the *Altmark* (Feb. 1940), the aircraft carrier *Ark Royal* off Sol-lum, and the old but reconditioned battleship *Barham*. A few weeks later (19 Dec.) the battleships *Queen Elizabeth* and *Valiant* were severely damaged at Alexandria by human torpedoes which had penetrated the harbour. Brit. submarines in the Arctic inflicted heavy losses on Ger. ships carrying supplies to the Murmanak front, the *Tigris* sinking 5 and the *Trident* 3 transports, many other vessels probably being sunk. Early in Dec. the famous Australian cruiser *Sydney* (7000 tons) was lost in action with a Ger. armed raider, *Stiermark* (9400 tons). The sole information concerning the action was obtained from the survivors of the Ger. ship, who numbered 330. The fight had evidently been at close range. After the *Stiermark* had been blown up the *Sydney* disappeared over the horizon and nothing more was heard of her.

'*Prince of Wales*' and '*Repulse*' sunk by Japanese aircraft. Disaster overtook the Brit. Far E. fleet very soon after Japan, without declaring war, launched simultaneous attacks, on 7 Dec., on Pearl Harbor and on Siam (Thailand) with a view to invading Brit. Malaya. On 10 Dec. Britain's newest battleship, the 35,000-ton *Prince of Wales*, together with the battle-cruiser *Repulse*, were sunk by Jap. bombers off Malaya, thereby profoundly altering the balance of naval power in the Pacific. The attacks were pressed home with the greatest determination, but the enemy aircraft had not to encounter fighter resistance such as the Germans and Italians encountered in similar attempts to sink battleships by bombs. The anti-aircraft defences of the 2 ships were certainly used to good effect, but this was not enough, though 7 planes were brought down, and the lesson of the importance of protecting the skies above the seas where the navy operated was once more painfully learned.

Japanese losses in merchant shipping. To counterbalance allied disasters by land and sea in the E., Amer., Brit., and Dutch planes and Amer. ships were early taking toll of Jap. shipping. On 15 Jan. 1942, for example, an Amer. submarine sank a 17,000-ton liner, and on the following day 3 merchant ships, off Tokyo Bay. This brought the tale of Jap. losses at the hands of Amer. forces in the Pacific to 35 vessels—14 being warships, including the 29,000-ton battleship

Haruna. Between 13 Dec. 1941 and 16 Jan. 1942 Dutch submarines and aircraft also sank 2 cruisers, 4 destroyers, and other ships. On 23 Jan. Dutch bombers attacked a large Jap. convoy which was trying to pass through the Macassar Straits between Borneo and Celebes, direct hits being scored on a battleship, 2 cruisers, a destroyer, and 4 transports.

The Amer. Navy won a considerable victory in an attack on the Marshall and Gilbert Is. on 11 Feb., their cruisers, carrier-borne aircraft, and destroyers sinking 16 Jap. vessels aggregating 100,000 tons. The importance of a progressive reduction of Jap. shipping of all kinds so early was evident when account was taken of the wide commitment of the Jap. warships operating thousands of miles from Japan, and the comparatively restricted shipbuilding potential in their yards.

Escape of '*Gneisenau*,' '*Scharnhorst*,' and '*Prinz Eugen*.' It was at this time (12 Feb.) that the Ger. pocket battleships *Scharnhorst* and *Gneisenau* and the 10,000-ton cruiser *Prinz Eugen* (see 'BISMARCK,' THE), accompanied by destroyers, torpedo-boats, E-boats, and mine-sweepers, and well escorted by fighter aircraft, came out of Brest harbour and escaped through the straits of Dover to Germany. Visibility was poor and the enemy ships, which hugged the Fr. coast and were protected by screens of fighters from Fr. and Belgian airfields, which formed an 'umbrella' over the whole squadron, were never visible from the Brit. coast. In face of intense fire by the warships and fighter planes, Brit. coastal aircraft and Swordfish planes pressed home their attack on the squadron, 6 of the Swordfish being lost. The commander of the Swordfish squadron—Lt.-Cdr Esmonde—was awarded the V.C. (posthumous). No Brit. warship was lost, but public uneasiness at the escape of the Ger. ships, coupled with the disasters in the Far E., evoked a critical tone in the press and in the Commons.

Great naval battle off Java (27-8 February 1942). Late in this month there was a notable naval and air battle off Bali, exceeding in results even that of the Macassar Straits, Dutch and Amer. warships inflicting heavy losses on a Jap. invasion fleet. Another naval battle was fought on the night of 27-8 Feb. off the N. coast of Java but with severe loss to the Allies. In this action an allied force consisting of the Brit. cruiser *Exeter* (8390 tons), the Australian cruiser *Perth* (6830), the Amer. cruiser *Houston* (9300), the Dutch cruisers *De Ruyter* and *Java* (each 6000 tons), commanded by Adm. Doorman in the flagship *De Ruyter*, and accompanied by 1 Dutch and 3 Brit. destroyers, made contact with the Jap. ships half way between Surabaya and Bawean Is., the Jap. force comprising sev. cruisers, some of 10,000 tons, and 13 destroyers, organised in 2 flotillas. The Dutch destroyer *Kortenaer* was soon sunk; the *Exeter* was hit in the boiler room and dropped out of the line; the Brit. destroyer *Electra*, joining in a counter-attack, disappeared into an enemy smoke screen

and was not seen again. Later the enemy broke off the action under a smoke screen, but shortly afterwards, near Rambang, 2 enemy cruisers were seen and battle was again joined (1 Mar.), when both the *De Ruyter* and the *Java* were hit simultaneously, blew up, and sank. A similar fate seems to have befallen the *Perth* and *Houston* not long afterwards. The *Exeter*, her speed considerably reduced, the Brit. destroyer *Encounter*, and the Amer. *Pope* were all sunk later by 3 Jap. cruisers. In all the Allies lost 5 cruisers, 7 destroyers, and a sloop (*Varra*, Australian), against the Jap. loss of a 10,000-ton cruiser and 1 small cruiser for certain and probably 4 destroyers, while all the other cruisers were set on fire.

The battle of Sirte. Reverting again to the Mediterranean, the same month saw another successful convoy action (22-4 Mar.). A Brit. convoy, with supplies for hard-pressed Malta from Egypt, with the protection of a 6-in. gun cruiser, anti-aircraft cruisers, and destroyers under the command of Rear-Adm. Vian of *Cossack* fame, sighted and drove off 4 Lt. cruisers without loss to convoy or escort. Later the battleship *Littorio*, 2 8-in.-gun cruisers and 4 6-in.-gun cruisers, and some destroyers were sighted and, despite the disparity in strength, action was joined, a torpedo hit being scored on the *Littorio*, which was also hit by a Brit. cruiser's gunfire. Other Lt. ships were also hit and the enemy force, thrown into confusion, withdrew.

Further losses in Far East. Battle of the Coral Sea. In April further Brit. losses were sustained in the Far E., the cruisers *Dorsetshire* and *Cornwall* (each 10,000 tons) being lost through Jap. air attack in the Indian Ocean. About the same time the carrier *Hermes* was sunk off Trincomalee (see also AIRCRAFT CARRIER). But what was up to this date perhaps the biggest naval battle since Jutland—the battle of the Coral Sea—was fought (4-8 May) off the Solomon Is., some 1000 m. from the coast of Queensland, between Amer. and Australian naval forces and the Jap. fleet. This action certainly saved Australia from an immediate attempted invasion. The allied fleet and planes first sank a Jap. light cruiser, 2 destroyers, 4 gunboats, and, later, an aircraft carrier, 3 heavy cruisers, 1 light cruiser, and 2 destroyers—a total of 15 warships sunk, and a grand total of 37 ships sunk, damaged, or probably sunk. The Americans lost 1 aircraft carrier, 1 destroyer, and 1 tanker. This great naval and air battle temporarily ceased on 9 May. It represented the continued effort by the Japanese to extend their conquests towards the S. and SE. Their first efforts were aimed at expanding their air bases, but the Allies' air forces had so effectively bombed their landing fields that Japan's plans were frustrated. In this battle of the Coral Sea the issue was decided between aeroplanes flown from the opposing aircraft carriers.

The battle of Midway Island. The battle of the Coral Sea was a new kind of conflict and the experience was to be

repeated a month later in the important battle off Midway Is., the Amer. naval base 1300 m. NW. of Hawaii, when Amer. navy and army pilots from both shore bases and carriers dealt the blows which repelled attack by a powerful Jap. fleet, thereby confirming the significance of the naval revolution which had transformed warfare at sea. In the Midway battle 4 Jap. aircraft carriers were sunk, each with a complement of 1500 men. At least 3 transports, carrying 6000 troops, were torpedoed and sunk. This was the worst defeat in Japan's naval hist., for the spearhead of her naval and air striking power was broken by the loss of half her best aircraft carriers and she had now lost at least 6 of the 11 or more of the fully effective fleet of carriers with which she began the Pacific war. At least 200 planes, together with their trained personnel, went down with the carriers lost at Midway. For this victory the Amer. flying Fortresses, which repulsed and scattered the Jap. naval forces, were chiefly responsible. While the immediate results of these 2 battles was the removal of the Jap. threat to America's forward naval bases in the Pacific, the ultimate result was to shift the balance of naval power in the Pacific from its extremely one-sided bias in favour of Japan.

Hazards of Mediterranean convoys. During this period convoying in the Mediterranean had grown increasingly hazardous—more so even than to Murmansk; for Britain had lost the command of the sea in these narrow waters of the Mediterranean over which Nazi planes could operate freely from Sicily, Crete, and elsewhere. Consequently the problem of sending supplies to Malta and Libya became greatly aggravated and the ill fortune which awaited an important double convoy at this time had a most deleterious effect on the Eighth Army's battle against Rommel's army May-June 1942 (see AFRICA, NORTH, SECOND WORLD WAR, CAMPAIGNS IN). It had been decided to sail in 2 convoys so as to disperse the enemy's efforts to concentrate his attacks. The W. convoy got to Malta after destroying over 60 enemy planes. The E. convoy, under Rear-Adm. Vian, was also steering towards Malta when a force of Lt. battleships, cruisers, and submarines tried to intercept it; and eventually, owing to the exhaustion of anti-aircraft ammunition, Rear-Adm. Vian decided to return to Alexandria. The R.N. in these 2 convoy attacks lost 1 light cruiser and 4 destroyers; the enemy had 1 battleship torpedoed and 1 8-in. gun cruiser, 2 destroyers, and 1 U-boat sunk.

Naval operations, July-December 1942. During this period the most outstanding event in the W. was the allied landing in N. Africa on the night of 7-8 Nov. Until forces were ashore the responsibility for the operation lay in the hands of the navy, whose success was measured by the fact that the initial convoys arrived at the right time in the right place practically unscathed. The only damage was 1 Amer. ship torpedoed, but all her troops were landed without loss. Until the

U.S.A.A.F. and R.A.F. were able to operate from captured airfields the Fleet Air Arm provided not only protection to the ships, but also tactical reconnaissance for the army ashore. Thereafter the allied navy continued to keep the armies supplied and reinforced in the face of heavy U-boat concentrations, and maintained the offensive at sea against enemy forces. Meanwhile important naval operations were taking place in the S. Pacific. With the defeat of the Japanese at the Coral Sea and Midway Is. battles, the initiative passed to the Americans, and on 7 Aug. Amer. marines landed in the

manœuvred so as to intercept the Jap. ships. The resulting action took place off Savo Is. between the is. of Guadalcanal and Florida. The smaller Amer. ships attacked the Jap. battleships of the *Kongo* class at point-blank range. Their leaders, Rear-Adms. Daniel Callaghan and Norman Scott, were killed, but the Jap. force was heavily damaged and disrupted. The next night there was another clash between surface ships, 2 Amer. battleships of the new *North Carolina* and *South Dakota* class taking part. This was the biggest naval battle of the war up to that time, and the Jap. losses were

TRANSPORTS LYING OFF GIBRALTAR: PART OF THE GREAT ALLIED NORTH AFRICA EXPEDITION

Solomon Is., seizing the harbour of Tulagi. Though taken by surprise, the Japanese sent cruisers and destroyers to attack on the night of 8-9 Aug. and they had decidedly the best of the battle. H.M.S. *Canberra* and the U.S. cruisers *Quincy*, *Vincennes*, and *Astoria* were sunk. The Japanese escaped with little damage; but the Allies achieved their object, since the Japanese were unable to interfere with the transports. Every subsequent Jap. attack on the Solomons was decisively repelled with heavy loss in transports. There was a major naval action, which raged for sev. days in Nov., particularly on 12-15 Nov., between surface ships, off the Solomons. It was precipitated by a strong Jap. attempt to reconquer a vitally important beach-head on Guadalcanal (q.v.). A large Jap. fleet of transports steamed southward from the Shortland area. Strong reinforcements for Amer. land troops had just been landed in Guadalcanal and the Amer. cruiser and destroyer screen covering the landing was

1 battleship, 3 heavy cruisers, 2 light cruisers, 5 destroyers, and 8 transports sunk, and 1 battleship, 6 destroyers, and 4 cargo transports damaged. The Amer. losses were 2 light cruisers and 7 destroyers sunk.

It was during this period that the Fr. fleet at Toulon was scuttled. Following on the landing of Brit. and Amer. forces in Fr. N. Africa in Nov., Ger. forces entered Toulon. But the Fr. warships in the port were immediately scuttled by their crews. The battleships there were the *Dunkerque* and *Strasbourg*, each 26,500 tons, 1 old battleship, the *Provence*, 4 10,000-ton cruisers, 3 light cruisers, 1 seaplane carrier, and some 28 destroyers (6 Nov. 1942).

The navy continued throughout to provide escorts for the numerous convoys to Russia, Malta, the Persian Gulf, and elsewhere. One outstanding event was the successful passage of a large convoy to Russia on New Year's Eve, 1943. All the merchant vessels reached Russia safely,

but the destroyer *Achates* was lost and the *Onslow* damaged. The Brit. destroyers were commanded by Capt. R. St V. Sherbrooke (awarded the V.C.), whose escort was attacked by a greatly superior Ger. force consisting of a pocket battleship (*Lützow*), a cruiser (*Hipper*), and 6 destroyers. The action was fought in snowstorms and in semi-darkness off the N. Cape, Norway. It appears that the admiral commanding the Ger. task force mistook the 2 Brit. cruisers *Kent* and *Jamaica*, which had come to the assistance of the convoy, for the vanguard of a battle squadron. He therefore broke off the action and retired in accordance with previous orders.

N.E. of Flinschafen and in Huon Gulf, off New Guinea on 2-4 Mar., a large Jap. convoy of 12 transports and 10 warships (cruisers and destroyers), representing an aggregate tonnage of 80,000 tons, was completely wiped out, together with more than 80 Jap. planes. The ground forces, estimated at 15,000 men, who were destined for an attack on the Allies in New Guinea, were killed to a man. The Allies' total loss was only 1 bomber and 3 fighter aircraft, while a few other planes were damaged. This victory of the Bismarck Sea was so complete as to amount to a major disaster to Jap. arms and seacraft, besides demonstrating the superiority of allied fighter aircraft and pilots over the Japanese.

It may be mentioned here that by the end of Jan. 1943 aggregate Brit. losses (as stated in the Commons, 4 Feb.) were as follows: capital ships, 5; aircraft carriers, 7; cruisers, 25; armed merchant cruisers, 14; destroyers, 94; corvettes, 14; submarines, 44; monitors, 1; sloops, 8; mine-sweepers, 22; trawlers, 156; drifters, 14; mine-layers, 1; yachts, 3; gunboats, 5; cutters, 3. But in spite of losses the fleet was much stronger at that date than it was a year previously, and indeed during these 3 years of the war no fewer than 900 vessels of various classes had been added to the R.N. The ships lost in these 3 years by Germany, Italy, and Japan were: Germany, 1 battleship, 1 pocket battleship, 4 cruisers, 39 destroyers and torpedo-boats, 4 raiders, and 69 other miscellaneous warships, minesweepers, and small craft. Italy, 10 cruisers, 48 destroyers and torpedo-boats, and 35 other miscellaneous warships, etc. Japan, 2 battleships, 6 aircraft carriers, 17 cruisers, and 70 destroyers.

Naval operations, 1943. The most significant feature of sea operations in 1943 was the gradual reduction of the Ger. submarine menace. In the months May-July 1943 the Allies sank 90 U-boats. In the first 6 months of the year the number of ships sunk per U-boat operating was only a quarter that in the first half of 1942. Moreover during the first half of 1943 new ships completed by the Allies exceeded sinkings from all causes by more than 3,000,000 tons. Before the descent upon Sicily an armada of warships, troop transports, supply ships, and landing craft proceeded through Atlantic and Mediterranean waters, with scarcely

any interference from U-boats. Over 2500 vessels were involved in these latter operations and the losses were only about 80,000 tons. In the months Aug.-Oct. approximately 60 U-boats were destroyed. This brought the total Ger. losses since Sept. 1939 to between 700 and 800 submarines. The loss of 150 submarines in the 6 months May-Oct. 1943 meant a loss of 6000 trained men of the submarine service, a fact which was found to have a profound effect on the morale of the crews.

Following the collapse of It. resistance after the conquest of Sicily the It. Navy surrendered under the terms of the armistice with Marshal Badoglio. On 11 Sept. the prin. ships of the It. Navy—4 battleships, 6 cruisers, and 7 destroyers—which had sailed from Spezia, came into Valtorta under the escort of 2 Brit. battleships and a destroyer screen. Together with smaller ships, the total was 30. One uncompleted battleship fell into Ger. hands. When the fleet started from Spezia it had another capital ship with it, the *Roma*, but this ship was sunk by Ger. bombers as the fleet proceeded southwards. The result of this surrender and of the allied victories in N. Africa was that the R.N. once again completely dominated the Mediterranean with the great strategic advantage of greatly shortened sea routes.

Brit. midgeet submarines carried out a daring attack on main units of the Ger. battle fleet in their protected anchorages in Alten Fjord, N. Norway, on 22 Sept., inflicting severe underwater damage on the battleship *Tirpitz*. The attack involved extreme hazards and 3 of the submarines were lost, but the attack as a whole was successful. The submarines had to penetrate a highly defended base and, to do so, they had to pass through the minefields guarding the approaches to the anchorage; and, after negotiating the intricate fjords, always vigilantly patrolled by the Germans, had to carry out an attack in the strongly protected and confined waters where the ships lay moored and, finally, to regain their base, the same obstacles had to be overcome.

In the S. Pacific there was no great naval battle between the Allies and the Jap. fleet during 1943, but there was considerable activity on both sides in convoy work and in covering landings and, generally, in combined operations. Amer. warships co-operated effectively with the allied air forces in covering the allied landing near Lae in Huon Gulf, New Guinea, in Sept. 1943. A remarkable feature of these operations and others of subsequent months was that the Jap. Navy made no attempt to interfere with the Allies, a fact which probably meant that their previous losses were straining their resources. On 4 Nov. 2 heavy Jap. cruisers and 3 destroyers were sunk, and many others probably sunk, in a devastating raid on enemy shipping of all kinds in Rabaul harbour. This was the heaviest loss inflicted on the Japanese in this area since the battle of the Bismarck Sea (see further PACIFIC CAMPAIGNS IN SECOND WORLD WAR).

The outstanding naval event of the year

was the sinking of the 26,000-ton Ger. battleship *Scharnhorst*. She was brought to action off the N. Cape, Norway, on 26 Dec., when cruisers and destroyers supported the battleship *Duke of York*, under the command of Adm. Sir Bruce Fraser, in sinking her, the whole of the main action, which started in the late afternoon in the half-light of the Arctic dawn, being fought in the dark with the aid of radiolocation and starshells. Some 36 survivors of a crew of over 1400 were picked up, the Brit. casualties being 17 killed and no ships lost. The loss was a severe blow to Germany, for it was on the *Scharnhorst* that she relied to prevent vital supplies reaching Russia at a particularly critical stage of the campaign on the E. front.

In the Bay of Biscay on 27-8 Dec. 3 of 11 Ger. destroyers, which had emerged to convoy a Ger. blockade-runner, were sunk by the 2 Brit. cruisers, *Glasgow* and *Enterprise*. The blockade-runner had been intercepted earlier by a Coastal Command (q.v.) aircraft, which set her on fire with bombs so that she was abandoned in flames. It was soon after dawn on the following day that a Liberator of the U.S. Navy sighted the 11 Ger. destroyers about 200 m. from the spot where a Czech Liberator had bombed the blockade-runner to destruction. This Ger. force consisted of 5 modern *Narvik* class destroyers with five 5.9-in. guns and six *Elbing* class destroyers with four 4.1-in. guns—eloquent evidence of the importance to Germany of the blockade-runner's cargo, which probably contained Malayan rubber from the Jap. occupying authority.

Naval operations, 1944. The chief naval event in 1944 was the Jap. defeat in the last week of Oct. during the Amer. invasion of Leyte Is. (19 Oct.). This menacing invasion of the Philippines tempted the Jap. Navy to emerge and risk an attack on Halsey's Third Fleet which, sailing westward across the Pacific, had already taken the Marshall, Mariana, and Palau Is. on the way and was now acting as general cover to the allied land operations; and also on Vice-Adm. Kincaid's Seventh Fleet, whose role was that of escort and close support of the military force on Leyte Is. On 22 Oct. ships of the Third Fleet took up positions E. of the Surigao and San Bernadino Straits—the only passages through the Philippines—further N. off the Polillo Is., and E. of Luzon, as cover against any Jap. forces that might approach from those quarters. The Seventh Fleet continued in close support of the landing in Leyte Gulf, opening off the Surigao Strait. Next day Amer. carrier aircraft saw 3 Jap. forces approaching, 2 from the W. and 1 from the N. The first, coming through the Sulu Sea directly towards Surigao Strait, comprised 2 old battleships, 3 heavy cruisers, 1 light cruiser, and 8 destroyers; the second, a stronger force, steaming through the Sibuyan Sea towards San Bernadino Strait, comprised 2 new battleships, 1 fairly modern battleship, 2 old battleships of the *Kongo* class, 2 light and 10 heavy cruisers, and 15 destroyers. The

third squadron, coming from Japan, was seen 400 m. N. of Leyte Gulf, and comprised 1 large and 3 light aircraft carriers, 2 old battleships, 3 light cruisers, and 8 destroyers. In the morning of 23 Oct., before the approach of this third enemy squadron was known, Amer. carrier-based planes attacked the other 2 enemy squadrons, while Jap. land-based planes attacked Adm. Halsey's carriers cruising to the eastward. In this cross-air attack the Japanese lost 150 planes to the Americans' 8, but succeeded in hitting a light Amer. carrier which blew up and had to be sunk, the majority of the crew being saved. Amer. torpedo-plane attacks were concentrated on the Jap. force in the Sibuyan Sea and sank 1 light cruiser outright and damaged a number of other vessels, but the bulk of this Jap. squadron went on through the San Bernadino Strait during the ensuing night. The Jap. squadron in the Sulu Sea was attacked by bombers and fighters only and many ships were hit, but this squadron too held on its course, entering the Surigao Strait at night. Here it was engaged by the Seventh Fleet and completely defeated, one if not both its battleships, sev. cruisers, and most of the destroyers being sunk, for the Amer. loss of only a few motor torpedo-boats. The survivors of this Jap. squadron turned tail and retreated westward through the Sulu Sea again, but were sunk to the last ship by air attacks the next day. Prior to these nocturnal events the Americans had learned of the approach, from the N., of the Jap. carrier force and Adm. Halsey at once sent a number of his carriers to meet the enemy carriers at dawn on 24 Oct. This attack achieved complete surprise. The largest carrier and 2 of the 3 smaller ones were sunk outright by Amer. air attacks, which also sank a destroyer and crippled a cruiser and the third smaller carrier. Of those the cruiser was sunk the next night by submarine, while the remaining Jap. carrier was trapped and also sunk, together with another carrier which had escaped damage from the air, by the guns of Amer. cruisers and destroyers. Both enemy battleships of this carrier fleet were hit by bombs and one also by torpedoes as well; all the remaining cruisers and destroyers were hit by bombs and gunfire. No Amer. ship was hit in this action in the N. Halsey's carrier-borne aircraft then turned S., being now more urgently needed there than in the N. Meanwhile the Jap. Sibuyan Sea squadron, having passed the San Bernadino Strait and turned S. round Samar Is., came in contact with some of Kincaid's carriers and sank 2 of them by gunfire. But the enemy was then brought to action by Kincaid's fleet fresh from its night victory in the Surigao Strait, with which Halsey's carrier-borne aircraft, hurrying back from the N., now co-operated. Every Jap. ship was badly damaged, 1 heavy cruiser being sunk and a destroyer disabled, while the remainder of the squadron turned back through the strait, 1 straggling cruiser being sunk by pursuing Amer. cruisers. Next day carrier

aircraft from both Amer. fleets—together with Gen. MacArthur's shore-based aircraft—kept up the attacks on the westward retreating Japanese, sinking 2 more cruisers and (probably) 1 battleship. In all 3 battleships, 4 carriers, 6 heavy cruisers, 4 light cruisers, and 7 destroyers were sunk; while 4 battleships, 5 heavy cruisers, 1 light cruiser, and 2 destroyers escaped in a damaged condition. Amer. losses were 1 light carrier, 2 escort carriers, 2 destroyers, 1 destroyer escort (equivalent of a frigate), and a few lesser craft sunk; 8 escort carriers, 2 light cruisers, and 5 destroyers were damaged.

Another notable event was the sinking of the last great Ger. battleship, *Tirpitz*, by R.A.F. Lancasters on 12 Nov. Some 29 Lancasters, led by W. Cdr J. B. Tuit and Sqdn-Ldr A. G. Williams, attacked the ship in Tromsø Fjord with 12,000-lb. bombs. There were sev. direct hits and within a few minutes the ship capsized and sank. This final attack was the climax of a long series, which had probably disabled the ship as a fighting unit, though air observation did not definitely establish that fact. On her first appearance at sea on 9 Mar. 1942, a torpedo from an aircraft of the Brit. carrier *Victorious* off the Lofoten Is. sent her back to harbour for repair. Refitted she attempted to attack a Russia-bound Brit. convoy on 8 July 1942, but was hit by sev. torpedoes from a Russian submarine. She succeeded in reaching an anchorage prepared for her in the Alten Fjord, but was unable to leave for 14 months. In Sept. 1943 she joined the *Scharnhorst* in action against the very small Norwegian batteries in Spitzbergen, returning quickly to her lair for fear of a possible Brit. attack. There she was once more severely damaged, this time by the torpedoes of midget Brit. submarines. In April 1944, when seen to be capable of moving again, the period of air attacks on her began. Numerous hits by home fleet bombers, including at least 3 with heavy bombs, put her out of action for another 5 months. Bomber Command then took up the task with a succession of attacks on 15 Sept., 29 Oct., and 12 Nov., the last being the only time that the attackers were able to see the ship properly. One 12,000-lb. bomb hit her amidships, another in the bows, and a third near the stern. The ship heeled over rapidly and capsized with 700 ft of her keel sticking out of the water.

The U-boat menace was very greatly reduced in 1944—so much so that in 1 month of the year only 1 ship was lost, while in sev. other months the number sunk was negligible. Up to the middle of the year the Germans had lost since the beginning of the war more than twice as many U-boats as in the First World War, the total up to Aug. 1944 exceeding 500—the war memorial at Kiel recorded the loss during the First World War of 193 U-boats. In one month of 1944 (July) the number of U-boats destroyed was substantially greater than the number of merchant ships sunk by them. In Mar., 5 Brit. sloops on escort duty destroyed 6 Ger. submarines in the space of 20 days,

in one case capturing the whole crew of 51 of one large U-boat. Some 17 U-boats were sunk while attempting to interfere with the Anglo-Amer. cross-Channel traffic since the first landing of the Allies on the beaches of Normandy. While the Ger. U-boat fleet was then still of impressive size, the U-boats were now the hunted rather than the hunters; for they had been attacked from the Arctic to the Indian Ocean, aircraft playing a great part, together with surface forces. This pressure was maintained until all chances of revival of the U-boat campaign were killed, and this despite the development of new devices and methods by an ingenious and scientific enemy.

Naval operations in European theatre of war in 1945. *'Admiral Scheer'* and *'Lützow'* sunk. The Ger. pocket battleship *Admiral Scheer* was sunk in an attack on Kiel by aircraft of the R.A.F. Bomber Command on the night of 9 April 1945. She was turned completely upside down in much the same position as the *Tirpitz* in Tromsø Fjord. She was the second of the 3 pocket battleships to be put out of the war, the first being the *Admiral Graf Spee*. Germany's last pocket battleship, the *Lützow*, was sunk on 16 April by a small force of Lancasters in an attack with 12,000-lb. bombs at Swinemünde. Like the *Admiral Scheer* the *Lützow* was used for commerce-raiding early in the war, and later moved to Norwegian harbours for use against Brit. convoys to Russia. She was torpedoed by a Brit. aircraft off the Norwegian coast in June 1941 and again by midget submarines in Alten Fjord in Sept. 1941.

German ships captured in the port of Copenhagen. The last 2 big Ger. warships still seaworthy at the end of the European war, the cruisers *Prinz Eugen* and *Nürnberg*, were found by Brit. cruisers lying in the N. port, Copenhagen, with their Ger. crews on board. With them were 3 destroyers, 2 torpedo-boats, 10 minesweepers, 13 'flak' ships, 19 armed trawlers, and 2 armed merchant ships. Altogether about 135 warships of various types and some 600,000 tons of merchant shipping were captured in Copenhagen, which in the later period of the war was used extensively by the Germans for troop transport to Norway and for the evacuation of wounded from the Russian front.

Toll of midget U-boats. During the closing months of the war the Ger. Navy made extensive use of midget U-boats in a determined but vain attempt to interrupt the flow of allied supplies across the Channel and the N. Sea to the Continent. In the course of a series of actions, fought mainly in coastal waters, some 81 midget U-boats were either sunk or captured. After the capitulation of Germany about 100 more midget U-boats were captured.

Summary of U-boat losses in the battle of the Atlantic. With the surrender of Germany the grim battle of the Atlantic ended. It had been a long-drawn, relentless struggle extending over nearly 6 years and one which demanded not only

the utmost courage and endurance, but also the highest scientific and technical skill. Losses were heavy both in lives and materials and, at the peak in 1941 and 1942, the issue of the struggle hung in the balance. On the other hand 662 U-boats were destroyed and many others were destroyed by the Germans themselves in the final stage. Most of these successes were achieved by the combined allied naval and air forces working in the closest co-operation; some were due to mines laid from aircraft and ships; others to bombing in harbour; and a few U-boats were lost by marine perils.

transatlantic passages, independent of convoy protection.

British submarines in the war. During the war Brit. submarines caused the following enemy losses: 6 battleships damaged; 6 cruisers sunk and 15 damaged; 12 destroyers sunk and 18 damaged; 46 U-boats sunk or probably sunk; 112 minor war vessels sunk and 26 damaged. That is the summary against warships alone, but the part played by Brit. submarines was often concerned chiefly with the interruption of the flow of reinforcements and supplies to enemy forces overseas. In this form of warfare Brit.

Imperial War Museum: Crown Copyright

THE LAST BLOWS AT JAPAN

An effective attack by naval Avengers on Shimonoseki shipyard, Injo Shima, Inland Sea.

Up to 1943 the rate of shipping destroyed in the battle of the Atlantic in relation to the number of U-boats lost had been very favourable to Germany, but in the first 4 months of 1943 allied counter-measures began to make themselves felt and U-boat losses mounted rapidly. R.A.F. Coastal Command and escort carriers of the R.N. provided air cover on a scale which could not be matched by the Germans, and in April the allied chiefs of staff initiated a series of combined sea and air offensives directed against U-boats in the Bay of Biscay. Doenitz (q.v.) was to be attacked in his own waters. The result of these and other allied operations was that, in the month of May 1943, 37 U-boats were sunk, representing approximately 30 per cent of all U-boats at sea. Doenitz was forced to withdraw his U-boats from the N. Atlantic, and on 24 June allied ships of 15 knots or over were able to resume

submarines sank 1373 enemy supply and troopships, totalling 2,100,000 tons, and damaged a further 263 ships in these classes, with a tonnage of 790,000 tons.

British naval losses in the war against Germany and Italy. The Brit. Navy lost 730 ships during the war in the W., and the dominions 46 others. Brit. losses included the capital ships *Royal Oak*, *Hood*, *Prince of Wales*, *Repulse*, and *Barham*, and the aircraft carriers *Courageous*, *Glorious*, *Ark Royal*, *Audacity*, *Hermes*, *Eagle*, *Avenger*, and *Dasher*. There were also lost 134 destroyers, 77 submarines, 23 cruisers, 51 mine-sweepers, and 48 drifters, but numerically the highest losses were 240 trawlers. These totals do not include light coastal craft, and landing ships and craft. Losses of naval ships, of all sizes and sorts, amounted to 3282.

Allied mercantile marine losses in the war against Germany. During the war

some 4280 allied merchant ships, totalling 19,720,000 gross tons, were lost by enemy action. Of these, 2570, totalling 11,380,000 tons, belonged to the Brit. Empire. Neutral countries lost 490 ships, totalling 1,420,000 tons. U-boats accounted for 2770 ships, of which 1360 were British, 440 American, 670 other allied, and 300 neutral. There were 520 ships lost through mines, including 340 British and 15 American. The total losses through attacks by surface raiders were 330—including 210 British and 13 American. Hostile aircraft sank 750, of which 440 were British and 58 American. Some 400 vessels, including 220 British and 12 American, went down through other or unknown causes. Altogether the U.S.A. lost 538 ships, totalling 3,310,000 tons, and the other Allies, excepting the empire, 1172 ships, totalling 5,030,000 tons. In addition the Brit. Empire lost 610 ships of 1,120,000 gross tons. Losses of It. ships after Italy became a co-belligerent are included in these figures. Fr. ships are included up to the collapse of France in June 1940. After that date Free Fr. ships are included, but not Vichy ships.

American troop losses at sea. Ship sinkings or damage to ships cost the lives of 3604 Amer. soldiers in the war against Germany and Italy, i.e. in the African, Mediterranean, European, and Atlantic areas, but excluding casualties suffered during the invasion landings. Official returns show that of 4,453,061 Amer. troops who embarked in the U.S.A. for Europe, 1094 were lost at sea outbound. This comparatively small loss was due to the work of the allied navies, the vigilance of convoy escorts, and to the skill of the gun crews on the transports. The sinking involving the heaviest loss was that of the *Rohna*, a Brit. troopship, sunk by air attack in Nov. 1943 off Jidelli, Algeria, with the loss of 1015 men.

Naval operations in the Far East in 1945. The beginning of the year saw the U.S. Navy actively supporting the recapture of the Philippines. In the bombardments previous to the landings in the Lindayan Gulf on 9 Jan., Australian naval forces took part with those of the U.S.A. On 16 Feb. the Amer. advance across the Pacific reached the mainland of Japan when a naval force moved up to within 300 m. of Honshu and subjected Tokio and Yokohama to 9 hrs' bombing by 1500 aircraft from about 20 carriers. This was followed by 2 further heavy raids towards the end of the month, when naval aircraft were supported by 200 Superfortresses. Meanwhile on 19 Feb. Amer. forces assaulted the is. of Iwo Jima with massive naval and air support, but the is. was not won until 16 Mar., at the cost of 20,000 Amer. casualties, including over 4000 killed. The Brit. Pacific fleet now began to operate as a separate Brit. unit under Amer. command. It included 5 capital ships and 4 large carriers, besides numerous cruisers, destroyers, and other craft, and one of its first operations was an attack with Amer. naval aircraft on is. between Formosa and Japan. Attacks by

1500 allied aircraft were also made on the Jap. fleet in its home waters. On 1 April, in the largest amphibious operation up to date, troops landed on Okinawa after a crushing naval bombardment and under an air umbrella of 1500 aircraft. The left flank was covered by a powerful Brit. naval force. In strong counter-attacks, the allied fleet suffered loss and damage from Jap. suicide aircraft. Meanwhile a fast Amer. task force brought a Jap. naval force under air attack, sinking the battleship *Yamato*, and Brit. carrier aircraft attacked Formosa. Throughout May hard fighting continued at Okinawa which was not finally captured until 21 June. This gave the U.S. Air Force a base only 325 m. from the Jap. mainland. In the SW. Pacific Australian forces, supported by allied naval units, had landed in N. Borneo and New Guinea, to be followed in June by the capture of Labuan Is. On 14 July Japan itself was subjected to the first naval bombardment when Amer. warships poured 1000 tons of shells into the port of Kamaishi (Honshu). Thereafter bombardments by Brit. and Amer. surface forces alternated with joint attacks by as many as 1500 naval aircraft. Towards the end of the month Brit. and Amer. air attacks were concentrated on the remnants of the Jap. fleet sheltering in the Inland Sea and, in 3 devastating assaults, did immense damage both to ships and shipyards. Shattering sea and air bombardments of the mainland continued in Aug. and were quite independent of the atomic bombs dropped on 6 and 9 Aug. On 15 Aug. allied aircraft were starting a further attack in the Tokio area when the cease fire order was received. Japan had surrendered. On 27 Aug. a large allied fleet, under the supreme command of Adm. Halsey, U.S. Navy, arrived in Sagami Bay and Adm. Sir Bruce Fraser signalled to the Admiralty: 'The fleet has anchored in Japanese waters.' Of the Jap. Navy there remained afloat only 1 battleship out of 13, and that was damaged, 2 severely damaged aircraft carriers out of 21, 4 damaged cruisers out of 40. Jap. destroyers had been reduced from 165 to 26, and her submarines from 140 to 16. No fleet had ever been more thoroughly defeated.

The navy's sacrifice. In the whole course of the war nearly 51,000 officers and men of the R.N., excluding the navies of the dominions and the Royal Marines, were killed or missing. This number exceeded by over 20,000 the numbers killed in the First World War.

The more spectacular victories and successful actions fought at sea were really but a small part of the R.N.'s great contribution to the overthrow of Nazi tyranny; its real task lay in the unceasing vigilance, devotion, and toil that went to the maintenance of the sea communications of the empire and Allies throughout the war. The navy's losses in this war were two and a half times as great as they were in the First World War, and losses of merchant shipping amounted to the figure of 20,000 tons a day for most of 1942. The magnitude of

the navy's task is well illustrated by the fact that 996 U-boats were destroyed, an average of 1 every second day throughout the war. Of these U-boats one-third were destroyed within 500 m. of the U.K. See F. Taprell-Dorling ('Tafrall'), *Western Mediterranean*, 1942-5, 1947; G. Stitt, *Under Cunningham's Command*, 1944; Adm. Morison, *History of U.S. Naval Operations in World War II*, 1942, seq. still (1957) in course of pub.

Naval Reserves. In addition to all officers of the R.N. on retired pay, who are automatically on the reserve and liable to be called up in emergency, the navy maintains the following reserves: (1) Royal Fleet Reserve (R.F.R.), open to men with a minimum of 3 years' service in the R.N. or Royal Marines. It carries a retaining pay of 1s. to 1s. 6d. a day according to rating and demands 7 days' continuous training every 2 years. (2) Royal Naval Reserve (R.N.R.), which was reorganised in 1958 and now incorporates the old Royal Naval Volunteer Reserve (R.N.V.R.) and the Royal Naval Volunteer (Wireless) Reserve (R.N.V.(W).R.). The new R.N.R. is drawn from officers of the Merchant Navy, men of the Fishing Fleet, and those in civilian occupations ashore. The Reserve have 11 divs.: London, Ulster, Sussex, Tay, Tyne, Severn, Clyde, Forth, Solent, Mersey, and S. Wales. (3) Royal Naval Volunteer Supplementary Reserve (R.N.V.S.R.) comprises ex-temporary naval officers willing to serve in an emergency. No training is required. (4) Royal Naval Emergency Reserve (R.N.E.R.), estab. in 1949 for ex-naval ratings willing to serve in an emergency. No training is demanded. (5) Royal Marine Forces Volunteer Reserve (R.M.F.V.R.) is the first auxiliary reserve of the Royal Marines, and maintains units in London, Glasgow, Birkenhead, Bristol, and S. Shields, with detachments in certain other places. This reserve is run on the same lines as the R.N.R. (6) Royal Marine Emergency Reserve (R.M.E.R.), a reserve of ex-Royal Marine officers and men willing to serve in an emergency. No training is demanded. (7) Women's Royal Naval Reserve (W.R.N.R.), which provides women with an opportunity of part-time and ann. naval training. The W.R.N.R. works in close co-operation with the R.N.R. and has units attached to each of its divs. (see R.N.R. above). (8) Women's Royal Naval Supplementary Reserve (W.R.N.S.R.) comprises a list of ex-W.R.N.S. officers and ratings, with a minimum of 1 year's service, willing to serve in an emergency. (9) Royal

Naval Special Reserve (R.N.S.R.), which consists of R.N. and Royal Marine national servicemen who are fulfilling their part-time national service commitments on completion of their full-time service.

Naval Scientific Service, Royal, comparatively new branch of the R.N. retained after the Second World War as a permanent service. During the First World War there were great developments in the application of science to warfare, and the Admiralty had to bring in scientists to co-operate in the development of wireless, mines, gunnery systems, and devices for all sorts of purposes. The lesson of all this was quickly appreciated and a decision taken to retain in being a number of the experimental organisations which had sprung up during that war, and a number of the scientists in these organisations were persuaded to stay on permanently. The Admiralty Research Laboratory was built at Teddington, and the staff scattered about in the various estab. were brought under a single grading system and organised in what were known as the Admiralty Scientific, Technical, and Chemical Pools. During the inter-war period the situation remained comparatively static. Personnel was slightly increased during and after the Abyssinian crisis of 1935, but it was not until 1939 that any substantial change took place. The Second World War being recognised as a scientist's war, the naval scientific organisation expanded correspondingly and the personnel increased tenfold over the 1935 level and even then could not cope with all its tasks adequately. The old permanent corps was reinforced by scientists of all kinds drawn from every source. The achievements of this force were great and may be exemplified in the speedy mastery of the magnetic mine, and in other services the nature of which may not yet be divulged. The net result was that the Board of Admiralty was impressed with the need to give more adequate recognition in its organisation to the scientific arm, and in Sept. 1944 it announced its intention to establish after the war the R. N. S. S. This was done in 1946 when the post of chief of the R. N. S. S. was created, with the oversight of 4 new depts, each under a scientist of the status of full director. Thus to-day the R. N. S. S. holds a very central and important part in the Admiralty organisation.

The scope of the work of the R. N. S. S. is of the widest, covering research and development of every kind in physics, chem., and engineering by way of promoting the fully up-to-date fighting efficiency of the navy. The greater part of the work of the R. N. S. S. is concerned with ships. In addition to ordinary seaworthiness naval vessels must be capable of withstanding altogether abnormal stresses and strains from attack by guns, torpedoes, and mines and bombs. The effects of blast and explosion, both on the surface of the sea and beneath, pose most difficult problems, in the solution of which

the scientist can help the constructor. Again, the requirements of warships' and submarines' engines are stringent as compared with those of the mercantile marine, and the problems correspondingly greater. There is also the problem of communications, offering the widest field for the telecommunications engineer in radio reception, transmission, and direction-finding. As a further example of the value of the work done by the R. N. S. S. may be mentioned the fact that the navy possessed the Asdic device for countering the submarine menace at the outbreak of the Second World War, and throughout the war the R. N. S. S. in co-operation with certain univs. and industrial laboratories, kept the lead in the field of thermionic tubes, a success which was a major contribution to winning the war. The practical work of the R. N. S. S. is applied to civil life in industry in many ways. Examples of this are the development of the spectrographic method of analysis, which has in many cases replaced the old chemical method, and the application of radar as a navigational aid to the mercantile marine.

In the R. N. S. S. there are 2 main officer divs., the first consisting of the scientific officer grades, the second the experimental officer grades. The normal qualification for the scientific officer is a first- or second-class honours degree and the entry rate of pay for officers without post-graduate experience is £605 a year. Following a satisfactory probationary period, a scientific officer may expect promotion to the senior scientific officer (S.S.O.) grade (£1135-£1345) and to the prin. scientific officer (P.S.O.) grade (£1375-£1950), which he should reach in the early forties. Satisfactory entrants may expect to reach the senior (S.P.S.O.) grade (£2000-£2300) before the end of their careers. There is an appreciable number of posts in the deputy chief (D.C.S.O.) grade (£2400-£2700) and at £3000) and a very limited number at still higher pay. Special provision is made for what are known as 'special merit' appointments in the S.P.S.O. grade and very exceptionally in the D.C.S.O. grade for outstanding individual workers without any administrative responsibility. The experimental officer class is open to individuals with minimum qualifications of intermediate degree or higher national certificate. It is in 3 grades and pay ranges from an entry rate (£365-£655) rising to £805. Apart from a few chief experimental officers, the top grade is the senior experimental officer (S.E.O.) with a pay range of £1285-£1530. See 'The Royal Naval Scientific Service,' by F. Brundrett, in *The Central*, No. 99, June 1949.

Naval Treaty of London (1936), see under LONDON, TREATIES OF (10).

Navan, see AN UAMH.

Navan Fort (Eamhain Macha), 2 m. W. of Armagh, N. Ireland, a gigantic elliptical earthenwork. It was the seat of the ant. kings of Ulster.

Navarino, Pylos, or Neocastro, fortified seaport of Greece, on Navarino Bay, in the

prov. of Messenia, 56 m. SW. of Tripolis. To the N. are situated the ruins of the ant. Pylos. In the bay the English, French, and Russians united for the protection of Greece, and defeated the Turkish and Egyptian fleets (1827). See also PYLOS.

Navarra, Sp. prov. stretching from the Ebro (q.v.) to the Fr. frontier, consisting of that part of the old kingdom of Navarre (q.v.) which lay S. of the Pyrenees (q.v.). Spurs of the Pyrenees occupy the greater part of the N. and E., and here the rainfall is heavy and many of the valleys are fertile. There is a region of arid steppe in the SE., but cereals, oil, and wine are produced in the plain dists. watered by the Ebro and its tribs., the Ega and the Aragón (q.v.). In the NW. is the R. Bidassoa (q.v.). Iron, silver, lead, copper, and salt are found. The cap. is Pamplona (q.v.). Area 4056 sq. m.; pop. 386,400.

Navarre (Sp. Navarra), former kingdom in the W. Pyrenees, corresponding to the modern Sp. prov. of Navarra (q.v.), and to part of the Fr. dept. of Basses-Pyrénées (q.v.). Inhabited from early times by the *Vascones* (see BASQUES) it became subject to the Visigoths (see GOTHs) in the 5th cent., and to the Moors in the 8th cent. It remained, however, a centre of resistance to the invader under its native rulers, and it passed in 1285 to France by the marriage of Philip IV (q.v.) with Joanna of N. In 1328, on the death of Charles IV, the Fr. crown went to the Valois (see FRANCE, *History*) and the daughter of Louis X became queen of a separated kingdom of N. as Joanna II. In 1512 Ferdinand II of Aragón (q.v.) seized that part of N. which lay S. of the Pyrenees and joined it to the new Sp. kingdom. The portion lying N. of the Pyrenees was incorporated with France in 1589 by Henry IV (q.v.), who inherited the crown of N. through his mother, Jeanne d'Albret (q.v.). The Sp. Navarrese were allowed to retain many of their ant. municipal charters and constitutional privileges until the 19th cent. In that cent., as a result of the support they gave to the Carlists (q.v.), the central gov. abrogated their national assemblies (*Jueros*) and amalgamated their nationality with that of the rest of the Sp. kingdom. See P. Boissonnade, *Histoire de la réunion de la Navarre à la Castille*, 1893, and L. de Urabayen, *Geografía humana de Navarra* (Pamplona), 1929.

Navarrete, Juan Fernandez (1526-79), called El Mudo (being a deaf mute), Sp. painter, b. Logroño. It is supposed that he was a pupil of Titian at Venice. In 1568 he went to Madrid as salaried king's painter to Philip II, and painted in the Escorial the 3 pictures of 'The Nativity,' 'The Baptism of Christ,' and 'Abraham receiving the Three Angels.'

Navarrete, Martín Fernandez de (1765-1844), Sp. scholar and naval officer, b. Abalos. He entered the navy in 1780, and became a captain in 1796. From 1789 to 1792 he was appointed to collect documents relating to the hist. of the Sp. Navy; he was made director of the hydrographic dept in 1823, and senator and

director of the Madrid Academy of Hist. in 1837. His works include *Colección de los Viajes y Descubrimientos que hicieron por Mar los Españoles desde fines del Siglo XV*, 1825, *Disertación sobre la Historia de la Nautica*, pub. 1848, and *Biblioteca Marítima Española*, 1851.

Navarretia, genus of ann. herbs, chiefly Amer. family, Polemoniaceae; *N. squarrosa* is the Skunkweed of W. America.

Nave (Lat. *navis*, a ship), body of a church, from the west door to the chancel steps, and including the side-aisles, if any. This comprised the part of the church used by the lay public.

Navew, Naven, or Navet, old names applied to sev. cruciferous plants, but chiefly identified with *Brassica napus*,

any port or place from which they might reach enemy ter. or the enemy armed forces, and not covered by valid cargo navicert . . . shall, until the contrary is estab., be deemed to have enemy destination.' The effect of these provisions was that neutral shippers or ship-owners who shipped unnavicerted cargo to or from European ports did so at their peril. They ran the risk of losing both cargo and ship. Also under the provision of the ship warrant scheme the offending owner was liable to lose not only the warrant in respect of the particular ship concerned but also in respect of any other vessel in his possession.

Navicular Disease, or Groggy Lameness, inflammation and ulceration of the N.

NAVARRA: ESTELLA

Rape, and *B. rapa*, Turnip, cultivated respectively for their oily seeds and fleshy roots.

Navicert, system of naval control of neutral trade in time of war. The N. system implied the examination in neutral ports of outgoing cargoes and the issue of certificates to these free of contraband which would facilitate their passage through the naval control. The originator of the N. was Mr Skinner, U.S. consul-general in London during the First World War, but the system adopted in that war in 1916, which was revived in the early part of the Second World War to reinforce the system of control ports from Kirkwall to Haifa, differed from that in operation for the rest of the Second World War. An order in council in 1940 provided that 'any vessel on her way to or from a port from which goods might reach or come from enemy ter. or the enemy armed forces, not being provided with a ship navicert valid for the voyage on which she is engaged, shall, until the contrary is estab., be deemed to be carrying contraband or goods of enemy origin or ownership, and shall be liable to seizure as prize'; and also 'all goods consigned to

or shuttle-bone of the horse, invariably occurring in the forefeet, and due sometimes to hereditary causes or to overwork on hard roads, but more commonly to driving at excessive speed after the horse has been kept for some time without exercise. The inflammation causes a constant irritation in the foot, which results in contraction of the frog and alteration in the shape of the horse's foot until it resembles that of a donkey. Special shoeing, preferably with an india-rubber bar pad, and short shoe, affords much relief and enables the animal to work tolerably well, but the disease is incurable. Lameness can be abolished by unnering, i.e. an operation severing the nerve conveying the pain sensations from the hoof.

Navigation, name applied to the science of finding the position of a vessel at sea (or of an aircraft, as to which see AERIAL NAVIGATION) and so directing her from one point to another. During most of the first 15 cents. of the Christian era, sailors such as the Phoenicians, the Carthaginians, Greeks, and Romans depended entirely upon their observation of the skies and their proximity to the coast,

from which they seldom ventured out of sight. The Vikings probably did most of their navigating under similar conditions, and their discovery of Iceland, and possibly of America, was a result of their being blown out of sight of land and of their inability to direct themselves. During the Renaissance the science of N. became a more or less exact one. This was due very largely to the discoveries of the Portuguese sailors and more especially to the work of Prince Henry the Navigator. The cross staff, an invention by which long. could be determined, was first made by Werner about the beginning of the 16th cent., and, later, chronometrical observation in conjunction with the use of nautical instruments came into general use. Davis invented a back staff which seems to have been very generally accepted and this form of quadrant remained in use for a very long time. Much about the same time an instrument came into use for the determination of the height of the sun and stars (the astrolabe). The inventions and discoveries of Mercator did much to increase the accuracy of N. The inventions of Wright did much also in this direction, and finally towards the beginning of the 17th cent. arithmetic, trigonometry, and logarithms began to be used as methods of calculation. Probably the greatest work of this cent. was that of Martin Cortes, whose book was accepted as authoritative. The foundation of the Royal Observatory at Greenwich by Charles II in 1675 was the direct result of the need for a reliable method of determining the position of a ship at sea. In 1763 the *British Mariner's Guide* was pub. by Dr Maskelyne, and this was really the nucleus of the *Nautical Almanac*, which was first pub. in 1766 for the year 1767. Pub. has continued without interruption since that time. The author of the *British Mariner's Guide* had also, 2 years previous to this first pub., discovered a method by which long. might be determined by lunar observation.

PRACTICAL NAVIGATION: Coastal. In navigating a vessel along a coast the exact position is usually ascertained by reference to points of land, lighthouses, and beacons, in conjunction with a chart of the vicinity. When it is possible to refer to more than one point the position is easily ascertained, because a ship's position is where compass bearings, after correction for deviation, intersect on the chart. When only one point is available a bearing can be taken provided a sextant angle of the point or headland is also taken in daylight and the height of the point is shown on the chart. Another method adopted is to take a bearing of a point and then continue the vessel in the same course for some distance, at the end of which time another bearing is taken and these 2 bearings are marked down on the chart. By means of a parallel rule placed in the same direction as the ship's course, it is now possible to find and mark the exact position of the vessel when any current or leeway or both has been allowed for. Another variation of the foregoing methods of finding the position of the

vessel is known as the 'four-point bearing.' This is used when the ship is 'abeam' of the point of which observation is being made. A bearing is also taken when the point is 4 points on the bow. When it is possible to take observations of 2 points, these observations are taken simultaneously and marked on the chart; the point of intersection is the position of the vessel. With 3 points in view an instrument called a station pointer is used and the angles between them found by means of its 3 arms. These 3 arms are attached to a circle made of celluloid, and when the arms have been placed in such a position that they correspond with the angles between the points, it is placed on the chart, and the centre of the circle gives the exact position of the vessel. In coastal N. when the weather is foggy the ship is navigated by means of 'feeling' round the coast with the lead or sounding machine (see *Modern Ocean Navigation* below). Naturally this is the most unsatisfactory of all methods, and soundings have to be continually taken in order to get even an approximate position. When using this method it is necessary to know the state of the tide (see *TIDES*) and to reduce the soundings to low water, as all depths shown on a chart are given as low-water spring tides.

It is necessary to bear in mind that all bearings taken from the compass must be converted into magnetic bearings before being marked on the magnetic chart, and even if the chart is a 'true' one, variation must still be allowed for. A bearing may be best defined as an observation by compass of the direction in which a point lies from the vessel.

Modern ocean navigation. The increase both in the size and the speed of ships has led to many developments in the science of N. Problems formerly regarded as purely theoretical have within recent years become very practical, and the science of N. to-day is much more intricate and precise than it was some decades ago. A long ocean voyage is first mapped out as carefully as possible on a great circle chart, the shortest possible route being chosen. The track thus chosen is followed also on a chart which shows probable wind directions and currents, and is modified according to the information given therein. In addition the track chosen would be also modified by such information as navigator's books relating to that region would give, and by the information supplied by the Admiralty's *Ocean Passage Book*. Next the route would be transferred from a great circle chart to a Mercator's projection chart, on which the great circles are shown, for convenience' sake, as straight lines, whilst the 'rhumb' line (the representation of the N. of the ship) is shown as a curved line. All meridians and the equator are shown on Mercator's projection as straight lines. The great circles are *not* followed in the steering of the ship; each circle is divided into chords which are followed instead, since that means only the alteration of the course by one or two degrees at the end of each

chord, whereas to follow the great circle would involve the constant changing of the course. The general track to be followed having been laid down, there are 3 methods by which it is possible at any point to ascertain the position of the vessel. These are: (1) the recording of the track on charts, a difficult matter owing to the constant errors which creep in and which cannot well be avoided; (2) by trigonometrical calculation, which is based on the course steered and the distance run; (3) by astronomical observation. As long as the ship is in sight of land, those methods which have been described under the heading coastal N. are used. In rough or hazy weather continuous soundings are taken when in localities which are known to be dangerous, and it is necessary to remember that the soundings must be continuous, since an occasional sounding is more dangerous than useful. Lord Kelvin's sounding machine, which is still used for that purpose, consists essentially of a drum round which is coiled sev. thousand fathoms of fine wire, the free end carrying a specially designed sinker or lead (q.v.) which will enable a sample of the ocean bed to be brought to the surface. The wire passes over a registering wheel which indicates on a dial the length of wire run out. Two brakes are fitted to the large wire drum, one to control its rotation and the other automatically to stop the mechanism when the sinker reaches bottom. This amount of wire is available in a surveying ship, but the normal ship's outfit is only 300 fathoms.

A more modern method of ascertaining the depth of water is by echo-sounding. Broadly, this is done by producing a sound in the water near the surface and accurately measuring the short interval of time which elapses before the echo reflected from the bottom is heard. This system requires sensitive time-recording instruments, but has the advantage that sounding can be conducted in all weathers at any speed of the vessel. During these periods the coast chart is used, this being on a very much greater scale than the ocean chart, which is usually known as the small scale chart. Before losing sight of land the lat. and long. (q.v.) are calculated by means of the methods already described, and the exact position is transferred from the coast chart to the small scale chart. After this the position of the ship is calculated by the methods given under the heading (2) above. This method is rectified wherever possible by means of astronomical observation and by a calculation of the changes of lat. and long. by means of plane trigonometry, frequent use being made of the traverse tables. These methods of discovering the exact position of a ship are known as dead reckoning, and the modern ship's compass, patented by Lord Kelvin, has done much to ensure its accuracy. The distance run by the ship is obtained by the patent log, but it is not regarded as entirely accurate, the distance run by the ship being calculated more accurately by the number of revolutions of the

engines. The most accurate means of ascertaining the exact position of the ship, however, is by astronomical observation, and this is always employed wherever possible. Dead reckoning is only used during bad weather conditions. The astronomical observations are attended by many difficulties. The instrument

SPERRY GYRO-COMPASS

The gyroscope compass derives its north-seeking qualities from a combination of four natural laws, the first and second of which are properties of the gyroscope, the third gravitation, and the fourth the earth's rotation. These natural laws provide a source of directive force for a compass that indicates the true north and does so with a degree of steadiness comparable to that of an object on shore. In addition to indicating the true north, the Gyro-Compass is capable of operating, repeating, or indicating compasses wherever their indications may assist in navigating the vessel. (*Sperry Gyroscope Co. Ltd.*)

used for making these observations is a sextant (q.v.); but this, owing to the conditions under which it has to be employed, must give rise to some little error. Navigators attempt, and to a great extent succeed, in rectifying such error by taking the average result of a number of observations made at different times. One of the greatest marvels of modern N. is the reliance which can be placed upon N. by star observation. The most accurate of all observations is probably the twilight observation, when the brighter stars are

just visible and the horizon is visible also. For this purpose the armillary sphere is employed. This is a small celestial globe on which is marked all the prin. stars visible to the naked eye. By manipulating the sphere which is elevated, until sidereal time is under the fixed meridian, a correct representation of the heavens is thus obtained. Astronomical observations are made at sea for the purpose of ascertaining lat., long., error of the compass, and lat. and long. simultaneously. The chief heavenly bodies observed are the sun, moon, Venus, Mars, Jupiter, Saturn, and the Pole star, together with all stars of the first magnitude. The *Nautical Almanac* gives the position of all these for fixed times at Greenwich, and gives also all necessary information for computing the position of these bodies at all times in all places. An important development is the application of directional wireless telegraphy to N., being particularly useful in foggy weather for establishing the position of a ship approaching the land. The principle of operation of a direction finder depends upon the fact that the antenna, or aerial, of a wireless transmitting or receiving installation emits or absorbs radiations most strongly in its own plane. In the direction finder used in practice, the antenna consists of a flat coil of sev. turns of wire mounted on a vertical axis about which it is free to rotate so that its plane may be pointed in any direction of the compass. As a receiver it is turned until the signals are received at maximum strength, when it is known that the plane of the coil must point to the transmitting station. Direction-finding apparatus is either housed on land, when in response to a message from a vessel it can determine and signal to the ship its position, or carried on board and pointed towards a land station.

Another form is the rotating 'beacon.' This consists of a radio-transmitting station at some known point on land, having an antenna which is continuously rotated at constant speed and which is always automatically emitting a special Morse code signal. At a particular point in its rotation a characteristic signal is sent out. This system is declining in favour, although it has the advantage that no special wireless-receiving apparatus is required on the ship and the bearing can be taken on a broadcast receiver with the aid of a stop watch.

The gyroscopic compass has also been of great assistance to navigators. It has 3 important advantages: it is unaffected by magnetic effects of iron or steel in its vicinity; it always points to true or geographical north; and it is invaluable in high lats., where in a magnetic compass the card is straining to stand on its edge with consequent loss of efficiency. It is composed of a gyro-wheel rotated at high speed by electricity, and this, if free to do so, will always set itself so that its axis lies in the true north and south meridian. A compass card and auxiliary parts are mounted on gimbals. The actual gyro-compass is mounted in a special room in the ship, and repeaters synchronised with

it are erected where required in other parts of the vessel. The gyroscopic compass is regarded by many seamen as the greatest of all modern aids to N.

Radar. Radar (q.v.) is used for 3 main tasks in N.: (1) to provide warning of the approach of ships, icebergs, etc., and to avoid collisions; (2) to assist in the N. of coastal waters; (3) as an aid to the pilotage of restricted waters.

It is usual to provide scales of display so that the radar screen covers variously ranges up to 30 nautical m., 12 nautical m., 3 nautical m., and 1-2 nautical m. A set should provide a clear indication of coastlines at 20 nautical m. when the ground rises to at least 200 ft. and at 7 nautical m. when it rises to at least 20 ft. Ships should be seen at 7 nautical m., fishing vessels at 3 nautical m., and buoys at 2 nautical m. It has been found that by fitting buoys with corner reflectors the radar response can be increased to 8 or more nautical m. By means of a chart comparison unit the picture may be viewed in coincidence with a chart. Another method is to project a magnified image of a micro-film transparency of the chart on to the face of the plan position indicator (P.P.I.). Shore radar can be used for port and harbour supervision as it provides instantaneous information of movements in the port area. It is also of value in enabling the port authority to know whether buoys or light vessels have moved from their charted position in bad weather and, if so, to know their new position. The ports of Douglas (Isle of Man) and Liverpool are both fitted with radar and at the latter place the pilots carry portable radio telephones which enable the control staff on shore to communicate instructions and advice concerning the pilotage of the ship; this is of particular value in foggy weather or when unusual conditions exist. The Liverpool-Wallasey and Gravesend-Tilbury ferries are also assisted in bad visibility by shore radar in conjunction with a radio-telephone link. Experimental Ramark beacons have been estab. at St Catherine's, Isle of Wight, and Portland Bill light-houses. When the ship's radar aerial points towards these places a broken bright line appears from the centre of the radar screen to its circumference on the bearing of Ramark in relation to the ship. To enable the navigator to identify the Ramark, small dots are used for St Catherine's, large dashes for Portland Bill. The range of these beacons is 12-14 m.

Loran (Long Range Navigational Air) employs pairs of pulse-transmitting stations spaced up to 600 m. apart. The pulses are received and displayed on a cathode ray indicator from which the operator can determine the difference in arrival time between the 2 pulses. The ship's position is determined by taking a path difference reading from 2 pairs of stations. The observations and plotting take about 5 min. and the range over the sea is approximately 700 m. by day and double this distance by night. This system was used extensively during the

NAVIGATION BY MARINE RADAR

Simplified plan or chart of the Solent, the strait between the Isle of Wight and Hampshire, England, showing Ityd pier and the surrounding coastlines. In this and the accompanying diagrams the ship's position is shown as a white circle in the centre of the plan or screen, and its direction is assumed to be north-east by north. The scale of display may be changed so that the screen covers 30, 12, 3, or 1·2 nautical miles. The last three are shown by the concentric circles on the plan.

The illuminated 12-mile display on the radar screen of the Solent equivalent to the whole of the simplified chart at the left, as it would appear on the screen at a scale of approximately $\frac{1}{4}$ inch to 1 mile. With the ship in the centre, the surrounding coastline can be discerned as a recognisable pattern of light with its many indentations, harbour entrances, etc. On the port quarter an elongated pencil indicates Ityd pier, and surrounding buoys appear as several points of light.

DIAGRAMS OF PLAN POSITION INDICATOR (P.P.I.)

In this second diagram the range switch has been turned to the 3-mile position and the display thus brought up to the correspondingly larger scale of 1 inch to 1 mile. Surrounding objects are defined with greater clarity and detail. Reference to the circular range scales superimposed on the chart of the Solent shows the area which is embraced by the 3-mile range in relation to the above diagram.

The 1·2-mile position above gives an even greater expansion to the scale of the display, now covering the area within the smallest circle on the chart, the scale being 3 inches to 1 mile. Buoys are displayed with great accuracy. The thin bright line (thickened for the purpose of this reproduction) is the luminescent ship's leading line, brought on the screen by a switch.

Cossor Marine Radar

Second World War and the whole of the N. Atlantic and the Pacific was covered by Loran.

Gee is similar to Loran and consists of a master and 2 or 3 shore stations sited up to 80 m. apart and emitting continuous series of synchronised radio pulses from omni-directional aerials. The range over the sea is 100-50 m. The equipment is comparatively simple to operate and a navigator can plot his position in a minute.

Decca, like Loran and Gee, employs the 'hyperbolic' system. A number of transmitting beacon stations have been erected in Great Britain and on the Continent and, by means of special receiving equipment in a ship and special navigational charts on which are superimposed a lattice of lines of position, the ship's exact position can be ascertained. The range is approximately 300 m. and this system is practically confined to ships employed in the home and coasting trades (see also AERIAL NAVIGATION).

Navigation Acts, long series of Acts of a protective nature passed from time to time to prevent foreign competition on equal terms with Eng. ships. Although these Acts date back to the time of Richard II, the chief Act was that passed under Cromwell in 1651, directed principally against the Dutch. It provided that imports should be brought into England only in Eng. vessels or in vessels of the country producing the goods, and Eng. exports carried only in Eng. ships. The object was to monopolise as far as possible the carrying trade of the world. This restriction also applied to any Eng. dependencies. To a very great extent these laws accounted for much of the trouble between Great Britain and Ireland, and also between the Amer. colonies and the mother country. These restrictions on foreign trade were not totally withdrawn until the middle of the 19th cent., and even in the withdrawal the right was retained to retaliate if restrictions were placed on Brit. N. in foreign waters.

Naville, François Marie Louis (1784-1846), Swiss philosopher, b. Geneva. He was pastor at Chancy in 1811, and founded there, and later at Vernier, a model school. He followed the philosophy of Maine de Biran. He pub. *De l'éducation publique considérée dans ses rapports avec le développement des facultés la marche progressive de la civilisation, et les besoins de la France*, 1832, *La Charité légale*, 1836.

Navsari, tn of Bombay state, India, 145 m. north of Bombay. N. has for long been the main centre of the Parsees in India, and it is here that their priests receive their instruction.

Navy, Department of the, gov. dept of the U.S.A. ('The term 'Navy Department' is often used synonymously, but strictly speaking it refers only to the H.Q. estab. at Washington.) It is administered by the secretary of the navy, not of cabinet rank since 1947, when the dept was placed under the National Military Estab. The secretary's prin. civilian assistants are the under secretary of the navy, the assistant secretary of the navy, the assistant secretary of the navy for air, and the judge advocate general. The prin. naval adviser is the chief of naval operations, who is also the naval member of the joint chiefs of staff. The dept is administered on a bureau system introduced in 1842; these bureaux are: naval personnel, ordnance, ships, aeronautics, yards and docks, supplies and accounts, and medicine and surgery. See also UNITED STATES NAVY.

Navy, U.S.A., see UNITED STATES NAVY and NAVY, DEPARTMENT OF THE.

Navy and Navies. The general policing of the high seas has for a long time been one of the prin. duties of the Brit. N. To this end the English have in hist. maintained their supremacy of the sea, which in early times was a vital necessity when the is. was open to the invasions of the Vikings. The incursions of the Vikings made it necessary to provide some force by means of which the English could stop the constant menace of invasion from the E. Alfred the Great fought the Danes on their own element, and in order to do so made a levy on each of the seaboard cos. for the provision of a certain number of ships, or a certain amount of money or men for the upkeep of those ships, to defend the coasts of the country. Between Alfred's time and the Norman Conquest the 'levied' N. was supplemented by the possession by the king of royal ships, and during the years which followed the Norman Conquest the principles of feudalism were applied to the levying of a naval defence. The seaport tns held their charters and privileges in return for men and ships which were to serve the king for 15 days in the year at the expense of the tns. During the 12th and 13th cents. the fleet of the Cinque Ports was practically the national fleet, but this rapidly sank into disrepute, and the real R.N. came to be not the feudal array, but the mercenary N. In this respect may be compared the national N. and army, since both have come down from the purely mercenary forces which formed part of the conqueror's supposedly feudal invasion army, and which, especially under the later Plantagenets, displaced the feudal array. The main nucleus of the R.N., however, was the king's own ships, which were controlled by royal officials, and were entirely at the command of the king. The crusade of 1190 had one result at least, that of bringing into use in the Eng. N. the title of admiral, although it was not at first used in the

supreme sense in which it is used to-day, and indeed an admiral in that sense was not appointed until 1360, and a First Sea Lord, as the title is known to-day, was not appointed until well into the 15th cent. Even during the reign of weak Eng. kings the sovereignty of the seas was retained. In John's reign there were victories over Philip Augustus, and in Edward III's the victory at Sluys in 1340, and later over the Spaniards at Winchelsea in 1350. Up to this time, at any rate, the English had suffered no great defeat, and their claim to sovereignty in the narrow seas could not easily be disputed, as their retention of Calais for so long a period does much to prove.

During the Hundred Years War the English seldom found difficulty in invading France, and that perhaps was the supreme test. The N. led a somewhat chequered career during the period 1399-1485, but though it fluctuated in strength according to the strength or weakness of the reigning king it still remained in existence. During the Tudor period the N. increased in strength. Henry VII added to its numbers, not very greatly it is true, but nevertheless he laid the foundations for the greater N. which his son was to build. He also employed many of the royal ships on merchant ventures. Henry VIII took a deep interest in the N. He spent at least some proportion of the plunder of the monasteries in raising an efficient fleet, built according to the latest ideas. As far as the fleet is concerned, the Tudor period was a period of transition, but even during the reign of Elizabeth I it never became larger than it was during the reign of Henry VIII. Henry was also responsible for the estab. of a N. Board, under the direction of a Lord High Admiral, and this administrative reform remained in existence down to the time of William IV. The early hist. of the personnel of the fleet shows us that it was regarded very much more as a 'military' force than as anything else. The sailors who navigated the ship were not held of the same importance as the soldiers who defended it. They were also very much in the minority. By the time of Henry VIII this had to a very great extent changed, nor was this surprising. The era of discoveries had given the ships a very much wider scope than they had previously had. It was necessary now to have a majority of men who were capable of sailing and navigating the vessel. The fighting force, therefore, diminished very greatly in numbers. Further, the great strides which had been made in the science of navigation rendered it necessary that the men in command should be trained men, and not merely the favoured nominees of the king. It was fortunate that the same modernisation did not take place in Spain, so that the Armada battle was a conflict between the old and the new ideas of ships and sea warfare. Further, during the Tudor period the size of the ships increased, and although the number of ships in the N. of Elizabeth was less than in that of Henry VIII, nevertheless the actual tonnage was greater.

The Stuart period is of vast importance for the development of the N. During the reign of James I many great improvements were made. The position of Lord High Admiral was put into commission. Although the N. was not maintained at a very great strength, these commissioners nevertheless took steps to see that the fleet was efficient. Moreover the king himself took great interest in the development of the N., and especially in naval construction. This work was continued during the reign of Charles I, and many reforms were made in the matter of the personnel of the fleet, which was increased, and which received very much better wages. The ships that were constructed were of good quality, and it should be remembered here that Charles's first levy of ship money was in fact employed for the construction and increase of the N. The N. was, however, still small. At the outbreak of war the king had only about 40 ships, and these were handed over to Parliament by the newly created Lord High Admiral. During the period 1642-60 the N. passed into the hands of Parliament, and was controlled by admirals appointed by it. The N. did much good work, and under Cromwell it revived the days when it claimed the sovereignty of the seas. By 1660 the N. had more than trebled in size, and had nearly trebled in tonnage. Further, the naval service was no longer regarded as of necessity a service by pressed men; the admiral of the Commonwealth, realising the error of this, opened the service to voluntary servants as well as pressed crews. In view of the ever-increasing trade of England, and the necessity to protect the merchant service, the increase of the N. was essential to the well-being of the nation. During the reign of Charles II the N. did at last become truly national. The work of Samuel Pepys was of vast importance: as clerk of the Acts, and later as secretary to the Lord High Admiral, he spent his life in a constant and successful endeavour to put the administration of the N. upon a sound, ordered, and disciplined footing, and to provide ships and men for war and peace. The later hist. of the N. is a continuation of the rules which he laid down. Officers received a proper training from the time that they were boys, and special corps were founded in order to have an ever-increasing number of officers prepared for the service. The commerce of the country was much more amply protected, and piracy was put down with a strong hand. Up to the passing of the Test Act (1673) the Lord High Admiral was James, Duke of York (afterwards James II), who proved to be both interested and capable. The N. consisted of about 170 ships of over 100,000 tons, a personnel of 42,000 men, and nearly 7000 guns, a vast improvement on the previous reign.

When the revolution came in 1688 the control of the N. passed almost entirely into the hands of Parliament. The title of R.N. was still maintained, and occasionally the form of appointing a Lord High Admiral was gone through, but as a

purely royal force the N. ceased to exist. The N. was controlled by the Navy Discipline Act of 1660, which was, at the end of the war of the Austrian Succession, supplemented by an Act of George II's reign. In 1793, when war broke out with the Fr. rep., decisive command of the seas was not yet estab., though the N.'s line-of-battle strength numbered 85 ships, with a section of which Howe defeated a Fr. fleet off Ushant on 'the Glorious First of June', 1794.

Few great changes took place in naval construction until the reign of Queen Victoria. Many experiments were made, and the ships increased in size and in the

turrets carried an armour-plating of from 10 to 14 in. thick. The turret ships were in the course of time replaced by ships of the cruiser type. These were armoured and protected, and were speedier than the ordinary line-of-battle ships, but did not carry so much armour-plating and thus were not so well protected.

After 1880 Great Britain began a definite programme of naval construction calculated on a 2-power standard, i.e. up to the equality of the next 2 strongest powers in the world, which at that time meant Europe. From this programme developed the race in naval armaments which was a feature leading to the First

'THE GLORIOUS FIRST OF JUNE': LORD HOWE'S VICTORY, 1794

An aquatint after R. Dodd, reproduced by permission of the Parker Gallery, 2 Albemarle Street, London, W.1.

number of guns which they carried; but it was not until the beginning of the 19th cent. that the basic form of wooden ships with sails was changed. The first steam warship was constructed in 1814. After 1854 ships began to be armoured-plated, a tribute paid to the ever-increasing power of shells. The year 1860 saw the launching of the first ironclad of Great Britain, but this had been preceded by a vessel of like build launched by France in the previous year. (Guns were, however, quickly invented which could pierce the armour carried by these vessels, and so later ships had a greater thickness of armour, and carried guns which were powerful enough to pierce the armour of the opposing vessels. The ordinary ironclad was about the year 1862 superseded by the turret ship, and under the direction of Sir E. T. Reed, the constructor of the N., a ship was produced which was capable of firing in all directions from central batteries, and did not depend entirely upon its broadsides. Turret and mastless warships were now regarded as the latest thing in naval construction, and the

World War, but it was the other nations who set the pace, because in their building programmes lay the threat to the Brit. Empire. From it evolved the super-dreadnoughts, ships of 20,000 tons upwards, with a maximum speed of 25 knots, carrying up to 9 16-in. guns, and a formidable secondary armament, with armour plating of 14-in. thickness or more. In the First World War the Brit. N. played a dominant part, preserving the country from invasion, keeping open the lines of sea communication, blockading the enemy, and making possible supplies and reinforcements to enable the final decision to be reached on land. As an indication of this vital part played by the Brit. Grand Fleet Churchill spoke of Adm. Sir John Jellicoe, its commander-in-chief, as the only man on either side who could lose the war in an afternoon. The casualties sustained by the Brit. N. during this war were 254 warships of all types lost as against 937 total enemy warships destroyed, and 39,766 officers and men of whom over 33,000 were killed, while the N. expanded from 2,419,043 tons

in Aug. 1914 to 4,087,950 tons in Oct. 1918.

After the war Great Britain announced that she had adopted a 1-power standard in view of the building programmes in Japan and the U.S.A., and proceeded to lay down 4 new battleships of 48,000 tons each. Such was the state of affairs when President Harding invited nations to the Washington Conference, which attained a measure of success by eliminating the factor of competition in naval armaments from the field of international relationships. Limitations imposed on the size of battleships (35,000 tons) now produced novel designs of which the *Nelson* and *Rodney*, of 33,500 tons, with their main armament of 9 16-in. guns all forward, were the most unusual. Meanwhile the possibilities of air power were being appreciated, and it was argued that the day of the capital ship was over, but the building by Germany, limited by the Versailles Treaty (q.v.), of 3 10,000-ton pocket battleships of the *Deutschland* class revived interest in this type of ship. These Ger. ships mounted 6 11-in. guns, 8 5.9-in., and 5 3.4-in. anti-aircraft, and were designed for a speed of 26 knots. Electric welding was employed in their construction, and internal combustion machinery adopted for propulsive purposes. France replied with the *Dunkerque*, 26,500 tons, 29 knots, 8 13-in. guns, 16 5.2-in. guns, which was built during the negotiations for the London Naval Treaty, 1930 (q.v.), held to extend the provisions made at Washington. As a result of this treaty Great Britain, U.S.A., and Japan scaled down capital ship strength, agreed to a 6 year building holiday, and put further limitations on cruiser design. France, incensed at Italy's insistence on naval parity with her, refused to approve these limitations, and began to build *contre-torpilleurs* of 2569 tons, while the Italians produced their *condottieri*, which were small cruisers of over 40 knots speed. Meanwhile Brit. cruiser strength was steadily reduced, while that of all other maritime nations increased. A striking indication of the way in which Great Britain had reduced her naval power compared with that of other countries was given by the First Lord in Nov. 1933, when he stated that, since 1914, the U.S.A. had increased her naval personnel by 39,700 and Japan by 40,000, whereas Great Britain had reduced hers by 55,000. In 1931 Japan gave notice of termination of the Washington Treaty, claimed the right of equality, and, now independent of the League of Nations, began pursuing a virile course of her own in naval construction. In the U.S.A. a programme of new construction up to the limits permitted by the treaty, together with a general modernisation of her ships, was going forward, France was about to launch her first post-war battleship, Germany was asserting her old independence, and any numerical superiority possessed by Great Britain lay in semi-obsolete and obsolete ships. Such were the conditions when Great Britain negotiated a naval treaty with Germany (q.v.) on 18 June

1934, when it was agreed that the latter country could build a surface fleet up to 35 per cent of Brit. naval tonnage, and possess a submarine tonnage of equal strength. She was, however, prepared to adhere to Article IV of the London Treaty which forbade the torpedoing of merchant ships on sight. Fr. opinion was incensed at this agreement, regarding it as a blow to the unity announced at Stresa (q.v.), and it hardened the determination to have nothing to do with Washington ratios. Within a few months Mussolini awoke Great Britain from her dream of disarmament by his campaign in Ethiopia, which brought a concentration of Brit. naval strength in Alexandria. The answer to the question whether sea power was still effective before the air might of another nation seemed imminent. But hostilities were avoided, though events demonstrated the necessity for Britain to uphold her old position at sea.

During this crisis the second London Naval Conference opened in Dec. 1935 (see LONDON, TREATIES OF (10)), as the powers had agreed to meet within a year of the termination of the Washington Treaty by one of them. Japan withdrew, while France and Italy were unable to associate themselves with the agreement reached between Great Britain, the dominions, and the U.S.A. This limited capital ship armament to 14-in. guns, reduced the size of aircraft carriers, and imposed still further limits on cruiser construction. But the growth of international tension soon made the treaty abortive, and advantage was taken of the 'escape' clauses to meet the war which threatened. Could the N. still defend the vital interests of the empire in view of the new air menace? Had it the right type of ships? Were they properly armed? Were its functions adequately co-ordinated with those of the other services? And had the development of asdic reduced the threat from submarines which had nearly brought defeat in the First World War? All these questions were now to be answered, and lessons were to be learnt at great cost. It was soon apparent that, although a warship well manoeuvred was a more difficult target for an aircraft to hit with a bomb than had been expected, the ships themselves were woefully deficient in anti-aircraft guns. In many destroyers the torpedo tubes were removed, and combined low/high angle guns substituted as they became available; cruisers, such as the *Dido* class, were solely armed with these dual purpose guns, which also formed the secondary armament of the new battleships of the *King George V* class (see further 'KING GEORGE V'), and gradually numerous light, close-range anti-aircraft guns were mounted on their decks. Thus a few warships in company could eventually put up a heavy anti-aircraft barrage that both deterred and destroyed enemy aircraft. It was nevertheless clear that no warship, however armed, could operate with impunity within range of shore-based aircraft without the protection of some sort of air umbrella, and that insufficient attention

had been paid to sea/air co-operation. In 1939 the Fleet Air Arm had been regarded as little more than a long-range telescope for the fleet, useful perhaps to hinder an escaping fleet, and it had been accepted that carrier-borne aircraft must inevitably be slower and less powerful than their land-based equivalent.

However, from operations off Norway, in the Atlantic against the *Bismarck*, in the Mediterranean and in the Pacific (see NAVAL OPERATIONS IN SECOND WORLD WAR), emerged the modern conception of the Naval Air Arm, with its carriers providing the main 'hitting' power of the fleet (see AIRCRAFT CARRIER). The war indeed proved that naval aircraft could even win a sea battle before the guns on either side had fired a shot (see NAVAL OPERATIONS IN SECOND WORLD WAR, *Battle of Midway Island*). The elements of the air arm are now integrated with the fleet and comprise between one-quarter and one-third of the total strength of the N. The aircraft carrier has thus superseded the battleship as the most important fleet unit, although battleships in the Second World War, when operated properly, justified their existence and confounded the inter-war critics who prophesied their doom (see BATTLESHIPS). Protecting convoys against powerful surface raiders, hurling hundreds of tons of high explosive into enemy positions ashore in N. Africa, Italy, and Normandy, and protecting carriers themselves from both surface and air attack, they fulfilled their purpose in modern warfare. There were also occasions when weather conditions prevented the operation of aircraft, such as when a Brit. battleship, the *Duke of York*, destroyed the powerful Ger. battleship *Scharnhorst*, which menaced the convoys to Russia. Against submarines the early confidence in asdic was at first misplaced. The apparatus could certainly detect submerged U-boats in general conditions, but it was not designed to seek out the enemy on the surface at night. Thus U-boats were often enabled to approach on the surface without detection and attack convoys in darkness, causing heavy losses. These attacks could only be overcome by more escort vessels and, in due course, the corvette and frigate were developed. Not differing greatly from sloops, they possessed advantages in respect of handiness and economy of personnel, and, most important of all, could be built quickly and in numbers. They carried depth charges and H.A./L.A. guns. But it was not until the development of radar that the measure of the submarine menace could be taken, when they were once more subject to detection, whether on the surface or submerged. In countering the U-boat the N. developed a close association with Coastal Command (q.v.) of the R.A.F., while escort carriers sailed with nearly every convoy. These were merchantmen converted by the U.S.A. under lend-lease and returned at the end of the war. Towards the end of the war Germany had developed a device where, by fitting U-boats with a *Schnorkel* (or breathing

device), they could remain submerged for extended periods, and could thus escape both aircraft and the radar screen. Fortunately the war ended before this invention could influence the battle of the Atlantic to any great extent. In spite of the great battle against U-boats, however, and the developments in the mine and torpedo, it is a fact that these weapons did not influence the tactics of warships to the same extent as they did in the First World War.

In general it can be said that the N.s of Great Britain and the U.S.A. achieved their strategic objectives (see STRATEGY). They maintained the flow of shipping across the oceans, without which the strongest armies and air forces would have been powerless to act; they denied to the enemy his ability to use the sea, and imposed an effective blockade on his coasts; they successfully transported powerful armies across thousands of miles of ocean with barely a loss, making possible the campaigns in Africa and Europe; they guarded the flow of oil to feed the growing air forces; and, with the N. of the U.S.A. as the major partner in the area, carried the war across the Pacific to the threshold of Japan. Meeting the threat from the air they challenged it by making the aerial weapons their allies, changing their tactics without fundamentally altering their strategy. But at a cost. The losses to the Brit. N. (including dominion N.s and Royal Marines) were more than two-thirds greater than they were during the First World War: over 73,000 officers and men lost their lives, 1500 Brit. warships of all kinds were lost; but although over 2000 merchant ships were sunk in the N. Atlantic alone, this figure represented less than 2 per cent of the numbers conveyed. On the other hand, the axis powers lost 996 submarines (German 781) against the Brit. losses of 76, and almost 1700 other war vessels (including 627 in the Pacific destroyed mainly by the U.S.A.). Meanwhile, in spite of its losses, the Brit. N. expanded from 423 effective fighting vessels of all kinds in 1939 to 2040 in 1945, without including hundreds of landing craft and motor launches; and its personnel increased from 133,000 to 864,000. On the conclusion of war these figures rapidly decreased: warships were scrapped, sold, or transferred to dominion N.s, others placed in reserve, 4500 merchant craft employed on naval service were dispersed, over 1200 fishing vessels released, and by April 1957 the personnel reduced to 121,500. The rapid post-war reduction in personnel caused such a lack of balance from the loss of experienced men that in 1947-8 it was necessary to immobilise the greater part of the fleet. But the build-up to peace-time strength proceeded slowly, and the Brit. fleet, including vessels in reserve, stood in April 1958 at 1 battleship (reserve), 9 aircraft carriers (5 in reserve), 15 cruisers (8 in reserve), 1 guided weapon trials ship, 56 destroyers (30 in reserve), 105 frigates (54 in reserve), 57 submarines (18 in reserve), and 208 mine-sweepers (156 in reserve). One carrier, 3 cruisers, 14

frigates, 5 submarines, 25 mine-sweepers, and 7 coastal craft were under construction in 1958, and development work had started on a nuclear-powered submarine.

Since the Second World War the Brit. N. has resumed its peace-time functions of showing the flag as well as carrying out duties in connection with the occupation of ex-enemy countries. It has quelled disturbances in Aden, Mogadiscio, and the Solomons, and restored stability in many another troubled area; it has played an active part in coastal operations against Communist bandits in Malaya, in the

the Brit. N. has not worked alone, but in co-operation with other nations of W. Union and the N. Atlantic Treaty. For the first time in hist., during a period of peace, an international fleet assembled in Brit. waters in the summer of 1949, when warships of countries belonging to W. Union carried out combined manoeuvres and exercises under the command of a Brit. commander-in-chief. Recognising the vital importance of inter-service co-operation, much attention is also paid to the training of officers and men in the technique of combined operations, and in

THE FRIGATE, H.M.S. 'MURRAY'

Korean War, and in the Anglo-Fr. action in Egypt in 1956; brought succour to distressed areas; swept the sea of thousands of mines laid during the war; continued to chart inadequately surveyed coasts; and carried out investigations in the polar regions. (For the *Amethyst* incident see YANGTSEKIANG.) But its prin. function has not been neglected: the preservation of sea communications in time of war. Changed conditions produced by the growth of air power, the nuclear bomb, the development of high-speed submerged submarines, the extension of radar, have in no way altered this conception of the N.'s function, though they have demanded a different and more scientific approach to it. This has been recognised in the growth of the Naval Scientific Service (q.v.), and in the encouragement given to research. It constantly exercising to test new tactics

the joint naval/air anti-submarine school the problems of anti-submarine warfare are being investigated on a 2-service basis. To-day, owing to the technical developments and the growth of naval aviation, a greater part of the N. is quartered ashore than ever before. Conditions have improved. The number of married quarters for naval personnel serving in shore estabs. has been greatly increased; more attention has been paid in ships themselves to better messing accommodation and ventilation; pay has been increased, and more opportunities given to ratings who prove themselves worthy to rise in the service (see NAVAL EDUCATION and RANK). The maximum 1958 figure of 112,000 for the N. is to include 10,040 Royal Marines (q.v.), who in addition to their traditional functions now provide and train the permanent peace-time amphibious commando units, and 3370

W.R.N.S. (q.v.). The reserves (see NAVAL RESERVES) could probably provide another 100,000 at short notice in an emergency.

On the future of N.s there is considerable speculation. They have grown up in the past in a world composed of sovereign states, many of which had a common standard of material strength. But the Second World War left the world with only 3 great powers that counted: the U.K., the U.S.A., and the U.S.S.R. The first 2 powers have so many ideals in common that war between them is unthinkable, and the U.K. naturally makes no attempt to engage with her transatlantic partner in naval competition. Indeed, in the event of hostilities, the 2 fleets would probably be integrated under the N. Atlantic Treaty. Also to be borne in mind is the greatly increased naval strength of Commonwealth countries such as Australia, Canada, and India. Russia is essentially a land power, but now developing her N., especially submarines. It is argued that the nuclear bomb has destroyed the effectiveness of fleets, but, on the other hand, it has been pointed out that this weapon is unlikely to be used against ships at sea where, by spacing them at greater distances apart, the damage can be so reduced as to make its employment uneconomical. The nuclear bomb has, however, modified the methods of sea warfare without altering its conception. Large fleets concentrated in harbours, as they were in the First World War, face annihilation, but by dispersing ships in many different bases when in harbour this menace can be minimised. It can also be countered by the development of the 'fleet train,' composed of auxiliaries of all kinds, used in the Pacific to supply and maintain ships at sea for periods of months if necessary. It may be that command of the sea as previously understood will, in future, be confined only to specified strategic areas. But the fact remains that, apart from internal disruption, only the denial to the U.K. of its ability to move its ships across the sea can cause its defeat in war. It is appreciated, however, that air power has robbed the N. of its ability to shelter the U.K. against attack, and allow the country time, in the event of war, to gather its strength in comparative tranquillity. It may also be that the design and material of warships will be modified. Aircraft carriers may eventually become obsolete as aircraft may in time be replaced by guided missiles. Ships approximately similar to the carriers and destroyers of to-day will be armed with guided missiles and will carry helicopters for reconnaissance and anti-submarine operations. It would appear that the submarine, nuclear-driven and armed with guided missiles, has tremendous possibilities as a weapon of war. Finally, the only effective answer to the nuclear bomb, or any other form of attack, is the direct human control of the enemy stronghold, which must require the use of all arms in unison and collaboration. This process must involve the movement by

sea of large armies and their equipment perhaps half way across the world. So long as such transport, involving command of the sea, is indispensable to the operation of armies, N.s can never be obsolete. See also NAVAL OPERATIONS; NAVIGATION; SEA POWER; and UNITED STATES NAVY; and the section *Defence* in articles on countries.

Navy Board, The, board estab. in the reign of Henry VIII to superintend the administrative work of the navy. It remained in existence between the years 1546 and 1832, when it was abolished and its work taken over by the lords of the Admiralty.

Navy League, The, organisation founded in 1895 for the purpose of advocating the building of an adequate navy for the protection of Great Britain and the maintenance of sea-power. It is on the strictest of non-party lines, and aims at the educating of Parliament and the people on the lines laid down in its programme. It propagates information concerning the navy, past and present, by means of monthly, quarterly, and ann. pubs., by lectures, and by the pub. of many pamphlets.

Navy Yards, see DOCKYARDS, GOVERNMENT.

Nawanagar, see JAMNAGAR.

Naxos: 1. Is. of Greece in the Aegean Sea, the largest of the Cyclades (q.v.), has an area of 170 sq. m. It is mountainous and fertile. In antiquity it was famous for wine and was a centre of the worship of Bacchus. It was here he met and married Ariadne. It was colonised by the Athenians, conquered by Persia in

540 BC, and recovered its independence in 471 BC. In the 13th cent. it became part of a Venetian duchy, was taken by the Turks in 1566, and now belongs to Greece. Fruit, olives, vegetables, tobacco, and grain are grown. Emery is found in abundance in the S. of the is. Pop. 20,000.

2. Cap. of the above is., is a port on the NW. coast and the seat of a Gk and of a Lat. bishopric. Pop. 2100.

3. The first Gk colony in Sicily, founded from Chalcis in Euboea, 735 BC. In 403 BC it was destroyed by Dionysius I of Syracuse; but 45 years later the

He was tried by Parliament for blasphemy, whipped, branded, and imprisoned for 3 years. He repented, condemned his error, and again became a valued preacher. His works were pub. in 1716. See also lives by M. R. Brailsford, 1927, and E. Fogelklou, 1931.

Nazaré: 1. Tn of E. Baía, Brazil, on the l. b. of the Jaguaripe, 32 m. W. of Salvador. Flour, coffee, and hides are produced here. Pop. 14,000.

2. (now called Nazaré da Mata) Tn in Pernambuco, Brazil, 35 m. NW. of Recife. It is a market centre in a sugar- and coffee-growing area. Pop. 6000.

Canadian Pacific

NAZARETH

scattered pop. was re-estab. at the new city of Tauromenium (*Taormina*).

Nayar, a people of Malabar, on the W. coast of India, famed for their matriarchal and extreme matrilineal social organisation. Traditionally they practised polyandry, women of a family living as a joint family, *taravad*, and bringing up their children as members of that family, their husbands merely visiting them but retaining no rights over their wives and children. The system is now in decay.

Nayarit, state of Mexico (cap. Tepic), stretching along the subtropical Pacific coast, with Sinaloa to the N., Durango to the NW., and Jalisco to the W. and S. It is watered by sev. rivs., notably the Santiago (lower Lerma). Tobacco is grown here. Area 10,547 sq. m.; pop. 290,100.

Nayler, James (c. 1617-60), Quaker, b. Ardsley, Yorks. He joined the parl. army in 1642 and was present at the battle of Dunbar, 1650. In 1651 he became a Quaker and one of their most persuasive preachers, travelling through England. He was imprisoned at Appleby in 1653 and at Exeter in 1656. Then, overstrained, and ensnared by a few flatterers, he allowed them to lead him into Bristol as Christ was led riding into Jerusalem.

(Both tns were formerly spelled Nazareth.)

Nazarenes, name applied by Tertullus (Acts xxiv. 5) to the early Christians, but later applied to a Jewish Christian sect, better known as Ebionites (q.v.).

Nazareth (modern *al-Nasira*), tn of Galilee, Palestine, midway between the Mediterranean and the S. end of the lake of Galilee, important for its connection with the life of Jesus Christ, who spent His early years there in the house of Joseph and Mary. No mention of N. occurs in the O.T. and its insignificance in the time of Christ may be hinted by the term Nazarene applied to Him in derision. Until Constantine N. was inhabited by Samaritans; it declined rapidly after the Arab conquest, revived during the Crusades and again in the 17th cent. when the Franciscans estab. a church on the traditional site of the House of Mary. It is now a tn of 15,000 inhab. and around its hills are orphanages and hospitals. The Franciscans have reconstructed the churches of the Annunciation and of St Joseph. The church of the Melkites is claimed to be the synagogue where Christ preached (Luke iv. 16). The general aspect of N., with its hilly background, orchards, cypresses, and churches, is that of some Tuscan hill tn.

Nazareth Islands, see CARGADOS.

Naze, The, cape on the E. coast of Essex, England, 5 m. S. of Harwich.

Nazimuddin, Khwaja (1894-), second Governor-General of Pakistan. A member of a prominent Dacca family, he was educ. at Cambridge Univ., and called to the Bar. He was an influential collaborator with Jinnah (q.v.) in the Muslim League, where he was successively minister of education (1929-34), home minister (1937-41), chief minister (1943-5) in the then Bengal Gov., and, after the estab. of Pakistan, Premier of E. Bengal. He was knighted by the Brit. Gov. in 1934, but, in common with other prominent Muslim League members, he renounced the title in 1946. He succeeded Jinnah on the latter's death, as the second Governor-General of Pakistan, being sworn in on 14 Sept. 1948. After taking office he announced that the national memorials to the late *Quaid-i-Azam* (Jinnah) would take the form of a mausoleum, a mosque, a univ., and a national institute of technology. In 1951 he resigned as governor-general in favour of Mr Ghulam Mahomed to become Prime Minister after Liaquat Ali Khan (q.v.) had been assassinated. He retired from politics in 1952.

Nazirites, or **Nazarites**, among the anc. Israelites, those specially consecrated to the Lord and separated from the rest of the people. The Nazirite vow demanded: (1) Abstinence from intoxicating liquor and all the produce of the vine; (2) that the hair should never be cut; (3) avoidance of all ceremonial defilement, such as that involved by contact with a corpse. Early N. (e.g. Samson, Samuel, and the Rechabites) were vowed for life; but in later N.T. times the vow was temporary only, and its expiration was marked by a ceremonial offering, among other things of the cuttings of the hair (cf. Acts xviii. 18; xxi. 23 ff.).

Nazis, popular contraction of *National-socialistische Deutsche Arbeiterpartei*. The N., under the inspiration of Hitler, represented the revival of the *Nationalist* of the fatherland, the regeneration of the national and social life of Germany, and the rekindling of Ger. patriotism after a decade and a half of weak govts., which were sometimes strongly influenced by Communism. During this period unemployment was rife; there was corruption in public life, and the people as a whole suffered from an inferiority complex. Hitler succeeded in rallying the nation against the Communists and, in the elections, completely overwhelmed their leader, Thälmann. The incident of the Reichstag fire, too, enabled him to stage a dramatic trial of the alleged Communist incendiaries and thereby emphasised his ascendancy over them. Under Hitler the N. then carried out the 'Hitler revolution,' in which they assumed control of most of the police in Germany, banned the Social Democratic press, persecuted the Jews, issued emergency decrees for 'high treason,' instituted a Ministry of Propaganda under Goebbels (q.v.), replaced Braun as Prussian Prime Minister by Goering (q.v.),

dissolved the Catholic party, confiscated the funds of their chief political opponents, and disbanded the trade unions. After the official declaration that the revolution was accomplished a reign of terrorism ensued in which the N. mercilessly assailed all schools of thought opposed to their social and political outlook, driving thousands of persons into concentration camps. But the most characteristic feature of the Nazi persecution was Hitler's unremitting persecution of the Jews which began in 1933 and continued during the Second World War. The swastika or crooked cross, the symbol of the N., is related to Hitler's theory of Aryanism (q.v.); but the Nazi claim that the swastika was an anct. Teutonic or Nordic device is ill founded, for it is virtually a symbol of the sun and occurs in the relics of many earlier civilisations. The uniformed bodies of the N. played an important part in their success in gaining control of the reins of power. They include Storm Troops (*Sturmabteilung*), Security Corps (*Schutzstaffel*), and Hitler Youth (*Hitlerjugend*). See also GERMANY, *History*; HITLER, ADOLF; NATIONAL SOCIALISM; S.A. AND S.S.

Ndola, tn. of N. Rhodesia, commercial and distributing centre for the Rhodesian Copperbelt. N. is northernmost terminus of Rhodesia Railways. It has a copper refinery and a cobalt treatment plant. Pop. Europeans, 6000; Africans, 55,000.

Neagh, Lough, lake of Ulster, N. Ireland, largest in the Brit. Isles (17 by 10 m.). It receives the Blackwater and Ballinderry R.s and is drained N. to the Atlantic through the Bann R. The shores are mostly flat and marshy, and its waters have a petrifying quality. There are canals to Belfast, Newry, Tyrone, and Lough Erne. There are a few is. in the lake and it abounds in fish. Area 153 sq. m.; average depth 40 ft. See Moore's ballad, *Let Erin Remember*.

Neagle, Anna (real name **Marjorie Robertson**) (1908-), actress, b. London; married Herbert Wilcox, producer. She was a teacher of dancing, and a world championship finalist. Later she appeared in Charlot and Cochran revues, including *Wake Up and Dream*. She starred in *Sland Up and Sing*. 1931. Other stage appearances include *Peter Pan*, *Jane Austen's Emma*, and *The Glorious Days*. It is as a film actress, however, that she has achieved her greatest success. She won the International Gold Medal for the best actress of the year 5 times and the National Film Award for *Spring in Park Lane*, 1948, and *Odette*, 1951. Other films include *Good Night, Vienna*, *Bitter Sweet*, *Nell Gwynn*, *Peg of Old Drury*, *Victoria the Great*, *Sixty Glorious Years*, *Nurse Edith Cavell*, *They Flew Alone*, *I Live in Grosvenor Square*, *Piccadilly Incident*, *The Courtneys of Curson Street*, *Maytime in Mayfair*, *Lady with a Lamp*, *Ilacs in the Spring*, *King's Rhapsody*, and *My Teen-age Daughter*. Recently she has also turned to production. She was named a Commander of the British Empire in 1952.

Neale, Sir John Ernest (1890-),

historian, b. Liverpool. He was educ. at Liverpool Univ. and Univ. College, London. In 1925 he was appointed Prof. of Modern Hist. at Manchester and 2 years later Prof. of Eng. Hist. at London. He is an outstanding authority on Elizabethan hist. In 1934 the James Tait Black Memorial prize was awarded to his biography, *Queen Elizabeth*. Later works include *The Elizabethan Political Scene*, 1948, *The Elizabethan House of Commons*, 1949, and *Elizabeth I and Her Parliaments, 1559-81*, 1953. He was knighted in 1955.

Neale, John Mason (1818-66), divine and hymn writer, b. London. He belonged to the extreme High Church party, and in 1854 estab. at Rotherfield the sisterhood of St Margaret, afterwards transferred to E. Grinstead. He wrote or trans. nearly one-eighth of *Hymns Ancient and Modern*, and pub. *A History of Poets*, 1841, *A History of the Holy Eastern Church*, 1847-73, and *Medieval Hymns and Sequences*, 1851, 1863. See J. Julian, *Dictionary of Hymnology*, 1907, and memoir by E. A. Towle (with list of writings), 1907.

Neander, Johann August Wilhelm (1789-1850), Ger. theologian and historian, b. Göttingen; in 1812 became prof. at Heidelberg and at Berlin in 1813, where he devoted himself to the advancement of Christianity. He lectured on Church hist., ethics, and systematic theology. His prin. work is the *General History of the Christian Religion and Church*, 1852, trans. by J. Torrey, and widely circulated in England and the U.S.A. Other pub. were *The Life of Jesus Christ in its Historical Relations*, 1848, *The Emperor Julian and his Times*, 1850, and *Memorable Occurrences from the History of Christianity and Christian Life*, 1852, etc. See the life by A. Wiegand, 1890.

Neanderthal, valley of the Rhine Prov., Germany, in the dist. of Düsseldorf, near the vil. of Mettmann. Here in 1856 was found the skeleton of a prehistoric man whose cranium had a low forehead and was large and thick, with large protuberances in the occipital region. Other skulls, bearing similar characteristics, have been found in the caves and quarternary strata in France, Belgium, Bohemia, Italy, Moravia, Gibraltar, Uzbekistan, and Asia Minor. It is an Upper Pleistocene, late Early and early Middle Paleolithic form, whose potentialities have probably gone in to the making of ourselves.

The discovery in 1925 at Ehringsdorf, near Weimar, of a skull embedded in a travertine quarry seems to indicate that the men who lived in Germany in the preceding temperate period before the last or Würm glaciation set in must be assigned to the N. type in structural details. No evidence of the N. man's persistence after the earlier phase of this glaciation has been found anywhere. The Ehringsdorf man has generally been assigned to the Acheulean culture, but his tools are more akin in type to those of the Mousterian culture. While the skull

found at Ehringsdorf represents an early phase of Mousterian man the skulls found in Gibraltar and La Quina represent a late phase. If Ehringsdorf produced one of the latest finds in Europe, Gibraltar yielded the first N. skull—the skull of a woman known as Gibraltar I, found in a quarry at the base of the north face of the Rock in 1848. The parts of a second (Gibraltar II) skull were found in 1926 after an organised search in a rock shelter. This was the skull of a child in sev. parts. According to Sir Arthur Keith N. children must have assumed the appearance of maturity at an earlier age than modern children. He estimates the age of the child to have been about 5 at death, and that for this age it had a head and brain of truly remarkable size, and a larger jaw than the modern child of comparable age. The N. type, or at all events a variant of the extinct N. type, has been found near Tabgha, in Palestine (1925), and there is presumptive evidence that the shores of the Mediterranean were once inhabited by people of the N. or Gibraltar type. The man of La Chapelle-aux-Saints, also a modern discovery, is the largest-brained member of the N. species known to us. The cranial capacity of this skull measured 1625 c.c., nearly 150 c.c. more than in the average European man of to-day. The average cranial capacity of N. man probably exceeded that of modern man, and in potentiality for intelligence he was probably no less well endowed than ourselves. Two N. skulls found at La Quina in the dept of Charente lay in deposits assigned to the upper or later Mousterian culture. As in the case of Gibraltar, one skull is attributed to a woman, while the other is thought to be that of a child; but in the shape of head—particularly in the length and narrowness of the skull—the 2 pairs of skulls differed greatly. Up to now anthropologists have not traced the dolichocephalic N. man by his fossil remains into the W. of Europe beyond the Channel Is., and, although his work floors have been found in England, no skull has yet been discovered there. See also ANTHROPOLOGY and MAN. See Sir Arthur Keith, *The Antiquity of Man*, 1915, and especially his *New Discoveries relating to the Antiquity of Man*, 1931.

Neanthropic Man, name given by anthropologists to the proto-Europeans or forerunners of modern Europeans. Their origin and lineage are very conjectural, and the fact that the differences between them and their Neanderthaloid predecessors are very marked enhances the difficulties of the problem (see NEANDERTHAL). The main problem is to account for the divergence of N. M. into races and for the geographic distribution of these races in past times. Sir Arthur Keith suggests that men of the Neanthropic type of the later palaeolithic period came from the SW. of Asia, where later the early pioneers of civilisation also made their appearance. See ANTHROPOLOGY.

Neap Tides, see TIDES.

Neapel, see NAPLES.

Neapolis: 1. Anct seaport of Philippi in Macedonia, the modern Kavalla (pop. about 5000) being near the site. The tn was almost opposite Thasos. St Paul landed here (*see* Acts xvi. 9-11).

2. Anct name for Naples (q.v.) in Campania, Italy.

Nearchus, commander of the fleet of Alexander the Great in his Indian expedition, 327-325 BC. He received command of the fleet ordered by Alexander to be built on the Hydaspes, and conducted it from the mouth of the Indus to the Persian Gulf, the whole journey taking from Sept. 325 to Feb. 324. Fragments of his own narrative of his voyage have been preserved in the *Indica* of Arrian.

Nearctic, *see* GEOGRAPHICAL DISTRIBUTION.

Neath, municipal bor. and riv. port of Glamorganshire, S. Wales, on a navigable riv. of the same name, 7 m. N.E. of Swansea. An auxiliary fort was estab. at N. during the Rom. conquest of S. Wales (AD 70-80); the site of the Rom. fort was recently discovered and 2 gateways have been preserved. There are remains of an anct castle, and near by are the ruins of N. Abbey (founded 1130). N. has manufs. of tinplate, iron, copper, chemicals, and metal cans, and by-products of the coal industry. Briton Ferry, at the mouth of the R. N., and part of the bor. since 1922, was formerly the port for N. Pop. 33,300.

Nebo, *see* NABU.

Nebraska, one of the NW. central states of the Amer. Union, known as the 'tree-planter's state', bounded on the N. by S. Dakota and Iowa, on the E. by the R. Missouri, separating it from Iowa, on the S. by Kansas, and on the W. by Wyoming and Colorado. Area 77,237 sq. m. There is much prairie land, a strip of 'bad lands' and sandhills (N. and NW.), and high land in the W. towards the Rockies, Niobrara Summit and Gabe Rock rising over 5000 ft. The Platte, Missouri, Republican, and Niobrara are the chief rvs.; Omaha (pop. 251,117) and Lincoln (cap., pop. 98,884) are the chief tns. Omaha has an airport. Agriculture is the leading industry, oats, maize, wheat, rye, and hay being the chief crops. Wheat, alfalfa, apples, and vegetables are grown in the SE. Irrigation is practised in the W. The livestock industry is only second in importance to agriculture. The chief mineral products are limestone, sand, potash, and clays from which bricks and tiles are made. Slaughtering and meat-packing, centred at Omaha, are important industries, also dairying and flour-milling. Educational institutions are, at Lincoln: univ. of N., Union College, and N. Wesleyan Univ.; at Omaha: univ. of N. College of Medicine, Creighton Univ., College of St Mary, Duchesne College, and univ. of Omaha; others are Dana College (Hastings), Midland College (Fremont), and York College (York). There are also 5 state teachers' colleges. What is now known as N. was ceded by France to Spain in 1762, returned to France in 1801, and purchased by U.S.A. in 1803 as part of the Louisiana Purchase. N. ter. was organ-

ised in 1854; the state was admitted to the Union in 1867. There are 93 cos. Since 1937 N. has had a single-chambered legislature of 43 senators. Two senators and 4 representatives attend Congress. Pop. 1,325,510. *See* J. A. Morton, *History of Nebraska*, 1913; A. E. Sheldon, *Nebraska Old and New: History, Stories, Folklore*, 1937; G. E. Condra, *Geography, Agriculture, and Industries of Nebraska*, 1942.

Nebriša, *see* LEBRIJA.

Nebuchadnezzar, or **Nebuchadrezzar** (Babylonian *Nabu-kudurru-usur* — 'O Nabu guard the boundary'), King of Babylonia (605-561 BC). According to the Babylonian Chronicle N., while crown-prince, defeated the Egyptians at Carchemish. Thereafter in a series of campaigns he subdued Syria and Palestine, sacked Askelon, and defeated the Arab tribes. On 16 Mar. 597 BC N. seized Jehoiachin and Jerusalem which again, under Zedekiah, rebelled and was destroyed in 586 BC (*see* 2 Kings xxiv and xxv). Despite an earlier defeat in 601 N. appears to have invaded Egypt, c. 568 BC. He rebuilt Babylon and neighbouring cities extensively, helped by his queen Naqia (Nitocris). *See also* BABYLONIA. *See* D. J. Wiseman, *Chronicles of Chaldean Kings*, 1956.

Nebulae. The invention of the telescope made possible the recognition of many stars invisible to the naked eye. Nevertheless, except for the sun, the stars are at such enormous distances from the earth that they appear as mere points of light even when viewed by the most powerful of modern telescopes. In the 18th cent., however, the telescopes of Herschel and others led to the discovery of celestial objects that presented a cloudy appearance, and they were designated N. During the 20th cent. much has been discovered about N., which here can only be summarised. N. are divided into 2 main classes: those within our *galactic system* (q.v.) and those outside the galaxy, known as the *extra-galactic N.* In the galactic system 2 types of N. are found, known as the planetary N. and the diffuse N. The former have relatively small angular dimensions and are wisps of gas enveloping very hot stars which render them luminous. Most of them have disks which are elliptical in shape, hence their designation as 'planetary N.' It is believed that they were once novae (q.v.) which they resemble in some ways. Two well-known examples of this type are the Owl Nebula in Ursa Major and the beautiful Ring Nebula in Lyra. Diffuse N. are irregular in shape and have larger dimensions than the planetary N. They consist of gases in an extremely attenuated form, some of them presenting the appearance of dense clouds, while others appear as a faint haze. One of the finest of them, in the constellation of Orion, is visible on a clear night to the naked eye, surrounding the middle star of the Giant's sword. To the modern astronomer and philosopher the extra-galactic N. are the most important, because they are island universes on the same footing as our

galaxy, of which the solar system is only a very minute part. The Great Nebula in Andromeda is one of this class and can be seen with the naked eye; the light from it takes nearly 900,000 years to travel to the earth, yet it is one of the nearest of the extra galactic N. Recent research, however, has suggested that the distances given for the extra-galactic N. should be doubled (*see further under STAR*). The number of stars in these N. varies but is comparable with the number in our galaxy, i.e. about 100,000,000,000. The

the main body of the sun. These fragments condensed under their own gravitational attraction, and became the planets that continued to describe orbits round the sun under its gravitational attraction. Laplace's hypothesis has since been abandoned. While it may be true that stars originate from nebulae in the manner indicated by Laplace, this accounts only for the creation of our sun. According to Sir James Jeans's tidal theory the solar system was created from the original sun by the close approach

THE GREAT NEBULA IN ORION
60-in. reflector at Mount Wilson.

largest optical telescope (the 200-in. at Mt Palomar (q.v.)) has photographed N. more than 2,000,000,000 light years distant and the number contained in this space is estimated to be sev. thousand million. It is impossible to see individual stars in these very far off N., which appear as a faint luminosity due to the combined light of the stars composing them. *See NEBULAR HYPOTHESIS and RADIO ASTRONOMY.*

Nebular Hypothesis, an attempt to explain the origin of the solar system as an evolution from a nebula. Swedenborg and Kant both put forward tentative explanations of this kind, but Laplace (q.v.) was the first to develop a N. H. on strictly scientific lines. Briefly his hypothesis imagined that rotating nebulae were first formed by the condensation of gaseous matter, and that the sun was originally a nebula of this type. As the nebula continued to shrink, it rotated faster and faster, until fragments broke away from

of a larger star that raised tides of such violence in the sun as to cause fragments to be torn off it to form the planets, comets, etc., that with the sun constitute the solar system (q.v.). Many years ago this theory was shown by Prof. H. N. Russell, an Amer. astronomer, to be untenable. Although sev. other theories have been advanced in recent years, these have not been accepted, and the origin of the solar system still remains one of the unsolved problems of astronomy.

Necessity, specialised term in philosophy, religion, and logic implying causality and certainty when not deduced by restricted laws of formal reasoning. Logically the law of N. compels us to admit the truth of a conclusion or judgment based by laws of reason on other propositions already accepted, or, more particularly, as axiomatic, resulting from the evidence of 'common sense.' Mathematical conclusions are thus necessary: e.g. it is axiomatic that 2 straight lines

cannot enclose a space. Among the ancient philosophers and medieval schoolmen appeal to N. was extremely frequent, but with the advent of natural science and its inductive processes, dating from Bacon's *Novum Organum*, a vast class of necessary truths has been brought within the realm of logical demonstration, or embraced within the realm of theory, i.e. subject to further investigation. It is, however, in philosophy and religion that the doctrine of N. assumes importance, greater perhaps since the rapid rise of the theory of evolution and its popular exaggeration over too wide a sphere. N. would imply mechanical processes, as it were, in the whole universe, a view generally held to be incompatible with the operations of human and divine will. But for moral N. see CALVIN; DETERMINISM; KANT; LEIBNITZ; WILL; etc.; also PSYCHOLOGY.

Neck, in geology, the name given to columns of cooled lava which fill up an old volcanic chimney or crater. Up these passages or conduits volcanic materials were forced. N.s are characterised by a more or less circular pipe filled with consolidated ashes, or with crystalline lava. They vary considerably in size, from 20 yds in diameter to sev. m., and may be simple or complex in structure. They occur in all old volcanic dists., examples existing at Largo Law, Fifeshire; Arthur's Seat, Edinburgh; Dumbarton Hill; the Lothians; Derbyshire; in Auvergne; the Eifel; Bohemia; St Lucia (W. Indies, 'the Pitous'), Texas; California; and many of the W. states of N. America. The famous diamond mines of Kimberley, S. Africa, are another example, the blue-ground (serpentine breccia) occupying great funnels. See Sir A. Geikie, *Text-book of Geology*, 1882, 1924.

DIAGRAMMATIC SECTION OF
THE NECK

A, cervical vertebrae; B, spinal cord;
C, larynx; D, trachea; E, oesophagus.

Neck, portion of the body joining the head and trunk, also a constricted portion of any structure serving to join its parts. The bony structure of the N. is the cervical portion of the spinal column (see SPINE) consisting of 7 vertebrae. The spinal column contains the spinal cord, which in

the cervical region is oval in section; the amount of grey and white matter becomes increased in quantity. The blood is carried to the skull by the right and left common carotid arteries, and is returned by the jugular vein, which may be felt a little below and behind the angle of the jaw, after which it penetrates rather more deeply into the tissues. The N. also contains the gullet (q.v.) or food passage and the windpipe. The larynx (q.v.), or organ of voice, occupies a position where the windpipe connects with the pharynx (q.v.), and the form of one of its cartilages produces the projection known as Adam's apple. The thyroid gland (q.v.) lies just below the larynx and in front of the upper part of the trachea.

Neckar, riv. of Germany, which rises on the E. slopes of the Black Forest (q.v.), and winds, generally NW., past Tübingen, Stuttgart, Heilbronn, and Heidelberg, to join the Rhine at Mannheim (qq.v.). It is navigable for small vessels as far as Stuttgart. Length 228 m.

Necker, Jacques (1732-1804), Swiss financier and statesman of France, b. Geneva. Sent to Paris in his youth he joined the house of Thellusson, the banker, who took him into partnership. Married Suzanne Curchod, 1764 (see NECKER, SUZANNE CURCHOD).

During 12 or 13 years N. acquired a large fortune and retired. He then wrote sev. works on financial affairs. His *Éloge de Colbert* obtained a prize from the Fr. Academy. He afterwards wrote a memoir upon the Fr. finances, which so delighted Maurepas that he obtained for him the appointment of director of the Treasury (1776) and director-general of finances (1777), when, being against imposing new taxes, he endeavoured to make up the deficiency in the income by economy and loans. In 1781 he pub. *Compte rendu présenté au roi*, which disclosed the state of the revenue and expenditure of France. Shortly after this he resigned, withdrew to Switzerland, and wrote *De l'administration des finances de la France*, 1784. In 1788, on the resignation of Brienne, Louis XVI appointed N. director-general of finances. His second ministry was short, and he again retired to Switzerland, but after the taking of the Bastille the National Assembly demanded the recall of N. and Louis complied. He resigned in 1790, and spent his remaining days in Switzerland, writing political tracts. His daughter was the celebrated Mme de Staël. The memoirs of his private life were written by her, and the *Notice sur la vie de M. Necker*, 1820-1, by his grandson. See P. de Ségur, *Au Couchant de la monarchie Louis XVI et Necker*, 1776-81, 1913, and O. d'Haussonville, *Mme de Staël et M. Necker d'après leur correspondance inédite*, 1925.

Necker, Suzanne Curchod, Madame (1739-94). Fr. writer, b. Geneva, Switzerland, noted for her beauty, wit, and wide learning. After her marriage in 1764 to Jacques N., (q.v.), her house in Paris was a rendezvous of all the distinguished men of the day. She wrote *Réflexions sur le*

divorce and *Mélanges*, pub. by her husband after her death. She was the mother of the famous Mme de Staël. See G. PARY, *Mme Necker, her Family and her Friends*, 1913.

Necklace, The Diamond, see DIAMOND NECKLACE, THE.

Necromancy, mode of divination practised by the ancients by which the spirits of the dead were conjured up to answer certain questions about the future. In Homer's *Odyssey* the shade of Tiresias is brought up and consulted by Ulysses, and the witch of Endor is an example from O.T. hist. See DIVINATION.

Necropolis (*nekros*, dead; *polis*, city),

convert it into honey in their honey-sacs, by the action of enzymes invertase and diastase, changing sucrose into fructose and glucose. The honey is given up to other bees in the hive which store it in the combs. Also the drink of the gods, described by Homer as a red wine which Itebe pours out for the immortals (*Iliad* xix. 38 and iv. 3). N., in Gk mythology, had the power of conferring immortality on all who partook of it. The term is applied figuratively to any delicious drink, such as that made from sweet wine and honey.

Nectarine, smooth-skinned and generally more crimson-coloured variety of the

NECTARIES

A, sepal; B, petal; C, ovary; D, style; E, nectary; F, scale covering E.

(1) Section of Umbellifer: the nectary is a disk formed from the swollen bases of the styles. (2) Wallflower: nectaries lie internal to the base of the stamens. (3) Christmas Rose: nectaries are tubular petals. (4) Tubular petal from (3). (5) Petal of Lesser Celandine, front view. (6) Side view of (5). (7) Coltsfoot: disk floret; nectary lies within the corolla tube at the base of the style.

cemetery or burying-ground. The name was formerly applied to cemeteries in the vicinity of ancient cities, especially to a suburb of Alexandria, but is now used in a more extended sense for any large burial-ground. Ancient examples remain in Africa (Cyrene and the Egyptian Pyramids), Asia Minor, Greece, and Italy. See A. Bruckner, *Friedhof aus Eridanos*, 1909; R. Fugenschneider, *Nekropolis*, 1917; G. Karo, *An Attic Cemetery*, 1943.

Necrosis, death of a circumscribed portion of tissue surrounded by living tissue. The causes of N. are direct injury, obstruction in the circulation of the part, or incompetence in the nutritive agencies in the tissues affected. In coagulative N. an amount of fibrin is formed; this occurs in the blood and on the surface of mucous membranes, where a false membrane may be formed, as in diphtheria (q.v.). In liquefactive N. the action of autolytic enzymes liquefies the dead tissue. See also CARIES and GANGRENE.

Nectar, sweet juice secreted by the flowers of many plants in special sacs or glands called nectaries. It attracts insects which are instrumental in cross-pollination. N. consists of about 20 per cent sucrose (cane sugar) and 80 per cent water, plus traces of mineral salts, acids, etc. Insects, such as bees, collect N., and

peach, which can often be grown successfully outdoors against a S. wall, in a well-drained border of fibrous loam containing a good proportion of lime. Protection at the time of flowering against spring frosts and cold winds is very essential, as the flowers appear early and before the leaves. Planting is best done in Sept., against walls; trees trained fan-shape are best. The culture of N. under glass, particularly when grown in pots, is attended with excellent results, if free ventilation and liberal watering are provided, and over-cropping is avoided. See PEACH.

Nectary, usually a gland-like nectar-secreting body or disk on the receptacle of a flower, either between the petals or between the stamens and pistils. In some cases the N. occurs on the summit of the ovary; in others it lines the inside of the calyx-tube; and occasionally sepals or petals are modified, and in a few cases (such as the monkshood, Christmas Rose, and hellebore) are entirely converted to serve as N.s. The accessibility of the N. is perfectly adapted to the structure of the insect or other agent on which the pollination of the flowers mainly depends.

Nedim (fl. c. 1700-30 under Ahmed III), Turkish poet of the 18th cent., of the old Ottoman school. His 'ghazals' and

'*qasidas*' are marked by grace and originality. He was custodian of the library at Constantinople, founded by Ibrahim Pasha.

Needham, tn of Massachusetts, U.S.A., in Norfolk co., 10 m. WSW. of Boston, with manufs. of hosiery, knitted goods, rubber thread, elastic goods, and surgical and dental instruments. Pop. 16,313.

Needle, *Magnetic*, *see* COMPASS, MAGNETIC.

Needle Gun, *see* FIREARMS, Breech- and Magazine-loading Rifles.

Needle-point Lace, *see* LACE.

Needles. There are 7 different groups of N. which may be listed as follows:

Hand-sewing needles. Prior to the Second World War these were manuf. in large quantities in Japan, Germany, and the U.K. Since the Second World War manuf. of N. in China has very greatly increased, but no reliable figures are available. Eng. manuf. of N. is concentrated at Redditch in Wores. Sewing N. are made from 5-gauge carbon steel rod, which is drawn down to the requisite thickness by a series of holing and annealing operations. The resultant wire is then cut into 2-needle lengths, sharpened at both ends by automatic grinding, and passed into the making shop, where the N. are loaded into combine machines, set up for the particular type and gauge required; these grip each needle individually in a wormed feed, and carry it between 2 stamping dies, which mark the impression of 2 eyes, facing in opposite directions, in the centre of the 2-needle length. The wire is then carried forward on the same feed and the centre of each eye is punched out cleanly, the flash clipped off, and the wire broken apart in the centre to form 2 N. Tied into bundles of approximately 50,000 the N. are then passed over rotary grinding wheels which, working with extreme accuracy, remove all remaining roughness around the head and eye. Hardening and tempering are done in electrical furnaces which, by being kept air-sealed, keep the surface of the needle bright throughout the heat treatment. To remove all signs of grinding, stamping, or scale, the needle is then submitted to a particularly individual process known as 'scouring.' The N. are wrapped in long cylindrical parcels of hessian with a dressing of liquid soap and emery powder. This parcel is then bound together with cord and placed between one stationary and one sliding surface, which roll the parcel backwards and forwards between them under very considerable pressure for many hours. On their removal the N. are polished in a similar machine, cleaned, and nickel plated. Each needle is then inspected by hand and any necessary finishing, such as gilding, bluing, etc., is carried out. Finally the N. are either stuck in cloth or packed loose into packets for final dispatch to the customer.

Hardware needles. Prior to the Second World War Germany was the greatest manufacturer of these, followed by Great Britain; but since the Second World War China has also started their manuf. The

term covers all special N. used by trades other than tailoring or dressmaking, such as shoemakers, upholsterers, mattress makers, sail-makers, etc. Their manuf. is comparable to hand-sewing N., with which they overlap at certain points.

Hosiery needles, or latch needles. Chief manufacturer of these N., used on industrial knitting machines, is Canada, followed by Germany, Great Britain, and Switzerland. In the finer sizes their production calls for great accuracy and craftsmanship, but it is not individual in the same way as needle-making, and has more in common with normal light engineering.

Surgical needles, or suture needles. These are made in Germany, Great Britain, and in small quantities in America. All surgical N. have triangular cutting points, similar to gloves' N. This is to minimise tearing of the skin. They may either have an eye, similar to hand-sewing N., or be eyeless, as in non-traumatic N. where the gut is attached permanently to the body of the needle so that no eye is necessary.

Knitting needles. Manuf. of these is confined to no particular country, since the processes are very simple, particularly when worked in plastic. For ordinary domestic knitting they are made of anodised aluminium, plastic, nickel-plated steel, bone, or wood.

Machine needles. Manuf. of these N. is in many ways comparable to that of hand-sewing N., and prior to the Second World War 80 per cent of the whole production was concentrated in Germany, the remainder being made in the U.S.A. and a few in Great Britain.

Gramophone needles. These are really a by-product of the hand-sewing needle industry, and are manuf. wherever these are made, notably in Japan, China, Germany, and Great Britain.

Needles, The, name given to 5 remarkable rocks lying immediately off the W. extremity of the Isle of Wight (q.v.) in N. lat. 50° 39' and W. long. 1° 34'. Their origin is attributable to the sea beating on the sharp cliffs which form the W. point of the is., and the same influence is gradually wasting them away; the largest of them, which was 120 ft in height, was undermined and fell during a storm in 1764. They are white, but black at their bases, and curiously streaked throughout with black strata of flints. A lighthouse standing on this extremity of the is. rises 715 ft above the sea.

Needlework, work done with a needle and thread on cloth. Since sewing machines, invented in 1830, came into general use at about 1870, machine-sewing has superseded much that was done in the past by hand, but plain hand-sewing is the foundation of all other needlecraft. N. is one of the oldest crafts, and though it is primarily employed to join pieces of material to make a garment, it is also used for forms of decoration, e.g. tucking, quilting, etc. Two classes of stitches are used in garment-making, temporary and permanent. The temporary stitches are straight-tacking, and tailor-tacking or

thread-marking, the latter being used for marking the fitting line on 2 identical parts at the same time. There are a number of permanent stitches: these are used for joining parts of garments, for holding down turned edges, for protecting raw edges, for disposal of fullness, and for decoration. Permanent stitches include running, oversewing, ordinary hemming, slip hemming, invisible hemming, herring-bone stitch, and buttonhole stitch. Feather-stitching and scalloping are particularly decorative forms of permanent stitching. The same form of seam is used throughout a garment, the choice of seam depending on the nature of the material and the purpose of the garment. Fr. seams, for example, are used in materials that are not too thick and bulky, such as thin lingerie and outer garments of transparent material, e.g. nylon. A run and fell seam is used when a strong flat seam is required, one row of stitching being visible on the right side. Flat seams should always be used on garments which are to be worn next to the skin in order to avoid friction, and the seams should fall to the back. Open seams are frequently used on outer garments, and no stitching shows on the right side, and the seams can be pressed open so as to be almost invisible. Raw edges inside the garment can be made neat by cutting a tooth-like edge, or by using a narrow binding, or loop stitching.

Darning and patching. Some knowledge of patching and darning is indispensable in the home. Patching is generally applied to outer garments and large repairs to under-garments; darning is used on knitted fabrics. In all repair work the general condition of the garment, the cost of replacing it, and the time to mend it are factors in governing the choice of method, which is as important as suitability of method to material. Special attachments, which can be used on a sewing machine, e.g. a darning foot, facilitate repair work. Darning is a method of replacing worn threads, as distinct from patching, which is the insertion of whole pieces of material, and can often be made less obvious than patching. The hole or thin place is filled with threads carefully chosen to reproduce as nearly as possible the original web. Swiss darning is frequently employed to repair a hand-knitted garment, as actual new knitting stitches are made. The general principles of patching are similar to those of darning, i.e. the material of the patch is chosen to match that of the garment in colour, texture, and age. The patch is generally placed on the wrong side of the garment. Adhesive patches can now be bought.

Good N. is an essential foundation for the more exacting and complex stitches used in various types of embroidery and other needlecrafts. See also articles on DRESSMAKING; EMBROIDERY; LACE; SAMPLER. See E. Griffith, *A Manual of Plain Needlework*, 1934, 1944; Gladys Fry, *Embroidery and Needlework*, 1935; Anna L. Hird, *Principles and Practice of Needlework and Dressmaking*, 1942; W. Bull, *Basic Needlework*, 1954.

Neeenah and Menasha, twin cities in Wisconsin, U.S.A., on opposite sides of the Fox R. at the N. of Lake Winnebago, 90 m. N. of Milwaukee. They produce paper, paper products, printing, wood and metal products, machinery, and flour. Pop. about 12,400 each.

Neer, Aert van der (1603-77), Dutch landscape painter, b. Gorkum. He was particularly successful in rendering moonlight effects among the canal scenery of Holland, and in painting winter landscapes, with skaters on ice.

Neer, Eglon van der (1634-1703), son of Aert van der N., b. Amsterdam. He was a pupil of Vanloo, and became celebrated as a painter of historical pieces, landscapes, etc.

Ne Exeat Regno. At common law (q.v.) every subject may go out of the realm whenever and for whatever purpose he pleases; but because constitutionally every man ought to defend the realm, the sovereign has the prerogative (see Crown) of commanding him by the writ of N. E. R. not to leave the country, on pain of punishment for disobedience. This ancient writ was originally used to prevent the clergy from going to Rome, and was afterwards extended to laymen who were suspected of concerting schemes against the state. It has now become a part of the ordinary process of the high court by virtue of which bail (q.v.) may be obtained from any person about to go abroad with the object of evading the jurisdiction of the court. The legality of this application of the writ was in the time of Charles II.

Nefertiti, wife of Akhnaton (q.v.), King of Egypt in the 18th dynasty. A remarkably sculptured head of the queen, one of the finest extant specimens of Egyptian art, was discovered at Tell el Amarna, and is now in the Dahlem Museum in West Berlin. This head has greatly influenced the modern European ideal of feminine beauty.

Negapatam, or **Nagapattanam**, tn and small port of Madras state, India, on the Coromandel coast 48 m. from Tanjore. N. was an early Portuguese settlement. Apart from coastal traffic there are sailings to Malaya.

Negeb (**Negev**), The (Heb. 'south country'), semi-desert triangular-shaped region of Israel, extending from a base S. of Beersheba to an apex at the head of the Gulf of Akaba, 70 m. distant. Area about 4500 sq. m., or more than half the total area of Israel. The Negeb stands comparatively high on a wind-swept, sun-scorched plateau which slopes up gradually from the foothills of the Sinai peninsula to the high cliffs to the E. that overlook the Wadi Araba. It is mentioned frequently in the Bible under the names of various 'wildernesses.' Solomon and Jehoshaphat built fleets at Ezion-Geber to trade with the E. Later the Negeb was an important dist. of the Nabatean kingdom (N. Arabia). Trade routes were developed and sev. townships sprang up. The ruins of Nabatean civilisation—with great cisterns for the storage of drinking water—were excavated by Sir Leonard

Woolley (q.v.) and T. E. Lawrence (q.v.). Thereafter the Negeb dwindled into obscurity, inhabited only by the nomadic Bedouin. Under the Brit. Mandate for Palestine it was little developed, although the Jews made some land purchases and claimed it could be a great settlement area for the future. The strategic value of the Negeb as a bridge between Egypt, Transjordan, and Arabia was recognised by all sides, and the possibility always remained of the discovery of petroleum.

The Negeb was assigned to the Jewish state by the U.N. partition resolution of Nov. 1947, but in the course of the fighting in Palestine from May to July 1948 the Jews had not made good their claim. They rejected a proposal by Count Bernadotte, the U.N. mediator, to abandon their claims to the Negeb, in exchange for W. Galilee which they already held (although W. Galilee had originally been assigned to the Arabs), and in a series of campaigns from Oct. to Dec. 1948 occupied the whole of the Negeb. Since its incorporation in Israel, the Negeb has recovered something of its old prosperity. Beersheba is now a tn (pop. 17,000) connected by rail to Tel-Aviv and by good roads to the phosphate works at Sodom and the Red Sea coast. Numerous agric. settlements have been estab. in the N. Negeb, aided by the opening, in 1955, of a 66-in. pipe line bringing water from the R. Yarkon 70 m. distant. The small port of Elat has been built opposite Akaba. In the N. Negeb, near Gaza, oil has been discovered in small quantities. The development of the Negeb seems to be the only solution to the grave economic problems which have beset Israel since its inception, and presents the same challenge as the opening of the W. did to the pop. of the U.S.A.

Neghelli, Marchese de, see GRAZIANI.

Negligence. In Eng. law the commonly accepted definition of N., which is a tort (actionable wrong) remediable by an action of damages, is that it is the omission to do something which a reasonable man, guided by those considerations which ordinarily regulate the conduct of human affairs, would do, or doing something which a prudent and reasonable man would not do. The 2 cardinal facts of importance about N. are that it denotes a standard of conduct and not a state of mind, and that liability from it arises only where a duty is owed to the person aggrieved. In regard to duty, liability for N. may arise from the breach of duty owed to a particular individual, or to all persons indiscriminately. In the former case the personal duty may either be incident to some fiduciary (e.g. trustee and beneficiary), parental, or tutelary (guardian and ward) relationship, or exist by reason of a purely contractual relationship. In the case of N. manifested in performing or omitting to perform the terms of a contract, difficult questions arise as to whether the injured party should sue in contract or in tort, the practical difference being that the measure of damages in the former case will be the loss he may be reasonably supposed to

have sustained as a proximate consequence of the breach (q.v.), but in the latter case he may get anything a sympathetic jury sees fit to award. In regard to duties 'owed to all the world,' it is to be observed that these are necessarily of a restricted nature; and the bond of duty in most cases where the courts have held it to exist will be found to depend really on an antecedent voluntary act of the party held liable; e.g. if I observe a cart and horse, the driver of which (a personal enemy of mine) has temporarily left it unguarded, proceeding to the brink of a steep cliff, I am not liable for damages for N. because I do not take the trouble to stop the horse from walking over the cliff. But if, for example, I choose to run motor-buses or any other vehicle along the streets, I am responsible for any injuries sustained therefrom by passers-by which a jury or judge of fact is satisfied were due solely to the N. of my drivers. This example is useful to illustrate the meaning of 'contributory' N.: a person who might otherwise be entitled to damages for injuries or loss sustained by the N. of another was disentitled to recover a farthing if, notwithstanding the other's N., he himself could, at the decisive or last moment in the transaction, have by the exercise of reasonable care and prudence averted such injury or loss. By the Law Reform (Contributory Negligence) Act of 1945, however, such a person is now entitled to recover damages, though the amount is reduced proportionally to his share of responsibility. It is commonly said that N. is divisible into gross, slight, ordinary, and so forth. But the div. is unsound and illogical. No doubt what would be gross N. in a bus driver would be usually far less so in the case of an inexperienced man who was learning how to drive. But this will not affect the liability, for the law requires the standard of care or skill of the expert in a case where special skill is ordinarily to be expected; though, of course, in the above example the inexperienced driver would probably incur no liability if, for example, he were a passenger who had tried to stop a bus on the sudden illness of the regular driver.

Negombo, tn of Ceylon, on the W. coast, 20 m. NW. of Colombo. There is trade in cinnamon and a fishing industry.

Negotiable Instrument. The distinguishing features of a N. I. are: (1) it can be sued on by the holder in his own name; (2) the holder in due course is not affected by defects in or lack of title of his transferor or previous holders; (3) property in it passes by mere delivery; and (4) the holder in due course is not affected by certain defences which might be available against prior holders, e.g. fraud, undue influence, provided he himself were no party to such vitiating element. The law of N. I.s depends mainly upon statutes which themselves have been framed exclusively on the custom of merchants. The earliest forms of N. I.s were bills of exchange (q.v.), borrowed from the practice of Venetian and Florentine merchants in the Middle Ages, and, though much later, promissory notes. The list of N. I.s

tends to increase, one of the latest additions being debenture bonds payable to bearer. In the majority of cases it is essentially a question of fact to be proved by evidence whether or not a document is negotiable, though in cases where the negotiability is established, the court takes judicial notice of that fact, i.e. recognises it as a matter of law. The following documents, in addition to those already mentioned, are N. I.s: bank-notes, cheques, exchequer bills, dividend warrants, E. India bonds, circular notes, certain scrip and bonds, e.g. debenture scrip and various Amer. railway bonds. The law of N. I.s so far as bills of exchange, promissory notes, cheques, and bank-notes are concerned has long been codified in the Bills of Exchange Act, 1882. Postal orders are not negotiable if crossed for collection by a bank, though otherwise they can be freely transferred from hand to hand; nor are share certificates, share warrants, and share transfers, hence the forgery of the true holder's signature will not affect his rights: nor an IOU (q.v.); nor most kinds of scrip and bonds. Bills of lading can be transferred so as to give the transferee a right to sue in his own name, but otherwise they are not N. I.s because the transferee gets no better title than that of his transferor; and the same observations apply to policies of assurance. The holder in due course of a bill of exchange or any other N. I. is he who takes the instrument in good faith or without knowledge or notice of previous defects of title in it, and gives valuable consideration (*see CONSIDERATION*) for it. But a holder is not put to the trouble of proving consideration unless the party resisting liability on the instrument establishes the existence of some defect, e.g. fraud, duress, in the previous negotiation of the instrument. Sometimes bills or other N. I.s are marked 'not negotiable.' The effect of this is that the person receiving it will not have, and is not capable of giving, a better title to the instrument than that which the person from whom he took it had. But though the true owner is thus protected, the negotiability of the instrument is not otherwise affected in any way.

Negri, Ada (1870-1945), the only Italian poetess to whom the critics of her native land have given the title of 'great,' b. Lodi. She came from a working-class family and was a school teacher at first in Lombardy and later at Milan. She married a rich business man, from whom she soon separated. Her first book of verses was published when she was only 22, and her success was rapid. Her early books were the chants of an authentic daughter of the people, and were filled with a sense of revolt at things as they are. In her later works, her rhymes lost some of their spontaneity and became more classical in form although her themes were still humanitarian and feminist. Among her books of poems were (title trans.) *Fatality*, 1892, *Tempests*, 1896, *Maternity*, 1904, *Exile*, 1914, and *Prayers*, 1918. The shock of the First World War turned her talents to prose. *The Book of*

Mara, which appeared in 1919, recites with feminine audacity the death of a young lover. In *Stella Mattutina*, 1923, she gave a lyrical evocation in poetic prose of her infancy. *See* studies by N. Podenzani, 1930, and V. G. Galati, 1930.

Negri Sembilan, state of the Federation of Malaya (q.v.). Prior to 1946 it was one of the 4 states comprising the Federated Malay States, under Brit. protection. It is situated on the W. coast of the Malay Peninsula to the S. of the states of Selangor and Pahang. Its area is about 2600 sq. m. Its pop. of 345,700 (1957) consists of Chinese, Malays, Tamils, Europeans, and Eurasians. It is bordered on the N. by Selangor, S. by Johore and Malacca, E. by Pahang, and W. by the straits of Malacca (q.v.). It has a coastline of about 29 m. Its surface is diversified. The upper valleys and mts are densely wooded, the lower are fertile, producing rice and fruits in abundance. The main mt range of the Malay Peninsula ends in N. S., and the watershed between the E. and W. coasts in the S. part of the state is not mountainous. Gunung Besar Hantu, on the Pahang border, is the highest peak (4799 ft), while the highest peak within the borders is Telapak Burok (3915 ft). The country is drained eastwards by the K. Moar, but there are no large rivers. There is only one port, Port Dickson, which is connected with the seat of gov., Seremban, by a railway 24½ m. in length. Agriculture is the main industry. Tin is worked in considerable quantities and large numbers of elephants, buffaloes, and other cattle are reared. N. S. is a confederation of 9 states. Sungai Ujong, one of the larger of these, is mentioned in a Javanese poem in AD 1365 as being subject to the Javanese empire of Majapahit, *see* MALAYA (HISTORY). In the 15th cent. N. S. was ruled by chiefs of the old kingdom of Malacca. After the capture of Malacca from the Portuguese by the Dutch and Johore Malays in 1641, Johore took a leading part in the politics of N. S. until 1773, when the chiefs of the present-day leading states of the confederation invited a Sumatran prince, Raja Melewar, ancestor of the present ruler, to preside over it.

In 1874 the president or *undang* of Sungai Ujong (which is the most important of the 9 small states) invited the assistance of the Brit. Gov. in maintaining his rule, and a Brit. resident was appointed, and various others of the 9 states followed this example. Later a confederation known as Old N. S. was formed and in 1895 the resident of this confederation took charge of Sungai Ujong and of Jelebu, and the modern N. S. was constituted. Finally in 1898 the Yang Di-pertuan Besar of Sri Menanti (who at one time presided over the whole of N. S.) was again elected titular ruler of the whole state. The present ruler of N. S. succeeded to the throne in 1933 and became first paramount ruler of Malaya, 1957.

Negrillo, *see* NEGRITO.

Negrilo, or **Negrillo**, name originally

applied by the Spaniards to the Negro-like inhab. of the Philippine Is., an aboriginal race, somewhat dwarfed, inhabiting the mts. They are of an extremely low type, having no dwellings, living on wild fruits and roots, and on animals they can procure with their only weapon, the bow and arrow. The name has been extended to cover many other peoples. Besides the Aëtas or Philippine Negritos, there are many tribes scattered over the mountainous regions of the Malay Peninsula, such as the Jakuns, Sakais, and Semangs, and the Andaman islanders or Mincoopies, who are much purer than the others, who have intermixed with the Malay races. These form the E. div. of the race. In Africa there are sev. tribes inhabiting the equatorial forests and the mountainous regions round the great lakes, the pygmies of the Congo and Ogoway. Among these are the Wochua and Akka, inhabiting the basin of the R. Welle, N. of the Congo; the Batwa, about the R. Kasa and its tribs.; the Obongo, in the W. forests of equatorial Africa; in Masailand the Wandrorobo; and in S. Galla-land the Dume. As in the case of the Negroes, this race appears to have spread originally over the Indo-African continent, now submerged. There is marked likeness to the Negro in colour, nature of the hair, and protruding jaws; they are, however, of low stature, 3 ft 6 in. to 4 ft 10 in., and have 'brachycephalous' heads. In intelligence and morality they show marked similarity to the Negro, but are very much lower in the scale. See A. B. Meyer, *Über die Negriten oder Aëtas der Philippinen*, 1878; E. Tyson, *Essay concerning the Pygmies of the Ancients*, 1894; A. H. Keane, *Man, Past and Present*, 1900; W. Junker, *Travels in Africa*, 1900-2; H. Spencer, *Descriptive Sociology*, 1925; I. H. Evans, *Negritos of Malaya*, 1937; P. Schebesta, *Revisiting my Pygmy Hosts*, 1937.

Negro, Bush, see MAROONS.

Negro, Río: 1. Riv. of Argentina formed by the union of the Limay and Neuquén R.s, which rise in lakes in the Andes. It flows E. and SE., and after a course of 400 m. enters the Atlantic, 20 m. SE. of Viedma. Source of electric power.

2. Riv. of S. America, rising in Colombia, under the name Guainía. It flows E. and S., joining the Amazon as a trib. below Manaus. It is joined by the famous Casigñare Canal to the Orinoco system of Venezuela. It is navigable for steamers about 450 m., for canoes 680 m. Total length about 1400 m.; breadth 1½ to 15 m.

Negro-African Languages. The African natives speak very many different languages and dialects, whose relationship has, as yet, not been estab. Nor is the exact number of the languages certain, as it is not always easy to distinguish between language and dialect. Various estimates ranging from 500 to 1000 have been made, but a great majority of them are confined to quite small tribes, and only about 350 have been written down. Besides, migration has produced mixed languages and dialects which cannot be easily classified. Finally, a few languages

may be considered a kind of lingua franca: they are understood over wide areas and serve as a common language between groups belonging to different linguistic families. Such are Hausa in W. Africa, Swahili in E. Africa, and Yoruba and Ybo in Nigeria. However, for convenience we can classify the African native languages into 5 linguistic families. One of them, extending in broad lines to the N. and E. of the Sahara, forms a great part of the Semitic-Hamitic family (see SEMITIC-HAMITIC LANGUAGES). The following are the other 4:

Bushmen and Hottentots. Their languages are of a most primitive form, primarily monosyllabic, and characterised by a curious 'click' prefixed to most of their words. It gives their speech a staccato sound.

Bantu. According to Sir Harry H. Johnston, there are to-day 226 distinct Bantu languages spoken over nearly the whole of the S. third of Africa, and constituting a very distinct type of speech. Contrasted with others among the groups of Negro tongues, 'it is remarkable as a rule for the Italian melodiousness, simplicity, and frequency of its vowel sounds, and the comparative ease with which its exemplars can be acquired and spoken by Europeans.' The Nyanja dialects, which employ Rom. characters, are spoken by over 1,500,000 people, and are the most interesting group of this linguistic family. They are mainly spoken in the Nyasa Protectorate, lying between Lake Nyasa, N. Rhodesia, Tanganyika Ter., and Portuguese E. Africa. The most important Bantu language is Swahili, mainly spoken in Zanzibar; it employs the Arabic alphabet and has become a kind of lingua franca in E. Africa.

The Bantu and the Sudanese (see below) languages are remarkable for the fact that they are prefix-prenominal tongues; that is, they employ prefixes instead of suffixes to indicate tense, declension, and so forth, to an extent unparalleled in any other linguistic family. These prefixes, constituting the concord class, recur in exact agreement in the subject noun, and in the other members of the sentence, i.e. in the adjectives, verbs, verbal objectives, and all the other qualifications. In other words, the prefix of the first word of the sentence (that is, the basic nominal concept) must also be the prefix of all the other words of this sentence, thus producing an alliteration similar to but much more monotonous than that of old Eng. poetry. Another important characteristic of Bantu and Sudanese is that the conjugation of verbs shows aspects of action rather than the time-relations as in Indo-European languages. Thus it shows completeness, emphasis, continuity, negation, and other relations, but not very many temporal ones. There is a certain parallel to this in Semitic languages.

Sudanic, or Sudanese, or Sudanese-Guinean. Languages belonging to this linguistic family are spoken mainly in the area between the Sahara and the equator, from the upper Nile to the Gambia and Senegal. There is a great mass of what

are rather dialects than languages, and the interrelations of these forms of speech, and their relations with the Bantu languages and other tongues of the African continent, are very obscure.

The Yoruba, a higher-grade and commercially minded people, numbering about 3,000,000, inhabit the SW. corner of Nigeria from the sea to Jebba and from Dahomey to the borders of the Bini state. Nago of the Dahomey coast region, and the Bini tongue, seem to be related to Yoruba. Ybo, spoken in E. Nigeria, ranks as another chief language of Nigeria. Twi (originally Kwi or Ekwi or Okwi), also known as Oji, Odshi, Tvi, Chwee, Tshi, Amina, Ashanti, etc., is another 'typical' Sudanic language. It is spoken by over 1,000,000 people living in the Ghana state and in part of the Fr. colony of the Ivory Coast. Like most African languages it is divided into a number of dialects, the most important of them being Akuapem, Asante, Akyem. The Twi group of languages and the closely related Fante tongue belong to the Akan linguistic group. Efik, another interesting Sudanese language, is spoken by some 50,000 people in Calabar, Nigeria. Yoruba, Twi, and Efik were reduced to writing over a cent. ago. Mandingo, Kru, and Kpwezi represent the 3 main types of Nigeria. There are many other languages and dialects belonging to this linguistic family, but the majority of them, though important from the linguistic or anthropological points of view, have no great importance for practical purposes.

It has not yet been estab. whether the Bantu and the Sudanese languages actually form distinct families or should be considered as subfamilies of one family. While they have common characteristics of grammatical structure (see above), their phonology and vocabularies are quite distinct.

Nilotic languages. This group also offers many problems, especially with regard to its relationship with the Hamitic (Cushitic) tongues (see SEMITIC-HAMITIC LANGUAGES). Mention may be made of some of the Nilotic-speaking tribes, such as the Nuer, living S. of the Sudan, in the flat country watered by the White and Blue Niles (N.E. Africa), and the allied peoples Dinka and Shilluk, also living in the upper Nile region. The important people the Masai (E. Africa and E. Central Africa), and some other tribes, are regarded as representing a fusion of Hamites with Nilotic Negroes. The Ba Hima and Wa Tusi tribes (Uganda-Karagwe-Urindi) are considered a mixed Hamitic-Bantu people.

Negro Lethargy, see SLEEPING SICKNESS.

Negro Spirituals, Afro-Amer. religious songs, so named in the time of the civil war, though slavery is seldom mentioned in the songs and there is no spirit of vindictiveness in their words. The spirit of the Negro spiritual is informed by a docile melancholy, a patient yearning, and

a naïve confidence in the glory awaiting the singer in the next world. God, Jesus, Satan, and the great figures of the O.T. and the N.T. are dramatised in many N. S. Sometimes marching enters into Negro religious services, coupled with noisy religious exercises—a legacy, it is supposed, of the early Methodist revival meetings of the white masters. From a literary standpoint the words of Negro songs are mostly crude; picturesque and expressive phrases may occur, but their metrical arrangement is primitive, though the singers soon learn how to keep time and rhythm (see, for example, W. Jekyll, *Jamaica Song and Story*, 1907). As may be inferred from the origin of N. S. no less than from the gay and carefree character of the Negro, the emotional part is out of all proportion to the intellectual in the songs. This no doubt explains why the attempt to replace N. S. by the standard hymns of the white man's churches has, generally speaking, failed, except in the northern states and with the more educ. and sophisticated congregations of the cities. See also JAZZ and RAGTIME.

Negroes form one of the 4 great classes of the human race. In their purest form they are probably found along the Guinea coast, in the Gaboon, the basins of the Shari and Benue, and the lower Zambesi; but the Sudan is considered the home of the race. The term is now generally restricted to the S. or African branch, those of the E. region, of S. India, Malaya, New Guinea, etc., being Papuans or Melanesians. The former present various mixed types owing to Caucasian migration. The Negro characteristics are deep brown, almost black, skin, cool and velvety; short, black, woolly hair of elliptical section; short, flat, broad, snub nose with depressed base and dilated nostrils; black eye, black iris, and yellow sclerotic coat; prognathic jaws, facial angle 70°; thick lips, protruding and showing the inner red; high and prominent cheek bones; very thick skull, dolichocephalic (index 70°); cranial capacity, 35 (average European, 45); long arms; flat, broad foot with low instep, and 'lark hoof'; yellowish palms and soles; height (average 5 ft 10 in.) above the average. A marked feature is the early closing of the cranial sutures.

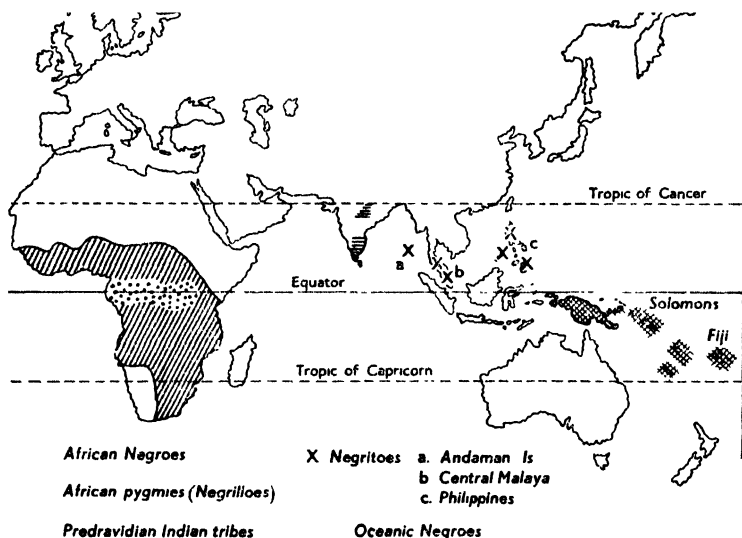

The Negro races in Africa comprise the true Negroes of W. Africa, the Nilotes and Nilo-Hamites of E. Africa, and the Bantu of E., Central, and S. Africa. The Bushmen, and the Semitic and Hamitic peoples of N. Africa, are not Negroes.

There are wide variations among Negroes, due to differences of climate and effects of migration and intermixture with Hamites and others. The African Negroes show every type of social development from simple tribal societies to great states of sev. million people (Buganda, Ashanti, Dahomey). In some of these societies descent is by patriline, in others by matriline, or both lines of descent may be recognised together. Polygamy is usually the ideal form of marriage, marriage being solemnised by the transfer of bridewealth. Negro religions are mainly cults of the dead or of spirits, but

most Negro tribes have a belief in a High God also. Beliefs in witchcraft, sorcery, magic, and fetishes are widespread. Slavery, by Arabs in the E. and Europeans in the W., has impoverished Negro Africa, many millions of its inhab. having being removed. To-day there are estimated to be 200 million Negroes in Africa alone.

The Negroes of Oceania and Melanesia are the inhab. of New Guinea and neighbouring is. They form small simple societies, in most cases without elaborate social organisation.

reached the New World, sev. d. in the 'Middle Passage.' Most New World slaves came from W. Africa, Congo, and Angola. Their descendants often still maintain certain tribal words and beliefs. To-day they are very intermixed with whites and other stocks, although in some areas (Haiti and Surinam) they have kept much to themselves and preserved many African customs. Their culture to-day depends largely on white influence, e.g. Portuguese Catholic in Brazil, Fr. Catholic in Haiti, Louisiana, and the Fr. Caribbean,

With acknowledgments to N. A. Barnicot

GEOGRAPHICAL DISTRIBUTION OF INDIGENOUS NEGROES AND SIMILAR PEOPLES

Pygmies may be counted among the Negroes, the African pygmies being Negrilloes and the Melanesian pygmies Negritoes.

The Negroes in the New World are the descendants of slaves brought from Africa by the European powers. There were slaves in the mines of Hispaniola by 1500, and they were brought to what is now U.S.A. in 1619. Early slaves were used in mines and on plantations, mostly sugar, and in domestic service. The trade declined towards the end of the 18th cent., but the invention of the cotton gin and demand for cotton stimulated it anew, and the trade continued until the 1860's, illegally in U.S.A. after 1808 when the constitution prohibited slavery. Total figures taken from Africa are unknown, but it is estimated that between 1666 and 1766 about 3 million were taken, and over 2½ million entered U.S.A. alone from 1808 to 1860. For every one who

Brit. Protestant in the Brit. is. and U.S.A. Everywhere there has been white intermixture through marriage and concubinage: in U.S.A. it is estimated that only 25 per cent are still pure Negro. There are some 15 million Negroes in U.S.A. to-day, defined as people with Negro ancestry; elsewhere in the New World numbers are not known since 'colour' is there defined socially only and censuses do not distinguish white from Negro, mulatto, etc.

In early days in U.S.A. Negroes worked on plantations, mainly cotton, in the S. states. Slavery was abolished in various states at different dates, until the civil war, after which it was abolished for the whole U.S.A. by the 13th Amendment to the constitution. During the reconstruction period in the S. states, 'carpet-baggers' from the N. (see KU KLUX KLAN) led the ex-slaves to the polls, and for a period almost all the S. states were ruled

by Negro legislatures made up for the most part of illiterates. With the withdrawal of federal troops, the whites turned the tables and secured control of all the political machinery of the commonwealths. By various state laws the Negroes were practically disfranchised, despite the plain reading of the amendments to the federal constitution. In some states property and educational qualifications were invoked. In others there was the 'grandfather clause,' whereby anybody whose ancestors had the vote in 1867 continued to have it. To this day in the real S. the Negroes are largely disfranchised, although they have the full right of the ballot in the border states like Missouri, Maryland, and Kentucky.

The story of the Negro in the S. is a long one of a humble but determined struggle to rise in the scale. By the various 'Jim Crow' laws the Negroes are given inferior facilities in transport, education, and welfare generally. Since the decline of the cotton industry due to the boll weevil, the mechanisation of cotton farming, and the industrialisation of the S., a good proportion of Negroes have moved from rural areas. Those who remain are hired labourers or sharecroppers who share their crops with white landowners. The First World War wrought a profound change in the Negro question. The N. as well as the S. was now confronted with it. With immigration into the U.S.A. stopped by the war, the great industrial plants of the N. were in serious need of more labourers, and the S. states were canvassed by agents, who induced Negroes by thousands to move N., where there were good jobs, high wages, the vote, and no colour discrimination in the public schools. The Negro pop. of cities like Chicago, Akron, and others was increased to a great extent. New York became the greatest Negro city in the world. In the Harlem dist. of New York city there are about 400,000 Negroes of all classes. The Second World War accelerated the process, and Negroes have entered certain industries in large numbers, especially meat, steel, motor car, and entertainment. There are also many Negro professional men throughout U.S.A.

But with all the drawbacks, N. and S., with all the dark chapters of lynchings and riots, the Negro race has made marvellous progress since the civil war. To-day there are about 950,000 Negro farmers in the U.S.A. The majority of these are, of course, in the S.: Georgia, S. Carolina, and Alabama. The thirst for education among the Negroes has grown immensely. The individual states of the S. have done much to foster this, and wealthy Negro people have endowed many schools. In the N. and W. states (where there were, at the last census, 2,750,000 Negroes, or 20 per cent of the pop.) there is practically no separation of schools for Negro and white youth. In the 18 S. states and the dist. of Columbia the children of 9,500,000 Negroes, or 80 per cent of the pop., attended separate schools until the state segregation laws were decreed illegal by the Supreme Court

in 1955. There are to-day over 42,000 Negro churches, with upwards of 5,250,000 members and property worth \$200,000,000. The Negroes are mainly Baptists, Methodists, and Presbyterians and there are many independent separatist churches.

Negro art, literature, etc. It is in sculpture that the most important contribution of primitive Negro art has been made. Negro sculpture exhibits great plastic freedom, showing that the artist was capable of feeling in 3 dimensions, whereas much European sculpture shows a two-dimensional limitation. In Europe the influence of Negro art has been considerable: the example of Epstein and Picasso may be cited. For song and dance the Negroes have a natural aptitude, and have set the example for much modern syncopated music and the styles of ballroom dancing, not only in America but also in Europe.

Apart from the prevalence of Negro jazz in white civilisation, Negro songs and spirituals have had a lasting popularity. Negro singers such as Roland Hayes, Marian Anderson, and Paul Robeson have won for the Negro a high place in that art; and the Negroes' musical ability has also shown itself in gifted compositions by Wm. C. Handy, Wm. Grant Still, and others.

Literature among Afro-Amer. writers is often mystical, or is directed towards the social betterment of the Negroes. The Negro as subject was not overlooked by the white writers, particularly those of the S., such as Joel Chandler Harris and Thomas Nelson Page. A bold treatment of the Amer. Negro was given dramatically in *The Nigger* by Edward Sheldon (1909), and the one-act plays of Ridgely Torrence (*Granny Maume*, *The Rider of Dreams*, and *Simon the Cyrenian*, 1917) are also concerned with the Negro, while the controversial play, *Green Pastures*, may be mentioned, and the novel, *Loray*, by du Bose Heyward. But the most significant development has been the creation of literature by Negroes themselves, fully race conscious and impatient of the old sentimental and humorous aspects. There are realists who objectively try to describe Negro life, as they alone can know it, with full details of dialect, superstition, and religious ecstasy. There are the symbolists, more concerned to express the real racial feeling buried deep in the Negro's soul. These men for the most part eschew dialect. They try to do in literary Eng. what Irish writers have done for their peasant folk. This is best illustrated in the various 'blues' by Langston Hughes and the verified Negro sermons written by James Weldon Johnson. In Claude McKay there is presented the defiant Negro poet who resents the slights and injuries put upon his race. Countee Cullen's *Black Christ*, dealing with a lynching, is famous among Amer. students of Negro poetry.

West African indigenous art. There is an individuality in W. African indigenous art and a genuine tradition that justify its special consideration. The aesthetic

aspect of African culture is a discovery of the present generation. The basis of African art was essentially religious, and its tradition in W. Africa is threatened by the crumbling of the religious and tribal systems under which it grew up. Educational reform may go far to check the evil influence of bad European models on indigenous arts; but it is evident that, if the ritualistic beliefs which dictated the forms of the older carvings are yielding to new conceptions of life and death, form and style will require careful and

British Museum

Nimba mask, which is carried on the shoulders, and used by the Baga tribe of French Guinea.

sympathetic guidance. The monumental heads of Gabun, the bronzes of Benin, the masks of the Portuguese Congo, and the sculpture of the Ivory Coast all prove that in the sphere of art W. Africa is coherent and as a whole has regional unity in its plastic art. There are signs of external influences, as, for example, in the designs of the state chairs of the tribal chiefs of Ashanti, which betray a European influence, while some carvings in the Fr. Sudan show Nilotic traces; but, generally speaking, W. Africa has made its own characteristic contribution to the artistic creations of the world. Much that is implicit in the work, the meaning of its symbolism, the ancestral associations of its forms: much of all this is necessarily lost on the European observer, and indeed, belonging to a passing age, there is danger that soon they will hardly be understood by any but the older African generations. The outstanding achievements in the sculpture include

masks for ceremonial use; the long-necked heads from Gabun; red terra-cotta heads of Ifé, Nigeria; the heads of the Baluba from the Belgian Congo and Manyema in the Fr. Congo; and the bronze heads from Benin.

Negros (formerly Buglas), is. of the SW. Visayas group, Philippines, between Cebu (SE.) and Panay (NW.), with the active volcano, Mt. Malaspina or Canlaón (8088 ft.). The mt. ridge forms a continuation of Mindanao (Dapitan). Sugar cane, coffee, tobacco, and rice are produced. Bacolod and Dumaguete, caps. of the occidental and oriental provs., are the chief tns. Area 4905 sq. m.; pop. 1,218,700.

Naguib, Mohammed (1901-), Egyptian soldier and politician, b. Khartoum. He was educ. at Gordon College, Khartoum, the Military Academy, Cairo, and Cairo Univ. He rose to high rank in the army, served in the war against Israel, 1948, and was one of the leaders of the *coup d'état* which deposed King Farouk, 1952. He became commander-in-chief of the army and military governor of Egypt, and in June 1953 became President of the Egyptian Rep. He was ousted from power by Nasser (q.v.) in Dec. 1954, and subsequently retired completely from public life.

Negús, title of a king or ruler in Ethiopia, the emperor being *N. nagast* (king of kings). In the last two cents. the rulers of Amhara have claimed it.

Negus, mulled port, once a popular drink. Nehemiah. The book of N. is closely connected with that of Ezra (q.v.), and in the Jewish canon the two form a single book under the name of Ezra. It tells

how N., cup-bearer to Artaxerxes, learnt of the condition of Jerusalem, obtained leave to visit it, and set about its restoration; and of the actions of Ezra in restoring the observance of the law. See L. E. Brown, *Early Judaism*, 1920.

Nehru, Jawaharlal (1889-), Prime Minister of India since independence in 1947. N. was b. Allahabad, India, of Kashmir Brahman stock, and is frequently called Pandit N., the term signifying his Kashmiri descent. N. himself objects to its use. Son of Motilal N. (q.v.), he was educ. in England at Harrow and Trinity

The High Commission of India
PANDIT NEHRU

College, Cambridge. He became a barrister of the Inner Temple, and practised law at Allahabad. He rapidly estab. his political position as a fervent nationalist, and in 1918 became secretary of the Indian Home Rule League and a member of the All India Congress Committee. He became general secretary of the latter in 1929, and president of the Indian National Congress, 1929-30. He became president again in 1936-7.

Throughout his political career until independence was achieved N. displayed the most determined nationalism and tended to the more extreme exhibitions of it against the Brit. Gov., spending in all 13 years in prison for illegal and subversive activities. Yet, impatient as he was of all delay, his great admiration and respect for Mahatma Gandhi (q.v.), with whom his reasoning could not always agree, restrained him from excess. Though much of his life has been spent in bitter and determined opposition to the Brit. Gov., he has never been anti-British, and has a sincere appreciation of Britain and W. thought and culture, and their contribution to development in India. As Prime Minister he remains probably the most sturdy supporter in India of the Commonwealth connection.

Since independence he has been foreign minister as well as Prime Minister. It has been his continuing aim to develop India industrially, economically, and socially at the greatest possible speed, and for that purpose he has determined to avoid entanglement in international disputes; his logical conviction that war provides no solution is as strong as his humanitarian loathing of war as such. As leader of the second largest Asian country in a world tending to divide itself into two irreconcilable blocs, it is not surprising therefore that his reactions to specific international problems have often give rise to puzzlement and misunderstanding in one bloc or the other. This fact, however, has not caused him to waver in any degree from his objective or his course.

N. would not claim to be an exceptional administrator; in that aspect of gov. he suffered a great loss in the death of his life-long colleague Sardar Vallabhbhai Patel (q.v.). Yet since the murder of Mahatma Gandhi (q.v.) in 1948, N. has held an unrivalled sway over the people of India, and his voice is the authentic voice of India as a whole. During his years in prison under the Brit. Gov., N. devoted much time to reading and writing. His best known works are *Autobiography*, 1936, 1942, *India and the World*, 1936, *Before and After Independence*, 1950, and *The Discovery of India*, new ed., 1956.

Nehru, Motilal (1861-1931), Indian Swarajist, father of Jawaharlal N. (q.v.). Advocate in high court at Allahabad, where he had a magnificent residence; in 1919 he turned his house into a free school which eventually became Congress H.Q. He founded the *Independent*, and presided over Congress, 1919 and 1928; supported non co-operation and was imprisoned. In 1923 he entered the Legislative Assembly and became president of Swaraj party, 1925. In 1928 he presided over the All Parties Conference at Bombay, which produced the N. report recommending dominion status. He endorsed Gandhi's civil disobedience in 1930 and was sentenced to 6 months' imprisonment. A man of great learning and culture, with a keen appreciation of the graces of life, he was a convinced nationalist, but hopeful that the substance of nationalist demand could be achieved by agreement with the Brit. Gov. Towards the end of his life that belief was shaken, but he retained a liberal outlook and an unfailing courtesy.

Neile, Richard (1562-1640), Archbishop of York, b. Westminster. Having taken his doctor's degree in divinity in 1600, he became in 1605 Dean of Westminster. In 1608 he was made Bishop of Rochester and appointed Laud his chaplain, and in 1610 was translated to Lichfield, removing to Lincoln, 1614, Durham, 1617, and Winchester, 1628. He was an uncompromising churchman, prominent in the party of which Laud (q.v.) became the leader. He sat regularly on the High Commission and in the Star Chamber, and in 1631 was made Archbishop of York.

Neill, Alexander Sutherland (1883-), educationist, b. Forfar. After studying at Edinburgh Univ. he was successively office-boy, draper, teacher, and journalist. In 1921 he helped to found the International School, which was located in Germany, Austria, and then England. His unorthodox theories on education and child psychology are set out in *A Dominic's Log*, 1915, *A Dominic Dismissed*, 1916, *A Dominic in Doubt*, 1920, *A Dominic Abroad*, 1922, *A Dominic's Five*, 1924, *The Problem Child*, 1926, *The Problem Parent*, 1932, *The Problem Teacher*, 1939, *The Problem Family*, 1948, and other books.

Nellson (Nellson-Terry), Julia (1869-1957), actress, b. London. She studied music with success but abandoned it for the stage, playing Galatea to Lewis Waller's Pygmalion. She married Fred Terry, and appeared generally under Beorbohm Tree's management until Terry began management in 1900, after which she appeared with him. Her best-known parts include Nell Gwyn in *Sweet Nell of Old Drury*, Lady Blakeney in *The Scarlet Pimpernel*, and Rosalind in *As You Like It*. See her memoirs, *This for Remembrance*, 1940.

Nellson, Lillian Adelaide (c. 1848-80), assumed name of Elizabeth Ann Brown, also known as Lizzie Bland (Bland being her stepfather's name), actress. She made her debut at Margate (1865). Her most celebrated role was that of Juliet. She was popular also in America, appearing at Booth's Theatre, New York (1872).

Nellston, tn in Renfrewshire, Scotland, 10 m. SW. of Glasgow. Thread manuf. and bleaching are carried on. Pop. 5951.

Neisse (Polish Nysa), name of 2 tribes. of the Oder (q.v.): 1. The Silesian N. which rises near Kłodzko (q.v.), in Poland, and flows 120 m. NE. to enter the Oder 15 m. NW. of Opole (q.v.).

2. The Lusatian N., which rises in the region of Liberec (q.v.), in Czechoslovakia, and then forms the boundary between Poland and the dists. of Dresden and Kottbus (in the Ger. Democratic Rep.), joining the Oder S. of Fürstenberg (qq.v.). Length 140 m. Together with the Oder it has formed since 1946 the boundary between Germany and Poland.

Neisse (tn), see NYSA.

Neihart, Matthias, see GRÜNEWALD, MATTHIAS.

Neiva, tn of central Colombia, cap. of Huila dept, on the r. b. of the Magdalena, 75 m. from Girardot and 218 m. from Bogotá. It produces cattle and coffee, and its industries include the manuf. of Panama hats. It has good air, rail, and road connections. Pop. 41,284.

Nejd, or **Najd** (Arabic 'upland'), the plateau in N. Arabia which slopes from the W. mts to the Persian Gulf. Usage varies: the name may include the whole of N. Arabia E. of the mts or only that part S. of Jebel Shammar (q.v.). Some parts like Qasim and Washm have their own names. Taken in the larger sense the area is 800,000 sq. m. and the pop. 3,000,000. The greater part is desert, including the Nejd and Dahna, though

the sand provides grazing in the spring. In places oases are numerous, the beds of the wadis may be flooded, and in Aflaj there are even ponds, one of which may be called a lake. Riyadh (pop. 60,000) is the cap., and other tns are Boreida (30,000), Anaiza (25,000), Shaqra, and Hail. (These figures are estimates and may have to be increased by two-thirds.) Qatif and Uqair, ports on the Persian Gulf, are suitable only for the local sailing craft. The inhab. are mostly Bedouin who bred camels and, to a lesser extent, horses, but motor transport has damaged this trade severely. Dates and some cereals are grown for home consumption and small quantities of dates, hides, and ghee are exported. Such industry as there is supplies home needs. The whole economy of the country has been changed by the discovery of oil in the E. round about Dahrn near the is. of Bahrain. A railway runs from the oilfields (Dammam) to Riyadh. Nejd was the scene of the original Wahhabi movement; the inhab. still hold that form of the Muslim faith and the King of Saudi Arabia belongs to the family which in the beginning supported Ibn Abd al-Wahhab. For the hist. see ARAHIA and SA'UD, IBN.

Nek (or **Poort**), Afrikaans (q.v.) word in common use throughout S. Africa, meaning a mt pass.

Nekrasov, Nikolay Alekseyevich (1821-1877), Russian poet. His main theme is the suffering of the Russian lower classes, and he did much to draw the attention of educ. society to it. Chief poems: *Who Lives well in Russia?*, *The Railway*, *Peasant Children*, and *Russian Women*. He owned and conducted the radical monthlies *The Contemporary* (q.v.) and *The Notes of the Fatherland*.

Nelson, Horatio, Viscount Nelson, Duke of Bronte, in Sicily (1758-1805), admiral, fifth son of Edmund N., rector of Burnham Thorpe, Norfolk. was b. there 29 Sept. On his father's side he came of a family of clergymen; his grandfather was rector of Hilborough, as his father had been, and two of his brothers were clergymen, one, Wm N., after Horatio's death at Trafalgar, being gazetted Earl N. of Trafalgar, with remainder to the heirs male successively of his sisters, Mrs Bolton and Mrs Matcham. Of N.'s childhood little is known. He himself has written that he was at the grammar school at Norwich and afterwards at N. Walsingham, where a brick in the wall covered by glass is still pointed out, marked with the initials 'H. N.' On 17 Nov. 1770, Capt. Suckling, having been appointed to the command of the 64-gun ship *Raisonnable*, entered his nephew on 1 Jan. 1771 as a midshipman. Soon afterwards he went with his uncle to the *Triumph*, guardship of the Medway, in the rating of 'captain's servant,' this being a recognised practice to secure training as a naval cadet. Early in 1773 he was transferred at his own request to the *Carcass*, which was going on a voyage of discovery in the Arctic, an education of trial and hardship for a boy of 15. Later he was rated as a midshipman 'aged 18'

(a gross fiction to conceal irregularities) of the *Seahorse*, a frigate which was fitting out for the E. Indies. In this vessel he visited almost every part of the E. Indies, but under the trying climate his health gave way, and on 14 Mar. 1776 the commander ordered him to be discharged to the *Dolphin* for passage to England. N. himself said that the kindness of Capt. Pigot of the *Dolphin* saved his life and indeed he seems to have regained his health as soon as he reached England. Some days later he was appointed Lieutenant of the 64-gun ship

LORD NELSON

Worcester, by order of Sir James Douglas, commander-in-chief at Portsmouth, and, no doubt, through the interest of Capt. Suckling, who was now comptroller of the navy. Mark Robinson, captain of the *Worcester*, treated N. as an equal rather than a very young acting lieutenant, and some few years later in an action off the Chesapeake Robinson strongly influenced N.'s tactical studies.

Meanwhile, having passed the necessary examination at the navy office, he was promoted to be lieutenant of the *Lovestoft*, 10 April 1777, a 32-gun frigate fitting out for the Jamaica station. The *Lovestoft* had the good fortune to have for its captain Wm Locker, who had distinguished himself in the Seven Years War and afterwards joined Hawke's flagship, the *Royal George*; and the valuable lessons Locker had learned from Hawke he now passed on to N. There is no doubt of the great influence he had on N., whom he found avid of knowledge, zealous for the service, and restlessly energetic, qualities which won his heart as a sailor and as a man. In 1778 N. was moved on probation into Sir Peter Parker's flagship *Bristol*, but his probation did not last long, and on 8 Dec. 1778 he was promoted to be commander of a brig, and, 6 months later, to be captain of a Fr. prize renamed *Hinchinbroke*. In this vessel he led an expedition

against Grenada on the extremely unhealthy Lake Nicaragua, but was afterwards prostrated by malaria and apparently near to death when he was recalled to Jamaica by his appointment to the *Janus*, a 44-gun ship (being succeeded on the *Hinchinbroke* by Collingwood). After recuperating for some months in England he was appointed to command the *Albemarle*, a 28-gun frigate. He cruised for many months without any particular success, but gave satisfactory proof of his ability as an officer, and earned the approval of Lord Hood. He was placed on half-pay in 1783, but not long after was appointed to the *Porras*, and went to the W. Indies, where he captured 5 Amer. ships engaged in irregular trading, in defiance of the instructions of Sir Richard Hughes. Actions for illegal detention were brought against N., who had, perforce, to remain a prisoner on board his own ship. Eventually an order came out for N. to be defended at the cost of the Crown, and so, for the time, his share in the affair might seem to have ended, but for some years afterwards new writs were issued which, though always defended by the Crown, were a source of great annoyance to N.

In Mar. 1783 he sailed for St Kitts, being there for sev. months. Here he fell in love with a young widow, Frances Nisbet, niece of Herbert, president of Nevis, and daughter of Wm Woolward, a judge of the is. But contrary to the common assumption of a love match, the tone of his letter to Frances suggests esteem rather than passion. They were not married until Mar 1787, Prince William, who had come out as captain of the *Pegasus*, giving the bride away. In the summer of 1788 N. went to Norfolk and made his home with his father at Burnham Thorpe, where he lived for a period of 4½ years, during which time his applications for employment met with no response beyond a formal acknowledgment, possibly because he was regarded as a man likely to give trouble in time of peace by excess of zeal, as witness the law-suits over the seized Amer. traders. At this time he was in straitened circumstances, for in addition to his uncle's allowance of £100 a year, he had only his half-pay of £120. It was not until a war with France was threatened in 1793 that he was given the command of the *Agamemnon*, in which in Aug. he conveyed troops to Naples, where he became acquainted with the Eng. minister, Sir Wm Hamilton, and his beautiful and notorious wife, Emma (q.v.). In the following year the commander-in-chief, Lord Hood, attacked Corsica, and gave N. the command of the landing party. N. was successful in the operations at Bastia and Calvi, but at the latter engagement lost the sight of one eye. N. gained valuable experience in this, his first real action against the French, off Genoa (1795) in which the *Agamemnon* was the Eng. ship most closely engaged. The memory of the action is notable for N.'s criticisms in his letters of Adm. Hotham's conduct of the battle, and posterity may

be justified in assuming that had N. been in command most of the Fr. ships would have been captured. He was promoted commodore in 1796, and in the following year, for his share in the victory off Cape St Vincent, was raised to the rank of rear-admiral.

He had waited 18 years for his flag rank but was still under 40. (Collingwood reached flag rank at 50, Howe at 45, St Vincent at 53, and Saumarez at 44.) In the same year in an engagement he lost his right arm. For his successful attack on the Fr. fleet in Aboukir Bay (1798) he was created Baron N. of the Nile. His attachment to Lady Hamilton was now very strong, and he was at Naples whenever he could possibly be there. What N. had never yet found in women Lady Hamilton gave him—admiration and appreciation, undisguised and unstinting; and, by the admission of even her unfriendly critics, in giving that admiration she lent reality and grace to the part she was playing.

After his return to England in company with the Hamiltons, a return necessitated by ill health, N. and his wife separated. In 1801 he was promoted vice-admiral, and was in command of the attack on Copenhagen, being raised to the dignity of a viscount for his services. At this famous battle N.'s flagship, the *Elephant*, commanded by Capt. Foley, who had distinguished himself at the battle of the Nile, was in the centre opposite the Dan. commodore Fischer's ship *Dannebrog*. As to the popular incident of the telescope and N.'s blind eye, it is well confirmed that Sir Hyde Parker, through Otway, his flag-captain, made it clear that the signal to discontinue the action should be understood as permissive and Foley also so understood it. But Col. Stewart (who told the story), who stood beside N. when he lifted his glass, was not aware of the tenor of Otway's message and failed to appreciate that N.'s action and words were jocular. He lived with the Hamiltons in London and at their country house, and after the death of Sir Wm in 1803 continued his intimacy with the widow. Lady Hamilton bore N. 2 children, both daughters, but the second *d.* soon after birth and N. never saw her. N. left it to her to buy the house at Merton, the only home they ever had in England, for he was unable to get leave from the Admiralty even for a few days. Here he spent his happiest hours and from here he set out to fight his last battle.

In May 1803 N. was appointed to the command of the Mediterranean fleet, and made the *Victory* his flagship. He lay off Toulon in the hope of the Fr. fleet coming into the open, and so being able to engage it. Napoleon's plan was for the Fr. and Sp. fleets to meet in the W. Indies and there combine into an overwhelming force. Villeneuve, now in command of the Fr. fleet at Toulon, managed to evade N., but a storm drove him back to the shelter of the forts; but later he was able to get away, while N. was delayed at Maddelena by contrary

winds. He eventually, on 21 Oct., engaged the allied fleets off Trafalgar, and shortly before the action began hoisted from the flagship the famous signal,

England expects that every man will do his duty.' It may be noted here that Adm. Mahan and most authorities state that it had been laid down by N. in his memorandum of 9 Oct., that if the Eng. fleet should be to the windward of the enemy, it would be his object to bring it, in 3 lines, parallel to and within gunshot of the enemy, from which position the lee line of ships would bear up all together and attack the enemy's rear, while the weather line and advance squadron threatened the van until such time as it became expedient for them too to bear up and attack the enemy's centre. But the lightness of the wind made it impossible to manœuvre into the requisite position without risking the loss of a whole day and of the opportunity to attack at all. N., however, had no doubt foreseen and discussed the contingency, so that the modification of his plan, which was apparent, was no doubt at once understood by his subordinates. Ideally the Eng. fleet was in 2 lines perpendicular to the Allies' single line, but in fact the lines on both sides were very irregular, and on the part of the English were rather elongated clusters. This modification of the plan did not, however, affect the essential part of it, and as Mahan writes: 'It is not to the discredit but greatly to the credit of his conception, that it was susceptible of large modification in practice while retaining its characteristic idea.' The victory was complete and decisive, but, when the fate of the action was determined, N. was shot down on his quarter-deck, and *d.* a few hours later.

His last words were: 'Thank God I have done my duty.' His body was brought home, and, after lying in state at Greenwich, was publicly buried in St Paul's Cathedral on 6 Jan. 1806. There are many memorials to him, the most notable being the lofty monument in Trafalgar Square, London. He was one of the greatest, if not the greatest, of Brit. naval commanders, and his bravery and skill were beyond all question. The Commons liberally endowed the title, which, as said above, passed to Wm N., gave £15,000 to each of the sisters, and £200 a year for life to Lady N. upon whom N. had settled £1200 a year when they separated. A N. annuity of £5000 a year was paid by the State from 1806 until 1946, when the gov. introduced a Bill (entitled the Trafalgar Estates Bill) to terminate it on the death of the then earl or his heir. On N.'s character it is agreed that at 21 he had charm of manner which reflected a kind and generous nature. There is abundant evidence that N. frequently displayed the self-assertive vanity of a boy, with all a child's love of praise, and a woman's love of flattery, which Lady Hamilton knew how to give. But that he could also act as an officer, judge, and statesman we know from the record of his life and on the evidence of the Duke of Wellington (who once, and only

once, met N., at the Colonial Office in Whitehall). He was of delicate health and diminutive figure, which gave no external hint of his intellectual powers or of the eagerness for glory, or rather honour, which he possessed from his earliest years as a midshipman.

Bibliography. There are many biographies. The most popular was for long that by Robert Southey (1813). The voluminous *Life* by Clarke and McArthur (2 vols.), 1808, has been the foundation of most later lives, but should be read with considerable reserve on account of the uncritical attitude of the authors; many of its anecdotes are mere sailors' yarns resting on doubtful authority. Capt. A. T. Mahan's *Life of Nelson: the Embodiment of the Sea Power of Great Britain* (2nd ed.), 1899, is valuable for its handling of naval technique. The prin. authority for N.'s private life is *The Hamilton-Nelson Papers* (2 vols.), 1894, which were privately printed; many of these have been used in J. C. Jeaffreson's *Lady Hamilton and Lord Nelson* (2 vols.), 1888, and *The Queen of Naples and Lord Nelson* (2 vols.), 1889. The best short life is John Knox Laughton's *Nelson*, 1905, which contains an excellent historical background. The prin. authorities for N.'s professional life are his dispatches and letters, which were ed. by Sir Nicolas Harris Nicolas (7 vols.), 1844-6; James's *Naval History*; the official correspondence of Adms. Hood, St Vincent, and others (now in the Public Record Office), and E. Chevalier, *Histoire de la marine française sous le Consulat et l'Empire*, 1886. See also G. A. Stephen, *Horatio, Viscount Nelson*—a catalogue of books, pamphlets, articles, and engravings relating to Nelson in the Norwich Public Library, 1915; C. Wilkinson, *Nelson*, 1931; R. Capes, *Poseidon: a Personal Study of Admiral Lord Nelson*, 1947; the authoritative and excellent life by Carola Oman, 1947; G. Rawson, *Letters from Lord Nelson*, 1949; O. Warner, *A Portrait of Lord Nelson*, 1958.

Nelson, Thomas (1780-1861), son of a Stirlingshire farmer, first pub. popular reprints of religious works from his second-hand bookshop in Edinburgh in 1798. The firm of N. which he founded were pioneers in the use of the rotary press (shown at the 1851 Exhibition) and of half-tone blocks, for which they developed a new type of surfaced paper. In 1854 they opened a New York office, to be followed by branches in Toronto, Paris, Melbourne, and Johannesburg.

Nelson: 1. Mun. bor. of Lancs, England, 3½ m. N. of Burnley, granted its Charter of Incorporation in 1890. It is one of Lancs's prin. cotton tns, the home also of iron foundries, brick yards, confectionary manuf., surgical appliances, and other industries. The council owns the water undertaking, covered market, public library, cemetery, public baths, an open-air swimming pool in Marsden Park, civic restaurants, sewage and refuse disposal works, and 3 recreation parks. Pop. 34,384.

2. Prov. dist. of the S. Is. of New

Zealand. There are many mineral deposits awaiting development; dolomite, feldspathic clay, cement, marble, and limestone are produced. The prov., particularly the N. portion, is best known for its fruit, tobacco, and hops. Apples are the main crop with pears next, though peaches, plums, cherries, and small fruits, including raspberries, currants, etc., are produced in abundance. In 1948 the apple and pear crop reached 1,250,000 bushels. There is a large canning factory in Nelson city and a modern state fruit-processing plant in Motueka, which is a centre of the fruit industry about 35 m. from Nelson city. Nelson is the only dist. in New Zealand where tobacco is grown, commercially, and in 1947 more than 4300 ac. were planted and over 5,000,000 pounds of leaf produced. From the Kent hopfields more than a cent. ago early settlers brought hop sets which flourished in the dist., where the industry has continued ever since. It is the only dist. in New Zealand in which hops are grown, and from it the commercial needs of the dominion are supplied. The ann. yield is about 3300 bales. Tomatoes, grown mainly in and around Nelson city, have developed into a major industry which is supplying the markets in many centres throughout the dominion. In 1947 the crop value was about £220,000, 22 ac. being grown under glass. Another big industry is that of timber production. The prov. probably has the largest area of standing native bush in New Zealand. Milling of the timber is extensive, but reliance is being placed more and more on exotics. Some 50,000 ac. have been planted, mainly in the state plantation, and there are in addition 25,000 ac. of privately owned plantations. Milling of this timber is proceeding. The cap., Nelson city, up to the date of the abolition of prov. gov., was the seat of the Nelson Prov. Council. In 1858, by letters patent, Queen Victoria constituted Nelson a bishop's see and a cathedral is in course of construction. Nelson was founded in 1842 under the direction of the New Zealand Co., and was the third of the settlements estab. by Edward Gibbon Wakefield's famous company. Its institutions include one of the oldest secondary schools in the dominion. Nelson College (for boys) was founded in 1856 and has a roll of over 700 of whom nearly 300 are boarders from other parts of New Zealand and even from abroad. Nelson Girls' College, under the same board of governors, has a roll of over 500 of whom nearly 100 are boarders. Another of Nelson's notable institutions is the Cawthron Institute, which is well known throughout New Zealand and the scientific world for its valuable work on soils, mineral deficiencies, and the control of fungus and insect pests. The institute owes its origin to Thomas Cawthron, an old Nelson resident, who left practically the whole of his fortune, amounting to £240,000, for the promotion of scientific research in its application to the primary industries of New Zealand. In its work the institute has the co-operation of the

gov. dept of scientific and industrial research. Nelson is the chief port of the prov., having a good harbour capable of berthing ships 550 ft long and drawing up to 22 ft. Area of prov. 10,870 sq. m.; pop. 70,825. Pop. of Nelson city, 22,519.

3. City in the S.E. of Brit. Columbia, Canada. It stands on the W. arm of the Kootenay Lake, and is the chief tn of the silver-mining dist. of W. Kootenay. The tn was incorporated in 1897, and has fine schools, churches, etc.; there are saw-mills, marble and veneer works; granite is quarried and jam is manuf. Nelson is a tourist resort. Pop. 7117.

NELUMBO: LOTUS

Nelumbo (synonym **Nelumbium**), genus of 2 species of aquatic plants, family **Nymphaeaceae**. *N. lutea* is the Amer. Lotus; *N. nucifera* the E. Indian Lotus, with large, fragrant, white, tinted flowers, sacred to many peoples of the E. in India and China. Hindus believe that the whole universe rests on a Lotus blossom. It is a symbol of beauty, purity, the sun, and of life. The Sacred Lotus of Egypt was probably *Nymphaea lotus*.

Nematodes, **Nematoda**, **Threadworms**, or **Round-worms**, order of unsegmented round-worms with a mouth, a swollen gullet, and a digestive canal running the whole length of the body. They vary in size from *Eustrongylus gigas*, of which the female exceeds a yard in length, to the very minute *Heterodera*s, parasitic on plants and less than $\frac{1}{16}$ of an in. In some N., notably the Strongyle, which causes 'gapes' in chickens, the male is attached to the female, the whole resembling in form the letter Y. A large proportion of N. are parasitic in animals, including man. *Trichina spiralis* enters the human system from badly cooked pork, and millions of the worms of this species have been found in the body of a man. Many N. are the causes of very heavy losses amongst domesticated animals. Apart from intestinal N., one of the most serious parasites is *Strongylus micrurus*, which causes verminous bronchitis ('husk' or 'hoose') in calves that

are put out during the autumn months on wet pastures. This and many other parasitic worms are checked or eradicated by the presence of salt in the soil. One of the most serious plant parasites is *Heterodera radiciola*, which causes root knot disease in tomatoes and cucumbers. *Ascaris lumbricoides* is a common parasite in pigs and man. See also ANKYLOSTOMIASIS; ASCARIS; FILARIASIS; PARASITES; TRICHINOSIS. See W. Yorke and P. A. Maplestone, *The Nematode Parasites of Vertebrates*, 1926; B. G. and M. B. Chitwood, *An Introduction to Nematology*, 1937; T. Goodey, J. B. Goodey, and M. T. Frankling, *Nematode Parasites of Plants Catalogued under their Hosts*, 1956.

Nematus, see SAW-FLIES.

Nemausus, see NIMES.

Němcová, Božena (1820-62), the first eminent Czech woman writer. She began by writing patriotic poems, and went on to stories which she claimed to be folktales but which were actually her own invention. She used a folk motif, but added her own feelings and experiences (e.g. *Národní báchorky a pověsti*, 1845-1847). Many striking female characters appear in her stories. *Babička* is her best-known work (Eng. trans. *The Grandmother*, 1891). It is a vil. novel, full of idealised reminiscence, in which the ann. round of country life is described. Her later works show more interest in social reform, especially as regards the position of women.

Nemea, anct site in Argolis (q.v.), with a grove and temple of Zeus. It was the scene of the Nemean Games (q.v.), and of Heracles' legendary killing of the Nemean Lion.

Nemean Games, one of the 4 great athletic festivals of Greece, held at Nemea biennially from 516 bc. The records mention all the usual contests (running, wrestling, boxing, etc.), excepting the chariot race. The N. G. were celebrated under the presidency of Cleonae, Argos, and Corinth in turn; the prize was a wreath of wild parsley; and many of the victors are commemorated in the *Nemean Odes* of Pindar (q.v.). See E. N. Gardiner, *Greek Athletic Sports and Festivals*, 1910.

Němeký Brod, see HAVLÍČKŮV BROD.

Nemertea, subdivision of unsegmented worms allied to, and by some authorities arranged among, Platyhelminthes, the flat-worms. They are long, ribbon-shaped animals. Most of them are marine, but a few occur in fresh water and a few also on land. It is doubtful whether any are true parasites.

Nemesis, genus of about 50 S. African ann. or perennial herbs, family Scrophulariaceae, of which *N. strumosa* and its varieties are popular garden half-hardy flowers.

Nemesianus, Marous Aurelius Olympius (fl. late 3rd cent. AD), Rom. poet. b. Carthage. He wrote poems on hunting, *De Venatione* and *Cynagetica*; on fishing, *Halieutica*; and on aquatics, *Nautica*. There is an ed. with trans. in J. W. and A. M. Duff's *Minor Latin Poets* (Loeb Library), 1934.

Nemesis (Gk, 'retribution'), daughter

of night, and goddess of vengeance and chastisement, also called Adrasteia, 'she whom none can escape.' She personifies indignation at all disturbance of proportion, punishes the arrogance (*hybris*) that accompanies good fortune, and brings things again within normal bounds.

Nemesius (fl. c. AD 390), Christian philosopher, was Bishop of Emesa in Syria. Very little is known about the facts and dates of his life. He is chiefly remembered as the author of *Peri phuseōs anthrōpou* (On Human Nature), a treatise on anthropology from the Christian standpoint. It was first ed. by Valla (1538), and was trans. into English by George Wither (1636). See A. Bender, *Untersuch. über Nemesius*, 1898.

Nemetodurum, see NANTERRÉ.

Nemophila, genus of hardy annuals (family Hydrophyllaceae) with blue or white flowers and pinnatifid leaves. *N. menziesii*, and varieties, of *N. America*, is grown in gardens.

Nemours, Louis Charles Philippe Raphaël d'Orléans, Duc de (1814-96), second son of Louis Philippe of France. The title of Duc de N. was first borne by the Armagnac family, and was revived in Louis Philippe. He was offered, but refused, the throne of Greece (1825) and of Belgium (1831). He fought in the Algerian expedition (1836-41), and after the revolution of 1848 lived in England till 1870.

Nemours, Fr. tn in the dept of Seine-et-Marne, on the Loing, a popular resort of Parisians. It has gravel and stone quarries. Pop. 5300.

Nemptodurum, see NANTERRÉ.

Nen, or **Nene**, riv. rising in the W. of Northants, England, and flowing past Northampton and Peterborough into the Wash. Length 90 m. The N. is connected with all the central waterways of England by canal.

Nenagh, cap. and assize tn of the N. riding of co. Tipperary, Rep. of Ireland, 11 m. ENE. of Killaloe and 5 m. from Lough Derg. N. Castle is a Norman circular keep (c. AD 1200). Industries include agriculture, slate quarrying, and aluminium and textile manuf. Pop. 4400.

Ne-Ne, or **Hawaiian Goose**, species of goose related to the Canada goose (q.v.) but with shorter wings and reduced webs on the feet. About a hundred years ago some 25,000 N.s lived on Hawaii, but the introduction of pigs, cats, dogs, and rats (and the mongoose) has almost led to the extinction of this ground-nesting bird. Writing in June 1952, Peter Scott stated that 32 Hawaiian geese survived. Steps are being taken to save this species.

Nenets (Russian pl. *Nentsy*), Samoyed (q.v.) people living on the shores of the Polar ocean from the White Sea in the W. to the Yenisey in the E. Nenets Nat. Dist. (formed 1929) lies W. of the Urals, in the Archangel oblast (q.v.), and includes the northern section of the Pechora coal basin. There is reindeer raising, fishing, hunting, and coal-mining. The cap. is Nar'yan-Mar. It is an area of banishment (since 17th cent.) and labour camps. Area 67,300 sq. m.; pop. (1956) 37,000,

(1937, 28,000), mostly Russians and Nenets.

Nennius, St (fl. 6th cent.), Irish abbot, one of the 'Twelve Apostles of Ireland.' The details of his life are unknown, except that he was a disciple of St Finnian of Clonard.

Nennius, Brit. historian (fl. early 9th cent.), compiler of the *Historia Brittonum*, of which there are sev. versions; the chief MSS. are the Cambridge, the Vatican, and the Harleian. He lived on the borders of Mercia and Wales. The book commences with a purported account of the colonisation of Britain by the Anglo-Saxons. It is an uncritical jumble of history and legend, and chronologically unreliable, but modern scholarship has shown that it contains much valuable material on a little-known period of Eng. hist. Geoffrey of Monmouth (q.v.) used N.'s work as a basis for his own, but with considerable additions which make it historically far less valuable than the original.

Neocastro, see NAVARINO.

Neodymium, metallic element, symbol Nd, atomic number 60, atomic weight 144.3. Didymia is one of the oxides known as the gadolinite earths; it was formerly supposed to be the oxide of a metal didymium. Didymium was, however, split up into 2 components, N. and praseodymium, in 1885. The former gives rise to pink salts and the latter to green. See RARE EARTHS.

Neo-Hellenic, see ROMATIC.

Neo-Kantianism, or **Neo-Kantism**, is the philosophy of Kant (q.v.) as taught and interpreted by his successors. Notable among these in modern times are Meyerson, Helmholz, Riehl, and Hermann Cohen. Meyerson approaches philosophy from the direction of natural science, whose aim, he holds, is the discovery of rationality in things, that is, the reduction of differences to an identity which absorbs them all. His work, which may be termed a theory of knowledge, was supported by Einstein, and may briefly be described as a belief in the uniformity of nature and its response to speculative inquiry. Helmholz, with whom may be mentioned Hannequin, declares that the principle of causality is nothing else than the supposition that all phenomena of nature are subject to law, that the cause of a phenomenon is therefore the law, though he later modified this somewhat dogmatic statement by an acknowledgment that he has followed Kant too closely, maintaining finally that the principle of causality was only a hypothesis of the reign of law in all phenomena (see his treatise *Über die Erhaltung der Kraft*, 1847). Colding, the Dan. physicist, a year after Meyerson's first treatise, brought forward an independent proof of the axiom of the conservation of energy and confirmed it experimentally; he also assumed it to be a law of reason. It is in connection with present-day ventures into psychological study that a revival of interest in Kant's theories has most extensively occurred; and in the confusion which many thinkers to-day experience between psychology and theory of knowledge, Kant's clear

doctrines propounded in his *Critique of Pure Reason* serve to dispel the difficulty of demarcation. He definitely stated that the *Critique of Pure Reason* was not to be regarded as an inquiry into psychological phenomena, but rather as a study of the criticism and possibilities of experience. See H. Helmholtz, *Wissenschaftliche Abhandlungen*, 1882, and *Verträge*, 1896; L. Rougier, *Philosophy and the New Physics*, 1922; H. Höfding, *History of Modern Philosophy*, 1924; E. Meyerson, *Identity and Reality*, 1930.

Neolithic (New Stone Age), see FLINT IMPLEMENTS and STONE AGE.

Claudgen

NEON LIGHTING

An installation in which 3000 ft. of tubing are employed. The vertical name sign is in 2-ft. letters illuminated by ruby-red tubing.

Neon (Gk, 'new'), chemical element, symbol Ne, atomic number 10, atomic weight 20.2. N. is one of the constituents of the atmosphere, of which it forms about 1 part in 100,000 by volume. It was discovered in 1898 by Sir W. Ramsay and Prof. M. W. Travers. N. mixed with other inert gases is used in gas-filled electric lamps, and for advertisement purposes in electric discharge tubes, in which a variety of shapes and colours is possible. Pure N. only produces 1 colour—red. N. discharge tubes are also used in aerodrome beacons, because of the fog-penetrating powers of the light they produce. Chemically N. is completely inert; it forms a member of the group of inactive gases. See INERT GASES.

Neophyte (Gk *neophytos*, newly planted), name given by the primitive Church to

the new Christians, that is, to the pagans who had newly embraced Christianity and had been baptised. The term is still used by Rom. Catholic missionaries to denote a convert from heathenism. In general language, newly entered upon, e.g. Ben Jonson's 'neophyte player'.

Neoplatonists, name given to an illustrious succession of ancient philosophers who claimed to found their doctrines and speculations on those of Plato. It is not easy to say with whom Neoplatonism commenced. Scholars differ as to how much should be included under that term. By some it is used to designate the whole new intellectual movement proceeding from Alexandria, comprising, in this broad view, the philosophy, first, of Philo Judaeus and of Numenius the Syrian; second, of the Christian Fathers (Clemens Alexandrinus, Origen, etc.); third, of the Gnostics; and fourth, of Ammonius Saccas and his successors. Others, again, would exclude the second of these (though the Alexandrian divines frequently Platonise), while a third party is disposed to restrict the application of the term to the fourth. The last of these modes of regarding Neoplatonism is the one most current. A fresh stream of life was first poured into the old channels of Platonic speculation by Ammonius Saccas and Plotinus, and it is this fact which gives the school which they estab. its best claim to the exclusive title of *Neoplatonist*. The essence of all the Alexandrian speculations consists in the blending of Platonic ideas with oriental mysticism; the peculiarity of the N., strictly so called, lies simply in the novelty, audacity, and ingenuity of their reasonings. They aimed at constructing a religion on a basis of dialectics. They strove to attain a knowledge of the Highest by assuming the existence of a capacity in man for passing beyond the limits of his personality and acquiring an intuitive knowledge of the absolute, the true—that which is beyond and above the fluctuations and dubieties of 'opinion.' This impersonal faculty is called *Nous*. Plotinus, in fact, set out from the belief that 'philosophy' (i.e. 'Absolute Truth') is possible only through the identity of the thinker, or rather of the subjective thought, with the thing thought of, or the objective thought. The God of Plotinus and the other Alexandrians is a mystical Trinity. The Divine Nature contains within it 3 Hypostases (Substances); its basis, if we may so speak, is called Unity, also poetically Primitive Light. From 'Unity,' as the primordial source of all things, emanates 'Pure Intelligence' (*Nous*); its reflection and image, that by which it is intuitively apprehended; from Pure Intelligence, in turn, emanates the 'Soul of the World' (*Psyché tou pantos*), whose creative activity produces the souls of men and animals and 'Nature'; and finally, from Nature proceeds 'Matter,' which, however, is subjected by Plotinus to such refinement of definition that it loses all its grossness. Unity, Pure Intelligence, and the World-Soul thus constitute the Plotinian Triad. Other Neoplatonic philosophers were Porphyrius,

Iamblichus, Aedesius, and Proclus. See A. Richter, *Neoplatonische Studien*, 1864-1867; C. Bigg, *The Christian Platonists*, 1886, and *Neoplatonism*, 1895; A. Drews, *Plotin*, 1907; T. Whittaker, *The Neo-Platonists*, 1921; W. R. Inge, *The Philosophy of Plotinus*, 1923; N. A. Robb, *Neoplatonism of the Italian Renaissance*, 1935; R. E. Witt, *Albinus and the History of Middle Platonism*, 1937; P. V. Pistorius, *Plotinus and Neoplatonism*, 1952.

Neo-populism, ideological trend in Soviet Russia in the 1920's headed by Prof. Chelintsev. It was a further development of Liberal Populism (see POPULISM) and insisted on the basis of empirical studies that Marxist theory was not applicable to the peasant economy and that the best course in agric. policy would be to support individual peasant farming and encourage peasant co-operatives. The Communists considered N. an ideology of the *kulak* (q.v.), and with the beginning of the collectivisation of agriculture (q.v.) N. was suppressed and its leaders imprisoned.

Neoprene, form of synthetic rubber produced in America, the first to be commercially successful. It is obtained from butyl chloride, and may be vulcanised with zinc oxide.

Neoptolemus, son of Achilles and Deidamia, also called Pyrrhus. At the death of his father, Ulysses took him to Troy, and he entered Troy in the wooden horse. At the fall of Troy he slew the aged Priam. Among the captives Andromache (q.v.), widow of Hector, was given to N. Ultimately he wedded Hermione, daughter of Menelaus, previously betrothed to Orestes, and was slain by the latter.

Neosho, riv. rising in Morris co., Kansas, U.S.A., and flowing into NE. Oklahoma to join Arkansas R. NE. of Muskogee. Length 460 m.

Neottia nidus-avis, Bird's Nest Orchid, native to Britain, with a dense spike of brown flowers in early summer, growing usually under oak- or beech-trees.

N.E.P., see NEW ECONOMIC POLICY.

Nepal, independent native kingdom on the NE. frontier, India, comprises a portion of the S. slope of the Himalayas; it is bounded on the north by Tibet, on the S. and W. by Uttar Pradesh and Bihar, India, and on the E. by Sikkim and Bengal. The state is separated from the plains of India by the long, narrow strip of land, resembling Eng. downs, but unhealthy, called the Terai, which extends along the whole S. border. North of this, and running parallel with it, is the great forest of N., from 8 to 10 m. broad, abounding in wild animals. Still further north is a tract of hilly country, and above that are 2 tracts of greater elevation, which include among their peaks Mt. Everest (29,141 ft), Dhaulagiri (26,286 ft), and Makalu (27,790 ft). The prin. rivs. are the Kurnali, the Rapti, the Gunduk with its great tribs., and the Sun Kosi. The climate, most unhealthy in the Terai, is healthy and pleasant in the hilly and mountainous dists., suggesting that of S. Europe. Rice, maize, and millets are the

prin. crops. The Ghrkhas (q.v.) (Gurkhas or Nepalese) are divided into numerous tribes, the largest being Magars, Gurungs, Newars, and Bhutias (Bhotias), the aboriginal stock being Mongolian. Hinduism is the predominant religion. Since the treaty of Sagauli (1815) Brit. relations with N. have been friendly. Hostilities between N. and Tibet broke out in 1854 and ended in a treaty in 1856 under which Tibet paid an ann. tribute and promoted trade relations with N. The cap. is Khatmandu (q.v.) (pop. 108,800). Under a royal proclamation in 1951 the state is administered by the maharajah, King of N., with an advisory assembly, a Prime Minister, and a Cabinet. N. is in close and commercial relations with the Indian Gov. In the First and Second World Wars N. gave unstinted aid to the Brit. Gov. in men, money, and material. Much attention has recently been given to communications, and in 1954 a road was opened between Khatmandu and the railroad at Amlekganj. There is an air service between Khatmandu and Calcutta. N. is of great archaeological interest, being connected with the life of Buddha. Area 54,000 sq. m.; pop. 8,400,000. See Col. W. Kirkpatrick, *Account of the Kingdom of Nepaul*, 1811; W. Hamilton, *An Account of the Kingdom of Nepál*, 1819; P. Landon, *Nepal*, 1928; W. B. Northey, *The Gurkhas: Manners and Customs*, 1928, and *The Land of the Gurkhas*, 1937; H. Davis, *Nepal, Land of Mystery*, 1942; S. Cutting, *The Fire Ox and Other Years*, 1947; R. N. W. Bishop, *Unknown Nepal*, 1952; H. W. Tilman, *Nepal Himalaya*, 1952.

Nepenthes, genus—the only one of the family Nepenthaceae—of remarkable shrubby plants with small green or brown flowers, borne in long racemes, and with leaves dilated at the ends into pitcher-shaped appendages with a lid-like lamina. The broad, strap-shaped portion of the plant, which resembles a leaf blade, is the wing petiole or leaf-stalk. The size of the pitcher varies from that of a thimble to about 20 in. in length, with a capacity of about 2 quarts. The pitchers act as traps for insects and larger animals, attracted both by the bright colours of the pitchers and by a honey-like secretion round the entrance, which provide nitrogenous food for the plant. About 30 species are known, mostly natives of tropical Asia and the Malay Is. The culture of N.s is easy if abundance of moisture and a tropical temp. can be provided. The pitchers must be kept partly filled with water. The roots should be set in well-drained baskets containing peat fibre and sphagnum.

Nepeta, see CATMINT.

Nepheline, rock-forming mineral whose formula is $\text{Na}_2\text{Al}_2\text{SiO}_6$. Its crystals are transparent, have a hardness of 5½, and sp. gr. 2.6. Two varieties of the mineral are found: glassy N., in small, transparent crystals, occurring in late volcanic rocks, and elaeolite, large crystals; or massive, with varying colours owing to the presence of other minerals. When of a good colour, examples of elaeolite are cut as gems.

Nepheline Syenite, rock of plutonic origin containing essentially alkali-feldspars and nepheline, together with other accessory minerals. Sodalite often accompanies it.

The only important N. S. found in Great Britain occurs near Loch Borolan in Sutherland in Scotland. N. S. is found in Scandinavia, the U.S.S.R., and many parts of Africa.

Nephelium, see EUPHORIA.

Nephrite, more common form of Jade (q.v.) or **Axestone**, is a hard mineral (hardness 7 and sp. gr. 3), massive, compact, very tough, and without any cleavage. In colour it varies from white to bluish-green, and may be blotched or veined. It is sometimes translucent, and is greasy to the touch. In composition it is a silicate of magnesia and lime, although some alumina and oxide of iron are often present. Some mineralogists regard it as a massive form of tremolite. It is found in granite, gneiss, greenstone, etc. It was confused with jadeite until Damour (1863) showed that jadeite was silicate of alumina and lithia, which is fusible, whereas N. is infusible. N. takes a beautiful polish, and is highly prized for ornaments, especially the bright green varieties. The Turks made it into handles for sabres. Many imaginary virtues have been ascribed to it. Thus people once wore it as a charm against epileptic fits and nephritic (Gk. *nephros*, the kidneys) complaints; hence its name. The prin. sources of the mineral at the present day are New Zealand, China, NW. America, Corsica, and Egypt.

Nephritis, inflammation of the parenchyma (essential tissue) of the kidneys. **Acute glomerulo-N.**, or Bright's disease, is an acute inflammation of the glomeruli (see KIDNEY). It is often related to a haemolytic streptococcal infection elsewhere in the body and occurs particularly in connection with scarlet fever and streptococcal sore throats. Acute glomerulo-N. is characterised by markedly diminished output of urine—sometimes almost complete suppression—albumen in the urine (albuminuria), blood in the urine (haematuria), raised blood pressure, and oedema. The inflammatory process renders the glomeruli incapable of performing their normal function of filtering fluids, salts, and urea from the blood stream, and it is this impairment of function which causes the oliguria (diminished output of urine), the hypertension, and the oedema. The haematuria and albuminuria are products of the glomerular inflammation. The greater the degree of glomerular inflammation, the greater the impairment of function and the more marked the symptoms. Severe and untreated acute glomerulo-N. may lead to complete renal failure and death. **Chronic glomerulo-N.**, or chronic Bright's disease, may follow an unresolved acute condition or may start insidiously without previous acute symptoms. It is a progressive disease, producing in a chronic form the same impairment of function as the acute form. **Acute interstitial N.**, a form of nephritis

in which the inflammation affects the tissues in between the glomeruli rather than the glomeruli themselves. Consequently the signs and symptoms are fewer than in glomerulo-N., since the function of the glomeruli is not impaired to a similar extent. Interstitial N., however, may lead to fibrotic contraction of the kidneys and impaired function later in life.

Nephrosclerosis, disorder of the vascular system of the kidneys due to arteriosclerosis (q.v.). Owing to the arteriosclerosis the blood supply to the kidneys is diminished and impairment of function results. N. is always associated with high blood pressure. In the elderly, N. results from a generalised hardening of the arteries; the progress of the disease is slow and in some cases is part of the inevitable wearing-out process to which senile tissues must eventually succumb. An acute, progressive form of N., known as **malignant hypertension**, occurs in middle-aged persons. In this condition the arteriosclerosis is not generalised but localised to the renal vascular system. A very high blood pressure is the rule in malignant hypertension and it is a grave disease, the cause of which is not fully understood. Treatment in many cases fails to arrest its rapid progress towards a fatal termination from uraemia (q.v.) and cardiac failure.

Nephrosis, inflammation of the tubules of the kidneys (q.v.) and frequently associated with glomerulo-nephritis (see NEPHRITIS).

Nepigon Lake, see NIBIGON.

Nepomuk, or **Pomuk**, John of, patron saint of Bohemia, see JOHN, ST.

Nepos, Cornelius (c. 100-c. 25 BC), Rom. historian; friend of Cicero, Atticus, and Catullus. His prin. work was entitled *De viris illustribus*, of which considerable portions survive in what is believed by some to be an epitome by Aemilius Probus. See the ed. of O. Wagner, 1922; also the text with Eng. trans. by J. C. Rolfe (Loeb Library), 1929.

Nepos, Flavius Julius (d. AD 480), last but one of the emperors of the W., b. Dalmatia. He was the nephew of Marcellinus and the son-in-law of Leo I, Emperor of the E., who proclaimed N. Emperor of the W. in 474. He crushed his rival Glycerius and made peace with the Visigoths by ceding to them the Gallic prov. of Auvergne. He was driven out of Italy by Orestes (475), but retained some authority in Dalmatia until his murder in 480 at Salona.

Neptune, see POSEIDON.

Neptune. The discovery of N. is the most triumphant record of mathematical astronomy. Adams of Cambridge (1845) and Leverrier of Paris (1846) both determined its position from no other data than certain perturbations of Uranus. Galle, instructed by Leverrier, found the planet on 23 Sept. 1846, within half an hour. The magnitude lies between 8 and 9 and it is invisible to the naked eye, though visible through a good opera glass as a greenish disk; angular diameter at mean opposition, 2.52", real diameter

33,000 m., but a little uncertain; volume, 72 times that of the earth, its mass 17 times; density, 0.24. The mean distance does not follow Bode's law, being 2793 million m. from the sun; the orbit has an eccentricity of 0.0086, the least with the exception of Venus, making a difference of solar distance of 48,000,000 m. Inclination of orbit, 14° ; revolution completed in a little less than 165 years at a velocity of about 34 m. per sec., rotation not yet determined, though probably about 16 hrs. The spectrum, the light being feeble, is difficult to determine, and indicates the presence of a dense atmosphere similar to that of Uranus; a dark band in the red was identified in 1932 by Dunham as due to methane. *Satellites*: (1) Triton, discovered by Lassell in 1846; distance 223,000 m.; period 5 days 21 hrs 27 min.; orbital inclination, $34^{\circ} 53'$, moving backwards like those of Uranus. (2) Nereid, discovered 1 May 1949 by Kuiper at the McDonald Observatory, Fort Davis, Texas. Distance from N. 3,500,000 m., diameter 200 m.; period, nearly 1 year; moving backwards close to plane of ecliptic.

Nérac, fr. tn. cap. of an arron., in the dept of Lot-et-Garonne, on the Baïse. It has a trade in wine, brandy, horses, and poultry. Pop. 6000.

Nerohinsk, tn in the Chita oblast of SE. Siberia, 130 m. E. of Chita. It is the historical centre of an area with large deposits of gold, non-ferrous and rare metals, worked by convicts. It was founded in 1653; the Russo-Chinese treaty was signed here in 1689. Pop. (1937) 15,000.

Nereid, satellite of Neptune (q.v.).

Nereids, nymphs of the Mediterranean Sea, daughters of Nereus and Doris, the most famous of whom were Amphitrite, wife of Poseidon, Thetis, mother of Achilles, and Galatea. The Naiads were the nymphs of fresh water, and the Oceanides the nymphs of the great ocean. See also NYMPHS.

Neretva (formerly Naro, or Narenta), riv. of Yugoslavia, one of the few considerable rivs. flowing into the Adriatic. It rises near Mt Zelengora in Hercegovina, flows NW. and then SW., and enters the sea near Metrovic. The mouth of the riv. is marshy.

Nereus, Gk god of the sea, son of Pontus and Gaia. He married the Oceanid Doris, by whom he became father of the Nereids (q.v.). He was a prophet and could change his form at will. He is generally represented as a calm and gentle old man with a trident.

Nergal, deity in the Babylonian and Assyrian pantheon. N. was a god of war and hunting and was identified with the sun in its adverse effects (e.g. bringing disease), and thus god of the underworld. Possibly of Hamitic origin, and by some identified with Nimrod, N. was associated with the planet Mars.

Neri, Philip, St (1515-95), b. Florence. In 1550, with sev. of his friends, he estab. a confraternity for the care of poor pilgrims visiting Rome, as well as of the sick generally, which has numbered among its

associates many of the most distinguished members of the Rom. Catholic Church. This confraternity was the germ of the more celebrated Congregation of the Oratory, which was founded by St Philip in concert with his friends Baronius and Tarugio, both afterwards cardinals, Sabriati, and some others. The main object of this association was the moral instruction and religious training of the young and uneducated. St Philip was canonised by Gregory XV in 1622. His feast is on 26 May. See L. Pennelle and L. Bordet, *Saint Philip Neri and the Roman Society* (Eng. trans.), 1932.

Nerine, genus of S. African bulbous plants, family Amaryllidaceae, about 18 species; *N. sarniensis*, the Guernsey Lily, and *N. flexuosa* are popular garden forms.

Néris-les-Bains, Fr. spa in the dept of Allier, near Montluçon. It has Rom. remains and a curious Romanesque church. Pop. 4300.

Nernst, Walther (1864-1941), Ger. physicist, studied in Zürich, Berlin, Graz, and Würzburg. Prof. at Munich, 1894, and Berlin, 1905-33. He did much valuable work on the third law of thermodynamics (q.v.) and its applications to thermochemistry. He was awarded the Nobel prize in 1921.

Nero (AD 37-68), Rom. emperor, b. Antium, the son of Cn. Domitius Ahenobarbus and of Agrippina, daughter of Germanicus Caesar. His mother becoming the wife of the Emperor Claudius, Claudius adopted him (AD 50), and his name, originally L. Domitius Ahenobarbus, was changed to N. Claudius Caesar Drusus Germanicus. After the death of Claudius (AD 54) the Praetorian Guards, at the instigation of Atrianus Burrhus, their prefect, declared him emperor instead of Claudius's son Britannicus. His reign began with the semblance of moderation and good promise, under the guidance of Burrhus and his tutor Seneca the philosopher; but the baleful influence of his mother, together with his own moral weakness and sensuality, frustrated their efforts, and he soon plunged headlong into debauchery, extravagance, and tyranny. He caused Britannicus, the son of Claudius, to be treacherously poisoned at the age of 14, and afterwards (AD 59) caused his own mother, Agrippina, to be assassinated, to please his mistress, Poppaea Sabina (the wife of his prin. boon companion, Otho, afterwards emperor), in order to marry whom he also divorced and afterwards put to death his wife Octavia, the sister of Britannicus. The low servility into which the Rom. senate had sunk at this time may be estimated from the fact that it actually issued an address congratulating the hateful matricide on the death of Agrippina. The affairs of the empire were at this time far from tranquil. In AD 61 an insurrection broke out in Britain under Queen Boudicca, which was, however, suppressed by Suetonius Paulinus. At home matters were not much better. The emperor was lampooned in verse; the senate and priesthood, alike venal, were also satirised by

audacious malcontents; Burrhus, a valuable friend, d.; and even Seneca, though not a great moralist, outside his books, thought it only decent to retire from court. In July 64 occurred a great conflagration in Rome, by which two-thirds of the city was reduced to ashes. N. himself is usually believed to have been the incendiary. It is said that he admired the spectacle from a distance reciting verses about the burning of Troy, but many scholars doubt whether he really had any hand in it. At all events, he laid the blame on the Christians, and persecuted them with the utmost cruelty.

NERO
Vatican, Rome.

He rebuilt the city with great magnificence, and reared for himself on the Palatine Hill a splendid palace, called, from the immense profusion of its golden ornaments, the *Aurea Domus*; and in order to provide for this expenditure, and for the gratification of the Rom. populace by spectacles and distributions of corn, Italy and the provs. were unsparingly plundered. A conspiracy against him failed in the year 65, and Seneca and the poet Lucan fell victims to his vengeance. In a fit of passion he murdered his wife Poppaea by kicking her when she was pregnant. He then proposed to Antonia, the daughter of Claudius, but was refused, whereupon he caused the too fastidious lady to be put to death, and married Statilla Messalina, after killing her husband. His vanity led him to seek distinction as a poet, a philosopher, an actor, a musician, and a charioteer; and he received sycophantic applause, not only in Italy, but in Greece, to which, upon invitation of the Gk cities, he made a visit in 67. But in 68 the Gallic and Sp. legions, and after them the Praetorian Guards, rose against him to make Galba emperor, and N. fled from Rome to the house of a freedman, Phaon, about 4 m.

distant. The senate, which had hitherto been most subservient, declared him an enemy of his country, and the tyrant ended his life by suicide on 9 June 68. See B. W. Henderson, *Life and Principate of the Emperor Nero*, 1903; M. P. Charlesworth (editor), *Documents Illustrating the Reigns of Claudius and Nero*, 1939; C. M. Franzero, *Life and Times of Nero*, 1954.

Nero, Gnaeus Claudius, Rom. general who was consul in 207 BC. In that year he intercepted Hasdrubal, who was crossing from Spain to Italy with reinforcements for Hannibal, and severely defeated him at the battle of the Metaurus. Over 50,000 Carthaginians perished, and amongst them Hasdrubal himself. N. was censor sev. years later.

Nero, Tiberius Claudius, Rom. soldier, served as quaestor under Caesar in 47 BC, was on the side of Brutus after the latter's death, but was later reconciled to Octavian. He is principally known as the husband of Livia Drusilla, and father of her 2 sons Drusus and Tiberius, the latter of whom became emperor. In 38 Octavian divorced his wife, Scribonia, and married Livia, who had obtained a divorce from N.

Neroli, Oil of, see ORANGE.

Nerzhinsk, see NERCHINSK.

Nerthus, see HERTHA.

Neruda, Jan (1834-91), Czech writer, best known for his poems and short stories. Pub. 6 major collections of poems between 1857 and 1896 (posthumous). He was analytical, ironical, self-critical, a careful rather than a spontaneous writer, and avoided society. Besides poetry and short stories, he engaged in nearly every other form of literary activity (journalism, art criticism, drama, etc.).

Neruda, Wilma, see HALLÉ, LADY.

Nerva, Marcus Cocceius, Rom. emperor (AD 96-8), b. Narnia, Umbria, ad 30. On the assassination of Domitian N. was declared emperor by the praetorian guards, and his administration restored tranquillity to the state. The class of informers was suppressed; and N. swore that he would put no senator to death, a promise which he faithfully observed. See B. W. Henderson, *Five Roman Emperors*, 1927.

Nerval, Gérard de (1808-55), adopted name of Gérard Labrunie, a Fr. man of letters. In 1828 he pub. a trans. of Goethe's *Faust*, and later on he collaborated with Théophile Gautier. He was a great traveller, and narrated his adventures in the *Revue des deux mondes*. His most interesting literary contribution is his *Aurélien, ou le rêve et la vie*, 1855, a record of his own insanity; perhaps his best work is his collection of stories, *Contes et facéties*, 1852. See R. Bizet, *La Double Vie de Gérard de Nerval*, 1928; K. Haedens, *Gérard de Nerval, ou la sagesse romantique*, 1939; S. A. Rhodes, *G. de Nerval: poet, traveller, dreamer*, 1951.

Nerves, see NERVOUS SYSTEM.

Nervi, It. seaside resort, in Liguria (q.v.). It is on the Riviera (q.v.), 4 m. E. of Genoa (q.v.), and has beautiful gardens and olive groves. Pop. 9000.

Nervii, powerful Gothic tribe which

inhabited Hainaut, parts of Brabant and E. Flanders, and the prov. of Antwerp. In 57 BC they were defeated by Julius Caesar at the battle of the Sambre (*Bell. Gall.* ii. 15-28).

Nervous System, that part of the mechanism of the body whose special function is the co-ordination and control of the activities of the organs. The system is composed of nerve-cells or neurons, which are linked together and capable of sending impulses from one to the other. In other words, the nerve-cell has a life or metabolic existence of its own, which is modified in a particular manner by certain stimuli received from outside itself, and which modifies the metabolism of an adjacent nerve-cell or certain other cells, such as those of muscle. In this way impulses are conveyed from the exterior to centres within the body, and from such centres to other centres or to other tissues. The effects of what may be called nerve-currents are divisible into 3 classes: those changes which involve movements in certain structures, as the contraction of a muscle; those changes which involve modifications in consciousness, as a special or general sensation; and those changes which are merely chemical, that is, which stimulate the production of certain substances, as in the various secretory organs. The different nerves are responsive to different stimuli, and each nerve transmits its impulse in one direction only. The latter property has given rise to the distinction between efferent and afferent nerves: those that conduct impulses outwards from a nervous centre, and those that conduct impulses towards the centre. The chief kinds of efferent nerves are: (1) Motor nerves, which convey currents to voluntary or involuntary muscles and excite them to contract; (2) accelerator nerves, which produce an increase in the rate of rhythmical action, such as those which make the heart beat at a greater speed; (3) inhibitory nerves, those which retard the rate of rhythmical motion, or stop it altogether; and (4) secretory nerves, those which cause secretion to flow out from the various glands. The chief kinds of afferent nerves are: (1) Those which convey impulses to the central system and there give rise to impulses to be carried away by efferent nerves, as in reflex action; (2) those which convey impulses giving rise to the special sensations of sight, hearing, etc.; (3) those which convey general or non-localised sensations; and (4) those which give rise to the experience of pain. The N. S. is also to be classified according to the anatomical disposition of the nerves and nervous organs. The most convenient classification involves 3 divs.; the central N. S., the peripheral N. S., and the sympathetic nerves. These divs. are somewhat arbitrary, but are sanctioned by custom and convenience. The central N. S. consists of the brain and spinal cord. The peripheral system consists of the cranial nerves, the spinal nerves, the sense organs, e.g. the eye and ear, and the motor end-plates. The sympathetic system consists

of the ganglia situated on either side of the spinal column, with their connections. Before describing these systems in detail the properties of nerve-substance in general must be discussed.

Nervous tissue is of 3 kinds: nerve-cells, nerve-fibres, and neuroglia, or connecting tissue. Nerve-cells vary greatly in form and size. The form of cell which makes up the brain and spinal cord consists of a protoplasmic nucleated body, from which arise certain processes. One process is known as the axis-cylinder process or axon, and the others are collectively called the dendrites. The axon possesses a uniform diameter and throws off collateral branches without diminishing in section; the dendrites divide into numerous branches, which taper off as they pass from the cell-body. The axon appears to be the structure by which communication is made between cell and cell, and it is an essential part, not only of a nerve-cell, but of a nerve-fibre. In some fibres the thread-like axon becomes sheathed with a substance called myelin; it is then called a medullated fibre; if the sheath is absent, it is called a non-medullated fibre. Whether medullated or not, the fibre may possess a thin sheath called the primitive sheath or neurilemma, placed externally to the myelin if the fibre is medullated. The part of the brain and cord which contains nerve-cells is called grey matter, while the white matter of the brain and cord is made up of medullated fibres without a primitive sheath. The nerve-fibres which proceed to the various parts of the body are bound up in bundles which we call nerves.

Central nervous system. The central or cerebro-spinal system consists of the brain and the spinal cord, both of which are elsewhere described. The most important part of the brain is the cortex, which is made up of grey matter. There are subsidiary masses of grey matter in the interior of the brain, in the cerebellum, and in the spinal cord. It is in this grey matter that voluntary action arises, and to it are also brought the impulses which give rise to sensation. The subsidiary masses of grey matter are concerned with involuntary and reflex actions, while the white matter may be looked upon as a communicating medium only.

Cranial nerves. These nerves are concerned mainly with the supply of the head. There are 12 pairs of them, and they are spoken of by their numbers as well as their names: (1) The *Olfactory* nerve is purely sensory; it comes from the nose and proceeds to the cerebrum; it is the nerve of smell. (2) The *Optic* nerve is purely sensory; it enters the eyeball at the rear and connects with the cerebrum by way of subsidiary masses of grey matter called the *corpora quadrigemina* and *corpora geniculata*. (3) The *Oculomotor* nerve is purely muscular, and supplies most of the muscles of the eye. (4) The *Trochlear* nerve is muscular, and supplies the superior oblique muscle of the eye. (5) The *Trigeminal* nerve is mainly sensory. It divides into 3 main branches for the upper, middle, and lower portions of the

head and face region. It has a smaller motor branch for the muscles of mastication. (6) The *Abducens* nerve is motor and supplies the external rectus muscle of the eye. (7) The *Facial* nerve is a motor nerve, supplying the facial muscles. Injury to this nerve causes the loss of all power of facial movement and expression. (8) The *Auditory* nerve is divided into 2 parts: the *cochlear* nerve, which is the true nerve of hearing, and the *vestibular* nerve, which connects with the semicircular canals and conveys those impulses which enable the body to be kept in equilibrium. (9) The *Glossopharyngeal* nerve is mixed sensory and motor. Certain muscles of the pharynx are impelled to action by it, while other fibres are concerned in sense of taste. (10) The *Vagus* or the *Pneumogastric* nerve has varied functions; it contains fibres which convey motor impulses to the stomach and intestines, afferent impulses from the lungs, etc. (11) The *Spinal Accessory* nerve contains motor fibres for the larynx and some inhibitory fibres for the heart; it also supplies a few muscles in the neck and back. (12) The *Hypoglossal* nerve is the motor nerve for the tongue muscles.

The *Spinal* nerves arise from the spinal cord and run out through holes between the vertebrae to supply the trunk and limbs, though some of the upper ones are concerned with the head and face. The div. into spinal and cranial nerves is arbitrary and not real. There are 31 pairs of spinal nerves, whose names depend on the part of the spinal column from which they pass. Thus there are 8 cervical, 12 dorsal, or thoracic, 5 lumbar, 5 sacral, and 1 coccygeal. Each spinal nerve is a mixed nerve, containing both motor and sensory fibres. As they emerge from the spinal cord, the motor and sensory bundles are separated. The sensory fibres come from the back of the spinal cord; their point of emergence is called the posterior root, and a spinal ganglion is situated at that point, consisting of a collection of nerve-cells which have 2 axis-cylinders proceeding from them, by which the cells communicate in one direction with the skin, and in the other with the spinal cord or brain. The motor fibres sprout from the grey matter of the spinal cord, and proceed by way of the anterior roots to the mixed nerves, and thence to their destination in the end-plates of the voluntary muscles.

Sympathetic system. Some of the anterior root fibres pass to a chain of ganglia running down on each side of the vertebral column and called the sympathetic chain. These ganglia consist of nerve-cells, and the fibres from the anterior roots branch round these cells and stimulate them to send out impulses by their own axis-cylinder processes to the involuntary muscles. The medullated fibres which carry the impulses from the spinal cord to the ganglia are termed pre-ganglionic; those which start from the ganglia are non-medullated and are called post-ganglionic. The impulses which affect the involuntary muscles must not be understood to originate in the

ganglia. The ganglia serve as redistributing stations, where an impulse received from one afferent fibre may be communicated to a number of cells in the ganglion which convey by their own axis-cylinders the impulses to the various involuntary muscles. Among muscles served are those which effect the peristaltic movements of the alimentary tract, those which constrict the arteries and regulate the circulation, including the muscles of the heart to some degree, the unstriated muscles of the lungs and windpipe, those which control the size of the pupil of the eye-ball, those connected with the sweat glands of the skin, etc. See H. Gray, *Anatomy* (31st ed.), 1954, and S. W. Ranson, *Anatomy of the Nervous System* (9th ed.), 1953.

Nesbit, Edith, see BLAND.

Ness (Eng. *nose*; A.-S. *naese*; Ger. *Nase*; Icelandic *nes*; Lat. *nasus*; Fr. *nez*), geographical termination signifying promontory. Names in -ness abound among the Orkney and Shetland Is., and on the coast of Caithness; and along the E. coast of Great Britain as far as Dungeness in Kent. As the corresponding termination -næs prevails in Scandinavia, the existence of names in -ness in Britain is held as an evidence of Scandinavian colonisation.

Ness, Loch, long, narrow lake in Inverness-shire, Scotland, extends NE. and SW. and is 23 m. in length and 1½ m. in average breadth. It receives the Moriston, the Oich, the Foyers, and other streams, and its surplus water is carried off to the Moray Firth by the Riv. N. In many places it is 130 fathoms in depth. There is much controversy over the reported appearances of a supposititious 'monster' in the loch.

Nesselrode, Count Karl Vasil'yevich (1780-1862), Russian statesman of German origin, b. Lisbon. He was foreign minister, 1814-56, and took part in the congresses of Vienna, Aachen, Troppau, Laibach, and Verona, always succumbing to the influence of Metternich. He signed the peace treaty of Paris at the end of the Crimean War.

Nessus, see CENTAURS and HERCULES.

Neston, urb. dist. of Cheshire, England, 12 m. from Chester. It stands on the estuary of the Dee. Pop. 9922.

Nestor, legendary son of Neleus, King of Pylos. When Pylos was attacked by Hercules he alone of the 12 brothers was spared. He fought against the Arcadians, Eleans, and Centaurs and took part in the siege of Troy. In old age he was renowned for his wisdom.

Nestorian Church, see NESTORIUS.

Nestorius (d. c. AD 450), b. Germanicia, a city of N. Syria, in the patriarchate of Antioch, probably studied under Theodore of Mopsuestia. After ordination at Antioch, he was chosen by the emperor, 428, as patriarch of Constantinople. Soon after his consecration a priest called Anastasius, who had followed Nestorius to Constantinople, in a sermon (by some ascribed to Nestorius himself) declared that the Virgin Mary could not truly be called 'Mother of God,' as she was only

the mother of the man Christ. Nestorius warmly defended this view, and elaborated it into the theory since known as Nestorianism which exaggerated the distinction of 2 natures in our Lord into a distinction of 2 persons, the human person of Christ and the Divine Person of the Word. In the controversy that ensued, Cyril of Alexandria condemned the doctrine of Nestorius, as did Celestine of Rome, with a threat of deposition and excommunication. Nestorius remaining firm in his opinions, a council was convened at Ephesus in 431, at which Cyril took the most active part, and in spite of the absence of the patriarch of Antioch and his bishops, Nestorius was condemned

of all liturgies still in use, and of great historical value, remarkable for having no words of institution in the consecration prayer; (2) that of Theodore; (3) that of Nestorius. These last also are old, though the first is the oldest. Uniate of Nestorian origin are called Chaldeans.

In their prosperous days under the Muslim rule, the Nestorians displayed an unparalleled missionary zeal and enterprise, to which Marco Polo bears witness, for he found their churches along all the trade routes from Bagdad to Peking (whence the legend of Prester John). Remains of their churches, which once flourished all over Asia, have been found in India (at Madras and Travancore), in

British Railways

In the background is the Glengarry Forest, with the peak of Sron a Choire Ghaireibh (3066 ft); in the middle distance is the Caledonian Canal (River Quoich).

and deposed. Considerable opposition was offered to this, but ultimately Nestorius was confined in a monastery near Constantinople and after 4 years banished to the Greater Oasis in Upper Egypt. After sev. changes in his place of confinement, Nestorius *d.* in exile. See J. F. Bethune Baker, *Nestorius and his Teaching*, 1908, and G. R. Driver and L. Hodgson, *The Bazaar of Heracleides*, 1925.

Nestorian churches. The bishops of Edessa and Nisibis adhered to the teachings of Theodore of Mopsuestia and Nestorius, and found many supporters in Syria and Persia. The schismatic Church which they founded survived and flourished after the Muslim invasions until the Mongol incursions of the 13th and 14th cents. finally disrupted them and drove them to the mts of Kurdistan. There they still survive, a strange, hard-living, largely illiterate community, isolated from the rest of Christendom for cents. until befriended by the Anglican Church, fiercely retentive of their primitive rites, and governed by an hereditary patriarch, the Catholicoi or Mar. They are known variously as Nestorians and Assyrians. Their service books survived in MS. until printed for them by the Anglicans. They have 3 anct liturgies: (1) that of the Holy Apostles Addai and Mari, the most anct

Ceylon, and in various parts of China. The Tartar invasions seem to have swept them all away, with the exception of a small community in Malabar. These claim to have been founded by St Thomas and St Bartholomew, but the origin of this legend is believed to be the fact that in 745 a band of Nestorian emigrants arrived there from Bagdad and Nineveh, led by one Thomas of Kana. Other emigrants joined them from Persia in 822. They lived there under their own king as a sort of Indian caste. The efforts of Pope John XXII to win them in 1330 failed, but in the 16th cent., when they were oppressed by the Muslims, they did ask help of the Portuguese, only to bring on themselves the Jesuits and the Inquisition. In 1599 at the Synod of Dampier they submitted under duress to Rome; but as the Dutch weakened the Portuguese grip on them, in 1653 they rebelled and chose Archdeacon Thomas to be consecrated bishop for them by the Nestorian Catholicos. The Portuguese foiled this attempt and also a second attempt to secure a bishop from the Copts. In 1665, however, their power was gone and, the Nestorian connection having now somehow been interrupted, Thomas was consecrated for them by a visiting Monophysite, the Jacobite Bishop of Jerusalem,

since when they have been Monophysites and in communion with the Syrian Jacobites. See A. J. Maclean and W. H. Browne, *The Catholics of the East and his People*, 1892; G. M. Rae, *Syrian Church in India*, 1892; J. Stewart, *Nestorian Missionary Enterprise*, 1918; A. Fortesque, *The Uniat Eastern Churches*, 1923; S. Gaselee, *The Uniates and their rites*, 1925; B. J. Kidd, *The Churches of Eastern Christendom*, 1927; P. Saeki, *The Nestorian Monuments in China*, 1928; G. Dix, *The Shape of the Liturgy*, 1946.

Nests, in natural hist., are the places chosen or constructed by birds or any other animal for incubation, hibernation, or general residence. They vary enormously, from mere saucer-like hollows in the ground to some of the most elaborate and beautiful structures found in nature. Birds that are content with slight depressions in the ground, such as terns and plovers, lay eggs which so closely resemble the ground that they generally escape detection. A decided advance on this kind of nest is the burrow, such as that occupied by the sand-martin, kingfisher, or puffin. In many cases these underground N. are made in burrows left by rabbits or voles. Many birds and some animals make their N. in the hollows of trees; the female of the Bornean rhinoceros hornbill is sealed up by the male for many weeks, and thus absolutely protected. The mud N. of the swallow family and other birds are wonderful examples of industry. Some of these weigh as much as 8 or 9 lb. Among the crudest N. that are made with collected material, such as sticks, leaves, blades of grass, or hair, are those of the wood-pigeon, which are so loosely put together that the eggs are visible through them. The evolution of such N. to the complex structures of the finches or the wrens and their choice of site is plainly due to the instinct of concealment. Some fish and some insects and spiders have developed great nest-building craft. Various mammals such as harvest mice, squirrels, and rats also build N.

Swallows, martins, sparrows, and flycatchers prefer houses as nesting sites; the thrush tribe, finches, and linnets use evergreen bushes and hedges. Most species construct N. which are highly distinctive, and chaffinches produce those of the highest quality. The better builders also prefer a particular sort of site, especially the warbler, which adapts its nest perfectly to its position, preserving a uniformity of height above the water or marsh. Generally the N. of home birds are more solid than those of visitors, the former having more time at their disposal. The blackbird's is one of the heaviest, and the lesser whithroats' is of the lightest.

Nests, Edible, are produced in the Malay Is. and Australia by species of swifts, or swiftlets. In most of the mud-nest-building birds saliva is secreted to mix with the mud. In these swiftlets the secretory glands are so developed that the use of mud and other matter is abandoned, the nest being formed mainly

or entirely of the bird's own secretion. These N. are in great demand by the Chinese for making bird's-nest soup. From the Malay Is. millions of N. are annually imported into China.

Nessus, see **LOLOS**.

Net Book Agreement, see **BOOKSELLING**.

Net (short) Ton, see **METROLOGY**.

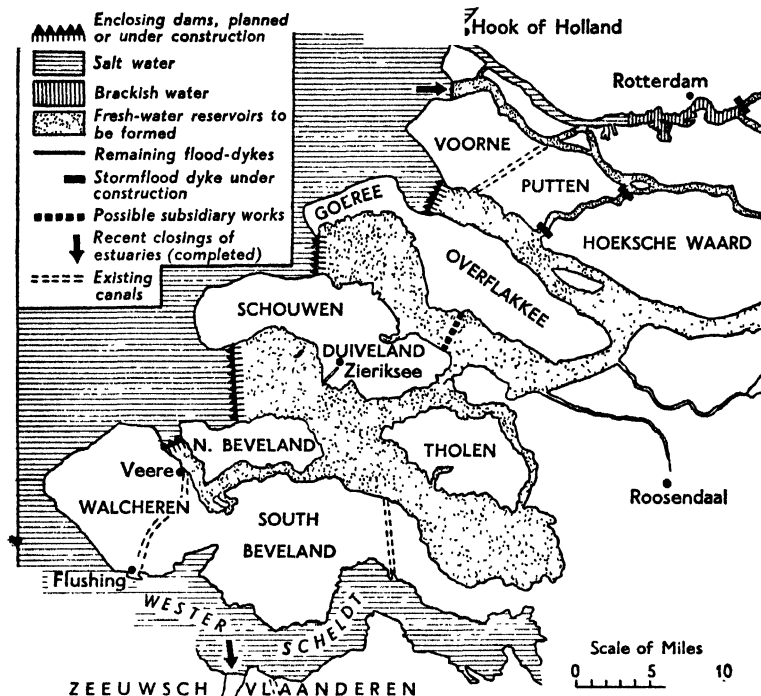

Netball, popular game in England and the Commonwealth for girls and women. It is played by 2 teams of 7 players each, with a leather, moulded, or rubber Association football, size 5. N. is played indoors or outdoors on a court of a hard surface, 100 ft by 50 ft. At each end and marking the centre of a shooting circle of 16 ft radius is a post, 10 ft high, holding a metal ring of 15 in. diameter, placed horizontally at the top. A team consists of 2 shooters, 3 centre court players, and 2 defenders. The shooters and their opposing defenders are the only players allowed in the circle. Started by a centre pass, taken alternately by the opposing centres, standing in the centre of the court, the ball is passed from player to player to a shooter in the circle, who then scores by throwing the ball over and through the ring. When in possession of the ball, a player may not step with it, or play it twice in any way. Infringements earn a free pass to the other side. No player may hold another, or push her, or be rough in any way. This is penalised by a free shot from the edge of the goal circle. The duration of the game is 2 halves of 20 min. each, with a half-time interval. The game is controlled by 2 umpires. The national body in England is the All England Netball Association. New rules were introduced in June 1957 and last for 3 years. See also **BASKET BALL**.

Nâthe, riv. of Belgium, trib. of the Rupel (q.v.). The N. is formed at Lier (q.v.) by the confluence of the Great and Little N., the main rivs. of the Kempen (Campine) region, both flowing from E. to W. The N. supplies the drinking water for the Antwerp agglomeration. The main filtering works are at Walem, 7 m. SW. of Lier.

Nether Stowey, vil. of Somerset, England, 8½ m. from Bridgwater, centre for the Quantock Hills (q.v.). Here Coleridge lived (1796-8) and wrote many of his best-known poems; Wordsworth moved here in 1797, and together the poets conceived the *Lyrical Ballads*. Pop. 612.

Netherlands, The (Dutch *Nederland*), kingdom of NW. Europe, lying between 50° 45' and 53° 36' N. lat., and 3° 22' and 7° 14' E. long., bounded on the N. and W. by the N. Sea, S. by Belgium, and E. by Germany. Its greatest length from N. to S. is 195 m., and its greatest breadth 120 m.; the land area is 13,868 sq. m., total area 15,765 sq. m. The coastline, formed by the deltas of the R.s Rhine, Waal, IJssel, and Scheldt, is very long. In 1958 the pop. amounted to some 11,070,000, making the Netherlands the most densely populated country in the world.

Topography. The country is very low

MAP OF THE ISLANDS OF THE PROVINCE OF ZEELAND AND SOUTH HOLLAND, SHOWING THE ENCLOSING DAMS, WHICH ARE PLANNED AND UNDER CONSTRUCTION

and flat, partly lying below sea level. It forms part of the great N. European plain, being situated at its NW. corner. Much of the NE. area (Drenthe and Groningen) is covered with wide heaths and peats, but the marshes have been drained to a great extent. Some 25 per cent of the present land has been reclaimed; the marshes formed by the deltas of the Maas, the Rhine, and the Scheldt have been turned into arable land, and vast tracts (polders, q.v.) have been reclaimed from the sea, notably the following: Beemster (in 1612), Haarlemmermeer (in 1852), Wieringermeer (in 1930), and the NE. Polder (in 1942) (qq.v.). The polders make a vital contribution to the Dutch economy. Dykes and embankments hold the sea in check and keep canals and rivers from overflowing their banks. Mechanical methods have now largely replaced the wind power formerly used in operating the pumps which regulate the water levels. The most extensive drainage schemes have been in the region of the former Zuider Zee (q.v.), now called IJsselmeer (q.v.), where reclamation in the SE. and SW. is still in progress. In

1918 an Act was passed to form a new prov. by damming and draining parts of the Zuider Zee. After completion (expected in 1980) the area of the Netherlands will be increased by 546,000 ac. of land. The Afsluitdijk (q.v.), completed in 1932, separates the IJsselmeer from the N. Sea. Locks were in use on canals in the Netherlands early in the 14th cent.; the largest lock in the world, that at IJmuiden (q.v.), on the canal connecting Amsterdam with the N. Sea, was opened by Queen Wilhelmina in 1930. The maintenance of the canals, dykes, and locks, and land drainage, are the responsibility of a special public dept called the Waterstaat; this involved the Netherlands in expenditure of considerably more than £63,000,000 for the year 1958.

Administrative divisions and principal towns. The Netherlands is divided into 11 provs.: N.-Holland, S.-Holland, Zeeland, Utrecht, Gelderland, Overijssel, Groningen, Friesland, Drenthe, N. Brabant, and Limburg (qq.v.). The most densely populated prov. is S.-Holland, and the least densely populated Drenthe. The official cap. and largest centre is

Amsterdam (q.v.), while The Hague (q.v.) is the seat of the gov. and Parliament. Rotterdam (q.v.) is the second largest tn in the Netherlands, and the third largest harbour in the world. Eleven other tns have pops. of over 100,000: Utrecht, Haarlem, Eindhoven, Groningen, Tilburg, Nijmegen, Arnhem, Enschede, Breda, Apeldoorn, and Hilversum (qq.v.).

Communications. The favourable situation of the Netherlands, half-way between the N. Cape and the straits of Gibraltar, on the most navigated sea of the world, at the mouths of excellently

A smaller port of importance is Zaandam, N. of Amsterdam, lying in the highly industrialised Zaan dist. The NE. port of Delfzijl specialises in coastal trade, notably to Scandinavia and England, as does Harlingen in the NW. from which regular services to England are maintained. The Netherlands is situated at the junction of important high roads of economic significance. England lies across the N. Sea, Belgium and France adjoin the Netherlands in the S., and Germany in the E., and Switzerland, Austria, and Czechoslovakia are also easily attainable.

Ministry of Transport & Waterstaat, The Hague

ONE OF THE STREAM-CARRYING BREACHES CAUSED BY THE FLOODS OF FEBRUARY 1953

navigable rivs. communicating with the whole of central Europe by a system of canals, makes the country a natural gateway, as well as an emporium and centre of commerce. In this way 2 seaport tns came into existence which play a very important part in the world's trade—Rotterdam and Amsterdam. The equipment of docks, quays, storehouses, loading and unloading installations in both harbours is completely adapted to world shipping.

In 1957 the mercantile marine consisted of 1485 ships with almost 4 million gross registered tons. The number of Dutch vessels navigating the Rhine is 37 per cent of the total, their tonnage being 64 per cent. The country itself is intersected by a great number of rivs. and canals, totalling about 4500 m. and linked to the water and railway transport system leading to the heart of Europe.

The system of railways is not so congested as in some other W. European countries, as a great part of the conveyance of merchandise is by inland navigation. The railway traffic being mainly passenger traffic, its speed surpasses that of neighbouring countries. During the Ger. occupation in the Second World War the Dutch railways suffered much from war operations; hardly any locomotives were left; passenger carriages and goods vans had been transported to the E., rails had been taken away as well as the overhead wires of the electric railway system. Rebuilding was started after the liberation of the country, and to-day fast and frequent services are run over 1935 m. of railway track of which 70 per cent have been electrified. The last steam locomotive was taken out of service in 1958, and electric locomotives and Diesel traction engines are now used throughout

the country. Many important international airlines use the well-equipped airport at Schiphol. The Royal Dutch Airlines (K.L.M.), the oldest airline company in the world (estab. in 1919), have regular services to all the major cities of the world.

Industry absorbs about 43 per cent of the working pop., a rather curious fact, taking into consideration that the country itself is short of raw materials. Iron-ore,

superphosphate and oil works. Blast furnace works are estab. in IJmuiden. Here imported ores are processed, the greater part of the iron being again exported. One of the largest tin smelting works in the world is at Arnhem. The country has over 300 shipyards. There are various breweries, margarine and soap works, as well as gin and liqueur distilleries. The great labour productivity of the Dutch people has caused industries

Royal Netherlands Embassy

wood, and oil must be imported from overseas, and only in the S. (Limburg) is coal obtained in considerable quantities, which cover part of the home requirements. Potential oilfields are exploited in the E. part of the country. The output of the salt-mines in the E. can completely meet the inland requirements and even allows an export of about 60 per cent of this commodity. The favourable location of the Netherlands makes it possible on the one hand for raw materials to be easily imported, and on the other hand for the industrial products to be as easily exported to all parts of the world. Consequently, coupled with the experience and skill of the workers, Dutch industry consists primarily of refining, in which the raw materials are processed into products for export, as may be exemplified in its

to be developed which demanded specialised labour, such as the diamond industry, shipbuilding and machine-building, china and earthenware manuf., as well as radio, electrical, textile, and chemical industries. The world-famous Philips incandescent lamp and radio factories are at Eindhoven.

Agriculture and farming brought into existence the important industries of canned food-stuffs, potato-flour, and strawboard. Besides the manufacturing industries, handicrafts have flourished. The fine handiwork of goldsmiths and silversmiths and other artificers, as well as the products of the furniture-maker's, glazier's, and industrial arts, find their way to both the home and foreign markets.

Mining. In the S. the Netherlands

operates 12 mines, all with modern equipment, 4 of them being the property of the gov. Dutch mines supply a type of coal best suited to industrial purposes. Pre-war production amounted to about 13 million metric tons per annum. Before the Second World War part of the coal destined for industrial use was exchanged abroad for household coal. After the liberation the production of coal from the mines decreased considerably, owing to various causes such as undernourishment of the miners, lack of material, enlistment of mine workers into the services, departure of foreign labourers, and labour conflicts. Through lack of shipping-space, the elimination of the Ruhr as a supplier, the decline in the output of foreign collieries, and miners' strikes abroad, the imports of coal were not sufficient to cover the requirements of the industries and private use. However, the ann. output rose from 8 million tons in 1946 to more than 12 million tons in 1956.

As a secondary by-product to coal-mining reference can be made to coke and briquette factories, chemical factories for the production of nitrogen, hydrochloric acid, chloride of lime, coal-tar products, etc. The chemical works which manuf. secondary products of coal have an important share in the industrial production of the Netherlands. Thus important industries have been estab., such as those of artificial manure, plastics, dyes, pharmaceutical products, alcohol, lubricants, soap, artificial silk, perfumes, road-covering materials, insecticides, saccharin, and disinfectants. These articles form an increasingly important part of the country's export.

Agriculture and horticulture. Twenty per cent of the pop. is engaged in agriculture. Because of the density of the agric. pop. Dutch agriculture had to specialise in the production of fine agric. produce, such as valuable seed crops, vegetables and fruit, bulbs and decorative plants. In addition the Netherlands has the advantage of having neighbouring countries which have developed gradually into industrial countries. Consequently their demand for agric. products has increased considerably in the course of years. The communications between the Netherlands and her neighbours are short, which makes it possible to bring the above-mentioned products fresh to foreign markets. Even air transport is used for this purpose. More than 176 million guilders' worth of flower bulbs was exported in 1955. Other main exports are eggs, butter, cheese, condensed milk and milk-powder, chocolate, beer, cigars, and cigarettes. The food and beverage industry contributes one-fourth to the country's total exports. The Netherlands is a very large consumer of fertiliser.

Fisheries. Fishing is one of the oldest Dutch trades which throughout the ages has made important contributions to the national income. The herring industry is intensively developed, and large quantities of herring, oysters, mussels, and fresh-

water fish are exported. A remarkable activity has developed in the exploitation of modern refrigeration ships. The whaling industry which in former cents. used to be of great importance in the Netherlands, but declined in later years, was resumed in 1946.

Currency. The monetary unit is the guilder, also known as the florin, divided into 100 cents. The Netherlands Bank, founded in 1814 as a private institution, was nationalised in 1948 and has the sole privilege of issuing bank-notes.

Government and justice. The gov. of the Netherlands is a limited and hereditary constitutional monarchy. The executive power of the State belongs exclusively to the sovereign, but is exercised by a responsible council of ministers. The legislative rests conjointly in the sovereign and States-General, or Parliament. The latter is bicameral: the first or upper chamber is composed of 50 members, elected by the prov. states, and the second chamber of 100 deputies, elected directly. There is universal suffrage and the system of election is by proportional representation. Deputies are elected for 4 years and retire in a body, whereas the first chamber is elected for 6 years, one-half retiring in rotation every 3 years. The gov. and the second chamber only may introduce new Bills, the functions of the upper chamber being restricted to approval or rejection, without power of amendment. The meetings of both chambers are public, though each may, by majority decision, form itself into a private committee. The ministers may attend the meetings of the States-General, but unless they are members they have only a deliberative vote. Alterations in the Constitution can be effected only by a Bill giving reasons, followed by dissolution of the States-General and confirmation of the Bill by a two-thirds vote of the new States-General.

Justice is administered by the High Court of the Netherlands (Court of Cassation), by 5 courts of justice (Courts of Appeal), by 19 dist. tribunals, and by 62 cantonal courts. Trial by jury is unknown. The cantonal court, which tries minor offences, is constituted of a single judge; the more serious cases are tried by the dist. tribunals, formed, generally, of 3 judges; the courts are constituted of 3 and the High Court of 5 judges. All judges are appointed for life by the sovereign (the judges of the High Court from a list prepared by the second chamber). They can be removed only by a High Court decision.

Defence. The pre-war army was composed partly of volunteers and partly of men drawn by lot for 5 years' service, and kept on a peace footing of nearly 400,000. The colonial army numbered nearly 40,000, of whom about 14,000 were Europeans.

The post-war army is being formed as a component of N.A.T.O. The Royal Netherlands Navy is being built up to a modern force consisting of 1 aircraft carrier, 2 heavy cruisers, 12 destroyers, and 6 submarines, supported by an

escort force of 24 ancillary vessels. The Royal Netherlands Air Force is independent of the army and has been reconstructed since the war, now forming an integral part of the air defences of N.A.T.O. countries.

Culture and education. Although comprising only a small percentage of the European population, the Dutch people have on the whole an honourable share in European culture, and in some instances have even made an important contribution. In New York and Paris, in the National Gallery in London as well as in the Hermitage in Moscow, the pictures of

The names of Erasmus, Hugo de Groot (Grotius), Spinoza, are well-known names in hist.; Stevinus, Huygens, Swammerdam, and Van Leeuwenhoek excellent in the technical sciences. At the many technical institutes and laboratories scientific pioneering labour has been effected and continuous research work is being done to find new methods and improve results. Since the Nobel prize was instituted it has been awarded on sev. occasions to Dutchmen: the scientists Van 't Hoff and Debye for chemistry; Lorentz, Zeeman, Van der Waals, Kamerlingh Onnes, and Zernike for physics; Einthoven and Eyk-

Royal Netherlands Embassy

SKATING, THE MOST POPULAR WINTER SPORT IN THE NETHERLANDS

Rembrandt, Frans Hals, Ruysdael, and Jan Vermeer bear witness to the glory of Dutch painting in the 17th cent. Of the painters of a later period Van Gogh, Breitner, and Mondrian have especially become famous (*see DUTCH ART and DUTCH ART MUSEUMS*). The Amsterdam Concertgebouw Orchestra is among the best orchestras in the world.

Amsterdam, having been constructed from ant times onwards according to a definite scheme, is from an architectural point of view one of the most beautiful cities in the world. The 17th-cent. buildings and the modern quarters compete in beauty and stateliness, thereby giving an excellent example of Dutch architectural taste. The numerous monumental churches all over the country, within whose walls an intensive spiritual life flourishes, also form a lasting reminiscence of the skill of Dutch architects (*see BELGIAN AND DUTCH ARCHITECTURE*).

man for medical science; and Asser for peace.

The Netherlands has a well-founded reputation for a superior system of education. It is compulsory under national law (since 1920) for students to attend school up to the age of 15. Most students, however, avail themselves of an excellent system of secondary schools. The ant univs. of Amsterdam, Leiden, Utrecht, and Groningen have been supplemented by the Rom. Catholic Univ. of Nijmegen and the Calvinist Univ. of Amsterdam; there are also 3 univs. specialising in agriculture (Wageningen), technical subjects (Delft), and economics (Rotterdam and Tilburg).

Religion. Entire liberty of conscience is granted to the members of all religious confessions. The royal family and a great part of the pop. belong to the Reformed Church. By the census of 1947 the adherents were: Rom. Catholics,

3,703,600; Dutch Reformed Church, 2,988,900; other Protestants, 920,200; other creeds, 371,700; no religion, 1,641,300. The N. and N.E. provs. are predominantly Protestant, whilst the great majority of the pop. in the S. provs. of Brabant and Limburg are Rom. Catholics.

Art. See DUTCH ART.

Language. Dutch is a W.-Germanic language, akin to O.E. and Low German. In the 11th cent. the anct Dutch dialects were spoken in a wider area than that now occupied by the Netherlands and Flanders, and old Dutch (or Flenish) is still to be heard among villagers in the N. of France. Early in the 15th cent. literary clubs were founded by the Rederijkers, or lovers of letters, who met together to study literature and plays. To these clubs modern Dutch owes its origin. From the 12th to the 16th cent. there was no unity either in the written or in the spoken language. A trans. of the Bible ordered by the Dutch Gov. in 1619 and carried out by the best Dutch and Flem. philologists further laid the foundation of modern Dutch. A uniform mode of writing was achieved in all provs. during the 18th cent., but uniform speaking of the 'Standard' *Nederlandish* is still one of the aims of Flem. teaching in particular. In 1946 and 1956 the spelling of Dutch was simplified after decades of discussion led by the fervid promoter, Dr Kollerwijn.

The liberty of the press brought much foreign printing to the Netherlands, and the *Gazette de Leyde*, which distributed news all over the world, was in existence 1680-1814. Illiteracy hardly ever occurs in the Netherlands. Knowledge of foreign languages is customary rather than exceptional, a fact common in small countries with export markets, and forced on the Dutch by the fact that their own language is unknown to most of their customers.

Literature. See DUTCH LITERATURE.

Colonies. Before 1939 the colonial possessions of the Netherlands included W. Indian and E. Indian ters. Since the end of the Second World War the self-governing rep. of Indonesia (q.v.) has been created. This was formerly the Dutch E. Indies; the status of W. New Guinea has, however, not yet been settled. In 1954 Netherlands Guiana (q.v.), comprising Surinam and the Netherlands Antilles, became autonomous.

History. The inhab. of the Netherlands are descendants of a people called by the Romans the Batavi, who lived on an is. between the 2 branches of the Rhine, and the Frisians who dwelt further N. In recent years there has been much skilled and thorough research into various aspects of Netherlands prehistory (see, for example, *Drentsch Praehistorische Vereniging*, the ann. reports of the Society for Terpen Research), but there is no convenient account in English.

Rom. rule lasted until the 4th cent. AD, when the Franks overran the country. Charlemagne's dominion in the 8th cent. extended to the Netherlands, and he built a palace at Nijmegen on the Waal. Upon the estab. of the feudal system the country

was divided into small sovereignties. In the year 922 Dirk became Count of Holland, and the other *Nederland* provs., such as Namur, Hainaut, Limburg, and Zutphen, were divided between various barons and counts, autocratic rulers, owning allegiance to the dukes or earls of Lorraine, Brabant, and Flanders. Holland, Zeeland, Utrecht, Overijssel, Groningen, Drenthe, and Friesland, which were afterwards to form the United States of the Netherlands, were chiefly under the rule of the counts of Holland and the Bishop of Utrecht. It was between the 11th and 15th cents. that the cities of the Netherlands began to be important as commercial centres. In 1384 the Netherlands became the property of the Duke of Burgundy, and a little more than a cent. later were united to Spain under Charles V. The struggle for freedom and for civic and religious independence that was to last so long had already begun and came to a crisis in the reign of Philip II of Spain in the middle of the 16th cent., the immediate causes being the imposition of the Inquisition, and the maintenance of a standing army. William, Prince of Orange, known as William the Silent, who was the king's lieutenant in Holland, Zeeland, and Utrecht, became leader of the revolt against Sp. misrule, and the champion of Dutch Protestantism; and the foundation of an independent Dutch state owes more to him than to any other individual. By the capture of Brielle in 1572 Spain received her first serious reverse. In 1579 the Union of Utrecht was formed, by which the N. provs. banded themselves together to resist Spain, and in 1581 the Netherlands declared their freedom. After William's assassination, 1584, the struggle was carried on by his 2 sons, Maurice and Frederick Henry. Philip of Spain was beaten again and again at sea, and his successor was obliged to sue for a cessation of arms for 12 years. These years enabled the Dutch to recoup themselves for losses by attention to trade. The war, renewed after the armistice, was continued until 1648, when, by the treaty of Munster, Spain recognised the independence of the Netherlands.

Even while this struggle was in progress, the Dutch were making themselves masters of the sea. Their ships were in every ocean. The E. India Co., which led to the foundation of their Far E. empire, was started in 1602. Amsterdam, which instituted the first Stock Exchange, or Bourse, in 1532, had become one of the richest cities in the world. Trade brought rivals, and 2 great naval wars were fought against England in 1652-4, and again in 1664-76, in which the Eng. admirals found themselves about equally matched by Dutchmen like de Ruyter and van Tromp—the former inflicting upon England the indignity of sailing up the Medway and the Thames, destroying ships, in 1677. Then followed the war in which France and England united against the rep.; and which, but for Dutch naval power, might have ended disastrously for the Netherlands. The political struggle between the republican faction of de Witt and that

of the Prince of Orange ended with the murder of the de Witts (q.v.) and the triumph of William of Orange, who secured Eng. friendship by his marriage with Mary of York. This led to his subsequent elevation to the throne of England as William III (q.v.). English and Dutch then fought side by side in inflicting defeat upon Louis XIV of France. The treaty of Utrecht in 1713 concluded

the people that were not easy to harmonise. In 1830 the S. provs. seceded and Belgium (q.v.) was formed into a separate kingdom. The prin. events in the hist. of the kingdom of the Netherlands since 1830 are, briefly, the following.

In 1840 William I abdicated for political reasons in favour of his son, who, in 1848, granted a new and more liberal constitution to the people. The question

Spain.

the war, and also the period of the Netherlands' greatness as a world power. The 18th cent. was one of general commercial and political decline.

At the close of the 18th cent. the Netherlands was overrun by Napoleon's troops and forced to pay tribute to France. Louis Bonaparte was made King of Holland in 1806, but resigned 4 years later when the country was attached to the Fr. Empire. The Orange family had taken refuge in England when the French invaded the Netherlands, but on the fall of Napoleon they returned, and the N. and S. provs. were formed into the kingdom of the Netherlands. This union was not satisfactory; there were temperamental and religious differences between

of the Duchy of Luxembourg (from 1815 held by the King of the Netherlands) was settled in 1867 by making it an independent state. From the middle of the 19th cent. religious issues dominated Dutch domestic politics for many years, and sev. of the modern Dutch political parties have their basis in historical religious divs. But the country prospered industrially, and a beginning was made in the field of social legislation which was considerably expanded in the 20th cent. In 1890 Queen Wilhelmina, then still a child, came to the throne, being succeeded by her daughter, Juliana, on her abdication in 1948 (*see* below). The Palace of Peace, to which many nations contributed, was opened in 1913.

It is situated at The Hague. After the Belgian secession from the joint kingdom set up in 1815, the Netherlands played little part in European hist. until the Second World War.

In the last decades of the 19th cent. there arose a vigorous movement of material and intellectual expansion, a movement which was only temporarily halted by the First World War, which naturally affected the Netherlands' overseas trade. In the inter-world-war period, new industries were still coming into existence, as, for example, the Philips electrical works at Eindhoven, the rayon industry at Breda; while, at the same time, agriculture, particularly cattle breeding, dairy farming, and horticulture, all of which industries in the previous decades had begun to make good use of new methods of organisation and scientific research, greatly prospered. The coalfields of S. Limburg, which owed their later development to the fact that during the First World War the supply of Ger. coal became restricted, were exploited with considerable success; while the great scheme for the reclamation of the Zuider Zee, so as to add a new prov. to the country, was launched in 1923. During the First World War the Netherlands remained neutral. The ex-Kaiser Wilhelm and the ex-Crown Prince found refuge at Amerongen when they fled from Germany in Nov. 1918. The ex-Kaiser settled at Doorn. Although faced with sev. problems arising out of the war, the Dutch Gov. persevered with the policy of political and social reform begun in the previous cent. Universal suffrage and proportional representation were introduced; at the same time, the principle of absolute equality with regard to the public exchequer of 'public' undenominational education and 'private' denominational education was conceded in full and incorporated in the Constitution.

History during the Second World War. Ger. planes bombed Dutch towns before dawn on 10 May 1940 and then land forces crossed the frontier. The Dutch had no experience of modern warfare. It was 5 generations since the last hostile troops had entered their ter. They were now to receive the rudest awakening, and their situation was aggravated by a fairly big fifth column (q.v.); for there were sev. thousand Germans living in the Netherlands and a great many belonged to the National Socialist movement led by A. A. Mussert, a Dutch engineer in charge of the roads of Utrecht. Later on 10 May numerous Ger. paratroops were landed, especially on the big aerodrome of Waalhaven. On 11 May a Ger. armoured column entered Brabant and violent fighting occurred in The Hague. In the S. of the country Ger. armoured forces now constituted the gravest menace, and on the next day they reached Dordrecht, thus cutting communications with Belgium and France. The following day the queen left on a Brit. destroyer for England and was followed by the Dutch cabinet. The Dutch troops, forced back on the Grebbe Line, retired to the Water

Line, but their reserves were fully occupied against paratroops and fifth columnists. On 14 May the Ger. armoured column reached Rotterdam and heavy fighting took place between the Germans on the S. and the Dutch on the N. of the riv. The Germans now decided to destroy the centre of Rotterdam by air bombardment in order to force the Dutch to surrender, and within 4 hrs 25,000 dwellings were destroyed and the entire centre of the city became a blazing inferno. The Dutch commander had little choice but to surrender and the Dutch troops laid down their arms, though some continued to fight for some days in Zeeland. Thus ended the brief and tragic five days' war in the Netherlands (see further under WESTERN FRONT IN SECOND WORLD WAR). The Ger. vanguard entered Amsterdam on the 14th. To make a good impression on the Dutch, Hitler appointed Seyss-Inquart, an Austrian, to be Ger. Commissioner for the occupied Netherlands. As in Belgium so in the Netherlands, the Germans tried first to win the people by propaganda and cajolery. They announced that the New Order would leave things as much as possible in the hands of the Dutch themselves. The Nazification of the Netherlands was to be organised so gradually that the Dutch would be hardly aware of the process. A council of Secretaries-General was to be the nominal gov., but the real gov. consisted of the Reichs-commissioner and his assistants, while a group of Ger. officers were appointed to supervise Dutch prov. and municipal life. The Ger. order was characterised by its financial organisation under which Berlin was the centre of a European system of multilateral clearing, which made it easy for the Reich to sap the economic resources of the countries occupied by their troops. Dutch factories which fitted into the Ger. war-machine had orders forced upon them. The Dutch wharves were used for constructing Ger. U-boats. Dutch engineering industry was soon working to full capacity on Ger. army orders. The Netherlands was soon crushed under its financial burdens and the standard of living rapidly declined. Produce was carried away into Germany. Supplies, whether ample or scarce, were in the first place destined for consumption by the Ger. troops. Everything was done by Seyss-Inquart to impregnate Dutch institutions with the 'Nordic culture.' The fact that the Dutch people proved to be immune against Nazi cultural infiltration was partly due to the Churches, which developed into strongholds of patriotism. But if the Germans were able to close all schools and univs. and to fill the papers with propaganda and broadcast Nazi speeches all day, they were not able to turn the Dutch themselves into Nazis. Queen Wilhelmina remained more than ever the symbol of the will to resistance. There was active resistance too, and the Ger. military commander found himself forced to issue warnings against all kinds of sabotage.

The Netherlands did not again figure in

land operations until late in 1944 when the Anglo-Amer. chiefs of staff decided to use the newly constituted Brit. and Amer. Airborne Divs. on 17 Sept., to assist in seizing the Rhine crossings at Nijmegen and Arnhem after the rapid advance by the land armies. It seemed probable that through rapidity of exploitation both the Siegfried Line (q.v.) and the Rhine might be crossed and strong bridgeheads estab. before the Germans could recover sufficiently to make a definite stand in the Arnhem area. The first landings of the airborne troops were made on 17 Sept. and reinforcements followed on successive days. There was confused and heavy fighting in the area between Nijmegen

of April and the sea was reached on 15 April. By the 21st the whole area, apart from a small tip in the NE., was cleared as far as Harderwijk and the E. shore of the IJsselmeer. To the W. the IJssel R. line was stubbornly defended at Deventer and Zutphen, but the former tn fell on 10 April. In the S. part, the Canadian First Corps attacked from Nijmegen, and Arnhem was taken on the 15th. The Germans now withdrew into 'Fortress Holland' behind the Grebbe and New Water lines, protected by floods, beyond which no further allied advance was made in this sector. It was felt by Montgomery that an advance into the Netherlands would occasion great additional suffering for that

Netherlands National Tourist Office

HORTICULTURE IN THE NETHERLANDS: CARROT FIELDS AT LISSE

and Arnhem during the ensuing few days, and the position of the First Airborne Div. became so precarious that on 25 Sept. orders were given for the withdrawal of all forces across the Lower Rhine (for full details see WESTERN FRONT IN SECOND WORLD WAR). After this the Allies turned their attention to opening up Antwerp. By 30 Sept. the whole of S. Beveland had been cleared by Brit. and Canadian forces and the troops then continued their attack against the causeway connecting the S. Beveland Isthmus with Walcheren. Against Walcheren the Canadians attacked from the W., while amphibious forces, landed (1 Nov.) at both Westkapelle and Vlissingen, converged on the strongpoints of the is. By 9 Nov. the stiff resistance had ceased and some 10,000 troops had been captured. After this the line at Nijmegen westward to the sea was held by the Canadians so that, after the Rhine had been crossed into Germany, a thrust to the Baltic would isolate the Ger. forces in the Netherlands. Resistance in N. Holland collapsed in the first week

unhappy country and that the quickest and most economical way to free the country was to complete the destruction of the enemy forces elsewhere. In fact, the complete liberation of the country soon followed on the final collapse of all Ger. resistance in Europe, though during the last weeks of the Ger. occupation the Dutch suffered appallingly from shortages of food, etc.

The task of reconstruction was begun immediately after liberation. By the spring of 1947 the rebuilding of all the main road bridges had been completed either with permanent or temporary structures and nearly all the railway bridges had been replaced. The main communications having been re-established and the most important harbour installations repaired, constructional energies were next directed to the dual task of house building and rehabilitating the flooded agric. areas (more than 8 per cent of the agric. land was flooded and more than 2 per cent laid waste by Ger. fortified zones, minefields, and aerodromes), much

of the latter task being achieved by the end of 1947. The serious housing situation in which the country found itself after the war is indicated by the fact that nearly one-fourth of the total number of dwellings were damaged and nearly 3.75 per cent totally destroyed. Rebuilding took place very rapidly, priority being given to the erection of flats and houses; in places such as Arnhem and Rotterdam, where devastation was on a colossal scale, full advantage was taken of the unique opportunities offered of replanning whole town centres on the most modern lines. Side by side with material reconstruction the post-war govts. pursued a full programme of social improvements.

On 25 Jan. 1945 the first special tribunal for the investigation of collaboration charges was opened at 's Hertogenbosch. Over 90,000 persons were detained in the course of 1945. On 12 Dec. the leader of the Dutch Nazis, Mussert, was sentenced to death by a special court at The Hague. In April 1949 minor frontier modifications in the Netherlands' favour were made at points on the Dutch-Ger. frontier.

Since the war the Netherlands has been governed by a series of coalitions, often composed of interests which conflict on a number of important topics. In 1936 the country was without a gov. for sev. weeks while efforts to form a stable coalition were made by the leaders of various parties. Dutch political parties continue in many cases to have distinctive religious affiliations, but a notable feature of the post-war Netherlands has been the increase in the power of the Socialist party, which appeals to both Protestants and Catholics.

The question dominating Dutch politics in the immediate post-war years was the Indonesian problem. After sev. years of abortive negotiation and intermittent, but occasionally bitter, fighting, the United States of Indonesia was finally estab. (1950), and A. Soekarno (q.v.) elected first president of the new rep. The fighting stopped, and the transfer of sovereignty to the new state was approved by the Dutch and Indonesian parliaments. The question of Netherlands New Guinea remained unsettled, however, and continues (1958) to embitter Dutch-Indonesian relations.

The Netherlands is a member of Benelux and of N.A.T.O. Since the end of the Second World War her industrial resources have been revived and expanded; in Feb. 1953 disastrous sea floods affected large areas of the country, causing over 1800 deaths and extensive damage to land and property. Since then reclamation work, both on the regions flooded in 1953 and on other areas already destined for reclamation, has proceeded swiftly, continuing the vast scheme which was begun in 1923.

On the occasion of the national celebrations in honour of the fiftieth year of her reign and of her sixty-eighth birthday, which fell on 31 Aug. 1948, Queen Wilhelmina on 30 Aug. resumed for a period of 1 week the royal authority which she had relinquished the previous May in

favour of her daughter, Princess Juliana, who had since then acted as Princess Regent. On 4 Sept. Queen Wilhelmina formally signed an Act of Abdication at the Royal Palace, Amsterdam, in which she declared that she had 'completely, voluntarily, and irrevocably' abdicated all her royal dignities and prerogatives and transferred them to her daughter, Queen Juliana, the 5th monarch of the Netherlands and of the Royal House of Orange-Nassau, who was formally inaugurated on 6 Sept. in the Nieuwe Kerk in Amsterdam. Queen Wilhelmina after abdication took the title of Princess of the Netherlands, living in complete retirement.

Netherlands Guiana, or Surinam, semi-autonomous Dutch dependency, on the N. coast of S. America between lat. 2° and 6° N. and long. 53° 50' and 58° 20' E., has an area of 55,143 sq. m. and a pop. of 238,000. It is bounded on the E. by the R. Maroni (or Marowijne) which separates it from Fr. Guiana, on the W. by the Courantyne (or Corantijn), which divides it from Brit. Guiana, and on the S. by dense forests bordering on Brazil. Under the new Netherlands Constitution of Dec. 1954 there is an elected legislative council of 21; the governor appoints a ministry of 9 and advisory council of 5, in addition, and 7 district commissioners (Paramaribo, Surinam, Commewijne, Saramacca, Nickerie, Coronie, and Marowijne).

Communications. The general direction of the rvs. in the interior is from S. to N., but near the coast most flow in a westerly

direction, because the ocean currents sweeping W. from the Amazon have deposited silt at their mouths and thereby considerably enlarged the original land area. A few miles from the coast there is a narrow zone of savannahs, and beyond, drained in part by the upper reaches of the Maroni and the Nickerie, the unrelieved jungle stretching to the frontier of Brazil. The rvs. are much used for transport, especially in the Paramaribo region, connecting Moengo, Paramaribo, Marienburg, and Alliance. There are 400 km. of main roads and 83 m. of railways. Four shipping companies connect with U.S.A., France, the Netherlands, and the Caribbean coast and is. The airport at Zandery, 30 m. S. of Paramaribo, was built by U.S. forces in the Second World War, and is now in full civilian international use. Much of this jungle is uninhabited or only sparsely populated by nomadic Indians—who hunt, fish, and grow manioc and cassava—or by Bush Negroes.

Seven-eighths of the pop. of N. G. live in the narrow coastal belt into which almost all the agriculture and industry of the colony is concentrated: of these about one-third live in the cap., Paramaribo. The Amerindian pop. numbers only 3700, and the Bush Negroes are increasing and now number nearly 22,000. The Saramaccans form the largest tribe, numbering twice as many as the others together. They live in the region between the Surinam R. at Kappelstation and its confluence with the Gran Rio and Pikien Rio. The Aucasans of the upper Commewijne and Maroni Rs. are the only other important tribe. Their present civilisation is said by anthropologists to be practically identical with that of Africa in the 17th cent. Both the Saramaccans and Aucasans let their hair grow long and braid it in fanciful designs. The Bush Negroes live by hunting, fishing, and agriculture, and hunt with bows and arrows unless they can procure firearms. Their crops include yams, bitter cassava, peanuts, maize, dry rice, and a little sugar-cane. A serious crop pest is the umbrella or leaf-cutting ant which attacks newly planted fields, and old too if adjacent to the new. The Guiana Indians live in much the same state as they did when the country was first explored. The prin. agric. industries are sugar, rice, and coconuts. Cattle-breeding could be much more developed, as could the timber trade. Liberian coffee and cacao are also cultivated. Gold is found in the interior, and the forests yield balata (116,000 kilos in 1954) among other products. Bauxite (3,421,000 kilos in 1954) is also an important product. The ter.'s main trade is with the U.S.A. and the Netherlands. The plantations lie along the lower courses of the Surinam and Saramacca and also in the low-lying coastal regions, and the chief settlements are among these plantations. These settlements are inhabited by Javanese, Chinese, Negroes, and about 3000 whites. The total pop. is about 238,000, the main groups being: 3600 Europeans, 99,000

Creoles, 82,000 Hindus, 47,000 Indonesians, 4200 Chinese, and 2900 others. They all keep their characteristic faiths, and there is complete religious freedom. The average temp. from Dec. to Mar. is 80° F. The nights are cool and health conditions are favourable owing to the prevailing E. wind.

The gov. of N. G. is administered by a governor and an advisory council, all the members of which are nominated by the Queen of the Netherlands. The legislative body is called the States, whose members sit for 6 years. Paramaribo (q.v.) is the chief tn. Of the smaller tns Nieuw Amsterdam, close to the cap., is the administrative centre of the Commewijne dist. Nieuw Nickerie, second tn of N. G., is the centre of an important rice-growing dist. largely populated by Javanese and Indians. Coronie is surrounded by great swamps, but a new road to Paramaribo has lessened its isolation. Albina is a little frontier tn 18 m. above the mouth of the Maroni R. The first attempt at the settlement of N. G. was made in 1630 by Capt. Marshall, an Englishman. In 1644 some Dutch and Portuguese Jews from Brazil introduced sugar cultivation; but it was not until 1650 that a permanent settlement was effected by Francis, Lord Willoughby of Parham (see BARBADOS). In 1666 the colony capitulated to the Dutch, and by the Peace of Breda in 1667 it was ceded to the Netherlands in exchange for New Amsterdam, now New York, which thus became a Brit. possession. Thereafter Surinam was twice in the possession of England, from 1799 to 1802, and from 1804 to 1816, when it was finally handed back to the Dutch. See W. H. Brett, *The Indian Tribes of Guiana: their Condition and Habits*, 1868; G. Palgrave, *Dutch Guiana*, 1876; W. E. Roth, *An Inquiry into the Animism and Folklore of the Guiana Indians*; J. Rodway, *Guiana, British, Dutch, and French*, 1921; M. J. and F. S. Herskovits, *Rebel Destiny: Among the Bush Negroes of Dutch Guiana*, 1934; P. H. Hiss, *Netherlands America*, 1943; L. L. E. Rens, *Historical and Social Background of Surinam Negro-English*, 1953; International Bank, *Surinam: Recommendations for a 10-year Development Programme*, 1953.

Néthou, Pic de, see PYRENEES.

Netley, vil. in Hants, England, 3 m. SE. of Southampton. There are ruins of a Cistercian abbey (Early English and Decorated) dating back to the early 13th cent. The Royal Victoria (military) Hospital was opened after the Crimean War.

Nets are fabrics in which the threads cross each other at right angles, leaving a comparatively large open space between them. Netting differs essentially from weaving in that the threads are knotted at the intersections. The open spaces in N. are called meshes, and these correspond in size with an instrument used in net-making, consisting of a flat piece of wood or other hard substance, usually about the shape and size of a common paper-knife. In addition to this a peculiar kind of

needle is used, upon which a large quantity of the thread is placed, by winding it from end to end between the forked extremities. The art of net-making has been practised from the earliest times by the most savage as well as the most civilised nations. It is easy to see that the human race learned the value of this art from noticing how frequently land and water animals became entangled in the shrubs and weeds through which they attempted to pass. There are many illustrations of the uses of N. in the bas-reliefs of Assyria, Greece, and Rome, and in the mural paintings of Egypt. Until recently N. have always been made by hand. Hemp is the chief material for net-making. After the net comes from the loom it goes to the finishers, who, by hand, make the addition of a kind of selvage, consisting of sev. thicknesses of twine, to give strength to the edges. A great variety of N. are in use amongst fishermen, but the prin. are the seine, trawl, and drift N. See also FISHERIES.

Netsuke, Jap. ornament in the form of a toggle, usually made of wood or ivory, often carved with great inventiveness, from which hangs a cord to carry a tobacco-box, a medicine-case, or other small objects. The word is written with 2 Jap. characters, meaning literally 'root' or 'bottom' and 'attach' or 'meet' respectively. The purpose of the N. is to hold the article in question suspended from the girdle. See E. Ryerson, *The Netsuke of Japan*, 1958.

Left: Leaf of Dead-nettle.
Right: Leaf of Stinging-nettle.

Nettle, name given to a number of ann. and perennial herbs, characterised by stinging hairs on leaves and stems. The great N. (*Urtica dioica*) is a perennial with small green flowers in long, branched clusters. The tender tops are sometimes boiled and eaten as a vegetable in spring. Its fibre yields a yarn, said to be superior to jute and hemp, though inferior to flax, and is valuable for damasks and brocades. Some species are used in the manuf. of ropes and textiles. The small N. (*U. urens*) is an annual, with flowers in a short, seldom branched cluster. *U. pilulifera*,

the Rom. N., probably was introduced, and is very rare, possibly extinct. Dead-N. (q.v.) is of a different species, even though the white dead-N. (*Lantium album*) resembles in appearance the stinging N.

Nettlerash, see URTICARIA.

Nettuno, lt. port in Lazio (q.v.), on the Tyrrhenian Sea, 33 m. S. by E. of Rome (q.v.), and 2 m. NE. of Anzio. An important landing was made here by the Allies during the Second World War (see ANZIO). Pop. (tn) 12,100; (com.) 15,400.

Netum, see NOTO.

Network Analyser, small-scale model of an electric supply network consisting of generator elements, variable resistance and reactance line elements, load elements with transformers and resistance and reactance units, which can be combined in various ways by a plug-in system to simulate various networks, projected or actually operating. By means of a set of meters, the behaviour of the network under different conditions can be studied, the effects of faults or short circuits at any point, of load variations and generator regulation, on any section of the network can be measured directly. The simpler N. as work on d.c. only, the modern type use h.f. a.c. (500 c/s) to obtain high reactance values with low inductance; the generators may be 10–20 V., 10 m. A. electronic oscillators.

Neu Mecklenburg, former name of New Ireland (q.v.).

Neubrandenburg: 1. Dist. (*Besirk*) of the Ger. Democratic Rep. (E. Germany), bounded on the N. by Rostock, on the E. by the Polish prov. of Szczecin, on the S. by Frankfurt-an-der-Oder and Potsdam, and on the W. by Schwerin (qq.v.). It was formerly part of Mecklenburg (q.v.). Area 4195 sq. m.; pop. 635,000.

2. Ger. tn, cap. of the dist. of N., on the R. Tollense, 70 m. N. of Berlin. It was the cap. (1359–1471) of the duchy of Mecklenburg-Stargard. There was much damage during the Second World War. It has an 18th-cent. palace, and medieval churches and walls. There are engineering, chemical, and paper industries. Pop. 22,000.

Neuburg, Ger. tn in the Land of Bavaria (q.v.), on the Danube (q.v.), 46 m. NNW. of Munich (q.v.). It has ancient fortifications, and many fine old buildings. Pop. 15,000.

Neuchâtel (Ger. Neuenburg): 1. Canton in the W. of Switzerland, between Lake N. and the Fr. frontier. N. lies in the midst of the Jura Mts, 4 chains of which, running from NE. to SW., traverse the canton. The lake of N. is 25 m. long, and from 3 to 5½ m. wide. It is 1420 ft above the sea and has a depth of 400 or 500 ft. The natural products are iron ores, coal, asphalt, fruit, including grapes—from which good red and white wines are made—timber and corn. The rearing of cattle constitutes an important branch of industry, and large quantities of cheese are exported; but the speciality of the canton is watch-making and the chief centres of this industry are La Chaux-de-Fonds and Le Locle. Area 309 sq. m.;

pop. (1955) 136,600 Fr.-speaking Protestants. N. joined the Swiss Confederation in 1815.

2. Cap. of the above canton, occupying a magnificent site on the NW. shore of the lake of N. 25 m. WNW. of Bern, and is noted for its many charitable institutions and for the beauty of its charmingly situated environs. Its anc. castle, an abbey church dating from the 12th and 15th cents. (now Protestant), and its art museum are of interest. The tn is an educational centre and has a famous univ. established from the academy in 1909. It is the seat of the watch-making industry, and also manufs. jewellery and condensed milk. Pop. (1955) 30,100.

'Neue Zürcher Zeitung,' oldest Zürich daily newspaper (circulation 72,000), founded in 1780, and since 1894 pub. 3 times each week-day. The leading Swiss paper, it represents Swiss liberalism, and has regular supplements on technical matters, art and literature, sport, travel, and automobiles, and enlarged week-end eds. There is also a special daily issue for abroad, with a circulation of 12,000 copies.

Neuenahr, see APOLLINARIS WATER.

Neuenkirchen, see NEUNKIRCHEN.

Neuf-Brisach, see BRISACH.

Neufahrwasser, see GDANSK.

Neufchâteau, Fr. tn, cap. of an arron., in the dept. of Vosges, on the Meuse. It has breweries. Pop. 4100.

Neufchâtel, see NEUCHÂTEL.

Neufchâtel, or Neufchâtel-en-Bray, Fr. tn in the dept. of Seine-Inférieure, on the Bèthune, 50 m. NE. of Rouen. It is noted for its cheese and cider, and is a centre for livestock and poultry. Pop. 3800.

Neuhäusel, see NOVÉ ZÁMKY.

Neuhoff, Theodor von (c. 1690-1756), Ger. adventurer. He served in the army of Charles XII of Sweden, and was an ardent supporter of the Jacobite cause. His fame rests upon his helping the Corsicans against the Genoese, and ultimately ascending the throne of Corsica as Theodor I (1736). He was, however, forced to abdicate soon afterwards.

Neuilly-sur-Seine, Fr. tn in the dept. of Seine, a W. suburb of Paris, near the Bois de Boulogne (q.v.). Part of a former royal château remains, and there are sev. other châteaux, in one of which peace was signed between the Allies and Bulgaria in 1919. N. is a residential dist., and has numerous clinics and convalescent homes. Pop. 68,100.

Neukölln (formerly Rixdorf), suburb of SE. Berlin (q.v.), Germany, on the Teltow canal, 5 m. from the city centre. It has workers' residences, and textile and engineering industries.

Neumann, Alfred (1895-), Ger. novelist and dramatist, b. Lautenburg, Prussia. He was reader for Georg Müller, Munich publishers. He is known chiefly for his many historical novels, in which he uses the lessons of the past to illustrate present-day political situations and problems. Literary recognition and the Kleist prize came with *Der Teufel*, 1926, on the despotism of Louis XI. *Rebellen* (trans. as *The Rebels*), 1928, and its sequel

Guerra, 1929, had the Carbonari and It. independence respectively as their theme. *Der Held*, 1930, is founded on the murder of Rathenau in 1922. Historical portrayal is again the background of *Königin Christine von Schweden*, 1926. *Narrenspiegel*, 1932, departs from the unalloyed historic manner by reason of its coarse Rabelaisian humour. N.'s plays include *Königsmaske*, 1928, *Frauen Schuh*, 1929, and *Ilans Daniell*, 1931. With the Nazis' advent to power N. went to America, writing there *Neuer Caesar*, 1934, and *Kaiserreich*, 1936. He has also written a biography of Musset, 1925, novelettes, short stories, trans. of Musset, Molière, and Lamartine, essays, and poems.

Neumann, Balthasar (1687-1753), Ger. architect, b. Eger. Exponent of the baroque style. Among the buildings he designed were the archiepiscopal residence at Würzburg; the schloss at Brühl; and churches at Neresheim, Mainz, and Vierzehnheiligen.

Neumann, Teresa (1898-), Bavarian stigmatic, b. Konnersreuth. She received the marks of the 5 wounds of Christ during Lent 1926, experiencing every Friday since then a vision of His Passion. She is visited by pilgrims from all parts of the world. See Father Pacificus, *Story of Teresa Neumann*, 1950, and Hilda Graef, *Difficulties in the Case of Teresa Neumann*, 1950.

See also STIGMATISATION.

Neumann's Law, see INDUCTION, ELECTRO-MAGNETIC.

Neumünster (anc. Wippendorf), Ger. tn in the Land of Schleswig-Holstein (q.v.), 18 m. SSW. of Kiel (q.v.). It is an anc. tn, but to-day is completely modern in appearance. During the Second World War it was very severely damaged. There are railway workshops, and textile, leather, iron, paper, machinery, and stone industries. Pop. 75,900.

Neunkirchen: 1. Tn of the Saarland (q.v.), on the Blies, 12 m. NE. of Saarbrücken (q.v.). It is a coal-mining centre, and has important iron and steel industries. Pop. 43,000.

2. (or Neuenkirchen) Austrian tn in the prov. of Lower Austria, on the Schwarza. It has iron and textile industries. Pop. 10,600.

Neuquén, prov. of Argentina, between the Colorado and Limay R.s., with an area of 36,429 sq. m. and a pop. of 190,900. The surface on the whole is mountainous, and the prin. riv. is the N. The celebrated Lake District ski-ground is in this prov. The cap., also named N., is situated in NW. Patagonia on the Roca railway, 700 m. from Buenos Aires. Near at hand is the great Río Negro barrage. Pop. 8500.

Neuralgia (Gk *neuron*, nerve; *algos*, pain), medical term for an intermittent pain in the area of distribution of a sensory nerve or nerves. It is a symptom, not a disease. It is usually caused by inflammation (neuritis) or pressure on the nerve or nerve root, or to the exposure of the nerve endings to irritation, as in toothache or sinus infection. N. of certain nerves occurs so frequently that the

symptoms have in course of time been labelled as disease entities. Thus *Sciatica* is a N. of the sciatic nerve; *intercostal N.* N. of the intercostal nerves; *tic douloureux*, N. of the trigeminal or fifth cranial nerve supplying the side of the face and tongue. *Treatment* consists in removing the cause if possible, analgesics and, sometimes, the surgical measure of injecting nerve ganglia or roots with alcohol or local anæsthetics.

Neurasthenia (Gk *neuron*, nerve; *asthenia*, weakness) is a comprehensive term which was formerly very loosely applied to a large number of psychogenic disorders characterised by nervous exhaustion, difficulty in concentrating attention, easy fatigability, and disinclination for bodily effort, faulty memory, sensation of pressure on the head, spinal irritability, insomnia, disturbance of digestive functions (including constipation, sense of fullness after eating, and flatulent dyspepsia), disturbance of sexual functions (e.g. amenorrhoea and dysmenorrhoea in women, and impotence and spermatorrhoea in men), disturbances of the special senses (involving head noises, blurring of vision, etc.).

The outlook upon N. has completely changed of late years. It is now recognised that many of the conditions which were formerly labelled N. were either anxiety states or hysteria syndromes, and the term is now reserved for conditions presenting a clinical picture in which fatigue is the sole or at least the leading symptom. The result is that, compared with formerly, the term is now rarely used. Views regarding its aetiology have also undergone a complete change. It is increasingly realised that though, in a number of cases, the onset of N. corresponds to a period of worry and overwork, or to a shock, these are merely the occasion, not the cause, of the illness. The neurasthenic suffers from an arrest of psycho-sexual development; remaining at a level of preoccupation with himself and his interests, unable to adjust himself to the need of open and outward manifestation which is essential to success and happiness. He suffers from a fixation at an auto-erotic level of development which hinders him from the activities which win social esteem and self-respect. This state is reflected in the feeling of guilt which plays an important role in the psychological make-up of the neurasthenic. The modern concept of its aetiology has inevitably led to a readjustment in the views formerly held regarding its treatment. On the assumption that overwork was the prin. cause and that the symptoms were therefore due, almost directly and wholly to fatigue, treatment was formerly aimed at enforcing absolute rest. In the Weir-Mitchell treatment, for example, in order to prevent the slightest expenditure of unnecessary energy, the patients were not allowed even to feed themselves. While the importance of suitable diet and adequate rest in hygienic surroundings is, of course, still recognised, psychotherapy is now regarded as essential if a complete

cure is to be achieved. See G. Ballet, *Neurasthenia*, 1911; R. Vittoz, *Treatment of Neurasthenia by Means of Brain Control*, 1928; D. M. Armitage, *Challenge to Neurasthenia*, 1935; D. K. Henderson and R. D. Gillespie, *A Text-book of Psychiatry* (7th ed.), 1950. See also PSYCHASTHENIA.

Neurath, Baron Konstantin von (1873–1956), Ger. politician and diplomat, b. Tübingen and educ. in Berlin. He was councillor in Constantinople (1914), minister to Denmark (1919), ambas. to Italy (1922), and to Britain (1931). He became Ger. minister of foreign affairs (1932–8), and was president of the privy council from 1938. N. became notorious as Reich 'protector' for Bohemia and Moravia (1939–41). Later he retained formal relationship with the Nazi gov. as minister without portfolio. N. advised Hitler to withdraw from the disarmament conference under the League of Nations and played an important part in Hitler's decision to reoccupy the Rhineland. As 'protector' of Bohemia and Moravia, he set up an administration similar to that in Germany. He abolished political parties there and trade unions, introduced Nazi racial laws, and compelled Czech industry to work for the Ger. war effort. But his efforts on behalf of Czech students imprisoned after the Ger. occupation, and his policy generally, were considered too lenient by Hitler, and he was recalled in 1941. He was tried at Nuremberg as a war criminal in 1946, and sentenced to a 15-year term of imprisonment, but released before his death.

Neuritis, inflammation of a nerve, may be localised or multiple. In localised N., caused by injury, cold, pressure, etc., there is considerable pain along the course of the nerve. Multiple N. is the simultaneous inflammation of nerve trunks, often symmetrically situated on both sides of the body. N. may result from the toxins of micro-organisms, e.g. those of diphtheria, influenza, syphilis, malaria, smallpox, dysentery, etc. Poisoning by alcohol, arsenic, lead, copper, phosphorus, carbon monoxide, and anilin compounds, or auto-intoxication through diabetes or beri-beri (q.v.), may also be exciting causes of N. The symptoms vary according to the cause. There is numbness, loss of power, and atrophy of muscle in certain parts. In milder cases the atrophy disappears, but in other cases there may be ultimate paralysis of the parts. At first the superficial reflexes may be exaggerated, but are later lost as a rule. Treatment deals, in the first instance, with the relief of pain. The only cure, however, is the elimination of the cause.

Neurosis, see ANXIETY STATES; OBSESSIONAL PSYCHONEUROSES; PSYCHONEUROSIS.

Neuruppin, Ger. tn in the dist. of Potsdam, on the W. shore of Lake Ruppiner, 38 m. N. by W. of Potsdam (q.v.). It was the cap. of Ruppiner co. until the 16th cent. It is a health and sporting resort, and has printing and chemical industries. Pop. 25,000.

Neusalz, see NOWA SÓL.

Neusatz, Yugoslavia, *see* NOVI SAD.
Neusiedlersee (Hungarian *Fertő Tó*), lake of central Europe, mainly in Burgenland (q.v.), Austria, but partly also in Győr-Sopron co., NW. Hungary. It is slightly salt, is shallow and reed-grown, and its area (up to 130 sq. m.) varies. In the E. it is connected with an extensive marsh called the *Hanság*, now being drained.

Neusohl, *see* BAŃSKÁ BYSTRICA.

Neuss (Rom. *Novaesium*), Ger. tn in the *Land* of N. Rhine-Westphalia (q.v.), on the Rhine opposite Düsseldorf (q.v.), with which it is connected by bridge. It has a fine 13th-cent. church, and there are remains of a Rom. camp. There are iron, paper, and foodstuff industries. Pop. 65,000.

Neustadt: 1. Tn in Poznań prov., Poland, *see* LŹWÓWEK.

2. Tn in Gdańsk prov., Poland, *see* WEJHEROWO.

3. Baltic seaport in Germany, in the *Land* of Schleswig-Holstein (q.v.), on Lubeck Bay, 31 m. SE. by E. of Kiel (q.v.). During the Second World War it was an important U-boat (*see* SUBMARINES) base, and is now a coastguard H.Q. Pop. 15,000.

4. Ger. tn in the *Land* of Bavaria (q.v.), 8 m. NE. of Coburg (q.v.). Pop. 7000.

Neustadt-an-der-Haardt, Ger. tn in the *Land* of Rhineland-Palatinate (q.v.), at the foot of the Haardtgebirge, 44 m. S. by W. of Mainz (q.v.). It has a notable 14th-cent. church, and other old buildings, and is an important centre of the wine trade. Pop. 31,000.

Neustettin, *see* SZCZECINEK.

Neustrelitz, Ger. tn in the dist. of Neubrandenburg, 15 m. SW. by S. of Neubrandenburg (q.v.). It was formerly the cap. of the Grand Duchy of Mecklenburg-Strelitz (*see* MECKLENBURG). It was very severely damaged during the Second World War. There is a palace, and there are engineering industries. Pop. 25,000.

Neustria, name given to the W. div. of the Frankish kingdom to distinguish it from the E. div., Austrasia (q.v.). The two became merged in the 8th cent.

Neutra, **Richard** (1892-), Austro-Amer. architect. b. Vienna, was trained there; returned there in 1919 after war service; worked for a short time under E. Mendelsohn (q.v.) in Berlin; and emigrated to the U.S.A. in 1923. He began practice at Los Angeles in 1926. His remarkably original designs include the Military Academy at Los Angeles, and many houses, hospitals, and schools in California, Texas, and Puerto Rico.

Neutra, *see* NITRA.

Neutral Point, the common terminal of the phase windings of a polyphase machine, transformer, or network. It is usually earthed, directly or through a resistance or reactance.

Neutralisation, **Heat of**, *see* HEAT OF FORMATION.

Neutrality, in international law (q.v.) the condition of states which stand aloof from a war between other states, the essential feature of the condition being this

negative attitude and not the positive attitude of offering impartial treatment to the adversaries. The word itself is of recent origin, as in the olden times when states were at war, all other states concerned were considered as on one side or the other. Late in the 17th cent. it was recognised that neutral states should give no assistance to belligerents, but such points as to what extent neutrals could prevent their ter. being used for hostile purposes, etc., were by no means clearly understood. The development of opinion gradually imposed stricter obligations upon neutral powers; e.g. it was once common for neutrals to supply troops to one of two belligerents under a previous treaty, and the practice was followed as late as 1826. The Hague Conventions of 1907 contain no specific prohibition of the supply of troops in land warfare, though the practice became extinct until the Sp. Civil War, 1936, when Germany and Italy, though nominally neutrals, sent troops to aid the insurgents against the republicans. In regard to naval warfare, it was agreed that the supply, in any manner, directly or indirectly, of warships, supplies, or war material of any kind by a neutral power to a belligerent power be forbidden. But a neutral is not bound to prevent the export or transit for either belligerent of arms, munitions of war, or in general of anything which could be of use to an army or fleet. In matters which do not relate to war a neutral must not refuse to one belligerent any advantage which she grants to the other. The question in regard to N. which has caused more controversy than any other is that respecting neutral goods on belligerent vessels, and vice versa. It was at first held that the ownership of the goods on board the vessels was the only thing to be considered; thus merchandise belonging to the enemy was seized on a neutral ship, but neutral merchandise seized under a hostile flag was restored. This system led to so much inconvenience and irritation that the opposite principle was adopted, and neutral merchandise under a hostile flag was seized, and hostile merchandise was safe under a neutral flag. *See on this* CONTRABAND; DECLARATION OF LONDON; DECLARATION OF PARIS.

It is a violation of N. for a neutral state to make a money loan to a belligerent, but it is more open to doubt in cases where the loan issues from neutral individuals. Though neutral states are not bound to prevent their subjects from lending money to belligerents in the ordinary way of business, they have, in circumstances of grave difficulty, deemed it right to impose restrictions, as in the First World War, when the U.S.A. declared that loans from Amer. bankers to any foreign nation which was at war were inconsistent with the true spirit of N. This declaration was deprecated in America, but the secretary of state adhered to it. As to the use of neutral ter. for fitting out warships, the *locus classicus* is the declaration of Jefferson, who held that it was incompatible with the sovereignty of the U.S.A. and

tended to interrupt the peace and good understanding between America and Great Britain to allow Fr. ships to be fitted out in Amer. ports; and the soundness of this opinion has never been seriously questioned. The dividing line between acts which the neutral is bound to restrain and those in which its subjects can engage at their peril is not always easy to decide. The distinction came into prominence in the famous *Alabama* case, where ultimately it was agreed, by the treaty of Washington, 1871, to refer the matter to arbitration (for the facts see 'ALABAMA.' THE). By the decision of the arbitration board in the *Alabama* case, it was laid down that a neutral gov. is bound to use due diligence to prevent the fitting out in, or departure from, any of its ports of a vessel which it has reasonable ground to believe is intended to carry on war with a power with which it is at peace; and that it is bound to prevent a belligerent making use of its ports as a basis of naval operations, or a source of recruitment of men or military supplies. It is the belligerents' duty to respect neutral ter. and territorial waters, but it is hardly necessary to point out that Germany in 1939 and after respected the rights of no neutral, either in this or in any other respect. Neutral states have the right to repress the intercourse of neutral citizens with citizens of either belligerent, if desired. Belligerents have the right of blockade, of injury (Lat. *anjuria*, forced service), of visit and search, and of the confiscation of contraband of war. Neutrals must prevent any recruiting, etc., for either belligerent, and must grant impartially any privileges, etc., which are not considered intervention in the struggle.

The right of *anjuria* was considered by the privy council in 1916, when the Crown claimed to requisition neutral property taken in prize. It was decided that the right is to be enforced only by application to the prize court, which must determine whether, under the particular circumstances, it is exercisable. In 1918 Great Britain and the U.S.A. had recourse to the right in the case of property not in the control of the prize court, by requisitioning a number of Dutch vessels that were in Brit. and Amer. ports. A neutral is allowed to give asylum to the troops or vessels of belligerents in circumstances which ensure that the use of its hospitality will be unaggressive. Thus, in 1871, a Fr. army sought asylum in Switzerland, and in the First World War Brit. and Ger. troops both sought refuge in Holland. Such troops must be interned as far as possible at a distance from a theatre of war, but officers may be released on parole. It is agreed that belligerents may not erect on the ter. of a neutral a wireless telegraph station or apparatus intended to serve as a means of communication with belligerent forces, or use any installation of the kind estab. by them before the war on the ter. of a neutral exclusively for a military end and not for the purpose of public correspondence. Thus, in 1914, Great Britain and France successfully protested against the use by Germany of

wireless installations in Ecuador and Colombia.

American neutrality legislation. Even the most powerful states are compelled sometimes to make sacrifices of neutral rights in order to keep out of war. This has been the case in Amer. hist., as in 1807 when Jefferson induced Congress to pass the Embargo Act, forbidding foreign commerce altogether by way of retaliation to Britain for her practice of searching Amer. vessels for refugee naval ratings, and to France for the Berlin and Milan decrees; and again in 1935-7, when Congress passed laws giving up certain maritime rights. The freedom of the seas was, therefore, voluntarily sacrificed in the hope of keeping out of war. It was largely in vindication of the freedom of the seas that the U.S.A. fought the war of 1812 and that it entered the First World War in 1917. It would seem that trading with a belligerent is hardly consistent with N. in fact, though it may be allowed by the theory of international law. In the First World War Amer. sentiment was strongly pro-Ally before the abandonment of N. Amer. industry geared itself rapidly to Anglo-Fr. war needs, and Amer. banks acted as purchasing agents for the Allies, floated loans for them, and estab. allied credits, but Amer. trade with the central powers was reduced to negligible proportions. Consistently with its strong element of isolationism or nationalism, coupled with disillusionment with the results of the First World War, Congress strove from 1931 onwards to legislate a cast-iron N. In 1934, when war between Italy and Ethiopia was imminent, Congress wanted to erect insuperable barriers against the export of arms, and laid down rigid rules applicable to all belligerents. Roosevelt, on the other hand, wished to be in a position to carry out a policy of helping in 'collective effort' against the responsible and guilty party, or in other words he wished the N. laws to give him a wide discretion, enabling him to deter or cripple aggressors and to help their victims. No fewer than 15 N. Bills were introduced and the resultant was a measure which prohibited the export of arms or implements of war to any belligerent nation, or to any country which might tranship to a belligerent; made it unlawful for an Amer. vessel to carry arms for or to any belligerent; and authorised the President to warn Amer. citizens that they travelled on the ships of belligerents at their own risk. The President was allowed no power to differentiate between righteous and wicked, aggressor or victim. He was permitted some discretion in defining the terms 'arms, ammunition, and implements of war' and in extending the embargo to states which might become involved in the conflict; but otherwise his hands were tied. There is but little doubt that President Roosevelt ought to have vetoed the measure, for there is evidence that when the Brit. Gov. was weighing the chances of war with Italy its cautious tendency was accentuated by the existence of this Amer. N. law. The Neutrality Act, however, was silent on civil

wars, or on wars partly civil and partly foreign, like the Sp. Civil War, and when Germany, Italy, and Russia all took a free hand in that war, Congress tried to repair the omission by means of a joint resolution forbidding the export of arms to Spain (8 Jan. 1937). This, however, operated unfairly to the Sp. republicans, for the Brit. and Fr. Govs. had failed to get other govts. to observe the 'non-intervention' agreement which they had signed. Germany and Italy broke their neutral or 'non-intervention' pledges and sent not only munitions but men to the insurgents. Thus the embargo did not safeguard Amer. N. because that was never threatened; it merely played into the hands of the aggressor nations. The N. law of 1935 expired on 1 May 1937. America's belief in collective security had gone. Congress was again resolved on a rigid statute, especially one which should include such vital war commodities as scrap metal, copper, and cotton. The N. law of 31 May 1937 retained the embargo on arms, etc., for all belligerents and the provision making it unlawful to deal in belligerents' securities; and it made travel by Americans on belligerent ships unlawful. It allowed the President to extend the embargo to any civil war which threatened the N. of the U.S.A. Its most striking provision, however, was the introduction of the 'cash-and-carry' clause, which in effect meant that after a war had begun those who wanted certain prescribed commodities or goods must come and get them and in effect pay for them. This Act, which was limited to 2 years' duration, marked the zenith of isolationist sentiment and was justifiably condemned by Mr Cordell Hull as substituting 'a wretched little bob-tailed, sawed-off domestic statute for the established rules of international law.' Subsequent events, which need not be detailed here, showed that it utterly failed in its purpose and in any case it was not flawless, for it was not truly neutral. The Act was, in fact, an encouragement to Germany's aggressive policy, as the Nazi gov. naturally hoped that Britain and France would not be able to get war material from America in war-time. Roosevelt urged repeal of the arms embargo early in 1939, and partial repeal was approved by the House of Representatives in July 1939; but the President insisted on full repeal and, eventually, Congress passed the Neutrality Act of 4 Nov. 1939, which provided that Amer. arms, etc., might be sold to belligerent countries only on a cash-and-carry basis. It was forbidden to any person within the U.S.A. to buy bonds or other obligations of a belligerent country gov., issued after the outbreak of war, or to extend credits to such gov. with the exception of certain commercial credits of a character ordinarily used in peace-time. Amer. ships were forbidden to carry supplies to belligerents or to enter combat zones: the coasts of the Brit. Isles, France, Belgium, the Netherlands, Germany, Scandinavia, and the Mediterranean were declared combat zones. Amer. citizens were not to travel on ships of belligerents.

Licences were required for arms exports. The Act did not apply to Amer. reps.

See W. Hall, *International Law*, 1880; L. Jones, *Law and Commerce*, 1907; F. Birkenhead, *International Law*, 1927; L. Oppenheim, *International Law* (vol. ii, *Disputes, War, and Neutrality*), 1928; N. G. Politis, *Neutralité et la paix*, 1935; A. Lamont, *Scottish Neutrality*, 1952.

Neutrality, in chem., is the state of a substance that has no effect on indicators (q.v.). More strictly, a neutral aqueous solution is one in which the concentration of hydrogen ions (q.v.) is exactly equal to that of the hydroxyl ions. On adding an acid to an alkali, a substance is at length formed that shows no reaction of either an acidic or an alkaline character; the alkali and acid are then said to have neutralised one another.

Neutrality Zone, American, zone of 300 m., and in some places up to 600 m., around the whole Amer. continents except Canada, estab. by the 'Declaration of Panama' at a conference of the 21 Amer. reps. at Panama on 3 Oct. 1939. It was suggested at this conference that all warlike acts at sea or in the air should be prohibited in this 'zone of security,' and in case of necessity enforced by joint action. The zone of security, however, was estab. only in theory and provision was made for mutual consultation on practical measures should hostilities occur in it. After the battle off Montevideo (13 Dec. 1939), in which the *Admiral Graf Spee* (q.v.) was sunk, consultation was initiated, and naval experts recommended that the reps. should intern all belligerent warships calling at Amer. ports. The Brit. Gov. protested against the estab. of the N. Z. as incompatible with international law, and as likely to lead to the Germans using the Amer. ports as a sanctuary for their ships. In fact, the zone did not come into practical existence.

Neutrino, a particle with no electric charge and of very small rest mass, possibly zero, and certainly less than $\frac{1}{1836}$ that of the electron. The particle was postulated in 1931 by Pauli to account for the fact that beta particles (q.v.) are emitted from radioactive nuclei with all energies up to a certain maximum value whereas alpha particles (q.v.) have discrete energies. It was shown that the total energy accompanying beta emission corresponded with the maximum beta energy. When slower beta particles are emitted the 'lost' energy is assumed to be taken away by the neutrino, with a velocity equal to that of light. Fermi developed the theory of the N. in 1934 and qualitatively accounted for the number of beta particles with different energies. The N., usually represented by ν , is also assumed to be emitted in the decay of certain mesons (q.v.). Because of its negligible mass and zero charge it has an extremely small interaction with matter. However, in 1956 it was detected by its interaction with a proton to produce a neutron and a positron (q.v.). An atomic pile was used for this experiment because it produces an enormous

number of N.s and therefore the probability of observing an interaction is large enough to make the experiment a reasonable proposition. See ATOM BOMB and NUCLEAR POWER.

Neutron, one of the elementary constituents of matter, a particle with a mass slightly greater than that of the proton, about 1839 times the mass of the electron, but having no charge. The idea that such a particle existed was suggested by Rutherford about 1920. N.s were first identified by Chadwick in 1932 as the radiation observed by Bothe and Becker in 1930 resulting from the bombardment of beryllium by alpha-particles (q.v.). The investigations of I. Joliot-Curie and F. Joliot in 1932 showed that this radiation ejected protons from hydrogen-containing material (e.g. paraffin) with energies that could not be explained in terms of gamma rays (q.v.), but were able to be accounted for by Chadwick in terms of N.s. Because N.s have no charge they have no electrostatic interaction with charged particles, e.g. protons, but they can collide with protons and suffer an interaction due to *nuclear forces*. N.s can be produced by a variety of nuclear reactions and play an important role in nuclear fission (see ATOMIC BOMB and NUCLEAR POWER). They are considered to be present in the nucleus together with protons. Thus an alpha particle, the nucleus of helium, consists of 2 N.s and 2 protons. The N. is heavier than the proton by about $2\frac{1}{2}$ electron masses, and can therefore suffer beta decay, i.e. the N. disintegrates into a proton and an electron with the liberation of 0.78 MeV of energy (see ELECTRON VOLTS). The half-life (see RADIOACTIVITY) for this process is about 20 min. and has been measured by experiments with an atomic pile, which is a powerful source of N.s.

Neu-Ulm, Ger. tn in the *Land of Bavaria* (q.v.), 75 m. W. by N. of Munich (q.v.). It is on the Danube, opposite Ulm (qq.v.). Pop. 14,000.

Neuve Chapelle, vil. in the dept of Nord, France, 8 m. SW. of Arras. There was an important battle around N. C. in 1915, in which the old vil. was almost entirely destroyed. The battle lasted from 10 Mar. to 12 Mar. 1915. Brit. and Indian forces began the attack, in an effort to prevent Ger. reinforcements going to the E. front, and to assist the French. The British won initial success, but by 12 Mar. Ger. reinforcements had been brought up and no further ground was captured. Brit. and Indian casualties totalled over 11,000, and in 1927 a memorial to the Indian dead was unveiled at N. C.

Neville, Alphonse Marie de (1836-85), Fr. painter, pupil of Delacroix and Picot. His large canvases depicting an episode in the siege of Sevastopol made a great sensation in 1859. This was followed by a series of military pictures dealing with the Crimean and Franco-Prussian wars. His most famous picture is 'The Last Cartridges.' He also collaborated with Detaille in the panorama of Rezonville, one of the best works of the kind.

Neuwied, Ger. tn in the *Land of Rhineland-Palatinate* (q.v.), on the Rhine, 45 m. NW. of Mainz (q.v.). It was founded in the 17th cent. by refugees of various religious sects. There are metal goods and pumice-stone industries. Pop. 20,000.

Neuzen, see TERNEUZEN.

Neva, riv. in NW. Russia, flowing out of Lake Ladoga W. into the Gulf of Finland. Although only 46 m. in length it is very full, since it is the only outlet of Lake Ladoga. The whole area of the Neva is dominated by Leningrad, which is situated in and around its delta. It is part of the inner waterways connecting the Baltic Sea with the Volga and the White Sea.

Nevada, one of the W. mt group states of the Amer. Union between the Rocky Mts and the Sierra Nevada, bounded on the N. by Oregon and Idaho, on the E. by Utah, on the SE. by Arizona, on the W. and SW. by California. Practically all of Nevada lies within the Great Basin. Its mt ranges average 50-75 m. in length, 6-15 m. wide, and 7000-10,000 ft. high. In the S. Nevada descends abruptly to the level of the Colorado lt. (470 ft. above sea level). The extreme S. boundary is formed for about 150 m. by the Colorado, and the Humboldt R. flows across over 300 m. of the N. dist., but this and other smaller streams end in salt lakes known as sinks. The climate is very dry and the soil barren except where irrigation has been effected. There maize, wheat, hay, alfalfa, sugar beets, barley, and potatoes are grown, but crops are chiefly subsidiary to the grazing of sheep and cattle. There are some 5,000,000 ac. of forest. The state has about 540,000 head of cattle and 470,000 sheep. Farms comprise over 6,000,000 ac. The leading occupation is mining, especially of silver and gold. Other minerals are copper, lead, zinc, iron, mercury, tungsten, gypsum, graphite, sulphur, vanadium, magnesite, antimony, nickel, cobalt, and borax. In 1950 the value of the mineral output was \$48,499,000. Copper smelting is the chief industry. The mts have yielded over \$1,000,000,000 of mineral wealth, of which the former Comstock lode has produced 60 per cent. The chief tns are Reno (32,497), which has a state univ. and an aerodrome, Las Vegas (24,624), Sparks (8203), and Carson City, the cap. (3082). Nevada was admitted to the union in 1864, and is represented in Congress by 2 senators and 1 representative. Its legislature consists of a senate of 17 members and an assembly of 47 members. It has a land area of 110,540 sq. m. In this state the death penalty is inflicted by means of lethal gas. The short period of residence for divorce, 6 weeks, makes Reno and Las Vegas favourite resorts for this purpose. Nevada is popularly called the 'Sagebrush state.' An atomic testing ground has been estab. in the Nevada desert with H.Q. at Indian Springs. Pop. 160,083. See J. G. Scruggs, *A History of Nevada*, 1935, and D. L. Morgan, *The Humboldt: Highroad of the West*, 1943.

Névé, or **Firn**, closely packed snow

formed in permanent snowfields by consolidation of the loose flakes under the weight of subsequent falls of snow.

Nevers (ancnt *Noviodunum*), Fr. tn, cap. of the dept of Nèvre, on the Loire. It was sacked by the Aedui in 52 BC while a depot for Caesar. The bishopric dates from the 6th cent. It has many fine buildings, including an 11th-cent. church, the cathedral, partly 13th cent., and a 15th-16th-cent. ducal palace. Chaumette (q.v.) was b. here. It has foundries, railway workshops, and printing works, and manufs. pottery and wines. Pop. 34,000.

Parliament on Cromwell's death and sat in the Commons for some years. In 1663 he was arrested on the suspicion of being concerned in the Yorks rising, but was acquitted. He was well known for his trans. of Machiavelli's works, 1675, and he wrote many offensive lampoons, including *Shuffling, Cutting, and Dealing in a Game of Picquet*, 1659, directed against Oliver Cromwell and others. He also pub. a short novel, *The Isle of Pines*, 1668.

Neville, Richard, see **WARWICK**, **EARL OF**.

Neville, Richard, 1st Earl of Salisbury

E.N.A.

NEVADA: THE STATE HIGHWAY BETWEEN VICTORY AND LINCOLN

Neveu, Ginette (1919-49), Fr. violinist, b. Paris. She studied at the Paris Conservatoire and with Karl Flesch, first appearing in public with the Colonne orchestra, when she was 7 years old. She appeared with leading Brit. orchestras many times between 1945 and 1949. Her interpretation of Beethoven was particularly outstanding: at her death she had estab. a reputation as the leading woman violinist of the cent. She was killed in an aeroplane accident while travelling to the U.S.A.

Neviges, Ger. tn in the Land of N. Rhine-Westphalia (q.v.), 8 m. ENK. of Düsseldorf (q.v.). Until 1935 it was called Hardenberg. There are textile and engineering manufs. Pop. 15,000.

Neville, Henry (1620-94), author, b. Billingbear, Berks. His political activities displeased Cromwell, who banished him from London in 1654. He entered

(1400-60), son of Ralph N., 1st Earl of Westmorland. He acquired his title through his wife in 1429, laying claim to it on the death of his father-in-law. He was warden of the W. Marches, and as such persuaded York to lay down his arms in 1452, and when the latter gained control of the gov., when Henry VI was temporarily insane, gave him his support and was made chancellor. He was defeated by the Lancastrian forces at Ludford (1459) and fled to France, but returned in 1460 and remained in charge of London while Warwick went to meet the Lancastrians at Northampton. He was captured after the battle of Wakefield and murdered in Pontefract Castle.

Neville's Cross (Durham), see **DAVID II**.
Nevin, Ethelbert (1862-1901), Amer. composer, b. Edgeworth, Pennsylvania. He studied at Berlin, Boston, and Paris. He wrote light piano pieces and songs,

among the latter of which *The Rosary* (1898) had a tremendous vogue.

Nevins, Allan (1890-), Amer. historian and journalist, educ. at Illinois and Columbia Univs. After working on various newspapers he became prof. of Amer. hist. at Columbia Univ., 1931. He was Harnsworth prof. at Oxford, 1940-1, and Director of the U.S. Information Service in Britain, 1946-7. N. has contributed much to the study of 19th-cent. Amer. hist. and his pubs. include a life of *Grover Cleveland*, 1932 (Pulitzer prize); *John D. Rockefeller*, 1940; *America, The Story of a Free People*, 1942; *The Ordeal of the Union* (Scribner Centenary and Bancroft prizes), 1946; a life of *Henry Ford*, 1953.

Nevinson, Christopher Richard Wynne (1889-1946), painter, etcher, and lithographer, b. London, son of Henry Woodd N. (q.v.). He studied art at St John's School of Art, the Slade School, and in Paris. Becoming known for war paintings, his first exhibition of these being in 1916, in 1917 he was appointed an official war artist. Some of his war pictures were bought by the Imperial War Museum and the Canadian War Memorials Fund. His subjects cover a wide range, but he is concerned less with artistic effects than with emphasising his comments on life. He made use of cubist, futurist, and similar expedients in design, though less from intellectual conviction than as an experiment. Among his best works are 'The New Forest' and 'Autumn Sunshine,' both of which give the effect of depth. His etchings include 'Manor Gates,' 'Looking through Brooklyn Bridge,' 'Cornish Landscape,' 'Ebb Tide, Rye,' 'Barmouth Estuary,' 'Steam and Steel,' and 'The King is Dead' (a pastel head). Some have been bought by the Brit. Museum, Tate Gallery, Birmingham and other city art galleries, Harvard Univ., etc. He pub. an autobiographical vol., *Paint and Prejudice*, 1937.

Nevinson, Henry Woodd (1856-1941), journalist, b. Leicester. He was educ. at Shrewsbury, Christ Church, Oxford, and Jena. He wrote 2 vols. of sketches and a *Life of Schiller*, 1889, which distinguished him as a writer of rare quality. As a war correspondent for the *Daily Chronicle* in the S. African war, he shared all the horrors of the siege of Ladysmith. Meantime his *Plea of Pan*, 1901, and *Between the Acts*, 1903, had won him fame. A journey to Angola resulted in the revelations of *A Modern Slavery*, 1906. He investigated the revolution in Russia, which he described in *The Dawn in Russia*, 1906. He was correspondent for the *Manchester Guardian* in the First World War on the W. front, and later at the Dardanelles, Salonika, and Versailles. His *Dardanelles Campaign*, 1918, together with *Essays in Freedom*, 1909, and *Essays in Rebellion*, 1913, are among his finest work. He also wrote *Lines of Life* (a book of verse), 1920, *Original Sinners* (a gallery of portraits), 1920, a critical study of Goethe, 1931, *Running Accompaniments* (essays), 1936, and, in 1939, *Films of Time* (fantasy). His last work was a

book of criticism and recollection with Thomas Hardy as the subject, pub. posthumously. His best-known books are the autobiographical series *Changes and Chances*, 1923, *More Changes, More Chances*, 1925, and *Last Changes, Last Chances*, 1928.

Nevis (formerly *Nievis* or *Mevis*), one of the Leeward Is., Brit. W. Indies, in the presidency (formed in 1882) of St Kitts, Nevis, and Anguilla. It lies in 17° 14' N. and 62° 33' W., and is separated from St Kitts by the 2-m. 'Narrows.' It has an area of 50 sq. m. and a pop. of 15,000. Like St Kitts the is. is volcanic but, unlike St Kitts, it is to a great extent covered with volcanic ashes from former eruptions; it is in fact one large mt. cone, the Peak, 3600 ft. Sugar-growing was formerly the prin. industry, but the cultivation of Sea ls. cotton has taken its place. Coco-nuts, yams, sweet potatoes, etc., are also cultivated. The climate, for a tropical is., is bracing and healthy; average ann. rainfall is 53 in., and the mean temp. ranges between 70° and 85° F. There are very few streams, and the water supply is derived from a catchment area high up on the mt and stored in public reservoirs, which furnish Charlestown, the cap. (pop. 1900), and some country dists. There are 11 elementary schools and 1 secondary. In Charlestown, which lies on the shore of a wide-curving bay in the SW., are the remains of the house in which Alexander Hamilton, who drafted the constitution of the U.S.A., was b. (11 Jan. 1757). The ancestral estate to the SE. of the tn is still known as 'Hamilton's.' The old Bath House Hotel is a conspicuous building near by and serves as a link with the past when Nevis was a fashionable health resort noted for its hot springs. The house is so solidly built that it has resisted the hurricanes of over a cent. Many old writers testify to the merits of the waters from the thermal springs, including Richard Blome and the Rev. Mr Smith, author of the *Natural History of Nevis*, 1745. It was in Nevis that Nelson met and married his bride, the widow Frances Nisbet, who was the niece of Herbert, president of Nevis. Nelson and Mrs Nisbet were married at Montpelier, 11 Mar. 1787, and the record of the marriage is still to be seen in the register at Fig Tree Church. Nelson's memory is also perpetuated by Nelson's Watering-place, a creek 3 m. N. of the cap. Nevis was discovered by Columbus in 1493 and was so named by him because its cloud-capped summit resembled *nieve* or snow. The is. was included in the grant to the Earl of Carlisle in 1627 and colonised by Eng. settlers from St Kitts in 1628. The settlement was nearly destroyed by the Spaniards the following year, and in 1706 it was laid waste by the French, who took away some 3000 slaves. The is. was captured by the French under the Marquis Bouillé in 1782, but was restored to England by the treaty of Versailles in 1783.

Nevis, Ben, see BEN NEVIS.

New Albany, city, cap. of Floyd co., Indiana, U.S.A., on Ohio R. (bridged) opposite Louisville, Kentucky. It

manufs. automobile parts, veneers and plywood, furniture, and prefabricated houses. Pop. 29,350.

New Amsterdam: 1. Tn of Brit. Guiana, on the Berbice, 63 m. SE. of Georgetown. The tn is traversed by canals. Pop. 10,000.

2. The old Dutch name for what is now New York city.

New Bedford, seaport city of Bristol co., Massachusetts, U.S.A., on Buzzards Bay, 55 m. S. of Boston. It was once the centre of the Amer. whale fisheries. Oil refining, tanning, and boot and shoe

breadth of 50 m. and is 300 m. long. It is very undeveloped except on the Gazelle Peninsula in the N. and in the S., where there are some plantations. The interior is but little known. A mt chain traverses the entire length of the Is. and there are active volcanoes. There are some good harbours, but Simpson Harbour, in Blanche Bay, is the only one visited regularly by oversea shipping. Copra is the chief product, and coffee and cocoa are also cultivated. Gold, copper, and coal are mined. Rabaul (q.v.) is the chief port. N. B. was discovered by Dampier

Canadian National Railways

SOUTHERN CROSS CAPE, GRAND MANAN ISLAND, NEW BRUNSWICK

making are carried on, besides the manuf. of silk and woollen goods. It has oil and candle factories, soap factories, sev. large cotton-mills, hoop-iron manufactories, and barrel factories. Of late years the oil business has declined, but N. B. has become one of the chief raw cotton concentration points in the E. It manufs. also cotton-spinning machinery, cotton goods, and cut glass. It is a summer resort and has a textile school. Pop. 109,189.

New Bern, city and co. seat of Craven co., N. Carolina, U.S.A., 85 m. NE. of Wilmington. It is a fishing, shipping, and boat-building centre; its chief manufs. include lumber, veneer, fertiliser, and clothing. Pop. 15,812.

New Brighton, see WALLASEY.

New Britain: 1. Largest is. of the Bismarck Archipelago (q.v.) in the Pacific Ocean, off the coast of Papua; has a mean

breadth of 50 m. and is 300 m. long. It is very undeveloped except on the Gazelle Peninsula in the N. and in the S., where there are some plantations. The interior is but little known. A mt chain traverses the entire length of the Is. and there are active volcanoes. There are some good harbours, but Simpson Harbour, in Blanche Bay, is the only one visited regularly by oversea shipping. Copra is the chief product, and coffee and cocoa are also cultivated. Gold, copper, and coal are mined. Rabaul (q.v.) is the chief port. N. B. was discovered by Dampier

in 1699. The natives are Melanesians. Area of N. B. and adjacent Is. is about 14,600 sq. m. Pop. (indigenous) 90,000.

2. City of Hartford co., Connecticut, U.S.A., 8 m. SW. of Hartford. Its chief manufs. are hardware, household electrical appliances, bearings, tobacco, foundry and machine-shop goods, clothing, wood and paper products. It has a state teachers' college. Pop. 73,726.

New Brunswick: 1. E. prov. of the dominion of Canada, is bounded on the NW. by the Bay of Chaleur, on the NE. by the Gulf of St Lawrence and the Strait of Northumberland, on the S. by Nova Scotia and the Bay of Fundy, and on the SW. by the state of Maine. These waters provide the prov. with a very extensive sea coast, 500 m. in extent, and indented by spacious bays, inlets, and harbours, which afford safe and commodious anchorage for shipping. The chief are the

Bay of Fundy, Chignecto Bay, and Cumberland Basin, the last 2 being merely extensions of the first; Passamaquoddy Bay in the S.; Verte, Shediac, Cocagne, Richibucto, and Miramichi Bays on the N.E.; and the Bay of Chaleur, 80 m. long by 27 m. broad, in the N.W. The surface is for the most part flat or undulating. With the exception of the dist. in the N. and W. bordering on the R. Restigouche and the state of Maine, no portion of N. B. is very high. The shores on the E. coast, and for 20 m. inland, are flat. The most S. point is a little S. of 45° N. lat., and its most N. a little N. of 48° . To the S.W. is

and radioactive minerals, added to already known quantities of bituminous coal, gypsum, and limestone, makes possible the development of the mining industry into one of the leading industries of N. B. The greatest concentrations of valuable ores have been discovered in the Bathurst and Newcastle areas, but almost all parts of the prov. have recorded finds of considerable value. The value of mineral production in 1954 was \$12,168,322 with a prospect of at least a \$3,000,000 increase for 1955. Lumbering and the manuf. of wood-pulp are the leading industries, but woollen goods,

New Brunswick Government Information Bureau

A RANCH IN ALBERT COUNTY, NEW BRUNSWICK

a group of is. belonging to the prov., the most important of which are Grand Manan, Campobello, Deer, and the W. Isles. The prov. of N. B. abounds in rvs. The prin. of those falling into the Bay of Fundy are the St John and the St Croix, the former 450 m. and the latter 100 m. in length; and of the rvs. that flow eastward into the Gulf of St Lawrence are the Richibucto, the Miramichi, and the Restigouche. The prov. contains numerous lakes, one of which, Grand Lake, is 100 sq. m. in area. The soil is deep and fertile, over 950,000 ac. being agric. land, producing a variety of crops amongst which potatoes, oats, and barley are prominent. The fisheries are valued at about \$22,000,000 annually. The climate is remarkably healthy, the autumn, especially the season called the Indian summer, being particularly agreeable.

The discovery, in 1951 and succeeding years, of some of the world's greatest proven concentrations of ore bodies, containing lead, zinc, silver, pyrites, copper, nickel, antimony, manganese, tungsten,

machinery, sugar, and paper are also manuf. Oil and natural gas are produced. The water-power resources of N. B. are great and it is estimated that the available and developed power is as much as 600,000 h.p. The Beechwood development (137,000 h.p.) was under construction in 1956. The prov. is represented in the Dominion Senate by 10 members and in the Commons also by 10. N. B., together with Nova Scotia, originally formed one Fr. colony, called Acadia. It was ceded to the British in 1713 and was first settled by Brit. colonists in 1764. Twenty years subsequently, in 1784, it was separated from Nova Scotia, and made an independent colony. The cap. is Fredericton (q.v.); the largest city is Saint John (q.v.). Area 27,985 sq. m. (crown lands 7,500,000 ac.); pop. 457,400.

2. City of New Jersey, U.S.A., on the S. bank of the Raritan R., 22 m. S.E. of Newark. It manufs. machinery, motor vehicles and parts, hospital supplies, chemicals, and pharmaceuticals; it also produces metal, wood, concrete, cork, and

felt products, clothing, leather goods, and dairy products. It is the seat of Rutgers Univ. and has a theological seminary, a state agric. college, and U.S. atomic laboratory. Near by is Camp Kilmer, troop centre; Joyce Kilmer's bp. and revolutionary houses are preserved. Pop. 38,800.

New Caledonia, is. of the S. Pacific Ocean, belonging to France, and lying about 720 m. ENE. of the coast of Queensland in Australia, in lat. 20°-22° 30' S., long. 164°-167° E. It is about 250 m. in length, 30 m. in breadth. It is of volcanic origin, is traversed in the direction of its length, from NW. to SE., by a range of mts, which in some cases reach the height of about 8000 ft. and is surrounded by sand-banks and coral reefs. There are secure harbours at Port Bulade and Port St Vincent, the former on the NE., the latter on the SW., part of the is. In the valleys the soil is fruitful, producing coffee, coco-nut, banana, mango, breadfruit, etc. The coasts support considerable tracts of forest, but the mts are barren. N. C. is rich in minerals: nickel, chrome, cobalt, silver, gold, lead, copper, manganese, antimony, platinum, and zinc. There are nickel smelters at Yate and Doniambo. N. C. also has a large livestock industry. The cap. is Noumea (10,400). N. C. is administered by a governor and privy council. There is also an elective council-general of 15 members. There is a narrow-gauge railway from Noumea to Paita (20 m.).

N. C. was discovered by Capt. Cook in 1774. It was claimed by the French in 1854 and used as a penal colony until 1894. N. C. became a Fr. Overseas Ter. in 1954. Its area is 8548 sq. m., and it has a pop. of 48,000. Dependencies of N. C. are the is. of Pines, Wallis and Futuna Is., Loyalty Is., Huon Is., Bêlep Archipelago, and Chesterfield Is. See J. Macmillan Brown, *Peoples and Problems of the Pacific*, 1927; W. G. Burchett, *Pacific Treasure Island*, 1941.

New Castle, see CASTILLA LA NUEVA.

New Castle: 1. Co. seat of Lawrence co., Pennsylvania, U.S.A., on the Shenango R., 43 m. NW. of Pittsburgh. The region is rich in coal, iron, and other minerals, and the chief manufs. are tinplate, fire-brick, flour, steel wire, glass, chemicals, heating equipment, auto parts, clothing, and beer. Its shipping trade is extensive. Pop. 48,830.

2. City, co. seat of Henry co., Indiana, U.S.A., in agric. area 41 m. NE. by E. of Indianapolis. It has greenhouses and manufs. machinery, automobile parts, furniture, etc. Pop. 18,300.

New College, Oxford, founded by Wm of Wykeham in 1379 as the college of St Mary of Winchester, the long title arising from the existence of another St Mary's College. The fine buildings retain much of the founder's design, and are notable for the chapel containing his pastoral staff, also for the cloisters (consecrated in 1400), and the massive detached tower. New buildings have been added. The lovely grounds contain portions of the old city wall. The original link with Winchester is

maintained by the reservation of 6 scholarships to boys from Winchester College.

New Deal, policy adopted by President Franklin Roosevelt in 1933 to overcome the crisis which threatened the collapse of the economic system of the U.S.A. Up to the time of the N. D. the states were presumed to have jurisdiction over almost all matters of a social character; thus the hours and wages of labour, the conditions of factory work, the welfare of women and children, education, etc., were all matters of state, not federal, concern. The N. D. changed this, but it required a national catastrophe to justify, and a bold administration to attempt, the change; and it was carried out only over the determined opposition of the supreme court. The N. D. legislation, which President Roosevelt's administration introduced, consisted partly of measures for recovery and relief, partly of measures for reform. It comprised a series of far-reaching economic and social measures, which reversed previous attempts to end the depression by ordinary deflationary means, and it was largely designed by a body of profs. and other expert advisers (nicknamed the 'Brain Trust') in 1932. The starting-point was the National Industrial Recovery Act of 1933, which, together with its agric. corollary, the Agricultural Adjustment Act (providing for large-scale assistance to farmers), placed control of industry and agriculture in the hands of the president. It set on foot a generous programme of expenditure on public works, so as to stimulate business and provide employment, aims which were helped by devaluation of the dollar by 40 per cent. and by the formation of the Reconstruction Finance Corporation, which granted the necessary loans, and the abandonment of the gold standard. It inaugurated a comprehensive programme for the conservation of natural resources, one of the chief instruments of which was the Civilian Construction Corps, which gave work to some 3,000,000 young men. It set up elaborate systems of unemployment relief, and, by 1940, some 16 billion dollars had been spent on direct relief and 7 billion on public works. Workers were encouraged to form trade unions by the Wagner Labor Relations Act, 1935, which Act, with the Fair Labor Standards Act, 1938 (designed to provide reasonable hours and wages), was an improvement on the labour provisions of the National Industrial Recovery Act of 1933, which latter Act had been voided by the court in 1935. A scheme of social insurance was introduced by the Social Security Act. The Banking Act and the Securities Exchange Commission placed financial control in the hands of the administration, thereby breaking the power of Wall Street. The N. D. raised taxes on the incomes of the rich and of corporations. It set up the highly successful Tennessee Valley Authority to develop the resources of one of the great interior basins of the country through the use of state-owned hydro-electric dams. In the field of labour, the N. D. enacted a series of epoch-making laws; while among

reforms in administration was the Hatch Act, which was directed against 'pernicious political activities' on the part of gov. employees and the corruption and extravagance of political parties. Essential parts of the National Industrial Recovery Act were declared invalid by the supreme court on 27 May 1935, and part of the Agricultural Adjustment Act on 6 Jan. 1936, but the chief economic institutions inaugurated on the basis of those Acts remained in existence and exerted a considerable influence on Amer. developments. The N. D. policies did not end unemployment, but certainly reduced the numbers (17,000,000) by anything up to 10,000,000.

To many contemporaries the N. D. seemed like a revolution, but in reality it was conservative in the same sense that the democratic policy of Jefferson and Wilson had been conservative. Its aim was to protect, against violation from the left or the right, the essentials of Amer. democracy, namely, the balance of interests under the constitution and security for property and for men. If in its philosophy the N. D. was democratic, in method it was evolutionary. 'Because for fifteen years legislative reforms had been dammed up, they now burst upon the country with what seemed like violence, but when the waters subsided it was clear that they ran in familiar channels' (Nevins and Commager). The conservation policy of the N. D. had been begun by Theodore Roosevelt; railroad and trust regulation was initiated some 50 years earlier; banking and currency reforms had been advocated by Bryan and, to some extent, achieved by Wilson; the farm relief programme owed much to the Populist party of the nineties; while in the sphere of international relations its policies were really continuations of the traditional policies of strengthening national security, maintaining the freedom of the seas, supporting law and peace, and championing democracy in the W. world. See A. M. Bingham, *Challenge to the New Deal*, 1934; T. E. Dewey, *The Case Against the New Deal*, 1940; J. T. Adams, *The Epic of America*, 1940 ed.; A. Nevins and H. S. Commager, *America: the Story of a Free People*, 1942; Frances Perkins, *The Roosevelt I Knew*, 1947; D. R. Fusfeld, *Economic Thought of Franklin D. Roosevelt and Origins of the New Deal*, 1956.

New Dongola, tn in Dongola, Sudan, on the l. b. of the Nile, 105 m. NW. of Merowé. It is the chief centre of trade and has an airfield. Pop. 36,900.

New Economic Policy (abbr. N.E.P.), economic policy of the Bolshevik Gov. in Russia, 1921-8, aimed at restoring the economy through concessions to private enterprise in agriculture, trade, and industry, and at neutralising the peasants politically. The policy was very successful, and the 1913 production level was achieved by 1927. See also **WAR COMMUNISM** and **FIVE YEAR PLANS**. See M. Dobb, *Soviet Economic Development since 1917*, 1948, and E. Schwartz, *Russia's Soviet Economy*, 1951.

New England, collective name applied to the states of Maine, New Hampshire, Vermont, Massachusetts, Rhode Is., and Connecticut, in the NE. of the U.S.A. The coasts were explored by Sir Humphrey Gilbert in 1583, and the dist. in 1614 by Capt. John Smith, who suggested the name. N. E. was the scene of the second area of permanent Eng. settlement in America (began 1620 at Plymouth Rock). Area 63,206 sq. m.; pop. 9,314,453.

New English, see **ENGLISH LANGUAGE**.

New European Order, see **NEW ORDER**.

New Forest, district in Hampshire (q.v.), England, triangular in shape, and bounded on the W. by the R. Avon, on the S. by the coast, and on the NE. by a line running from the borders of Wilts along Southampton Water. Area about 145 sq. m. It was already a forest when Canute issued his Laws at Winchester in 1016; in Domesday Book much of the area was crown land; William the Conqueror extended its area and enforced the Forest Laws more harshly. His sons Wm Rufus and Richard both met their deaths there while hunting. The main commercial importance of the forest was in the timber which was used extensively by the naval shipwrights from the 17th to the 19th cents. The prin. trees in the forest are oak and beech, with large patches of holly as undergrowth. Deer were removed officially in 1851, though they still exist in the N. F. A small breed of pony lives in the forest. Nately and Denny is a nature reserve. Among the places of interest in the forest are the vil. of Minstead, and its church with a 3-tiered pulpit and 2 galleries; Lyndhurst (q.v.) and its Verderers Hall; Wilverley Post, with fire watch-tower; Winchelsea Moor; Brookenhurst; and Beaulieu, with its ruined abbey of King John's time. Under a Bill introduced in the House of Lords at the end of 1948 the verderers may authorise, on terms, the enclosure by the Forestry Commissioners of up to 5000 ac. of forest land for the growth of timber; and also the enclosure, temporarily, of the ancient and ornamental woods so as to secure their preservation for regeneration. The verderers may also agree with the Ministry of Agriculture for the enclosure of up to 3000 ac. for cultivation and the improvement of grazing. Finally, the Bill provides for the reconstitution of the Court of Verderers. Of the 10 verderers 1 will be the official verderer, 5 will be elective, and 4 will be appointed by the Ministry of Agriculture, the Forestry commissioners, the local planning authority, and an amenity preservation society to be designated. The Bill extends the purposes for which the verderers may make or alter by-laws. See J. R. Wise, *The New Forest, its History and Scenery*, 1883; R. L. P. Jowitt, *Hampshire*, 1949; B. Vesey-Fitzgerald, *Hampshire and the Isle of Wight*, 1949; R. Wightman, *Wessex Heathland*, 1953.

New Forest Pony, see **HORSE**.

New Forest Ware, local fashion of Rom. pottery made chiefly in that area, where the kilns have been investigated, in the

latter part of the 3rd and the 4th cents. One variety has a dark metallic glaze while another shows a red slip on a cream or white fabric. White paint and rosette stamps are used as decoration.

New Georgia Island (Pacific Ocean), *see* SOLOMON ISLANDS.

New Glasgow, tn of Pictou co., Nova Scotia, Canada, on East R., 10 m. SE. of the seaport of Pictou. There are rolling and steel plate works, car works, foundries, woodworking and brick plants. Coal-mines are worked in the neighbourhood and agriculture is carried on. Pop. 9933.

New Granada, *see* COLOMBIA.

New Guinea, second largest is. in the world, N. of Australia, from which it is separated by the Torres Strait. Area about 304,200 sq. m., comprising a broad central mass from which protrude peninsulas to the W. (Vogelkop) and SE. Prominent features are the Gulf of Papua (SE.) and Geelvink Bay (NW.). Series of mt ranges run the length of the is. (1500 m.): Nassau (Mt Carstensz, 16,400 ft) and Orange Ranges in the W., Bismarck Mts and Owen Stanley Range in the E. There are many large navigable rivers. The climate is humid in coastal areas, but healthy in the highlands, with heavy rainfall except in the Port Moresby area. Dense jungle produces sago, coco-nut, and nipa palms, ebony, sandalwood, rubber, casuarina, cedar, etc. The fauna is similar to that of Australia. Agric. products include copra, rubber, coffee, sisal, and kapok. Mineral resources are gold and oil. Pop. about 1,750,000, comprising Melanesians, Negritos, and Papuans. N. G. was named by the Portuguese in 1546. The Dutch occupied parts of the W. in the 18th cent. and annexed them in 1848. In 1884 the NE. was annexed by Germany, and the SE. by Britain. Since the First World War all the E. has been administered by Australia, but the is. was occupied by the Japanese in the Second World War. There are 3 political divs.:

- (1) Netherlands N. G., W. of 141 meridian; area 159,375 sq. m.; pop. about 346,000.
- (2) Ter. of N. G., NE., and including the Bismarck Archipelago, Admiralty Is., and Solomon Is.; area 93,000 sq. m.; pop. about 1,000,000.
- (3) Papua, in SE., and including Trobriand, D'Entrecasteaux, and Louisiade Is. *See* H. Cayley-Webster, *Through New Guinea and other Cannibal Countries*, 1898; C. G. Seligman, *The Melanesians of New Guinea* (anthropological), 1910; C. G. Rawlings, *The Land of the New Guinea Pygmies*, 1913; F. W. Eggleston (ed.), *The Australian Mandate for New Guinea*, 1928; J. New Guinea, British, *see* PAPUA.

New Hall, Cambridge, third college for women in the univ., opened in Oct. 1954. Plans are projected for development along lines similar to those followed by the existing colleges.

New Hamburg, vil. of Waterloo co., Ontario, Canada, on R. Nith, 75 m. WSW. of Toronto. Pop. 1897.

New Hampshire, one of the New England states (known as the 'Granite State'), and one of the original 13 states of the U.S.A., between Vermont and Maine and N. of Massachusetts, with 18 m. of coast on the Atlantic. Land area is 9024 sq. m. The surface is largely mountainous, the chief range being the White Mts in the N. (Mt Washington, 6288 ft, is the highest in the New England states and in NE. U.S.A.). The range is cut by valleys and 'notches' (notably Franconia notch and Crawford notch). There are many rivers, the chief being the Androscoggin, Merrimack, Saco, Salmon Falls, and Connecticut, which afford plentiful water power. There are also about 600 small lakes, of which Winnepesaukee is the largest (25 m. long, 12 m. wide). Hay, potatoes, corn, vegetables, and fruit are grown. Fish resources include lobster, herring, and mackerel. Commercial forest resources comprise about 4,700,000 ac., and national forests about 806,000 ac. Manufs. are numerous and important, and include boots and shoes, gloves, cotton goods, woollens, hosiery, tools, machinery, and lumber and paper products. There are good granite quarries. Feldspar, mica, beryl, sand, gravel, and garnet resources are also worked. The univ. of N. H. at Durham was founded in 1866, and Dartmouth College at Hanover in 1769. The cap. is Concord (pop. 28,000). The prin. tns are Manchester (82,730), Nashua (34,660), Portsmouth (18,830), Berlin (16,615), Keene (16,530), Dover (15,870), and Laconia (14,575). N. H. was settled by Englishmen in 1623, and came under jurisdiction of Massachusetts in 1641. It became a separate royal prov. in 1679. Franklin Pierce, a native of N. H., was elected fourteenth president of the U.S.A., 1852. Pop. 533,242. *See* H. H. Metcalfe, *History of New Hampshire*, 1926; Federal Writers' Project, *New Hampshire: a Guide to the Granite State*, 1938; T. Kalljarvi and W. C. Chamberlin, *The Government of New Hampshire*, 1939.

New Harmony, tn in Indiana, U.S.A., on Wabash R., 22 m. NW. of Evansville, with oil wells and gravel pits. It was settled in 1815 by Ger. Harmonists, who sold out in 1824 to Robert Owen. The Workingmen's Institute Library is here. Pop. 1400. *See* G. B. Lockwood, *The New Harmony Communities*, 1902.

New Haven, co. seat of N. H. co., Connecticut, U.S.A., on Long Is. Sound, with an important foreign and coastwise commerce. It has many handsome buildings, public squares, parks, and gardens. It is the seat of Yale Univ., the Connecticut Univ. College of Pharmacy, Berkeley Divinity School, Albert Magnus College, Arnold College, and Larson College. It

is a commercial distributing centre, and has manufs. of electrical equipment, cutlery, wire and metal goods, paper boxes, clothing, lamps, rifles, clocks, hardware, and corsets. In addition there are meat-packing concerns, railroad shops, and trap-rock quarries. Fishing and dairy farming are carried on in the dist. Pop. 164,443.

New Hebrides, archipelago of Polynesia in the SW. Pacific Ocean, 1100 m. E. of Australia, lying between 13° and 20° S., and 166° and 170° E., and extending over 500 m. The N. II. (the total area of which is about 5700 sq. m.) include the Banks and Torres groups. The largest is. of the group are Santo (75 m. by 40 m.) and Malekula (nearly as large). Other is. are Efate, Ambrym, Erromanga, Epi, Aoba, Pentecost, and Macovo. In addition there are at least 60 small is. and islets. There are 4 good harbours: Vila and Havannah on Efate, and Ports Sandwich and Stanley on Malekula. The H.Q. of the administration are at Vila, which is the chief trade centre. The is. are volcanic and free from coral reefs. The soil is rich and deep, densely wooded, and produces breadfruit, sago-palm, bananas, sugar-cane, yam, taro, arrowroot, oranges, pineapples, and coffee, and particularly sandalwood. The chief exports are copra, coffee, cocoa, shell, and sandalwood. The natives are Melanesians and Polynesians. By a convention of 16 Nov. 1887 Britain and France set up a joint naval commission to protect the lives and property of the Brit. and Fr. subjects of the group, and in 1906 a Brit.-Fr. condominium gov. was estab. There is steamboat communication with Australia. The N. II. group was discovered by the Sp. explorer de Quiros (1606), who imagined he had at last found the long-sought S. continent and therefore named it Tierra Australia del Espiritu Santo. Bougainville visited the is. in 1768. It remained, however, for Cook to discover and chart the greater part of the group in 1774. Pop. 45,000. See also *ESPIRITU SANTO* and *MALEKULA*. See H. Le Chartier, *La Nouvelle Calédonie et les Nouvelles-Hebrides*, 1885; E. H. Imhaus, *Les Nouvelles-Hebrides*, 1890; Dr Robert Lamb, *Saints and Savages*, 1908; E. Jacob, *France and England in the New Hebrides*, 1914; W. H. R. Rivers, *History of Melanesian Society*, 1914; C. B. Humphreys, *The Southern New Hebrides: an Ethnological Record*, 1926; J. R. Baker, *Man and Animals in the New Hebrides*, 1929; T. H. Harrison, *Savage Civilisation*, 1936; *Captain Cook's Voyages* (Everyman's Library); Oxford Univ. Exploration Club, *New Hebrides Papers*, 1951.

New Holland, former name for Australia (q.v.).

New Iberia, cap. of Iberia par., Louisiana, U.S.A., 125 m. N. of New Orleans. It has manufs. of jewellery, paper, lumber, and foundry and machine-shop products. Salt is mined in the dist., and fruits, cereals, and sugar produced. Pop. 16,500.

New Ireland, is. of the Bismarck Archipelago (q.v.), area 3340 sq. m., length 230 m.; pop. about 20,000. Kavieng is the chief in and port. It exports copra.

New Jersey, middle Atlantic state of the U.S.A., in the N. Atlantic group, bounded on the N. and NE. by New York, on the W. by Pennsylvania and Delaware, and on the S. by the Atlantic and Delaware Bay. It was the third of the original 13 states which ratified the Federal Constitution. Area 7836 sq. m. (314 sq. m. being inland water). The N. of the state is hilly, being intersected by the N. J. Highlands, including the Ramapo Mts, Schooleys Mt, and Musconetcong Mt. Kittatinny Mt (1801 ft) is the state's highest point. These belong to the Appalachian system. To the S. the state becomes a gently undulating plain, sloping E. and W. It is drained by its chief rvs., the Passaic, Hackensack, and Raritan. The Hudson borders N. J. on the E. and the Delaware on the W. N. J. has numerous small lakes. The coastline is marked by barrier beaches, sand spits, and dunes backed by lagoons and marshes, and is studded with well-known resorts, including Atlantic City, Asbury Park, and Cape May. The land is well wooded and fertile. Some 2,300,000 ac. of hardwood forest remain, including oak, pine, maple, cedar, beech, birch, hemlock, and yellow poplar. Broad acres of scrub oak and stunted pine in the S. half of the state comprise the 'pine barrens.' N. J. is noted for its truck gardening and is fittingly called the 'Garden State.' Produce includes white and sweet potatoes, tomatoes, asparagus, peppers, sweet corn, lettuce, spinach, chard, and other market crops. Food processing is a major industry; and many fruits are raised, including apples, peaches, grapes, strawberries, and blackberries; marshland is utilised for cranberry bogs. In the N. and NW. dairying and farming prevail. The state also has a large ann. fish catch, including oysters, clams, crabs, mackerel, sea trout, bluefish, and cod. Sandstone and trap-rock are quarried and some iron is still mined. The state ranks high in copper smelting and oil refining. The chief manufs. are textiles, chemicals, machinery, silks, transportation equipment, paints and varnishes, machine tools, electrical apparatus, rubber and leather goods, tobacco products, plastics, furniture, and radios. Dyeing, ship-building, printing, publishing, and paper manufacturing are also important. The state has a fine system of highways, including the N. J. Turnpike and Garden State Parkway. These connect with New York via the George Washington Bridge and the Holland and Lincoln tunnels, with Staten Is. via the Goethals and Bayonne bridges and Outerbridge Crossing, and with Delaware via the Delaware Memorial Bridge. As well as by highways the state is served by many railroads, including the Pennsylvania; Delaware, Lackawanna and W.; Erie, W. Shore, Lehigh Valley; and others. Newark has a major airport. Leading educational institutions are Princeton Univ., Rutgers Univ., Stevens Institute of Technology, Seton Hall College, and Rider College. Port Newark is a major port, and there are miles of deep-water facilities along the Hudson R. The chief cities are

Newark (438,776), Jersey City (299,000), Paterson (139,336), Trenton (128,000), Camden (124,555), Elizabeth (112,800), E. Orange (79,340), Bayonne (77,200), Atlantic City (61,650), Passaic (57,702), Union City (55,537), Hoboken (50,676), and New Brunswick (38,800). N. J. was discovered by John Cabot in 1497; it was claimed by the Dutch, but passed to Eng. hands in 1664. Pop. 4,835,330. See E. J. Fisher, *New Jersey as a Royal Province*, 1911; I. S. Kull (ed.), *New Jersey: A History*, 1930; W. J. Lane, *From Indian Trail to Iron Horse*, 1939; D. Kemmerer, *Path to Freedom: Struggle for Self-Government in Colonial New*

guard base, and maritime schools are here; a navy submarine base (Atlantic H.Q.) is at Groton, on the opposite side of Long Is. Sound. N. L. is the seat of the Connecticut College for women. The ann. rowing contest between Harvard and Yale takes place here. Pop. 30,550.

New Lynn, tn on the W. boundary of Auckland, New Zealand, on an isthmus separating the Waitemata and Manukau harbours. It owes its industrial origin to the estab. of tanneries and brick works in the early days when the dist. was remote from the city area. The spread of pop. eventually reached its borders and to-day it appears physically as part of the city

Jersey, 1706-1776, 1940; C. S. Myers, *The Story of New Jersey* (5 vols.), 1945; J. E. Pomfret, *Province of West New Jersey, 1609-1702*, 1956. See also The N. J. Historical Society (pub.), *New Jersey Archives*.

New Jerusalem Church, see SWEDEN-BORGIAN.

New Kensington, tn of Westmoreland co., Pennsylvania, U.S.A., on Allegheny R., 14 m. NE. of Pittsburgh. It has huge aluminium and tinplate works, and also makes magnesium sheets, glass, and electrical and metal products. There are coal-mines in the neighbourhood. Pop. 25,146.

New London, seaport city of N. L. co., Connecticut, U.S.A., at mouth of Thames R., 45 m. E. of New Haven. The harbour is one of the deepest on the Atlantic. There are manufs. of metal products, printing presses, machinery, thread, chemicals, tools, bedding, clothing, wool and paper products, and clocks. It is a port of entry and a maritime centre: the U.S. Coast Guard Academy, the coast

of Auckland. Many new industries were estab. from 1939 to 1945, and a pottery company branched out into ceramic manuf. in 1942. This branch of its activities has a daily output now of over 20,000 pieces. Besides supplying a considerable proportion of the local market, it has developed a substantial export trade in Australia. Pop. 7544.

New Mexico, state in the SW. of the U.S.A., bounded on the N. by Colorado, on the E. by Texas and Oklahoma, on the S. by Texas and Mexico, and on the W. by Arizona, was organised in 1850 and admitted to statehood in 1912. It forms part of a rocky tableland, the Rocky Mts and the Sierra Madre ranges running through it. In the E. is the Llano Estacado, a barren plain, which is being brought under cultivation by dry-farming and which rises to mt ranges in the centre of the state, the W. being mainly plateaus. It is watered by the Rio Grande and its affluent the Rio Pecos, and the tribs. of the Colorado R. The average height above sea level in N. M. is 5700 ft, the

lowest height being 2876 ft. The climate is dry, the average rainfall being only 12-16 in. Some of the land is fertile under irrigation, and agriculture is rapidly becoming an important industry of the state. The main crops produced by dry-farming are grains, whilst fruit, vegetables, and cotton are grown. Pasture is abundant, particularly on the tablelands, where stock-raising and wool-growing are important occupations. Cattle total about 1,165,000 head, and sheep about 1,400,000. Mohair production is a leading industry.

E.N.A.

A COMMUNAL CAVE DWELLING IN THE RIO DE LOS FRIJOLAS, NEW MEXICO
This 'house' contains 200 rooms.

There is much good forest land. The mineral wealth includes gold, silver, copper, lead, zinc, potash (80 per cent of national output), coal, granite, limestone, sandstone, marble, and petroleum. The manu-., chiefly wood products and food, are comparatively unimportant. N. M. is a popular health and tourist resort. A great attraction is Carlsbad Caverns, an enormous series of limestone chambers, now a national park. The lowest depth reached is 1350 ft. and the largest room (called the 'King's Palace') is 4000 ft long with maximum width of 625 ft. and a ceiling of over 300 ft. Below this room are 3 vast chambers known as the 'Palace of Pluto,' discovered at the 800-ft level (150 ft below the 'King's Palace') in 1939. A U.S. atomic energy laboratory is at Los Alamos, and near by, at Alamogordo, in the S. desert region, the first atom bomb was tested in July 1945. Many of the white people of N. M. are of Sp. or Mexican descent, and Spanish is still spoken.

Part of the huge Navajo Indian reservation is in the NW.; in other reservations dwell Apaches, Hopis, and Zunis. There are many Indian pueblos or vils. The cap. is Santa Fe (28,000); other centres are Albuquerque (96,815), seat of the state univ.; Roswell (25,738); Clovis (17,318); Hobbs (13,875); Las Cruces (12,325); Gallup; and Socorro. The N. M. College of Agric. and Mechanic Arts is near Las Cruces, and the N. M. School of Mines is at Socorro. N. M. is popularly called the Sunshine State. Area 121,666 sq. m.; pop. 531,800. See E. A. Powell, *The End of the Trail: the Far West from New Mexico to British Columbia*, 1915; G. P. de Villagr , *History of New Mexico* (trans. Espinosa), 1933; L. Bloom and T. V. Donnelly, *New Mexico: History and Civics* 1933.

New Mills, urb. dist. and tn of Derbyshire, England, on R.s Goyt and Sett, 15 m. E. of Manchester; the prin. industries are textile printing, bleaching, and dyeing. Pop. 8400.

New Model, name given to the army organised by Parliament on 15 Feb. 1645. It was formed on the plan of Cromwell's Ironsides, and was under the command of Sir Thomas Fairfax, Cromwell holding the position of Lieutenant-general. Its first success was the battle of Naseby, and it was the chief military instrument of the parl. victory in the Civil war.

New Monkland, see MONKLAND.

New Norfolk, tn of Buckingham co., Tasmania, 21 m. NW. of Hobart, on the R. Derwent. Pop. 5000.

New Order (or Hitler's New European Order), introduced by the National Socialist Gov. in the countries overrun by the Nazi armies (1939-41). The N. O. was defined by Funk, Ger. minister of economics, on 25 July 1941, as meaning that 'the peace-time economy must guarantee to the Greater Ger. Reich a maximum of security and to the Ger. people a maximum consumption of goods, in order to increase their welfare. European economics must be directed towards this end.' The ultimate objective of the N. O. was to turn Europe into a single economic unit, self-supporting in essentials, while trade with the outside world would be conducted by a single authority dealing directly with individual states; for the N. O. did not recognise the right of other continents to the benefits of cohesion which it claimed for itself. In brief, the N. O. involved a ruthless readjustment of European economy to suit Ger. ends and a monopoly of industrial production in Europe for the 'master people' (*Herrenvolk*). The frontiers of the Reich were so drawn as to take in the main industrial areas of Europe: Luxembourg, Alsace-Lorraine, the Czech protectorate, Silesia, and W. Poland, including the large textile industrial area of L dz. The Reich bought up control of industries outside this central block, e.g. in Hungary, Rumania, and Yugoslavia, and probably control was estab. in some form over the industries of N. Italy. Otherwise industrial development outside the Reich was to be

suppressed, for the N. O. envisaged an agric. Europe feeding an industrial Germany. The N. O. offered certain evident attractions to the agric. or peasant states, since they would be certain of a market for their export surpluses of food and raw materials, without having to face the competition of the new world; but in fact, as Germany had manipulated the mark exchange since 1936, these satellite states would sell their exports cheaply and receive in return dear and inferior manuf. goods or nothing. The spectacle of a future Germany exercising world hegemony through economic control was reflected in her dealings with occupied countries during the war. The N. O. in action was in fact one long record of systematic terrorism (*see under* the historical sections of the various European countries concerned). It should be noted that the N. O. was originally a Jap. phrase, adapted to Jap. ambitions in the Far E., and that it was only after the phrase had been appropriated by Hitler and had fallen into disrepute in Europe that it was transmuted into 'Co-Prosperity.' But whether it be called the N. O. or Co-Prosperity, the substance was the same. It involved the conquest of all Asia, and economically it meant the subjugation to Japan of all the other members supposed to be enjoying Co-Prosperity, the weak points in which sphere were Japan's inadequacy of shipping facilities, and lack of steel, cotton, and wool.

New Orleans, chief city and seaport of Louisiana, U.S.A., cap. of Orleans par., on the Mississippi R., chiefly on the l. b. The largest municipal limits are co-extensive with those of the par. of Orleans, and among the suburbs are Westwego, Gretna, McDonoghville, and Algiers, its W. dist., with a riv. frontage of 3 m. The site on which the city is built is almost perfectly level and lies so low that the difficulties of drainage are great. N. O. lies below the level of the riv. at high tide and is therefore protected by an extensive series of embankments called levees. The cemeteries are a peculiar feature of N. O.; owing to the water-saturated nature of the soil, bodies are buried in vaults often 12 ft above the ground level, the coffins being ranged in tiers. In the past it was regarded as an unhealthy city, but modern scientific methods have changed this reputation. The climate is not marked by extremes of either heat or cold. The Fr. or Lat. quarter of N. O. is separated from the Amer. quarter, or New City, by Canal Street, the centre of the retail trade, and just below this street are many of the most important buildings of the city. The Custom House, built of granite, is one of the largest and most important edifices in the U.S.A. There are also the cotton exchange, city hall, criminal courts, Howard Memorial Library, the post office, sev. handsome churches, and other buildings. Tulane Univ., founded in 1834, has state support in the shape of remission of certain taxes. It has over 400 profs. and over 4000 students. Diluted Univ., a merger of 2

colleges founded in 1869, is for coloured students. The Fr. quarter of N. O. is that part closely connected with the hist., poetry, and romance of the city, and the influence of the Fr. and Sp. regimes still survives in the mode of life, customs, holidays, and social observances. A notable feature each year is the celebration of *mardi gras* with elaborate night pageants, balls, etc. N. O. has one of the most dramatic histcs. of any U.S. city, being one of the settlements of Bienville in 1718; it was made cap. of the vast region known as Louisiana. It was ceded with Louisiana to Spain in 1763. In 1800 it fell to France, from whom it was purchased by the U.S.A. in 1803 as part of the great Louisiana purchase. In the 18th cent. N. O. rapidly grew as the outlet for riv.-borne cargoes down the Ohio and Mississippi, ever-increasing numbers of rafts and flatboats floating downward with grain, salt meat, and potash to what then was a Fr.-owned port. It was at N. O. in the war of 1812 that the Americans defeated Pakenham's veterans, one of their few successes in that war. Sugar-growing in N. O. was introduced in 1794-1795 by an enterprising creole, Etienne Boré, who set up machinery and vats and inaugurated a boom. The first steamboat to run from Pittsburgh to N. O. and back was built in 1811 by Nicholas Roosevelt of a family which was later to become famous. In the Civil War David Farragut, with a fleet of wooden sloops, forced the surrender of N. O., the Confederacy's largest and wealthiest city. The most important industries, apart from sugar-refining, are rice-cleaning and the manuf. of cotton-seed oil, iron ware, soap, cotton goods, cigars, clothing, etc. Ann. tonnage of vessels entered and cleared in foreign trade is about 5,500,000 and 4,800,000 respectively. There is a navy yard and construction and repairing estab. Pop. 570,445.

New Pitsligo, mrkt tn of Aberdeenshire, Scotland, 10 m. SW. of Fraserburgh. Pop. 1360.

New Plymouth, cap. and a port of the dist. of Taranaki, N. Is., New Zealand, 160 m. SW. of Auckland. It has an extensive harbour, and is a holiday resort with magnificent spaces including Pukekura Park. There is an airport. Pop. 28,282.

New Pomerania, *see* NEW BRITAIN.

New Providence, *see* BAHAMAS and NASSAU.

New Red Sandstone, *see* TRIASSIC SYSTEM.

New River, Eng. artificial cut or channel now about 24 m. long, stretching S. from Chadwell and Amwell, Herts, just SW. of Ware; supplied from the Lee (Lea) and from wells, and conveying these waters to works at Hornsey and Stoke Newington (N. London). Reservoirs of the Metropolitan Water Board (q.v.) at the latter hold 92 million gallons. It is no longer an original source of supply but is a very useful part of the system of supply to N. London. Begun in 1609 by Sir Hugh Myddelton, it was completed in 1613, discharging into a Round Pond at N. R.

Head. The N. R. Co. was incorporated in 1819, Hugh Myddelton being its first governor. The property was originally divided into 72 shares (of £100 each), 36 being 'adventurers' shares' held by Myddelton and 28 others, and the remainder held by King James I in return for financial aid in the construction of the N. R. Charles I exchanged these (1631) for an annuity of £500 (King's or Crown Clog), the payment of which, after deduction of tax, is still annually made by the Metropolitan Water Board. The shares were in later years valued at over £100,000 each. The Metropolitan Water Board took over the undertaking of this and of 7 other water companies in 1904.

New River (U.S.A.), see KANAWHA.

New Rochelle, residential city of Westchester co., New York, U.S.A., on Long Is. Sound, 18 m. NNE. of New York. It manufs. plumbing and heating equipment, pharmaceuticals, and wood and metal products, and is the seat of the College of N. R. and Iona College. The house of Thomas Paine is also here. Pop. 59,725.

New Romney, see ROMNEY, New.

New Ross, mkt in co. Wexford, Rep. of Ireland, 23 m. W. of Wexford, on the R. Barrow. It is one of the oldest towns in the co. and was the scene of patriot resistance in 1798. It is now a prosperous industrial centre, but retains its medieval appearance. Pop. 5000.

New Russia, obsolete name for the steppe area N. of the Black Sea and the Sea of Azov which in the 18th and early 19th cents. was acquired by Russia, mostly conquered from Turkey, and populated by colonists from various parts of Russia as well as from the Balkans and Germany. It comprised the present Moldavian Rep., the oblasts of Odessa, Nikolayev, Kherson, Kirovograd, Crimea, Dnepropetrovsk, Zaporozhye, Stalin, and Voroshilovgrad of the Ukraine, and parts of the Rostov Oblast and Krasnodar Kray of the Russian Federal Rep. See also Bessarabia.

New Sarum, see SALISBURY.

New Serbia, in 18th cent. the name of a part of New Russia (q.v.) W. of the Dnieper, partly populated by Serbian colonists (1752-3). It comprised the present Kirovograd and part of Dnepropetrovsk oblasts with Novomirgorod as cap. The Serbian colonists are now completely assimilated.

New Siberian Islands, see NOVOSIBIRSKIYE OSTROVA.

New South Shetlands, group of is. in the Antarctic Ocean, see SOUTH SHETLANDS.

New South Wales, oldest state of the commonwealth of Australia, in the SE. portion of the is. continent, extending between lat. 28° 10' and 37° 28' S., and 141° and 154° E., with an area of 309,433 sq. m., and a coastline of over 700 m. There are 103 municipalities and 133 shires. Within the state of N. S. W. the mt range which girdles nearly the whole is. is most continuous and elevated, and is known as the Dividing Range. The section of this mt system on the S. boundary, called the Australian Alps, rises

in Mt Kosciusko to 6500 ft. From this the range extends northward, the watershed being from 50 to 150 m. distant from the E. coast, and thus divides the state into 2 slopes, with 2 distinct water-systems. The rivs. on the E. side descend with great rapidity, and in oblique tortuous courses, their channels often forming deep ravines. Many of them are navigable in their lower course for sea-going steamers. The prin. are the Richmond, Clarence, Macleay, Manning, Hunter, Hawkesbury, and Shoalhaven. The Hunter R., about 60 m. N. of Sydney, opens up one of the most fertile and delightful dists. in the country. The Dividing Range, which opposite to Sydney is called the Blue Mts, being singularly abrupt and rugged, and full of awe-inspiring chasms, long presented an impenetrable barrier to the W., and kept the colonists shut in between it and the sea, and utterly ignorant of what lay beyond. At last, in 1813, when the cattle were likely to perish in one of those long droughts that appear to visit this country at intervals of a dozen years, some adventurous individuals scaled the formidable barrier, and discovered those downs on the W. slope which now form the great sheep-ranges of Australia. A practicable line of road was immediately constructed by convict labour, and the tide of occupation entered on the new and limitless expanse. The numerous streams that rise on the W. side of the watershed within the state all converge and empty their waters into the sea through one channel within the state of S. Australia. The S. and main branch of this great riv. system is the Murray. The other great trunks of the system are the Murrumbidgee, which is navigable, the Lachlan, at times reduced to a string of ponds, and the Darling. The Macquarie, passing through the rich dist. of Bathurst (q.v.), is a large trib. of the Darling, but it reaches it only in the rainy seasons. Numerous good harbours are formed by the estuaries of the rivs.

Owing to the great extent of the state, stretching as it does over 11 degrees of lat., the climate is very varied. In the N. dists., which are the warmest, the climate is tropical, the summer heat occasionally rising in inland dists. to 120°, while on the high tablelands weeks of severe frost are sometimes experienced. At Sydney the mean temp. of the year is 65°. The mean heat of summer, which lasts here from the beginning of Dec. to the end of Feb., is about 80°, but is much modified on the coast by the refreshing sea breeze. The ann. fall of rain is about 50 in. Prolonged heavy rains periodically result in widespread floods along the course of the riv. systems.

N. S. W., although mainly dependent on primary industries (chiefly agriculture and grazing) for her export income, is now highly industrialised, and about one-third of the work force is in manufacturing industries. The prin. crops are wheat, maize, barley, oats, and vegetables, and fruit-growing has greatly developed in recent years—oranges, apples, and peaches

predominating. In 1954-5 there were 5,394,012 ac. under crops. The area under wheat was 2,918,670 ac. (37,718,000 bushels); oats, 657,292 ac. (7,667,169 bushels); maize, 50,617 ac. (1,767,258 bushels); lucerne (hay), 192,196 ac.; rice, 38,088 ac. (5,080,107 bushels); barley, 36,866 ac.; potatoes, 13,897 ac.; tobacco, 635 ac. The area under grapes was 18,205 ac.; citrus fruit (principally oranges), 32,065 ac. (3,585,757 bushels);

£A78 million, including 15 million tons of coal valued at £A43 million.

The staple exports are wool and wheat. The other prin. exports are butter, lead, coal, skins and hides, tallow, frozen biscuits, confectionery, fruit (fresh and preserved), wines and leather, timber, copper, tin, and zinc. The value of exports overseas in 1954-5 was £A220,657,000, and of imports from overseas £A346,030,000. The manufs. of the

NEW SOUTH WALES

BROKEN HILL, THE RICHEST SILVER, LEAD, AND ZINC MINE IN THE WORLD

Looking north along the line of lode, the Broken Hill South Ltd mine is seen in the foreground; behind it is the mile-long vast Open Cut, now worked out. To the right is the central power station which supplies all the mines with electricity.

other fruit, 59,059 ac. Sugarcane produced 222,213 tons of sugar. The recognition of the fact that the cultivable area might be greatly extended by a system of water conservation and irrigation has induced the gov. to undertake various detached works and schemes, which are designed to constitute a portion of the system necessary to serve the whole state. The most striking of these is the Murrumbidgee (q.v.) scheme with a storage dam across the Murrumbidgee at Burrinjuck. Enormous areas are utilised for grazing purposes—in 1955 there were 3,500,000 cattle and 59 million sheep which produced over 540 million lb. of greasy wool. The state is rich in mineral deposits, especially coal; silver, lead, and zinc are mined at Broken Hill (q.v.). In 1954 the value of minerals produced was

state are varied and numerous. The chief industrial products are industrial metals, machines, etc.; clothing, food and drink, and tobacco; chemicals, paint, and oil; wood-work, paper, printing, textiles and textile goods (not dress), skins, and leather (not footwear). Large iron and steel works with subsidiary factories are in operation near the coal-fields at Newcastle and Port Kembla. The products include iron and steel of various grades, boilers, pipes, wire, brass cables, etc. The value of the output of all manuf. goods in 1954-5 was £A1446 million. Sydney (pop. 1,897,710) is the cap. Other important tns are Newcastle, urban area, 181,740; Greater Wollongong, 95,830; Broken Hill, 32,000; Blue Mts, 23,330; Maitland, 21,630; Goulburn, 19,740; Wagga-Wagga, 19,640; Penrith, 18,790;

Orange, 18,570; *Lismore*, 17,620; *Albury*, 17,100; *Bathurst*, 16,390; *Lithgow*, 15,270; *Cessnock*, 14,630; *Grafton* and *S. Grafton*, 14,410; *Tamworth*, 13,940; *Dubbo*, 12,370; *Campbelltown*, 10,120; *Armidale*, 8,860; *Parkes*, 8,100; *Casino*, 8,000; *Inverell*, 7,680; *Kempsey*, 7,740; *Taree*, 7,610; *Queanbeyan*, 7,550; *Cooma*, 7,240. Sydney is the H.Q. of the squadron in Australian waters, and is the seat of 2 univs. A bridge across Sydney harbour, one of the largest arch bridges in the world, was opened in Mar. 1932. Education is compulsory between the ages of 6 and 15 years. The railways and tramways are mostly state-owned. On 30 June 1955, 6101 m. of gov. railway were open. N. S. W. took its origin in a penal estab. formed by the Brit. Gov. in 1788 at Port Jackson, near Botany Bay (lat. 34°). The prisoners, after their period of servitude, or on being pardoned, became settlers, and obtained grants of land. Transportation to N. S. W. ceased in 1840, and up to that date the total number of convicts sent thither amounted to 60,700, of whom only 8700 were women. They were assigned as bondservants to the free settlers, who were obliged to furnish them with a fixed allowance of clothing and food. In 1843 a practically elective legislative council was estab., and 12 years later responsible gov. was granted. The constitution is based on the Consolidating Act of 1902. Parliament consists of 2 Houses, the legislative council and the legislative assembly. The council, once a nominated body, was reconstituted after the referendum of May 1933, and now consists of 60 members. Of these, one-third retire every 12 years, and the remaining members, together with the members of the legislative assembly, vote to elect new members to the council. Voting is by the proportional preferential system. Council members receive an ann. allowance of £A500. The assembly consists of 94 members who are paid a salary of £A1875 a year. The duration of a Parliament is limited to 3 years. The Women's Legal Status Act, 1918, gives women the same political rights as men. The executive is in the hands of a governor, appointed by the Imperial Gov., and an executive council consisting of members of the Cabinet. The pop., 31 Dec. 1955, was 3,525,923. See *Official Year Book of New South Wales* (ann.); *New South Wales Pocket Year Book*; also A. G. Foster, *Early Sydney*, 1920, and E. Mitchell, *Australia's Alps*, Sydney, 1942.

New South Wales Government Railways. The first section of this system was opened by a private company in 1855, but soon taken over by the gov. of New S. Wales, which thereafter built almost all the lines in the state. The present system includes the S. line and branches (from Sydney to Wallangarra); the W. line and branches; and the N. Coast line linking Sydney and Brisbane by a continuous line. The gauge is 4 ft 8½ in. and 6113 m. are open.

The Federal Cap. Ter. Railway (Queanbeyan-Canberra), on completion, was taken

over by the chief commissioner of railways for New S. Wales, who worked the line on behalf of the Commonwealth Gov. until 1928, when the management was taken over by the Commonwealth railway commissioner. New S. Wales Railways rolling stock is used. It connects with the New S. Wales railway system at Queanbeyan and is about 5 m. in length.

New Stars, see **NOVAE**.

'New Statesman,' independent Eng. weekly periodical formed in 1931 by the amalgamation of 2 papers, the *N. S.* and the *Nation and Athenaeum*. In 1934 the *Week End Review* was also taken over and its name now appears as a subtitle to the *N. S.* The *N. S.* was founded in 1913, through the inspiration of Sidney Webb (later Lord Passfield) and Bernard Shaw. The *Nation* was founded in 1907, superseding the *Speaker* (founded 1890). In politics the *Nation* followed the *Speaker* in supporting the extreme radical wing of the Liberal party. In 1921 the *Nation* amalgamated with the *Athenaeum* (q.v.). The present combined paper, which has since achieved a record sale for this class of pub., is a political and literary review, markedly to the left in politics.

New Stone Age, see **STONE AGE**.

New Testament, see **BIBLE**.

New Theatre, St Martin's Lane, London, was opened 12 Mar. 1903, under the management of Charles Wyndham and Mary Moore. The following are among the best-known plays produced at the N. T.: *Saint Joan*, 1924; *The Constant Nymph*, 1926; *Richard of Bordeaux*, 1932; *Noah*, 1935; *The Gioconda Smile*, 1948; *The Cocktail Party*, 1950; *Under Milk Wood*, 1956; *The Summer of the Seventeenth Doll*, 1957. Between 1935 and 1947 the N. T. was the scene of sev. notable Shakespearian productions with Laurence Olivier and John Gielgud in the title roles.

New Towns. The New Towns Act, 1916, provides for the creation of N. T. by development corporations appointed and financed by the gov. Up to 1958 12 such tns had been started in England and Wales and 3 in Scotland. Though there are many examples in list. of N. T. founded for military or political reasons, or in colonies, the modern conception arises from the advocacy of garden cities (q.v.), the pioneer enterprises of Letchworth and Welwyn, and the recommendations of the Barlow Report, 1940, for urban dispersal (see **TOWN AND COUNTRY PLANNING**). Just before the Act the N. T. (Reith) Committee had submitted 3 reports (1946) dealing with almost every aspect of new-town planning and development: they suggested, among other things, that N. T. might be built by a variety of agencies, including corporations sponsored by large local authorities, and authorised associations, as well as by the gov. The Act, however, provides only for gov. sponsored development corporations. The sites are chosen and designated by the minister (now in England and Wales the minister of housing and local gov., and in Scotland the secretary of state for Scotland). Many sites were investigated

Stevenage Development Corporation

ST JOSEPH'S ROMAN CATHOLIC CHURCH, BEDWELL, STEVENAGE NEW TOWN

East Kilbride Development Corporation

EAST KILBRIDE NEW TOWN: PRINTING WORKS

before decisions were made. Of the 14 sites designated between 1946 and 1950, 8—Basildon, Bracknell, Crawley, Harlow, Hatfield, Hemel Hempstead, Stevenage, and Welwyn—are in the outer country ring of Greater London and intended to receive 'overspill' of industry and persons from the metropolis. Corby (Northants) is primarily for housing workers in a rapidly expanding steel works, as well as in some new factories. Aycliffe (Durham) is for workers in an industrial trading estate (q.v.) developed during the war. Cwmbran (S. Wales) is mainly to serve industries already estab. there. Peterlee (Durham) is designed as a new centre to gather a scattered mining pop. E. Kilbride (Lanarkshire) is to cater for part of the large expected overspill from Glasgow. And Glenrothes (Fife) is mainly to serve a new coal-field. All the tns strive for a variety of industry and a 'balanced' pop. In 1956 the fifteenth new town site was designated at Cumbernauld (Dumbarton), for Glasgow overspill. The areas of land designated vary from 880 ac. at Aycliffe to 10,250 ac. at E. Kilbride; this land is subject to compulsory purchase as required for development. Target populations range from 20,000 at Aycliffe to 80,000 each at Basildon and Harlow. The original pop. of the areas of the 15 N. T. was about 134,000, and they are to be expanded by about 558,000 to a total of about 692,000.

For each tn a separate development corporation is appointed (except that the same members serve for both Hatfield and Welwyn); the maximum is 9 members, of whom at least 1 is a local resident. The corporation appoints a qualified staff and prepares a careful survey and master plan, followed by detailed plans for each part of the tn. Finance for general development, and much of the housing, shops, and factory buildings, is advanced by the Exchequer to the corporations; schools

are provided by the co. councils, some housing and public services by local authorities, churches by religious bodies, public houses and some factories and shops by private enterprise, and some houses by owner-occupiers, on land leased or purchased from the corporations.

Considerable progress has been made by the first 14 tns. By the end of 1957, 298 industrial firms had occupied 10½ million sq. ft of factory space; 231,500 persons had been newly housed in about 75,900 dwellings; 118 new schools had been built for 55,000 pupils; and 1113 new shops completed. The expenditure by the corporations to Dec. 1957 was about £195 million, of which about £121 million was on housing. Most of this capital expenditure has proved remunerative. Up to 31 Mar. 1957 there was an accumulated revenue deficiency of £1·8 million, but the ann. deficiency of the 12 tns in England and Wales was diminishing, and in the years 1955-7, 6 of the tns showed a revenue surplus.

The planning, architecture, and landscaping of the N. T. are a great advance on older industrial tns. In detail of layout they vary considerably; some are criticised as too open, some as too compact; in most the standards of housing density, roads, space for schools and playing fields, etc., are those currently accepted in Great Britain as desirable. All show at an early stage much vigour as communities; voluntary societies spring into being more rapidly than meeting places and other facilities can be provided for them, and this is a topic of some agitation. In social composition there is a more than average preponderance of the younger age groups and of industrial workers; the tns seek therefore to attract commercial as well as factory employment, and to increase the proportion of houses for owner-occupiers.

Country town development. Substantial as the N. T. programme is, it is not

STATISTICS OF 14 NEW TOWNS

Name	Corporation Appointed	Designated		Capital Expenditure to Dec. 1957 (£000)
		Area (acres)	Population (proposed)	
LONDON RING				
Basildon	Feb. 1949	7,834	80,000	19,627
Bracknell	Oct. 1949	1,860	25,000	9,855

Peterlee	Mar. 1948	2,350	30,000	6,600

* Area to be built up, 2,500 ac.

considered sufficient to take the overspill anticipated from the proper redevelopment of congested city centres. Estimates of probable displacement in 15 years from 1956 range from 2 million persons to 4 million. As a measure supplementary to the New Towns Act, the Town Development Act was passed in 1952 (for England and Wales only). This provides for arrangements between local authorities for the transfer of pop. and employment from congested cities to smaller towns and county dists. capable of planned expansion, with financial aid from the Exchequer. Early schemes under this Act were for the expansion of Bletchley by 10,000 and of Swindon by 20,000 persons (from London). By 1958 many other schemes had been agreed or discussed for transfers to various places from London, Birmingham, Merseyside, and Bristol. The obvious need of greater speed in dispersal gave rise to pressure for more adequate grants to 'receiving' authorities under the Act, and for the building of more N. T. under the New Towns Act of 1946. See *Reports of New Towns Committee* (3), 1946; *Town and Country Planning* (special N. T. issues), Jan. 1951 on; G. M. D. Block, *The Spread of Towns*, 1954; Norman Mackenzie, *The New Towns: the Success of Social Planning*, 1955; *Reports of Ministry of Housing and Local Government*; and books under GARDEN CITIES. See also OVERSPILL.

Agent-General for British Columbia
THE PATTULLO BRIDGE OVER THE
FRASER RIVER AT NEW WESTMINSTER

New Westminster, city of Brit. Columbia, Canada, former cap. of the colony, on the r. b. of the Fraser R., here crossed by a fine bridge. It is served by the Canadian National and Canadian Pacific Railways, and by the Great N. from the U.S.A.; an electric railway connects it with Vancouver, 12 m. ESE. N. W. was founded by the Royal Engineers in 1859 and incorporated in 1860. A fire occurred in 1898, when a large part of the city was destroyed. The fresh-water harbour is third among Canada's seaports, the chief exports being lumber, lead bars, ores, and fruit. Manufactures include wood products, paper, fertilisers, and cordage; meat-packing and canning are also carried on. Pop. 31,357.

New Year's Day has been celebrated in all parts of the world, and from remote antiquity, with special festivities. Its date has, however, varied considerably. The New Year of the anc. Egyptians and Persians began with the autumnal equinox (1 Sept.). The Jews (eccl. 1) and the Babylonians made it begin with the spring equinox. The Greeks (until the 5th cent. BC) celebrated it at the winter solstice. During the Middle Ages, Christian countries almost invariably began the New Year on 25 Mar. According to the Julian calendar (q.v.), N. Y. D. was 1 Jan., and the Romans observed this day as a general holiday. Visits were paid and presents exchanged. The gifts were known as *strenae* (cf. the name for N. Y. D. in France, *le jour d'étrennes*), and so great were the imperial *strenae* that they ultimately became a subject of legislation. The early Christians were not expected to take part in either the new year's revels or the Saturnalia of Dec., and many of the fathers order N. Y. D. to be kept as a fast. But the need for this vanished, and even in England the custom of giving New Year's gifts continued down to the time of Charles II. It has now been superseded by the custom of giving Christmas presents. The date is observed as the Feast of the Circumcision (q.v.).

New York, Chicago and St Louis Railroad, important railway company operating 2185 m. of track in the busy N.E. areas of the U.S.A. It was incorporated in 1923 as an amalgamation of sev. lines, including the N. Y., C. and St L. R.; the Chicago and State line; the Toledo, St Louis and W.; the Lake Erie and W.; and the Fort Wayne, Cincinnati, and Louisville. At one time a large part of the line was operated by the New York Central Railway. It is usually known as the Nickel Plate Road.

New York, New Haven and Hartford Railroad Company was incorporated in 1872, and now operates 1771 m. of track in one of the most densely populated areas of the E. states of America. Some 127 m. of the New York-Boston main line are electrified. A subsidiary company operates bus and lorry services.

New York Bay. The Lower (outer) Bay is that part of the Atlantic which washes the converging shores of Staten Is. and Brooklyn. Between these is, runs a strait called The Narrows, through which the Upper (inner) Bay is reached. This is some 6 m. wide and 7 m. long, and at its inner end are the mouths of the Hudson and East R.s., with Manhattan Is. and New York City lying between them.

New York Central System was started as a large railway combine in 1868. It is now one of the largest railways in America, and has a total mileage of 10,714, including affiliated lines; the main line runs from New York to Chicago, but it has important branch lines and connects with most of the E. states railway systems. The operating revenue in 1952 was \$806,926,218.

New York City originally was the is. of Manhattan; but greater New York includes the bors. of Manhattan, Bronx,

Brooklyn, Queens, and Richmond. New York disputes with London the claim to be the largest city in the world. Taking a radius of 25 m. New York is the centre of a larger pop. (12,831,950). It has more Germans living in it than many large cities in Germany, more Irish than Dublin, and more Italians than most big Italian cities. There is also the great transitory pop. which is always a feature of large ports. The Negro pop. is the largest of any city. The Jews are chiefly Polish and Russian. Chinese, Swedes, and Norwegians have each

U.S.A., and is the commercial and financial metropolis of the States. The Stock Exchange, the building designed by George B. Post, and completed in 1922, is in Wall Street, a narrow street leading E. out of Broadway, which forms an E.-W. street across lower Manhattan, and across which run the avenues. Fourth and Fifth Avenues were mostly residential, and here were the palatial homes of the business kings, but in recent years many of the old houses have given way to commercial buildings. The prin. shopping dist. is from 32nd to

Aerial Exploration Inc.

NEW YORK: A VIEW LOOKING SOUTH-WEST, SHOWING SOUTH MANHATTAN
Upper Bay is on the left; behind the skyscrapers are the Hudson River and Jersey City. In the foreground (East Side) is Manhattan Bridge; beyond it Brooklyn Bridge and the main financial district of Manhattan.

a strong colony in N. Y. C., and are prosperous, quiet, working citizens. Owing to the size of Manhattan Is. (12 m. in length and very narrow), skyscrapers have been erected. The Empire State soars up 102 storeys, attaining a height of 1473 ft. and is the tallest structure in the world. Other notable ones are the Chrysler building (1046 ft high); the Chanin Tower (680 ft high); the Woolworth building (792 ft high); the Singer Co.'s building (612 ft high); and the New York Telephone building in W. Street (498 ft high). Skyscrapers of from 35 to 50 storeys have now become a commonplace in N. Y. C. The Waldorf-Astoria hotel, with its twin towers reaching over 625 ft., is the biggest hotel in the world. The New Yorker is another notable skyscraper hotel, reaching a height of 470 ft. N. Y. C. is the great mart and exchange of the

57th Street. Bowery, extending N. of Chatham Square, is one of the poorer parts of the city. Four lines of railway have termini in Manhattan, including the New York Central and the Pennsylvania. They have the 2 finest railway stations in the world. Eight other lines have termini across the Hudson R. in New Jersey and convey their passengers to N. Y. C. by ferry or bus or tube trains. There is a vast underground railway along the whole of Manhattan Is., and extending to the Bronx, Brooklyn, and Queens. New York is the largest port in America, more than half the import and export trade of the U.S.A. coming by way of this city. New York harbour, formed by the North and the Hudson, consists of 2 bays, the Upper and Lower, divided by The Narrows, and bounded on the SE. by Raritan Bay, NE. by Brooklyn and Long Is. Sound. The

promontory of Sandy Hook with lighthouse is the first land sighted by European travellers. The enormous statue of 'Liberty enlightening the World,' by Bartholdi, stands on Bedloe's Is., and has a pedestal of 150 ft. The water communication of the Hudson R. and the New York State Barge Canal is of the utmost importance, for much of the wheat sent from Chicago market is thus shipped to Europe. Many of the piers are on the New Jersey side at Hoboken. The U.S. naval shipbuilding yards are on the Brooklyn side, where there are extensive docks and 36 m. of improved water-front. The ferries crossing the river are of immense size. The city is noted also for its daily papers, over one-seventh of which are printed in foreign languages; 2 are in Yiddish. Columbia Univ. was founded as King's College on the result of a public lottery in 1754. Its present site is on Morningside Heights and it includes Barnard College for women. New York Univ., one undergraduate dept of which is on Univ. Heights, was founded in 1831. It is a huge organisation and is divided into 3 centres, the undergraduate dept, the school in Washington Square, and the school of commerce in Trinity Place. The New York College, whose buildings were completed in 1900, has a policy of free education. Fordham College has developed from a theological seminary into a complete univ. The New York Public Library, estab. by consolidation of the Astor, Lenox, and Tilden foundations, was opened in 1911. The Bellevue Hospital Medical School is the largest medical school in America. There are over 550 churches: Trinity, at the head of Wall Street, Grace Church, the Church of the Transfiguration (Episcopalian), the vast and costly cathedral of St. John the Divine on Morningside Heights, St. Patrick's Cathedral (Rom. Catholic), Christ Church on Park Avenue (Methodist), and the fine Jewish synagogues are all notable.

As most business from the 19th cent. centred in Manhattan Is., and as the whole area was very narrow, the only way of expansion was in the air. Hence, after skyscrapers were invented, New York developed them to their highest pitch. The early ones, like the Pulitzer and Flat Iron buildings, to-day look almost like pygmies compared with those erected subsequently. In order to provide for light and air, the new building laws require the step-back or terraced form of building, which gives to these enormous structures something of a Babylonian aspect. The time is probably rapidly approaching when most of Manhattan will consist of skyscrapers. Wall Street section—the financial dist.—is filled with them. Another great group was constructed between 30th and 60th Streets, and many avenues are lined with them. There is one group devoted to the clothing and needle trades, another to medical schools and hospitals. Skyscraper hotels are the fashion in New York. Most of the modern ones range from 18 to 50 storeys high, and have

from 750 to 2200 bedrooms, each with private bath. The vast working pop., accumulated in the skyscrapers during the day, has made the traffic problem the most difficult in the world. In the morning and evening the streets are congested with motor vehicles, the sidewalks with pedestrians travelling to bus lines or underground, there known as the subways. The city has not been able to build its subways fast enough to accommodate the crowds.

New York possesses at least 2 thoroughfares which are world famous—Broadway and Fifth Avenue. The latter is the great retail, shopping, and club avenue. Broadway, between 39th and 60th Streets, is the centre of the theatrical and night life. It is the section known as the Great White Way, because of the vast series of electric advertising signs which almost turn night into day. In some aspects N.Y.C. is the city that never sleeps. Buses and subways run all night; there are countless drug stores and restaurants which never close their doors, and there are cinemas which have performances which start at midnight. Central Park is 840 ac. in extent, and has many magnificent drives and walks. The Metropolitan Museum of Art faces the E. side of the park. It is one of the greatest in the world and was greatly enriched by the princely legacies of Benjamin Altman, J. Pierpont Morgan, and Felix Warburg. The city frontage on the Hudson R. from 72nd Street northwards has been made into a beautiful scenic driveway, Riverside Drive, which is bordered by the W. Side Highway. In Brooklyn the prin. park is Prospect Park, famous for its gardens. That part of the city known as the Bronx contains the huge Bronx Park, in which is located a zoo, the richest and one of the largest and best equipped in the world. New York Harbour has 771 m. of waterfront, and the city is served by La Guardia, New York International (Idlewild), Newark, and Teeterboro airports, truck freight lines, and many state and interstate bus systems. A system of express highways links N. Y. C. with neighbouring cities and the bors. with one another. Internal transportation includes connected underground systems, linking all the bors. except Richmond, as well as bus and trolley lines and the largest fleet of taxicabs in the nation. Among New York's bridges are the George Washington, Henry Hudson, Brooklyn, Bronx-Whitestone, Triborough, Queensboro, Hell Gate, Williamsburg, and Manhattan. Lincoln and Holland tunnels and railroad tunnels pass beneath the North R., and Queens-Midtown Tunnel, subway tubes, and Brooklyn Battery Tunnel pass under the East R. Plans for a bridge between Brooklyn and Staten Is., over The Narrows, have long been under discussion. The chief industries are the manuf. of cloth (a quarter of the national output), fur goods (90 per cent of the national output), hats, leather goods, jewellery, printing and publishing; food processing, metal-working, the manuf. of drugs and medicines,

machinery, wood products, textiles, and scientific and precision instruments; automobile assembling, and shipbuilding and repairing. On Manhattan Is. the tendency is for private houses to become impossible except for people of wealth, and for the dense pop. to live in ever larger and more elaborate 'apartment houses.' Pop. (1950) Manhattan, 1,960,100; Brooklyn, 2,738,175; Bronx, 1,451,277; Queens, 1,550,489; Richmond, 191,555; total 7,891,596. See TAMMANY HALL.

History. In 1609 Henry Hudson discovered the riv. named after him and also the is. of Manhattan. In 1624 Peter Minuit, appointed director of Dutch colonies in America, arrived at Manhattan and bought the entire is. from the Indians for 24 dollars' worth of beads

Eng. colonies in America, but also from Europe, so that by 1643 some 18 languages were being spoken there, and the future of N. Y. C. was thus already marked by a cosmopolitan character which was to make it unique. The famous Peter Stuyvesant, with his wooden leg, was the last Dutch governor of the settlement. Under him the restlessness of the people came to a head. They wanted a voice in their own gov., strengthened in this by what they saw going on in the neighbouring Eng. colonies. The home company finally decided that the governor should have a council of 9, chosen from a larger number selected by the people. Nevertheless, he managed to keep things very largely in his own hands until fate eventually overtook him. In 1664, England claiming the

NEW YORK IN 1746

and ribbons. To-day that is. is the most valuable piece of land in the world. Thus began what was to be the modern Babylon. It was governed by Minuit and a council of 5 appointed by the Dutch W. India Co. in Holland. The people had no voice in their gov. At first growth was very slow, and at the end of 5 years there were but 300 people living in the tn, which was named New Amsterdam. The home company, desiring to attract settlers, in 1629 adopted the patron system. Under this any member of the company who would bring or send at least 50 settlers, 15 years old or over, would be granted an estate of 16 m. of frontage on the Hudson R., and as far back as his resources would permit him to develop. The patron was bound to provide a farm for each of his tenants, who in their turn were bound to remain on it for 10 years. The more powerful of these patrons became immensely wealthy, and in after years formed what was known as the Knickerbocker aristocracy of N. Y. C. It included such well-known names as the Van Rensselaers, Schuylers, and Livingstons.

New Amsterdam now began to grow, and attracted people not only from the

colony on the ground of the Cabot discoveries, King Charles II presented the entire surrounding country to his brother, James, Duke of York. Richard Nicolls of the R.N. set out with 500 veteran soldiers. On reaching New England, he was joined by Eng. colonial militia from Connecticut and sailed for the mouth of the Hudson. Stuyvesant wanted to fight but the people were not with him, and he was compelled to surrender the tn, which was at once named New York. Old Stuyvesant retired to his farm or 'hovey'—after which that famous dist. of N. Y. C. is named—and later became fast friends with Governor Nicolls. Nine years later a Dutch fleet reconquered New York, but the next year by peace treaty it was returned to the English. Under the English N. Y. C. became a busy mart containing over 10,000 people by 1750.

In the late 18th cent., before the revolution, New York had prospered and developed more than any other Amer. city, though both Philadelphia and Boston were equally important ports. New York owed its position to the fact that it was the natural outlet and cap. of the Middle Colonies (see on this J.

Truslow Adams, *The Epic of America*, 1942). Already it had a more mixed and polished society than anywhere else on the E. coast, though some historians claim that Boston far outstripped it as the literary cap. of the U.S.A. even as late as the first half of the 19th cent., and that in the late 18th cent. it was rivalled by Philadelphia for commerce. John Adams, on his way to staid Philadelphia, was impressed by the splendid houses, fine salons, and elaborate cuisines. At this period the city had its clubs, balls, concerts, pleasure gardens, and coffee-houses. A funeral in New York sometimes cost sev. thousand dollars, and the wealthy people dressed in the latest London modes, with silks and velvets, powdered wigs, and small swords (see A. Nevins and H. S. Commager, *America*, 1943). There were grammar schools but no general system of instruction. King's College (now Columbia Univ.) trained Alexander Hamilton and Gouverneur Morris, but wealthy families sent their sons to the Brit. univs. At this time (1790) the pop. was 33,000. The year 1789 saw New York developing temporarily into a national cap., and President Washington at first occupied a residence just outside the city on Franklin Square and then later took an imposing mansion (McComb) in Lower Broadway, while Vice-President Adams occupied a large house on Richmond Hill. Congress sat at both Wall and Broad Streets. In the 1830's the new Amer. classes converted the city from a federated to a democratic city. To-day New York stands unchallenged as the marine, commercial, financial, journalistic, and literary metropolis of the New World. See J. G. Wilson, *Memorial History of the City of New York*, 1891-3; M. J. Lamb and B. Harrison, *History of the City of New York: Origin, Rise, and Progress*, 1896; Mrs S. Van Rensselaer, *History of the City of New York in the Seventeenth Century*, 1909; R. I. Warshaw, *The Story of Wall Street*, 1930; E. W. Spaulding, *New York in the Critical Period 1783-9*, 1932; C. Beaton, *Portrait of New York*, 1948; A. Nevins and J. A. Kront, *The Greater City—New York, 1893-1948*, 1948; Nagel Guides, *New York*, 1955.

New York City Transit System. The N. Y. C. T. S. was formed in June 1940. The city, through its Board of Transportation, had built the independent city subway and operated it since the opening in 1932. In 1 June 1940 the board took over the Brooklyn-Manhattan Transit Corporation and its subsidiary the New York Rapid Transit Corporation, tramways operated by the Brooklyn & Queens Transit Corporation, and buses operated by the Brooklyn Bus Corporation. The railways of the Interborough Rapid Transit Co. and of the Manhattan Railway Co. were acquired on 12 June 1940. Other bus routes were taken over in 1947 and 1948. The city of New York has leased to the New York City Transit Authority for not less than 10 years from 15 June 1953 all properties, etc., formerly operated by the Board of Transportation.

There are 237 m. of electric railways, subway and elevated, 48 m. of tramway and trolleybus routes, and 526 m. of bus routes.

'**New York Herald**' was founded 6 May 1835, by James Gordon Bennett, in New York City. It was the first Amer. newspaper to make a feature of shipping, religious, and financial news. It sent H. M. Stanley to Africa in 1869. Under Bennett's son and heir it achieved wide circulation and fame and estab. an ed. issued daily in Paris. The paper was purchased by Frank A. Munsey in 1920, and merged with the *Sun*, under the title *New York Herald*. In 1924 the *Herald* was purchased by the *New York Tribune* and merged with that paper under the title of *New York Herald Tribune* (q.v.).

'**New York Herald Tribune.**' The *New York Tribune* was founded in New York City in 1841 by Horace Greeley, who remained its chief proprietor until 1872, when it was taken over by Whitelaw Reid as editor-in-chief and owner. Reid had served the paper as its chief correspondent during the Civil war. Under Reid the paper became the most stalwart Republican jour. of the E. With the development of Amer. newspapers, the *Tribune* was in the van with its huge Sunday ed. Reid's son, Ogden Reid, succeeded him in control of the paper. In 1924 he purchased the *New York Herald* and merged under the name *New York Herald Tribune*. This paper is the most widely read Republican jour. in the country, and combines a progressive international with a conservative domestic outlook.

'**New York Journal.**' founded in 1882 as the *Morning Journal*. It had a chequered career until 1895 when it was bought by Wm Randolph Hearst, who immediately deprived most of the other New York papers of their best brains by paying higher salaries. Hearst made of it a more or less sensational newspaper, which achieved a huge circulation and gave rise to the phrase 'yellow journalism.' It was largely due to the campaign of the *Journal* and other Hearst papers that the people of the U.S.A. were aroused to the point of forcing their gov. to make war on Spain in 1898.

New York State, most influential of the U.S.A., called the 'Empire State,' one of the original 13 states, is 3 times the size of England. It is bounded NW. by Lake Ontario, N. by the prov. of Quebec, E. by Vermont, Massachusetts, and Connecticut, SE. by New Jersey and Pennsylvania, S. by Long Is. Sound and the Atlantic Ocean, and W. by Lake Erie. Land area 49,576 sq. m. The beautifully wooded Adirondack Mts are in the N., the Catskills in the E., Shawangunk Range in the S. Lake Seneca and Lake Cayuga are the largest of the Finger Lakes, a belt of lakes in W. New York, and both are about 40 m. in length. Lake Geneva is one of the prettiest. The beautiful George and Champlain lakes lie E. of the state. The famous Hudson R., with Mohawk trib., flows eastward and southward through this state alone, whilst the Delaware and Susquehanna rivs. drain

the central part. The Erie Canal, opened in 1825, connects the Hudson with the Great Lakes. The largest cities are New York, 7,891,957; Buffalo, 580,132; Rochester, 332,488; Syracuse, 220,583; Yonkers, 157,800; Albany, the cap., 134,995; Utica, 101,530; Schenectady, 91,780; Niagara Falls, 90,872; Binghamton, 80,674. The state sends 43 members to the lower house of Congress at Washington, and it is sometimes called the pivotal state, owing to its influence. Education is compulsory between 7 and 16. Univs. include Columbia, New York Univ., Cornell (Ithaca), Syracuse, Rochester, Buffalo, Colgate (Hamilton), Union (Schenectady), and the U.S. Military Academy at West Point, besides Fordham (New York City), Hamilton College (Clinton), the College of the City of New York (New York City), the Union Theological Seminary (New York City), the General Theological Seminary (New York City), Vassar (Poughkeepsie), Barnard College (New York City) for women, and many law and medical schools. The governor is chosen for 4 years. The Senate, which meets at Albany, is composed of 36 members, elected every 2 years, and the Assembly of 150 members, elected every 2 years, 35 being sent from New York City. There are 62 cos., 5 of which comprise the city of New York. Native vegetation consists mostly of maple, hemlock, birch, beech, white pine, spruce, fir, chestnut, yellow poplar, stunted pine, and scrub oak. The commercial forest land amounts to some 11,000,000 ac. N. Y. S. lies largely in the U.S. hay and dairy belt, with about 17,500,000 ac. of farm and dairy land, of which 6,500,000 are in crops. Despite its large cities N. Y. S. is predominantly rural. It ranks second in the U.S.A. in dairying. Besides the large hay crop, oats, wheat, corn, barley, and rye are raised. N. Y. S. ranks second in apples and grapes, and also produces peaches, pears, cherries, plums, and berries. The chief fruit-producing areas are the Finger Lakes (wine-producing) and Hudson Valley. The state is second only to Vermont in maple sugar and syrup production. Truck farming on Long and Staten Is. is also important. Fish resources, from Long Is. Sound and the Atlantic, include shad, cod, flounder, bluefish, haddock, weakfish, blackfish, oysters, clams, and lobsters; there are also whitefish, shad, and herring from the Great Lakes. N. Y. S. produces a wide variety of minerals, including petroleum (S.W.), rock salt, clay, gypsum (W.), zinc, natural gas, cement rock, sandstone, slate, granite, and pyrite. It ranks first in talc, abrasive garnets, emery, wollastonite, and ilmenite. N. Y. S. has been the leading manufacturing state since 1840. Clothing manuf. is the largest industry, followed by printing and publishing, food processing, and the manuf. of machinery, rugs, carpets, textiles, transportation equipment, furniture, refined petroleum, scientific and precision instruments, electrical equipment, tobacco products, chemicals, paper, and

leather goods. Almost two-thirds of the manufacturing output is concentrated in the New York City area, centring in the port of New York, which handles 25 per cent of U.S. domestic trade and 50 per cent of its foreign commerce.

New York State Barge Canal, see CANAL.
New York 'Sun' was founded in New York City in 1833 by Benjamin Day, who wrote, ed., and printed the paper by himself. In 1868 it passed into the hands of Charles A. Dana, a brilliant, sarcastic, often sardonic editorial writer, who forced upon his staff a style of such high level that the *Sun* was for years the American newspaper man's bible. Dana maintained his own domestic and foreign news service, desiring to have accounts that were different from the highly standardised ones then sent out by news-gathering associations. He was succeeded by Wm M. Laffan, who kept up the paper's high standard until his death in 1909. Frank A. Munsey bought the *Sun* and the *Evening Sun* in 1916, merging the morning ed. with the *New York Herald* in 1920, but continuing the evening paper under the shorter name, *Sun*. The *Sun* ceased pub. in Jan. 1950, and was amalgamated with the *World-Telegram*.

'New York Times' was founded in New York City by H. J. Raymond in 1851. The paper had a chequered existence, and was moribund when Adolph S. Ochs, who had made a success with the *Chattanooga Times*, bought it in 1896. Ochs had the ideal of a conservative paper which would never indulge in yellow journalism, and adhered strictly to that programme. To-day the *N. Y. T.* has its own special correspondents in all the great cities of the world. When Ochs became firmly seated in the saddle, to distinguish his paper from the yellow journals, he adopted the motto which is still printed on the first page, 'All the News That's Fit to Print.' The *N. Y. T.* not only prints it, but does so in *extenso*. Its Sunday issue is enormous, averaging about 400 pages. In politics it is Democratic, but independent. See E. Davis, *History of the 'New York Times'*, 1921.

New York 'World' was founded in New York City in 1860 and taken over by Manton Marble, who ed. it until 1883, when it was purchased by Joseph Pulitzer, who had made a success with a newspaper in St. Louis. Pulitzer 'shook up the journalistic dry bones' of the metropolis by the methods of the new journalism and 'stunts.' The paper soon achieved wide circulation. But there was a firmer foundation to its appeal to the public in that Pulitzer made of the jour. a great liberal newspaper right in the heart of conservative New York. In 1931 it was amalgamated with the *New York Telegram*, and became the *World-Telegram*. On 4 Jan. 1950 the *World-Telegram* absorbed the *Sun* and became the *World-Telegram and Sun*.

'New Yorker,' literary and satirical U.S. weekly magazine, first issued in Feb. 1925. Its chief owner was Harold Ross, who also ed. it. It is pub. by the New Yorker Magazine Inc., whose offices are

at 25 W. 43rd Street, New York 18. It estab. a type of pictorial joke, in which written explanation was reduced to a minimum and attention directed on the joke even at the cost of visual accuracy. This style has had great influence on comic art in America and Europe. The *N. Y.* has, from its first issue, maintained a frankly optimistic and boisterous outlook. It is the nearest Amer. counterpart to *Punch*, but possibly has a less national appeal, being particularly styled to suit the inhab. of New York City. It also contains rather more technical articles than are found in *Punch*.

New Zealand. The dominion of N. Z. consists of 2 large and sev. small is. in the S. Pacific. The is. forming the dominion proper for general practical purposes are the N. Is., the S. Is., and Stewart Is., each with its adjacent islets, and the Chatham Is. Outlying is. included within the boundaries as proclaimed in 1847 are Three Kings Is., Auckland Is., Campbell Is., Antipodes Is., Snares Is., Bounty Is., and Solander Is. Is. annexed to N. Z. are the Kermadec Is. (annexed in 1887), Cook Is. and other Pacific Is. (all annexed in 1901). The Pacific Is. consist of Niue or Savage Is., the S. Cook group (Rarotonga, Mangaia, Atiu, Mitiaro, Aitutaki, Mauke, Takutea, Manuae), and the N. Cook group (Palmerston Is., Penrhyn or Tongareva Is., Manahiki Is., Rakahanga Is., Pukapuka or Danger Is., Nassau and Suvarrow Is.). The proclamation of Brit. sovereignty over N. Z., dated 30 Jan. 1840, gave the boundaries of what then constituted the colony, but these were changed by letters patent in 1842, by the Imperial Act of 1863, and again by proclamation in 1901. The boundaries extend approximately from 33° to 53° of S. lat. and from 162° E. long. to 173° W. long. The N. Z. Gov. also administers W. Samoa, at first under a League of Nations mandate and latterly under a trusteeship agreement of the U.N.; and, jointly with the U.K. Gov. and the Gov. of Australia, holds the trusteeship over Nauru Is. In 1923 the coasts of the Ross Sea, with adjacent is. and ters., were declared a Brit. settlement under the British Settlements Act, 1887, and named the Ross Dependency. In 1925 the Union or Tokelau Is. were excluded from the Gilbert and Ellice Is. colony and put under the administration of the governor-general of N. Z., and later delegated to the administrator of W. Samoa. The total area of N. Z. (excluding mandated ter., Ross Dependency, and Tokelau Is.) is 103,723 sq. m.; N. Is. and islets 44,281 sq. m.; S. Is. and islets 58,093 sq. m.; Stewart Is. and islets 670 sq. m.; the Chatham Is. 372 sq. m. (total, dominion proper, 103,416 sq. m.); 'outlying' is. 307 sq. m.

Coast. The coastline of N. Z. is very long in proportion to its area. Since nearly the whole of the N. Z. land mass lies parallel to the direction of its mt ranges it is not greatly indented and there are few natural harbours. Even where natural harbours do exist, like those on the E. coast of the N. Auckland Peninsula, they are often of little economic consequence owing to their unfavourable situa-

tion. The only 2 safe natural harbours of the N. Is. of which the fullest commercial use can be made are Auckland and Wellington. The prin. straits are Cook Strait, Foveaux Strait, Coromandel Channel, and French Pass. The Is. of Kapiti is in Cook Strait, and Ruapuke Is. in Foveaux Strait, whilst there are sev. is. and islets off the coasts of the main is.

Mountains. The mountainous character of N. Z. is one of its most striking physical features. In the N. Is. mts occupy about one-tenth of the surface, but with the exception of the 4 volcanic peaks of Egmont (8260 ft), Ruapehu (9175 ft), Ngauruhoe (7515 ft), and Tongariro (6458 ft) they do not exceed 6000 ft in altitude. Of these 4 the first-named is regarded as extinct, and other volcanoes include Mt Tarawera and White Is., both of which have in recent times erupted, with disastrous consequences. Closely connected with the volcanic system are the multitudinous hot springs and geysers. The S. Is. contains much more mountainous country than is to be found in the N. Along almost the entire length runs the great chain known as the S. Alps, rising to its culmination in Mt Cook (12,349 ft), and no fewer than 17 peaks of this range are over 10,000 ft high. Owing to the snowline being low in N. Z., many large and beautiful glaciers exist, the Tasman Glacier (S. Alps), over 18 m. long and 1½ m. wide, being the largest. In the N. Is. the 2 prin. ranges are the Ruahine Range and the Tararua Mts. To the W. and N. of the Ruahine Range are the Kaimanawa and other ranges. The volcanoes of Tongariro and Ruapehu are to the S. of Lake Taupo; the most noteworthy peak in the N. Is., Mt Egmont, stands in the centre of a promontory on the SW. coast and is conical in shape. The S. Alps are crossed at intervals by low passes, and their highest summits are covered with perpetual snow, and have immense glaciers in their higher valleys. Between Mt Franklin and the W. coast are the Paparoa Mts, and between these and the E. coast are the Kalkoura Mts (highest peaks Tapuenuku, 9465 ft, and Alarm, 9400 ft, with 9 others over 7700 ft). The chief peaks of the S. Alps besides Mt Cook are Tasman (11,475), Dampier (11,287), Silberhorn (10,757), Lendenfeldt (10,450), David's Dome (10,443), Malte Brun (10,421), Torres (10,376), Teichmann (10,370), Sefton (10,354), Haast (10,294), Elie de Beaumont (10,200), Douglas Peak (10,107), La Pérouse (10,101), Haidinger (10,059), De la Bèche (10,058), The Minarets (10,058), Aspiring (9975), Hamilton (9915), Glacier Peak (9865), Aiguilles Rouges (9731), Nazoni (9716), Darwin (9715), Chudleigh (9686), Annan (9667), Lowe (9653), Haeckel (9649), Le Receveur (9562), Goldsmith (9532), Big Mac (9511), Conway Peak (9510), Bristol Top (9508), Walter (9507), Grey (9490), Green (9307), Hutton (9297), D'Archiac (9279), Bell (9276), Hochstetter Dome (9258), Earnslaw (9250), Nathan (9200), Barnicoat (9183), Silbald (9181), Arrowsmith (9171), Spencer (9167), The Footstool (9073), Rudolf

(9039), and The Dwarf (9025). There are also at least 90 other named peaks all over 8000 ft, and 50 over 7500 ft. Although N. Z. is mountainous it has extensive plains, lying mostly on the W. side of the N. Is. and on the E. side of the S. Is. The general character of N. Z. scenery is similar to that of the Brit. Is., although the latter have nothing like its mts, lakes, hot springs, geysers, etc.

Rivers. N. Z. abounds in rivs., most of which are, however, shallow and rapid. Owing to the steep grades of their channels, few are suitable for navigation,

strip of coastal plain and cut their channels through old glacial drifts which at one time furnished rich leads of alluvial gold. Chief rivs. flowing from the central portion of the S. Alps to the Tasman Sea are the Taramakau, Arahura, Hokitika, Wanganui, Wataroa, Waiho, Karangarua, Haast, and Arawata. All these rise in glaciers and their valleys are noted for their magnificently diversified bush and mt scenery. The general features of the rivs. which flow into the W.-coast sounds are somewhat similar except that few rise in glaciers, and the rivs. on the E.

New Zealand Government

PEMBROKE ROAD, WAKATIPU, SOUTH ISLAND

except near their mouths, but to compensate for this drawback they furnish ideal sites for power plants; and no country S. of the equator, except Chile and Patagonia, possesses greater stores of energy conveniently placed. The rivs. flowing into the Tasman Sea are the Waikato, Wairoa, Mokau, and Wanganui, and they are useful for modern transport, especially the Waikato. This riv. rises in the snows of Ruapehu, and flows in a northerly course for 20 m. as a mt torrent till it reaches Lake Taupo, on leaving which it plunges over the Huka Falls, formed by a hard ledge of volcanic rock, and then runs first NE. and then NW. till it reaches the sea. The central and S. parts of the Tararua and Rimutaka ranges are drained by the Manawatu, Otaki, and other streams running into Cook Strait by the Hutt R. which flows into Wellington harbour, and by the Ruamahanga and its tribs. Sev. large rivs. rise in the Ruahine Mts and their northerly extensions. In the S. Alpine system, the streams flowing to the W. coast of S. Is. cross the narrow

slope of the Alps present features similar to those on the W. coast in their upper courses, but their valleys are broader and flatter. The largest of these rivs. is the Clutha, its vol. of discharge being greatest of any riv. in the dominion. Portions of the course of the Clutha are navigable, though only to a limited extent; but it is important commercially because it has yielded, by means of dredging operations, large quantities of gold. The Jacobs, Oreti, Mataura, and Taieri rivs. belong to the Southland and Otago dists.; forming the N. boundary of the Otago prov. dist. is the Waitaki, which drains a large area of Alpine country, and includes in its basin Lakes Tekapo, Pukaki, and Ohau; its main affluents are the Tasman and the Godley. The chief rivs. rising in glaciers on the S. Alps are the Rangitata, Ashburton, Rakai, and Waimakariri, and further N. are the Hurunui and Waiau.

Lakes. The N. Z. lakes are usually attributable to the filling up of hollows formed by faulting or warping, or by

volcanic explosions, or by the irregular accumulation of material round volcanic vents, or to the interference with riv. valleys by glaciers; and, since all these agencies have operated on an extensive scale in N. Z. in comparatively recent geological times, it is not surprising that its lake systems are well developed. The striking lakes of the middle of N. Is. are due to volcanic action; those in S. Is. to glacial action. Hence there are 2 distinct types of lake scenery. In the S. Is. the lakes lie amidst splendid mt scenery, their waters 'rendered milky-white at times with the finest of sediment worn from solid rocks by powerful glaciers, and swept down to the quiet waters of the lake by turbulent glacial torrents.' In the N. Is., the relief of the land near the volcanic lakes being by no means marked, the shores of the lakes are rarely precipitous, and their scenic interest depends on their surrounding subtropical bush and partly on their desolate and forbidding environment. The largest sheet of fresh water in N. Z. is Lake Taupo, in the heart of the N. Is., at an elevation of 1211 ft above the sea (area 238 sq. m., greatest length 25 m., greatest breadth 17 m., maximum depth 534 ft). Near the middle of the lake lies the is. of Motutaiko, probably the summit of a volcanic cone. The lake forms an enormous reservoir of power conveniently located for exploitation. An interesting group of lakes lies in the midst of the thermal region to the NE. of Lake Taupo. These comprise Rotorua, Roto-itī, Roto-ehu, and Rotomā. The largest lake of the SE. group is Tarawera, N. and W. of Mt Tarawera; others are Rotokakahi, Okaroku, and Okataina, all owing their interest to the thermal action which occurs near them, and to their fishing, for they are especially well stocked with trout. Some 40 m. from the E. coast, in Hawke's Bay dist., is Waikare Moana (21 sq. m. in area), lying 2015 ft above sea level, and having a maximum depth of 846 ft. Along the coastline are many small lakes, such as Rotokawa and Horowhenua; and a large shallow expanse of water occurs near the mouth of the Wairarapa valley, called Lake Wairarapa.

In the S. Is., in the Grey R. valley, are 2 fair-sized lakes, Brunner, 15 sq. m., and Poerua—the former bounded on 2 sides by high wooded granite peaks. A beautiful sheet of water is Lake Kanieri (8 sq. m.) in the basin of Hikitika R., near Mt Tuhua. On the E. side of the main divide lie the great valley lakes belonging to the riv. basins. These include Lakes Sumner, Coleridge, Heron, Tekapo, Pukaki, Ohau, Wanaka, Hawea, Wakatipu, Te Anau, Manapouri, Monowai, Hauroko, and Pōteriteri.

Before the eruption of Mt Tarawera in 1886, the Rotomahana Lake was widely celebrated for its pink and white terraces and boiling springs, which were then destroyed. The hot springs of the N. Is. form one of the most remarkable features of N. Z. They are found over a large area, stretching from Tongariro, S. of Lake Taupo, to Ohāewai (a distance

of 300 m.); but the prin. seat of hydro-thermal action appears to be in the vicinity of Lake Rotorua, 40 m. NNE. from Lake Taupo. In spite of the destruction which was wrought in 1886, the natural features of the country, lakes, geysers, and hot springs (which last-named possess remarkable curative properties in certain complaints), are still very attractive to tourists and invalids. The importance of conserving the famous region as a sanatorium for all time has been recognised by the gov. and it is dedicated by a statute to that purpose.

Geological formation. The geological hist. of N. Z. is as complex and as ancient as that of a continent. Lava probably persisted in the N. Z. area from the oldest Palaeozoic age, or even earlier. The 2 important geological periods for N. Z. are those that followed the 2 latest mt-building movements, the Kaikoura deformation of the late Tertiary time, and the Hōkonui deformation of the early Cretaceous. The deposits of the intervening period of relative crustal stability cover a large part of the land, and contain all the coal and most of the limestone of the country. The soils on which grow the forests, pastures, and crops are of post-Tertiary age, and the great bulk of the gold has been won from deposits formed during the same period.

Seismology. Earthquakes are, unfortunately, somewhat frequent in N. Z., that of 1931 being especially severe. The earthquakes of the Auckland Peninsula, a seismically sensitive dist., may be locally severe, but are not usually felt far from their point of origin. The tectonic earthquakes along the main earth-fold, however, shake large areas; but, fortunately for N. Z., the most severe earthquakes originate along the great shears that cut the submerged flank of the main fold 200 m. E. of the N. Is. Many great faults and fault zones have been traced by seismologists for long distances, but a few only have been active since European occupation. Recent levellings indicate that the earth block towards the E. is sinking somewhat irregularly, a movement causing some of the innumerable local aftershocks still being felt in that area. Other sensible earth movements occurred in connection with the Taupo earthquake of 1922, the Amuri earthquake of 1888, the Wellington earthquake of 1855, and probably the Awatere earthquake of 1848. In 1929 the NW. part of S. Is. was visited by a severe earthquake which was felt over the whole dominion, but only 17 lives were lost, as against over 200 in the much more severe earthquake which occurred in Feb. 1931 in N. Is., with disastrous results to the tns. of Napier and Hastings in the prov. dist. of Hawke's Bay (in Napier about 145 persons lost their lives).

Climate. The climate of N. Z. is temperate and healthy, and similar to that of Great Britain, save that it is warmer and more equable. More rain falls on the W. than on the E. coast, and the climate is more equable on the former. Naturally considerable variations are met with in

different parts of a country which extends for over 1000 m. from N. to S.; the extreme N. of N. Is. is subtropical in character, whilst severe frosts and deep snow on the uplands are common in winter in the S. Is.

Flora and fauna. The only pre-European mammals were the Maori rat and the now extinct dog, but there were also native bats. The native plants are numerous and include many peculiar species. There are about 120 indigenous forest trees, all of them evergreen; the kauri pine, sev. kinds of cedar, red and white birches, and the iron-wood tree may be mentioned. A great variety of ferns is found, and large tracts are covered with nutritious indigenous grasses which support over 32,000,000 sheep. The N. Z. flax (*Phormium tenax*) is a plant of considerable importance, being much used in rope-making. With few exceptions the most beautiful flowers of N. Z. belong to the high-mt flora. There are giant buttercups, white and yellow (but nearly all the flowers are of these colours), and they are to be seen by the acre; there are also lovely ourisias, with the flowers in whorls round the stem, as in some of the Asiatic primulas; forget-me-nots, yellow, bronze, purple, or white; the snow-groundsel, with marguerite-like flowers; and edelweiss, far surpassing the Swiss. But the chief plant of the mts is the *Celmisia*, whose leaves cover subalpine slopes with a mantle of white. Birds are numerous, and also include many species peculiar to the country, such as sev. flightless and weak-winged types. These include the kiwi (see *APTERYX*), kakapo or ground parrot (*Strigops*), takahe (*Notornis mantelli*), and the extinct moa and *Aptornis*. There are also the parrots kea and kaka. Fresh-water fish, with the exception of eels, are not plentiful, though many lakes and rivs. are well stocked with trout; but many varieties of edible fish are found on the shores, and excellent oysters. Sharks are common, but rarely attack man, and penguins are found on the islets of the far S. and elsewhere. Amongst sea mammals whales are the most important, and at one time extensive whaling was carried on, but the industry has declined greatly since 1840. There are no reptiles beyond various species of lizards and frogs. The only poisonous land animal is the *katipo*, a beach spider.

With the advent of Europeans the whole face of the fauna of N. Z. was changed. Capt. Cook introduced the first pig in Queen Charlotte Sound in 1773. With settlement sheep, cattle, and horses, and other domestic animals, were brought; also song-birds, and animals, birds, and fish for sport, such as deer, trout, pheasants, and quail. But the introduction of rabbits, stoats, and weasels was an irretrievable blunder, owing to the damage wrought by these animals to vegetation and bird life.

Railways. Construction on the first railway in N. Z. was begun in 1860 and the first part opened in 1863. The line ran from Christchurch to Lyttelton. All railways in N. Z. are now state-owned save

some 180 m. and private lines to factories, etc. In 1945 there were 3504 m. of railway, 1684 being on the N. Is. and 1820 on the S. Is. In 1955 the total revenue received from railway and ancillary road services was £31,285,000; expenditure was £29,417,000. In recent years there has been a great development of Dieselelectric trains and rail cars.

English Electric Company

HYDRO-ELECTRIC POWER

Piriapua power station of the Waikaremoana scheme, containing two 28,000-h.p. water turbines. The operation of this station is completely automatic.

Shipping. Regular and frequent steam traffic exists between all the prin. ports of N. and S. Is., and communication is maintained with Australia, England, and America. The prin. lines are the N. Z. Shipping Co.; the Union Steamship Co.; the Oceanic Steamship Co.; Shaw Savill and Albion Co.; Blue Star Line; and Port Line. The prin. ports of the country are Auckland and Wellington in the N. Is., and Lyttelton and Port Chalmers in the S. Overseas shipping showed a marked increase after the Second World War. The total of ships entering in 1955 was 2200, being more than 3 times the average for 1938-9, which was 635. Net tonnage in 1955 was 9,184,000. About four-fifths of the ships entering were British.

Airways. Complete control of air transport as a national service was estab. by an Act of 1945. All internal airways are operated by the N. Z. Airways Corporation which was set up by the Act. Tasman Empire Airways Ltd., a N. Z. company, operates services to Australia and Fiji. Passenger miles flown by internal scheduled services in 1955 were

93,890,000, and miles flown 6,195,000. On external services (by T.E.A.I.) 4,237,000 m. were flown and 51,000 passengers carried.

Fisheries. With its great length of coastline N. Z. has always been famed for the productivity of its fisheries. Off its more northerly coasts subtropical fish are found and off the S. coasts are found cold-water fish and the fur-bearing seal. The most important edible fish are the schapper, the tarakihi, mainly taken by trawlers in the waters of the Hauraki Gulf, Bay of Plenty, Hawke's Bay, etc., and a variety of flounders, blue cod, and the groper. The fishing industry is controlled by the marine dept and all engaged therein commercially must hold a licence. The most important fishing ports are Auckland, Wellington, Thames, Timaru, Napier, Port Chalmers, Lyttelton, and The Bluff. There are extensive oyster beds in Foveaux Strait and on the E. and W. coasts of Auckland. Crayfish occur in abundance and also N. Z. whitebait. There is a small whaling industry, and seals are taken under strict gov. supervision.

Minerals and mining. The gold-mining industry has declined in importance since the early stages, when it contributed so largely to the progress and settlement of N. Z. The chief minerals are gold and silver, platinum, osmiridium, tungsten ore, iron, silica sand, stone, pumice, sulphur, and coal. The value of gold mined in 1953 was £488,703 (38,656 oz.); silver, £23,292 (75,888 oz.); coal, £6,419,000; tungsten ore, £40,091; limestone for agriculture, £1,121,013; and silica sand, £73,451. Other minerals include copper, manganese ore, cinnabar, tin (cassiterite in the form of 'stream-tin' occurs near Port Pegasus), petroleum (drilling has been carried out in recent years in Taranaki, Hawke's Bay, and Canterbury), kauri gum, phosphate rock, greenstone. N. Z. has a great variety of handsome and durable building stones. Valuable non-brickmaking clays are found. Uranium deposits have been discovered in the Buller Gorge.

Agriculture. N. Z. is primarily an agric. country: much of the soil is rich, varied, and fertile, the climate mild and equable, and the countryside well watered. While it is mainly a grazing country noted for its dairy cattle and sheep, crops of wheat, oats, and roots are extensively grown. Two-thirds of the surface of N. Z. is suitable for agriculture and grazing and the total area under cultivation in 1946 was nearly 20,000,000 ac. The chief crops grown are wheat (73,000 ac. in 1955-6, 123,751 ac. in 1948), oats (36,000 ac.), and barley (44,000 ac.). In various parts of the N. Is. fruit-growing, especially apples, pears, and peaches, is carried on extensively. Citrus fruits are produced, and lemons in particular are cultivated on a considerable scale. There is an export trade in apples and pears.

Forestry. All state forests and related afforestation activities are controlled by the State Forest Service headed by the director of forestry. In Mar. 1946 the

area of state forests was 9,189,763 ac., representing 13.8 per cent of the total area. The policy is one of conservation and expansion, particularly with a view to combating soil erosion. The prin. softwoods include white pine, mt cedar, kauri (the largest and most celebrated tree of N. Z.), black pine, miro (used in house-building), silver pine, tanekaha, and totara; hardwoods, black, hard, red, and silver beech, black-maire, hinau, kamahi, kokehoe (sometimes called cedar), manuka, or tea-tree, pukatea, N. and S. rata, rewarewa, and tawa. The prin. timbers milled in N. Z. are rimu and kahikatea. The value of forest products in 1953-4 was £17.2 million.

Commerce. The chief industries of N. Z. are the meat freezing and preserving industry and the butter, cheese, processed milk, and allied industries, and the new newsprint industry (see KAWHAU and KINLEITH). Next to these come the saw-milling, paper and printing, engineering, and textile industries. The prin. exports are wool, butter, cheese, frozen meat, hides, skins, and gold. About 80 per cent of exports go to Brit. countries, and the U.K. supplies about 50 per cent of imports. The prin. exports in the calendar year 1955 were: wool, £93,780,000; dairy produce, £70,051,000; meat, £68,194,000. Total exports were £258,850,000. Imports in 1954 totalled £245,820,000 c.i.f. (Cost, Insurance, and Freight), value: machinery and transport equipment, £61,489,000; textiles, clothing, and footwear, £35,372,000; food, beverages, and tobacco, £24,829,000; mineral fuels, £14,964,000; chemicals, including manuf. fertilisers, £13,327,000; base metals and manufs. of metal, £27,135,000.

In 1936 the gov. introduced a guaranteed price system for dairy produce, to ensure stability of income for producers, and undertook the marketing of the purchased produce. During the Second World War this system was extended to all farm produce in effect, by the system of bulk purchase agreement entered into with Britain, and the arrangement continued until 1955 except for wool (1949). The vol. of production of secondary industries, that is, those not connected with processing primary products, increased by 47 per cent between 1938-9 and 1946-7, and the numbers employed increased by 30 per cent. In the main, expansion has been in the development in new branches of existing industries such as engineering, textiles, and clothing. N. Z., however, lacks supplies of some vital industrial raw materials, e.g. iron, and there is a shortage of power supply, despite the many hydro-electric schemes.

State participation in economic activities has long been a familiar feature in N. Z., and increased during the term of office of the Labour Gov. (1935-49). It takes the form of direct state action, as in railways, tourist services, and broadcasting, and also of controls designed to ensure state direction of the country's economy, whilst leaving its administration to private enterprise.

Population. The pop. of N. Z. is

divided into the Maori and European pop., the Maoris being the native inhab., though another people had preceded them (*see* MAORIS). The Maoris are the finest in physique and the highest in intelligence of all the Polynesian peoples. Their language is a Polynesian dialect differing but slightly from the Hawaiian and other similar languages. The European pop. has shown an unbroken increase over the past 100 years, and the early preponderance of men over women has now been eliminated, the proportions being about equal. Immigration, which supplied the greatest source of pop. increase in the past, has gradually slowed down; in 1931-5

High Commissioner for New Zealand
OTAGO UNIVERSITY

there was a net exodus; in 1948 arrivals were 33,144, and departures 27,388.

The 1956 census gave the pop. of N. Z. as 2,172,350, inclusive of 135,015 Maoris. N. Is. pop. was 1,496,155, and S. Is. 676,195. The chief towns with pops. including Maoris were Wellington, 138,035; Lower Hutt, 47,756; Auckland, 380,412; Christchurch, 193,183; Dunedin, 99,326; Invercargill, 34,293; Palmerston N., 37,751; Hamilton, 40,600; Wanganui, 32,106; New Plymouth, 28,282; Hastings, 27,773; Napier, 27,492; Timaru, 34,700; Gisborne, 22,607; Nelson, 22,509.

In the 1956 budget the finance minister, J. T. Watts, budgeted for a Consolidated Fund surplus of £3.7 million from revenue totalling £204,100,000. Social security fund revenue for the year to 31 Mar. 1956 was £74,111,000, and expenditure £72,883,000.

Religion and education. There is no state Church, and no state aid is given to any form of religion. The main religious denominations in order of strength (1951) were as follows: Church of England, 37.8 per cent; Presbyterian, 24.3 per cent;

Rom. Catholic, 13.6 per cent; and Methodist, 8.1 per cent. There are small numbers of representatives of other Christian denominations and a few Hindus, Confucians, and Jews. Education is free, secular, and compulsory. The central administration of education is vested in a minister of education, and the local control is in the hands of 9 education boards, and of school committees. There are nearly 2000 public primary schools (314,561 scholars on the rolls in 1954). Secondary education is provided at 47 secondary schools, 100 dist. high schools, 28 technical high schools, and technical day schools. There are 9 secondary schools for Maoris besides many native schools and Maori mission schools. For higher education, there are 4 endowed colleges affiliated to the univ. of N. Z., and each specialises in one or more directions. At Dunedin, the special subjects are mining, medicine, dentistry; at Christchurch, engineering and chemical engineering; at Wellington, law and science; and at Auckland, commerce, engineering, architecture, and medicine. There are agric. colleges at Lincoln, Canterbury, and at Palmerston N. (Massey College), and there are 7 schools of mines besides the Otago Univ. School of Mines.

Social conditions. There is extensive legislation governing hours and conditions of work and basic wages in all sections of industry and agriculture. An 8-hour day is in force and disputes are settled under an Arbitration Act. A Social Security Act, passed in 1938, became operative on 1 April 1939. The prin. objects of this legislation are (i) to substitute for the system of non-contributory civil pensions, e.g. old age, widows' and other pensions, a system of monetary benefits on a contributory basis; (ii) the inauguration of a system of medical and hospital benefits, and of other related benefits. Mention may here be made of the work of Sir Frederick Truby King (1858-1938), a N. Z. physician b. at Wellington. He founded, in 1907, the Plunket Society for the health of women and children, and from 1921 to 1927 was director of child welfare in N. Z., achieving most beneficial results in the lowering of the child mortality rate.

Defence. A council of defence, consisting of 5 Cabinet ministers, the chiefs of staff of the services, and the secretary of the Treasury, deals with defence policy and organisation; it acts only in an advisory capacity and responsibility for decisions rests with the Cabinet. The minister of defence is the president of each of the 3 service boards which are concerned with training and administration. The N. Z. Army is a small regular force supplemented by the territorials. The decision to adopt compulsory military service (reversed in 1958) entailed a considerable increase in the total personnel. The navy includes the cruisers *Royalist* and *Black Prince*, 6 frigates, 2 corvettes, 10 trawlers, a survey vessel, and 4 coastal craft. The gross intake of men into the armed forces between 1939 and 1945 was estimated at 224,000, of whom

160,000 joined the army, 12,000 the navy, and 52,000 the air force. In addition, 10,000 women served in the forces. Total deaths in the services and mercantile marine were 11,625.

Constitution and government. The country was at first a dependency of New S. Wales, but was separated by letters patent in 1842. Its settlement was effected largely by the N. Z. Co., with a royal charter, which was surrendered in 1850. By an imperial statute of 1847 N. Z. was divided into 6 provs., later 9, Auckland, Taranaki, Wellington, Nelson, Canterbury, Otago, Hawke's Bay, Westland, and Marlborough, each governed by a superintendent and elected prov. council. In 1876 the prov. system of gov. was abolished, the powers previously exercised by superintendents and prov. officers passing to the governor or local boards, and the country was divided into cos. and bors. An Act granting representative institutions to N. Z. was passed by the Imperial Parliament on 30 June 1852. Under that Act the constitution of a General Assembly was provided for, to consist of a Legislative Council and a House of Representatives. The first session of the General Assembly was opened in May 1854, but the members of the executive were not responsible to Parliament. The first ministers under a system of responsible gov. were appointed in 1856. In 1907 the style and designation of the colony of N. Z. was altered to 'The Dominion of New Zealand.' By letters patent, 11 May 1917, the designation of governor was altered to 'Governor-General.' The legislative council was abolished in 1950. Members of Parliament receive a salary of £1100 a year. The members of the House of Representatives are chosen by electors possessing a liberal franchise: registration of electors on the roll is compulsory. Every elector, male or female, is qualified to become a member (women being given the right to be elected to either House in 1919). Every adult Maori in any of the 4 Maori electoral dists. can vote, provided he or she be not registered on any European roll. The House of Representatives now consists of 80, including 4 Maoris elected by the Maoris themselves. Control of native affairs, and the entire responsibility of dealing with questions of native gov., were transferred in 1863 from the Brit. to the N. Z. Gov. In 1865 the seat of gov. was removed from Auckland to Wellington on account of the central position of the latter city. Justice is administered by 10 supreme court judges besides 3 judges in special courts. The police force is a national body maintained wholly by the central gov. The death penalty, except for treason, was abolished by the Crime Amendment Act, 1941, but restored in 1949.

History. The hist. of the is. of N. Z. can be traced back some cents. through the traditions and genealogies of the Maori tribes whom Cook found in occupation, but Britain's influence on the country's destiny began only with the voyages of the great navigator in quest

of the S. Continent (see *TERRA AUSTRALIS INCOGNITA*). Tasman sighted the S. Alps in 1642 but he made no landing. Cook's first voyage off the coast was in 1769-70. Within a brief space of his return in 1771 a plan for the colonisation of the country was put before the Brit. public by Benjamin Franklin and the hydrographer Alexander Dalrymple (qq.v.), but colonisation began only after the loss of the Amer. states had brought the penal settlement of New S. Wales in contact with N. Z. Maori visitors to New S. Wales prompted the sympathetic interest of the colonial chaplain, Samuel Marsden, whose first mission was postponed by the massacre of the crew of the *Boyd* so that it was not till Christmas 1814 that Marsden

High Commissioner for New Zealand

THE TREATY HOUSE AT WAITANGI, BAY OF ISLANDS

The treaty of 1840 was signed here.

preached the first sermon in N. Z. Hongi, the Bay of Is. chief, exploited the missionaries in order to acquire arms for his wars against other tribes. Marsden's intervention, supported by the energy of the Rev. Henry Williams, however, thwarted Hongi's efforts to win a dominating position, and with his death (1828) the bane of intertribal wars was ended. But with no source of tribal authority or guidance, contact with European civilisation threatened the Maoris with political and economic collapse, and in 1830 Marsden suggested to the governor of New S. Wales the desirability of appointing a Brit. representative in N. Z., backed by naval visits in order to control a growing community which was incapable of adjusting itself to change without such control. The immediate result of this suggestion was that the Brit. Gov. sent a resident, James Busby, to the Bay of Is., to be subordinate to the gov. of New S. Wales, but Busby's attempt in 1835 to form a confederation of the united tribes of N. Z. proved abortive. The one man whose influence in N. Z. was profound and enduring was the celebrated Edward Gibbon Wakefield, whose efforts,

despite official and missionary antagonism, to inaugurate systematic colonisation marked, in effect, the dawn of a new era in overseas settlement. Enlisting the support of politicians, religious leaders, business men, and others, he eventually succeeded in his purpose of making N. Z. a Brit. colony in the full sense of the term. It is said that the home gov.'s hand was forced by indications of Fr. missionary infiltration and whaling expeditions in the seas off N. Z., factors which had indeed intensified Wakefield's efforts, for without even troubling himself over official sanction, his N. Z. Co. sent out its prin. agent, Col. Wm Wakefield, in May 1839 in anticipation of the arrival of settlers. In that year the gov. sent out Capt. Hobson, a naval officer, to negotiate with the Maori chiefs for the recognition of Brit. sovereignty, and the result was the treaty of Waitangi (6 Feb. 1840), the charter of Maori rights and a treaty which has had the greatest influence in winning that confidence in the Brit. Crown which has so greatly conduced to the harmonious relations subsisting between 'Pakeha' (white man) and Maori to-day, though in the intervening period there were wars and occasional violations of the treaty.

Hobson was, in effect, the first Brit. governor of N. Z., and under him Brit. law and gov. were estab. in the N., where the Maoris were most numerous and where the H.Q. of the N. settlement were moved from the Bay of Is. into Auckland, which in 1841 became the seat of gov. It was, none the less, the organised colonisation of the N. Z. Co. which ultimately had the most influence on the character and the plan of the new colony. Under the company's aegis was founded Wellington, while new colonies were estab. all round the coast by bodies of settlers who gave to them the names of their places of origin, e.g. Dunedin in Otago harbour, founded by the Free Church of Scotland in 1848, and Christchurch, founded by the Canterbury Association in 1850. The later settlements, profiting by their predecessors' errors, devoted themselves to pastoral activities from the outset and thereby founded N. Z.'s first staple industry. Land settlement, generally, did not expand as the company had hoped, and for many years settlers preferred to work in the tns for wages. A still greater error of the company was to ignore the validity or otherwise of the title to land sold to them over the heads of the Maori occupiers. Over this and other matters, such as the imposition of customs duties, discontent flared up into actual warfare in the N. in 1845, but the Brit. Gov. recalled Hobson's vacillating successor, FitzRoy (q.v.), and sent out the famous Sir George Grey (q.v.), governor of S. Australia, who soon compelled the Bay of Is. tribes to sue for peace. This was the period of Lord Durham's celebrated report on Canada, recommending the management of internal Canadian affairs by a Cabinet responsible to the Canadian electorate (*see* DURHAM REPORT), and in relation to N. Z. the Brit. Gov. agreed to the view of the N. Z. Co. that N. Z.

should have representative institutions. An Act to that effect was passed in 1846, though Grey was opposed to its proposed div. of the country into European and Maori dists., it being evident to him that the Maoris would never agree to a gov. in which they had no share. His arguments prevailed with the gov. and the Act was suspended pending a new Act of 1852. Though Grey had thus delayed self-gov. in N. Z. for 6 years it is still open to question whether the colony was really ready for it in 1852. The New Zealand Constitution Act of 1852 was a liberal measure for its time and, subject to subsequent amendments, it is still the basis of the constitution of N. Z. The Act, however, did not go so far as to provide for responsible gov. A motion seeking ministerial responsibility was moved in the local Assembly by Gibbon Wakefield, himself now a colonist, and this being almost unanimously passed, the Brit. Gov. acquiesced (1856). Thus within less than 2 decades of the setting up of Brit. authority in N. Z. (1840) that authority, with but a single important reservation, had been transferred to the colonists so far as their domestic affairs were concerned.

There were 2 Maori wars: the first lasted from 1845 until 1848; the second from 1860 with little intermission until 1870. But fully one-half of the tribes have always been friendly to the English and many of them fought on the side of the colonial gov. against their own countrymen. Permanent tranquillity was estab. in 1871 throughout the country. The real cause of the outbreak of 1860 was that the tribes and their chiefs felt that their traditions and whole way of life were jeopardised by the colonists, who had now so firmly estab. themselves that, in the S. Is., most of the land had been transferred to the Crown for nominal sums, while even in the N., where Maori settlements were much larger, the Crown owned 4,000,000 ac. Moreover the Maoris realised that they had no share or voice in the constitution, whence the Maori King movement or attempt to create a Maori state within the state; but mutual suspicion between Maori and European settler was incompatible with any hope of success for this movement. The operations in Taranaki (q.v.) lasted about a year, ending in Mar. 1861. Colonial volunteers and militia, in addition to imperial troops, had taken part in the campaign. At this juncture Sir George Grey returned to N. Z., having volunteered his good offices; but his efforts to win back the confidence of the tribes were in vain and the hopes of peace receded. The tribes of the Waikato, the heart of the Maori King movement, were preparing to renew the fighting. Brit. troops from Taranaki invaded the Waikato in July 1863. Meanwhile there was a protracted dispute with the Brit. Gov. as to whether the wars were justified and whether the use of imperial troops could be defended, and as to how far the colonial gov. was empowered to make war on its own responsibility. In the

result the colony, recalling Wakefield's advice to do so, relied on its own financial and military resources and the war at length seemed to die away. But in 1868 there was a fresh outbreak in Taranaki under a clever guerrilla leader, Te Kooti. At this moment of danger the home gov., anxious to rid itself of the colony's wars, withdrew the one imperial regiment then in N. Z. (1870), so that this later campaign was fought and won by colonial levies aided by friendly tribesmen. Maori losses were considerably heavier than those of the colonists, which were only a few hundred, and the Maoris had lost much of their belief in their own destiny as a race. Fortunately, however, there have always been tribesmen, such as Te Waharoa the 'king-maker,' who have been shrewd enough to grasp European conceptions of statesmanship and thereby foster the hope, gradually realised, that the long struggle would eventually lead the way to partnership. This process was hastened by a Colonial Act providing for the election of 4 Maori members to the House of Representatives and by the passing of the Native Schools Act.

Meanwhile gold had been discovered in Otago, in the valleys of the W. coast of S. Is. (1861-5), and the inevitable gold rushes spelt much, if irregular, development largely enhanced by the ambitious plans of Julius Vogel, a gold-seeking immigrant who had become colonial treasurer and, in that capacity, introduced his famous public works budget of 1870. Under his schemes 100,000 immigrants were brought into the country; railways were built to open up new lands; new industries, including woollen mills, foundries, and paper mills, were introduced. There was a severe reaction later from this 'Vogel boom,' but under Vogel's successor, Atkinson, financial equilibrium was gradually restored. In the early nineties the public debt of N. Z. was no less than £40,000,000, which in itself affords some indication of confidence in the destiny of the country; for the total amount invested in land and mortgage companies operating in N. Z. was £30,000,000, so that the total Brit. investment in the colony was about £70,000,000. Overmuch reliance on the London money market might, however, have seriously depreciated the country's credit and there was a crisis in 1894, when the N. Z. Gov. came to the aid of the Bank of N. Z. by guaranteeing an issue of new shares up to £2,000,000. It was significant, however, that the credit of the country was sound enough to save its leading bank from failure. The ensuing years saw considerable legislative activity in the sphere of fiscal and social reform; thus the Land and Income Tax Act enabled large estates to be compulsorily acquired for settlement, and during 1894-8 were passed a Factory Act, a Shops and Offices Act, an Act for compulsory arbitration in industrial disputes, and an Old Age Pensions Act, all Liberal measures which represented an important change in the progress of N. Z. towards political maturity, besides

revealing what later became emphasised as a characteristic N. Z. outlook, an outlook which has in recent years seen striking manifestation in an advanced social security scheme (1938). This Liberal programme was indeed the fruit of the distribution of power between the gov., as representing the people, and the strong capitalist class, resulting in the development of the country's resources to the general advantage, and it owed its success partly to the work of John Ballance and still more to the notable premiership of Seddon (q.v.). Seddon was in power to the end of his life and by his state coal-mines, state accident and fire insurance, and the like maintained the attitude characteristic of the earlier Liberal reforms; but he was not prepared to accede to more extreme Socialistic demands from the small farmers. The influence of the small farmers increased with each election, and though Seddon's successor, Ward, had no success with them, Massey (q.v.), leader of the new Reform Gov., who had been a working farmer all his life, enjoyed the confidence of the farming community. The development of N. Z. farming had gathered momentum, and the N. Z. farmers believed themselves to be the real masters of the country. In view of the great exports of wool and of dairy products there was some justification for their attitude. Feeling themselves the political masters they demanded the right to purchase their freeholds on reasonable terms, and Massey conceded this right.

Always loyal to the imperial connection, N. Z. freely supported Great Britain in the Boer War of 1899-1902. At the outset Seddon, with the practically unanimous support of the representatives, offered a N. Z. contingent, and some 7,000 officers and men were sent to S. Africa. Throughout his 13 years of office Seddon, of all dominion statesmen, was the strongest supporter of Joseph Chamberlain's dreams of closer union, and at the Colonial Conference (1902) he suggested that each of the self-governing colonies (as they then were styled) should maintain a body of troops especially for imperial service. At the Imperial Conference of 1911 Ward, who shared Seddon's imperial sentiment, put forward a plan for an imperial council to which the sev. dominions (as they now were styled) should elect members on the basis of their pop. But the proposal came to nothing, Asquith, the Brit. Premier, making it evident that the shaping of foreign policy was the exclusive prov. of the mother country. Ward's purpose, however, was to remedy the position that the dominions could be committed to war by the sole decision of the U.K. Gov. However, in 1909, when Brit. naval supremacy was threatened by Germany's programme of construction, N. Z. offered Britain a battleship. In the same year the N. Z. Gov. adopted the principle of compulsory military training. In the First World War an expeditionary force of 10,000 men sailed for the Middle E. and formed part of the famous Anzac Army. In all 117,000

men volunteered or were called up for foreign service, and 7000 for home service; and of these 92,000 were volunteers, conscription being introduced in 1916. During the later stages of the war there was labour unrest, and the N. Z. Labour party of to-day had its origin in those years. Taxation was greatly increased, but the war was financed by loans. N. Z. began the war with a national debt of £100,000,000; by the end of the financial year 1919 it was £176,000,000, much of the increase being, however, met by borrowing on the local market. The most important effect of the war in N. Z. was a ripening of national self-consciousness, coupled

aimed largely at Brit. shipping companies and middlemen. But although the net result of this legislation was the expansion of the farming industries, the restoration of pre-1914 prosperity seemed as remote as ever. The Coates (q.v.) Gov., formed after Massey's death (1925), was not in favour of further borrowing on London, but in 1928 Ward's Gov. was returned to office on a platform of land settlement and railroad development to be financed by loans, and £30,000,000 was borrowed in the next few years. When, however, in the economic crisis of 1930-2, it appeared that the Brit. market for N. Z. farm produce had shrunk, N. Z.'s economy was

High Commissioner for New Zealand
AUCKLAND FROM MOUNT EDEN

with a fuller appreciation of the difficulties and responsibilities of Britain. Massey, however, did not favour the Canadian and S. African demands for separate representation at the Peace Conference and separate membership of the League of Nations, and indeed he viewed those manifestations of nationalism with apprehension, yet he was not prepared to give Britain an unqualified support at every turn. Both Massey and Ward took part in the Peace Conference and duly signed the treaties. N. Z. became a member of the League and accepted W. Samoa as mandatory, giving up her previous desire for outright annexation.

After the war the interdependence of Britain's and N. Z.'s economies remained. N. Z.'s major preoccupation, for her previous prosperity had declined and the efforts to restore that prosperity form the content of economic and political hist. throughout the next 2 decades. This was, in part, effected in the early twenties by the passing of export control legislation

seriously threatened, though after the Ottawa Economic Conference (q.v.) hopes were entertained that the country's dairy produce exports would recover as the result of the institution of preferential tariffs against foreign produce. By the end of 1933 N. Z. was on the road to recovery, mainly through the expansion of the wool market, but in a world in which guns were of greater importance than butter the dairy industry was still at a low ebb, and in 1934 a Royal Commission, appointed to report on the industry, recommended control coupled with more efficiency. N. Z. economic anxieties were further increased in 1935 when the Brit. Gov. decided to tax imported mutton and lamb for the benefit of the home producer. In this crisis the country, under its first Labour Gov., in which Mr Savage secured 55 members in a House of 80, followed the path of economic nationalism. The Labour Gov.'s first important measure of credit policy was to change the Reserve Bank, estab. in 1934, into a Central Bank

to carry out the monetary policy of the gov. By 1938 N. Z. felt that its prosperity had been restored, for in 1937 her exports yielded nearly £67,000,000, almost as high a total as had ever been achieved. This was accomplished during an era of Socialist administration, when high wages were paid and an ambitious programme of public works set afoot as a system of relief for unemployment, pensions were increased, a big housing programme was begun, and the 44-hr week had been introduced; all this had been accomplished without having solved the problem of dairy produce exports, though agreement with Britain had been reached on the question of marketing of meat. But this newly won prosperity rested on an insecure foundation inasmuch as the country was importing more than it could pay for. The gov. found that it could only discharge its liabilities for interest on loans by a policy of restricted trade and in the result a new loan was arranged. Brit. Gov. credits of £5,000,000 for defence and an export credit of £4,000,000 to finance imports were granted as a result of the mission of Walter Nash (q.v.), the N. Z. finance minister. Throughout this period of repeated economic and financial difficulty, however, the will to co-operate with Britain politically was never wanting in N. Z. Common interests strengthened the community of sentiment and political tradition. Conscious of her interests in the Pacific, N. Z. actively supported the construction of the Singapore base (q.v.) and Massey protested when construction was suspended by the Brit. Labour Gov. of 1924. The N. Z. Gov. contributed £1,000,000 when work was resumed. With the return to office of a Labour Gov. in N. Z. in 1935 there was, for the first time, a pronounced difference of views on foreign policy between Britain and N. Z. This difference concerned 'collective security,' belief in which N. Z. shared with the Labour opposition in Britain as the best policy for the empire in general. For the N. Z. Gov. had a strong faith in the League of Nations and had little sympathy with the Brit. Gov.'s efforts to compromise between the moral ideals of appeasement and power politics. None the less, at the Imperial Conference of 1937 N. Z. agreed to co-ordinate her defence policy with that of Britain, and the nearer the clouds of the Second World War approached, the less did the N. Z. Gov. insist on its independent point of view, and the clearer became its sturdy resolve to stand by Britain. The Brit. declaration of war on Germany was regarded as binding on N. Z., and when war came New Zealanders stood loyally where their fathers had stood, side by side with Britain. The N. Z. Gov. agreed to send and maintain a force of 1 div. The achievements of this div., known as 2nd Div., under the command of Sir Bernard Freyberg, V.C. (q.v.) (who became governor-general in 1946), in Greece, Crete, at El Alamein, and in the advance to Tunis and in Italy, culminating in the final advance to Trieste, no less than the exploits of N. Z. members of the R.A.F.

and of the R.N. and an infantry div. which fought in the Pacific with U.S. forces, have added fresh lustre to the hist. of the country, besides emphasising her position as a loyal member of the Brit. Commonwealth of Nations. (See W. P. Morrell, *Britain and New Zealand*, 1944; A. J. Harrop, *New Zealand after Five Wars*, 1947; and the articles AFRICA, NORTH, SECOND WORLD WAR, CAMPAIGNS IN; ITALIAN FRONT, SECOND WORLD WAR, CAMPAIGNS OF; LONG RANGE DESERT GROUP.)

It was not until the end of 1947 that at long last N. Z. adopted the prin. sections (2-6) of the Statute of Westminster and passed a further Act asking the U.K. Gov. to legislate to relieve N. Z. of restrictions remaining, under an amending Act of 1857, on its powers to amend its own constitution, a request which was promptly acted upon by the passage of the New Zealand Constitution (Amendment) Act, 1949, repealing the New Zealand Constitution (Amendment) Act, 1857, and making it lawful for the Parliament of N. Z. 'to alter, suspend, or repeal, at any time, all or any of the provisions of the New Zealand Constitution Act, 1852.'

A national referendum held on 3 Aug. (1949) resulted in an overwhelming majority in favour of the Fraser Gov.'s proposals to institute compulsory military training in N. Z. The returns were: in favour, 533,016; against, 152,443. Sixty per cent of the electorate, including the Maoris, went to the poll. After 14 years in office the Labour Gov. was defeated by the National party, whose leader, S. G. Holland (q.v.), became Prime Minister (Dec. 1949). The Holland Gov. was soon faced with formidable trouble in the waterfront dispute which first began in June 1950, and eventually led to a long strike accompanied by disturbances which led to the formation of a Civil Emergency Organisation to assist in the maintenance of law and order. Ten thousand enrolments were made within a week. The creation of a new independent waterside workers' union proved a decisive set-back to the extremists, and the Prime Minister's firm attitude led eventually to the settlement of a protracted coal strike. On 11 July 1951 the Prime Minister announced in Parliament that the gov. would seek an early dissolution so that the electorate could give an early verdict on the handling of industrial disputes. At the election on 1 Sept., the gov. gained 53.6 per cent of the votes cast against Labour's 46.1, and won 50 out of 80 seats. Meanwhile the country had taken a full part in the U.N. intervention in Korea, 1500 volunteering for service on the first day and 5982 registering altogether for the special artillery force which was sent, with Brigadier R. S. Park in command.

In Mar. 1952 emergency measures taken to meet the financial situation included general licensing of imports, plans to expand production in export industries, and the pushing forward of the Murupara newsprint project. The Reserve Bank took steps to reduce the level of private

imports into N. Z., which had been running at £280 million annually. In Sept. it was announced that assisted immigration would be cut by one-third. The conclusion of the A.N.Z.U.S. pact between Australia, N. Z., and the U.S.A. was the subject of some criticism in the U.K. (which was excluded), but was defended by the Prime Minister as a necessary measure of insurance for the S. dominions.

For N. Z. the coronation of Queen Elizabeth II was made specially memorable by the announcement on the same day of the climbing of Mt Everest by Edmund Hillary and Tensing (qq.v.), members of Sir John Hunt's expedition. Hillary, a N. Z. apiarist, was knighted. He was subsequently selected to lead N. Z.'s Trans-Antarctic Expedition of 1956-8. The visit of the queen to N. Z. in 1953-4 was a triumphal success. Christmas 1953 was overshadowed by the Main Trunk railway disaster at Tangiwa when 151 people lost their lives. In Parliament on 6 July 1954 the Hon. T. Clifton Webb, minister for external affairs, said that N. Z. regarded the formation of a SE. Asia alliance as a matter of extreme urgency. The SE. Asia Treaty Organisation consisted of the U.K., U.S.A., Australia, N. Z., France, Pakistan, Thailand, and the Philippines. Wider in scope than the A.N.Z.U.S. pact, it did not, however, replace that pact.

At the general election of 1954 Labour gained 5 seats and the state of the parties was National 45, Labour 35. On his return from the Commonwealth Conference early in 1955, the Prime Minister recommended that N. Z. should send a force to Malaya to help in the fight against Communist terrorists. In June 1955 the gov. appointed Foss Shanahan, deputy secretary for external affairs, as Commissioner in SE. Asia. The appointment reflected the increased interest and importance to N. Z. of developments in the SE. Asia area. In May 1956 the Prime Minister visited Japan, underlining his belief that a friendly understanding with that country was desirable. The seizure of the Suez Canal by Egypt in 1956 was deplored by both gov. and opposition in N. Z. The gov. subsequently supported Britain's military intervention in Egypt, though not warned of it in advance. In 1957 Sir Anthony Eden visited N. Z. after his health had broken down and he had resigned the Brit. premiership. In 1957 Holland, the N. Z. Premier, criticised the Brit. Gov.'s failure to warn him of the timing of the first hydrogen bomb test at Christmas Is. A N. Z. trade mission to London, led by the minister of agriculture, succeeded in obtaining a 10-year guarantee against any diminution in Britain's purchases of N. Z. dairy exports. In Sept. Holland retired from the leadership of the National party and was succeeded as Prime Minister by K. J. Holyoake (q.v.), his deputy. At the general election in Nov. 1957 the National party was defeated and the Labour party came into power, with the Labour leader Walter Nash (q.v.) as Prime Minister.

Literature and art. As might be

expected, the literary roots of N. Z. are English. In the early days of the colony the time and energies of the settlers were almost entirely taken up with the hard task of developing the country and winning a meagre existence from the soil. Contact with the Maori culture provided them with little else but material for the natural historian. The earliest writing to come out of N. Z. consisted of scientific accounts of the natural hist. and natives of N. Z. Among these early writers may be mentioned Edward Jerningham Wakefield, *Adventure in New Zealand*, 1845; Ernst Dieffenbach, *Travels in New Zealand*, 1843; Sir George Grey, *Mythology and Traditions of the New Zealanders*, 1854. Poetry was even less in evidence in these early years, although a certain amount of rough verse in ballad form was written and disseminated in broadsheets by such men as Wm Golder (c. 1850).

The overriding preoccupation with economics and commerce persisted into the latter half of the 19th cent., and Samuel Butler, who went to N. Z. in 1860, wrote scathingly of the prevailing concern with sheep. At this time a number of minor novelists appeared who wrote long and serious novels of a high moral tone with involved plots and a strong Puritan bias. Lady Barker wrote *Station Life in New Zealand*, 1870, and *Station Amusements in New Zealand*, 1873, and other works of a domestic and semi-fictional character; Mrs C. Evans and Dugald Ferguson were authors of a similar school. At this time also a hist. of the Maori wars was written by J. E. Gorst (later Sir J. E. Gorst, q.v.), entitled *The Maori King*, 1864, an important and absorbing account from first-hand observation. F. E. Manning's *History of the War in the North*, 1862, and *Old New Zealand*, 1863, are full of lively description. Among poets of the period may be mentioned F. N. Broome, Alfred Domett ('Browning's 'Waring)'), and Thomas Bracken. Their work, however, was largely derivative and influenced by contemporary Eng. minor verse.

At the turn of the cent. the level of writing was improving, and perhaps the most noted author was Wm Pember Reeves, a well-known lawyer, politician, and journalist, author of *State Experiments in Australia and New Zealand*, 1902, *The Long White Cloud*, 1898, and writer of the national song *New Zealand*, 1898. Jessie Mackay, the poetess, belongs to this period, and Edith Grossman, the novelist, a strong supporter of the feminist movement.

At this time the cultured New Zealander was always strongly tempted to leave the somewhat prov. atmosphere at home and to migrate to London. Of such the most famous was Katherine Mansfield (q.v.). Born in Wellington in 1888, she was sent to school in London and returned to Wellington, only to leave again for England in 1909. Her stories and sketches have placed her among the foremost contemporary women writers. Another novelist, Wm Satchell, wrote between 1900 and 1914, and H. Guthrie Smith wrote *Tutira*,

a noted account of a N. Z. sheep station, in 1921. Guthrie Smith has been called the Gilbert White of N. Z., and his work has something of the imaginative qualities of both the poet and novelist. He gives a detailed account of the natural hist. of the locality, and also deals with man's influence on his natural environment, the habits and customs of the Maori, and the acclimatisation of European man and the effects of the various foreign flora and fauna which he introduced. Jane Mander wrote novels with N. Z. settings between 1920 and 1928.

After the First World War the quality of N. Z. literature improved considerably, and writers became emancipated from their Victorian models. From this time onward literary talent appears more frequently, though the domination of London is still apparent. The most promising poet in the 1920's was Eileen Duggan. Among novelists may be particularly mentioned Robin Hyde (the pseudonym of Iris Wilkinson), authoress of *Passport to Hell*, 1932, *Check to your King*, 1936, and many other novels, who was one of the most outstanding of the contemporary novelists. She has sensitive imagination and a great power of evocation. Present-day writers include Ngaio Marsh, John A. Lee, John Mulgan, Frank Sargeson, Guthrie Wilson, and Daniel Davin. Among poets may be mentioned Walter D'Arcy Cresswell, Evelyn Hayes, James K. Baxter, Ruth Dallas, A. R. D. Fairburn, Charles Brasch, Allen Curnow, Denis Glover, and Louis Johnson, who also writes prose stories. M. H. Holcroft, who is essayist, novelist, and journalist, and Alan Edward Mulgan, who has written literary criticism, may also be recalled. With the new contacts and widened horizons brought about by the war and modern communications the outlook for modern N. Z. writing is encouraging.

As with literature, so also the origins of N. Z. (European) art date back to about 1800 (for Maori art see MAORI), and the first efforts are few and far between, owing to the hard life led by the early colonists. Some of the early painters were draughtsmen in the employ of the N. Z. Co. and their task was to record various phases of the company's operations and activities. Among these may be mentioned Charles Heaphy, W. Swainson, and J. A. Gilfillan, who portrayed N. Z. life and scenery in the 1840's and 1850's. Their style is perhaps conventional and lacking in any great distinction, but faithful to detail. Those of the generation which followed were rather idealists who were greatly under the influence of contemporary Eng. traditions. John Gully, for example, employed hazy blues and greens more appropriate to the atmosphere of the Brit. Isles. Mention may be made of J. C. Richmond and W. M. Hodgkins, but the most important artist of the period was John Buchanan, a water-colourist, who dispensed with the prevailing naturalism and placed the chief stress on form and contour. By about 1870 a number of art schools had been

estab. in N. Z. and art societies founded and galleries opened; the N. Z. Academy of Fine Arts was founded in 1889 and thenceforth art flourished in its own right. At the same time a Dutch professional artist, Van der Velden, settled in N. Z., and it was he who provided a stimulus to N. Z. students. James Nairn emigrated from Scotland and introduced impressionism to N. Z. at this time. By 1900 it had, however, become customary for N. Z. artists to study in London and Paris, with the result that the level of technical competence was raised considerably, though inevitably some talent was permanently lost to the country, e.g. David Low, the famous cartoonist, and Frances Hodgkins. However, with the general improvement in communications after the First World War and the consequent spread of ideas, N. Z. artists responded to outside influences to a much greater extent. The influence of the Fr. post-impressionists has been great and, while it is difficult to single out any name in particular among contemporaries, the following deserve mention: T. A. McCormack, Stewart MacLennan, Russell Clark, A. J. C. Fisher, Cedric Savage, Vida Steinert, George Woods, E. Mervyn Taylor (noted for his fine woodcuts and engravings), and Eric Lee-Johnson (painter, lithographer, and designer).

New Zealand, Bank of, estab. in 1861 by an Act of the New Zealand Parliament, and has now more than 250 branches in Australasia. It acts as banker to the New Zealand Gov., which holds practically all the capital stock.

New Zealand Alps, mt range of S. Is., New Zealand, running 200 m. southwards from Arthur's Pass down the W. side of the is. The rock is largely a sandstone felspar combination called greywacke. Sixteen mts rise above 10,000 ft, all situated near the centre of the range. Their names, from N. to S., are Malte Brun, 10,421 ft; Etie de Beaumont, 10,300 ft; Minarets, 10,058 ft; Douglas Peak, 10,107 ft; Haidinger, 10,178 ft

(with a N. Peak, 10,030 ft); Lendenfeld, 10,450 ft; Haast, 10,294 ft; Torres, 10,376 ft; Tasman, 11,475 ft; Teichelmänn, 10,370 ft; Silberhorn, 10,757 ft; Mount Cook, 12,349 ft; Dampier, 11,287 ft; David's Dome, 10,443 ft; La Pérouse, 10,101 ft; Sefton, 10,354 ft. These mts are 3000 ft lower than the Swiss Alps, but of equal height from the practical view of the climber, for the valley floors are lower in proportion. The range is much more heavily glaciated than the European Alps. The Tasman glacier, on the E. side of Mt Cook, is 18 m. long and more than 1 m. wide. The Franz Josef, on the W. side, although much shorter is fed so heavily from its upper snow-fields (150 ft annually) that it flows to within 600 ft of the sea. Its measured movement at one point is 15 ft daily. There are no subalpine passes across the central sector of the Main Divide. The lowest is Copland Pass, 6950 ft, between Hooker and Copland valleys. Other useful passes are Graham's Saddle, 8739 ft, between the Rudolf and Franz Josef glaciers, and Pioneer Pass, 9000 ft, between the Haast and Fox glaciers; neither pass is easy. The weather of the N. Z. A. is notoriously unstable. The range lies just 20 m. from the Tasman Sea, whence heavy N.-westerly storms break upon the main ridge. These warm, wet winds precipitate on the high peaks and lesser ranges eastwards, and are dry when they cross the Canterbury Plains. They seldom deposit snow below 8000 ft. Good Alpine weather comes with the cold southerly winds, and these, if prolonged, deposit snow down to 4000 ft. The summer climbing season extends from mid Nov. to early April. Feb. and Mar. are reckoned the least unsettled months. Winter weather is much better than summer. Skiing is thus a popular sport. Alpine climbing started much later than in Europe. Mt Cook was first explored by the Rev. W. S. Green with 2 Swiss guides in 1882, but the first ascent was not made until 1894, when the summit was won by 3 New Zealanders, Fyfe, Clarke, and G. Graham. One of the earliest pioneers was E. A. Fitzgerald, who came with Zurbriggen in 1895 and climbed Mts Tasman, Silberhorn, Sefton, and Haidinger. Much exploratory and survey work was carried out during the last decade of the cent. by Douglas, Harper, Munnering, and sev. others. Malte Brun was climbed in 1894 and the Minarets in 1897. No more of the high peaks fell for 9 years, but from 1906 to 1912 all save one of the 16 were climbed. The last, Teichelmänn, held out until 1929. Much of the finest climbing and exploration is to be found on peaks below 10,000 ft, the best known of which, in Otago, are Mts Aspiring, 9975 ft; Earnslaw, 9250 ft; Tutoko, 9042 ft; Stargazer, 7810 ft. Red deer abound on the lower hills and do much damage. Chamois thrive on the N. part of the range. The kiwi has become a rarity. Recent years have seen great increase in the numbers of New Zealand mountaineers. The leading club is the New Zealand Alpine Club, formed in 1891. As a training ground for the

world's great ranges the N. Z. A. are not inferior to the Swiss and Fr. Alps, save in rock-work, and in some respects must be reckoned better, notably in ice-work, and in their demand for approach-marching with heavy loads, dangerous river-crossings, and high camping. See W. S. Green, *The High Alps of New Zealand*, 1883; E. A. Fitzgerald, *Climbs in the New Zealand Alps*, 1896; A. P. Harper, *Pioneer Work in the Alps of New Zealand*, 1896; S. Turner, *The Conquest of the New Zealand Alps*, 1922; J. D. Pascoe, *Unclimbed New Zealand*, 1938; R. Hewitt and M. Davidson, *Mountains of New Zealand* 1954.

'New Zealand Herald,' estab. in 1863, the only morning newspaper in Auckland, circulates throughout Auckland city and prov. Substantial coverage is given to world, national, and local affairs with special emphasis on agriculture. It is New Zealand's largest and most influential daily newspaper. An associated pub. is *The Weekly News*, circulating throughout New Zealand.

Newark, Lord, see LESLIE, DAVID.

Newark: 1. N.-on-Trent, municipal bor. and parl. div. of Notts, England, on the navigable branch of the R. Trent, 16 m. SW. of Lincoln. The par. church combines sev. architectural styles, with 15th-cent. Perpendicular predominating; a Norman crypt and part of the central piers indicate an earlier church. N. castle, in which King John d. in 1216, was founded in 1135, and rebuilt in 1170 and c. 1280. The ruined NW. façade and main gateway form an attractive feature of the public gardens there. There are manufs. of ball and roller bearings, agric. and other machinery, metal foundings, special kinds of plaster, a beet sugar factory, sev. maltings and breweries, and a good corn market. Pop. 23,500.

2. City, co. seat of Licking co., Ohio, U.S.A., 33 m. E. of Columbus. The trade centre of an agric. region, it does aluminium processing and manufs. glass and electrical and petroleum products. Indian mounds are near by, and Denison Univ. is 7 m. away at Granville. Pop. 34,300.

3. City and port of entry of New Jersey, U.S.A., co. seat of Essex co., on N. Bay, and 9 m. W. of lower Manhattan. It is the largest city in the state, known as a major centre for transhipment of rail, water, and truck freight; the deep-water terminal (Port Newark) and Newark Airport are units of the Port of New York. Newark produces electrical equipment, machinery, wire and metal products, fountain-pens, cutlery, leather goods, celluloid, chemicals, pigments, paints, paper products, beverages and food products, and jewellery; it has meat packing and fur dyeing, and is an important insurance centre. Newark colleges of Rutgers Univ., Newark Academy for Boys, a state teachers' college, a junior college, and Newark College of Engineering are here, and there is a public library founded and developed by John Cotton Dana. Newark has many historical shrines and buildings, and is the bp. of Stephen Crane. Pop. 438,776.

Newbottle, par. in the co. of Midlothian, comprises the mining vils. of Newton-grange (pop. 6000) and Easthouses (pop. 5000). N. Abbey, 1 m. S. of Dalkeith, was built by David I in 1140.

Newbery, John (1713-67), publisher and bookseller, b. Waltham St Lawrence, Staffs. When 17 years old he went to Reading and procured employment in the *Mercury* offices. In 1745 he opened a publishing house in St Paul's Churchyard; here he started newspapers, and amongst his contributors were Johnson and Goldsmith. He had often meditated a library for young people, and the venture, when made, proved a great success. The well-known books, *Goody Two Shoes* and *Tommy Trip and his Dog Growler*, may be recalled, also the *Lilliputian Magazine*. It seems that the writers of these stories under the titles 'The Renowned Story of Giles Gingerbread' and 'Miss Margery Two Shoes' were the brothers Giles and Griffith Jones. They appeared in N.'s Juvenile Library and also in the 'Lilliputian Histories' written by the Jones brothers.

Newbold and Dunstan, see WHITTINGTON and NEWBOLD.

Newbolt, Sir Henry John (1862-1938), barrister and poet, b. Bilston, Staffs, where his father was vicar. He was educ. at Clifton College, Bristol, and Corpus Christi, Oxford. Called to the Bar in 1887, he practised for 2 years. He ed. the *Monthly Review*, 1900-4. In 1892 his first book, *Taken from the Enemy* (a Napoleonic novel), was pub., and in 1895, *Mordred*, a tragedy. But his fame rests chiefly on the poems in *Admirals All* which appeared in *Longman's Magazine* in 1897. He was knighted in 1915 and became a C.H. in 1922. He also wrote *The Island Race*, 1898, *Stories from Froissart*, 1900, *The Sailing of the Longships*, 1902, *Songs of the Sea*, 1904, *The Year of Trafalgar*, 1905; *The Old Country*, 1906, *Songs of the Fleet*, 1906, *The Trymians*, 1911, *Poems, New and Old*, 1912, *Book of the Blue Sea*, 1914, *Book of the Thin Red Line*, 1915, *Tales of the Great War*, 1916; *Book of the Happy Warrior*, 1917, *Book of the Long Trail*, 1919, *Book of Good Hunting*, 1920, *Naval History of the War*, 1920, *Studies, Green and Gray*, 1926, and *New Paths on Helicon*, 1927. N.'s romances had their own charm, but they were not altogether successful in challenging the conventional methods of the historical novel. His *The Year of Trafalgar*, 1905, works out a convincing explanation of Nelson's and Collingwood's tactics in the battle, and, with its appendix of Trafalgar poems and ballads, gave him a reputation as a naval historian as well as a naval poet. Some years later he was invited to complete the work of Sir Julian Corbett as the official naval historian of the First World War. His own unofficial naval hist. is written with more freedom. He was prof. of poetry in the Royal Society of Literature from 1911 to 1921. See W. Archer, *Poets of the Younger Generation*, 1902, and C. Kernahan, *Six Famous Living Poets*, 1922.

Newbridge (*Droichead Nua*), tn in co. Kildare, Rep. of Ireland, on the Liffey, 6 m. N.E. of Kildare, and H.Q. of development of fuel resources of the Bog of Allen. Pop. 3000.

Newburgh: 1. Royal and municipal burgh and seaport in Fifeshire, Scotland, on the Firth of Tay. Its chief manufs. are linoleum and oilskin. It is also engaged in salmon fishing. Pop. 2500.

2. City in Orange co., New York, U.S.A., on the Hudson R., 60 m. N. of New York. Its chief manufs. are cotton and woollen goods, silk, machinery, tiles, medicines, and aluminium products; it also has shipbuilding. Pop. 31,950.

Newburn, urb. dist. in Northumberland, England, on the Tyne, 5½ m. W. of Newcastle. Industries are coal-mining, steel products, glass, bricks, and cordage. Pop. 23,740.

Newbury, municipal bor. and mrkt tn of Berks, England, on the R. Kennet, 17 m. SW. of Reading. Close by is the hamlet of Speen, built on the site of the Rom. *Spinæ*. During the Civil war the neighbourhood of Newbury was the scene of 2 battles, neither of them being decisive. During the second of these battles, Donnington Castle, resisted the Parliamentarians, being held by its governor Sir John Boys. One m. SW. of Newbury on the Andover Road is a memorial to Lucius Carey, second Viscount Falkland, who fell in the first battle of Newbury. The tn has sev. light industries. One of the local occupations is the training and stabling of racehorses, and there is a well-known racecourse. Pop. 18,310.

Newburyport, city, port of entry, and co. seat of Essex co., Massachusetts, U.S.A., on the Merrimack R., 37 m. NNE. of Boston. The prin. industries are the manuf. of boots, shoes, electrical apparatus, tools, and machine-shop products; there is also distilling. It is a former shipping, whaling, and shipbuilding centre. The city has a safe harbour and a fishing industry. N. is also a summer resort. Pop. 14,110.

Newcastle, 1st Duke of, *see* CAVENTISH, WILLIAM.

Newcastle, Thomas Pelham-Holles, 1st Duke of (1693-1768), politician, educ. at Westminster School and Cambridge; eldest son of the first Baron Pelham, assumed the name of Holles in 1711, on succeeding to the estates of his uncle, John Holles. He was a supporter of George I. and consequently in 1715 was created Duke of N. He was appointed lord chamberlain in 1717, and secretary of state for the S. Dept in 1724. Thirty years later he succeeded Pelham as Prime Minister, and in 1757 formed a coalition with Pitt, in which the latter was the dominant figure. He was lord privy seal in Rockingham's first administration (1765-6). *See* N.'s correspondence with Chesterfield (ed. Sir R. Lodge), 1930.

Newcastle: 1. Tn of Natal, S. Africa, near the Drakensberg Mts, about 130 m. NW. of Pietermaritzburg. Coal is mined in the dist. and there are 2 blast furnaces with a capacity of 150,000 tons of pig iron per annum. Iron ore exists in great

quantities locally. Good climate and beautifully situated at the base of the Drakensberg Mts. Pop.: Whites, 3000; Bantu, 7891; Asiatics, 2297; Coloured, 267.

2. City and port on the Hunter R., New S. Wales, 100 m. N. of Sydney. It is the largest tn of New S. Wales outside the metropolis, and is dependent mainly on coal-mining and the iron and steel industries. N. Harbour (Port Hunter) is the second port of New S. Wales and the fourth port of Australia in regard to the volume of its shipping trade. It ships coal, iron, steel, wheat, wool, and frozen meat. N. is primarily a coal-loading port, and the proximity of the coal-fields has led to the estab. of important industries, including the very up-to-date iron and steel works in the dist. The city of N. is 38 sq. m. in area and the pop. is 134,980. The pop. of N. urb. area (comprising the city and portion of adjoining Lake Macquarie Shire) is 181,740.

3. Tn of New Brunswick, on the Miramichi R., close to its mouth. It is the site of a large pulp and paper mill. Pop. 4248.

4. Popular seaside resort of co. Down, N. Ireland, on the W. fringe of Dundrum Bay. Pop. 3000.

5. **Newcastle-West**, mrkt tn in co. Limerick, Rep. of Ireland, 25 m. SW. of Limerick. Pop. 2700.

Newcastle-under-Lyme, market and industrial centre, parl. and municipal bor. of Staffs, England, 2 m. W. of Stoke-on-Trent. A castle was built here between 1142 and 1146; now only the excavated boundaries remain. St Giles's Church dates from the 13th cent., but was largely rebuilt between 1873 and 1876. N. is an important marketing centre for the dist.; its hist. shows great industrial progress during more recent years. The chief industries include coal-mining, tile making, textiles, wires and cables, electric lamps and equipment, and paper. In 1932 the bor. was extended to include Wolstanton, Chesterton, and Silverdale. Pop. 70,230.

Newcastle upon Tyne, parl and municipal bor., episcopal city, par., and also a city and co. of itself, situated on the N. bank of the R. Tyne, about 8 m. from the mouth of the riv. and the N. Sea, 272 m. N. of London. The city is within the geographical co. of Northumberland, England, but was created a co. of itself by charter of Henry IV in 1400. It was made a city in 1882. It is a quarter sessions bor. and an assize tn, with its own sheriff since 1400. The chief magistrate of the city has been styled mayor since 1216; the title of lord mayor was granted by Royal Charter under seal in 1906. The area of the municipal bor. is 11,401 ac. and it is divided into 4 parl. constituencies. There are 19 municipal wards, each returning 3 councillors to the city council, and there are 19 aldermen. The city is the seat of the bishopric of N., created in 1882 by the severance of Northumberland and N. from the antc see of Durham. Between N. and Gateshead on the opposite bank the Tyne is spanned by 5 bridges: the Tyne bridge, opened in 1928 by King

George V, with 2 main piers of steel and granite and a parabolic arch of steel lattice framework rising to a height of 193 ft above high-water mark; the swing bridge, which was opened in 1876; the high-level bridge, designed by Robert Stephenson, son of George Stephenson, and opened in 1849; King Edward VII bridge, opened in 1906; and the Redheugh bridge, built in 1870 but reconstructed in 1900.

N. has a long and interesting hist. The ground-plan of the Rom. station of *Pons Aelii*, situated on Hadrian's Wall (q.v.), is preserved, and many Rom. relics are in Blackgate (the Castle) Museum. Between the departure of the Romans and the Conquest there is no evidence to show that the site of N. was occupied. It was formerly surrounded by a wall over 2 m. long, begun in the latter part of the reign of Henry III. As a port N. became an important wool exporting centre during the 13th cent., while by the end of the 14th cent. the beginnings of an export trade in 'sea cole' to London and the S. had been firmly estab. The coal trade increased rapidly after the Reformation, when many of the coal-mines were wrested from eccles. hands and exports increased from 35,000 tons in 1565 to 400,000 tons in 1625.

Among the most notable of the public buildings is the cathedral, dedicated to St Nicholas of Myra, formerly the par. church of N. Tradition has it that the church of St Nicholas was founded by Osmund, Bishop of Salisbury, in 1091, but it is believed that a church was standing on the site long before then. The Norman church was destroyed by fire in 1216 and was replaced by a building in the Early Eng. style. The church as it is to-day is mainly the work of 14th-cent. builders, apart from the Perpendicular tower and steeple, built about 1430. St Mary's Rom. Catholic cathedral was built in 1844 from the design of Pugin, and its tall, graceful spire was added in 1872. All Saint's Church, planned by David Stephenson, was completed in 1796 on the site of an earlier church which was demolished; St Andrew's Church dates from the middle of the 12th cent. The church of St John the Baptist is mainly of the 14th and 15th cents. St Ann's Church was built in 1768 with stones from part of the tn wall. The church of St Thomas the Martyr (John Dobson, architect) was built in substitution for the old chapel of St Thomas on Tyne bridge, pulled down in 1830.

The castle, placed by the corporation in the care of the N. Society of Antiquaries, was probably called the New Castle to distinguish it from the older royal Northumbrian castle of Bamburgh, or perhaps 'new' was used in relation to the *Pons Aelii*. A castle was built on the site by Robert, son of William I, in 1080; though nothing of this survives, remains of the Norman wall are still to be seen. To-day the expression 'the Castle' denotes only the keep or tower. Of the S. wall more extensive remains are extant, including the Postern Gate. The keep was built by Henry II between 1172 and 1177. The

original appearance of the building has been entirely altered by the erection of battlements in 1810. The Black Gate is a later addition built by Henry III about 1249. The great hall of the castle has a modern roof, but the chapel is a fine example of late Norman architecture.

The guildhall on the 'Sandhill' is the anc. centre of municipal gov. of the tn. There is evidence of the existence of a guildhall as early as the 13th cent. The old guildhall was rebuilt and enlarged in the middle of the 17th cent. by Robert Trollop, and most of the interior of the present building dates from 1658. The ground floor is now a commercial exchange. In the hall on the upper floor the freemen of the city still hold their ann. Michaelmas guild meeting, and the commissions of assize are opened there by the circuit judges, though all cases are normally tried at the Co. Moot Hall (1810); since 1952 the guildhall has served as an overflow court. Near by are interesting Elizabethan houses.

Opening on the quayside are a number of narrow lanes called chares (from a Saxon word meaning 'to divide'). Near the site of the Pilgrim Street Gate stood the once famous monastery of the Grey Friars of N., where Duns Scotus is said to have been a brother. The many public buildings include the Mansion House, Jesmond, and the new city hall and baths (1928). Near by is the site of the Barras bridge, traditionally that of the long-drawn-out single combat (1388) between Harry Hotspur and the Earl of Douglas before the battle of Otterburn. Barras Bridge is now the site for N.'s new tn hall and civic centre. The Hancock Museum of Natural Hist. in Barras Bridge contains the collections of the Natural Hist. Society of Northumberland, Durham, and Newcastle, and also a large series of the original work of Thomas Bewick (1753-1828), the famous wood engraver, who was b. near N. Colleges and schools include Rutherford College and the College of Commerce, Dame Allan's School (a boys' public school founded 1705), and the Royal Grammar School (1525). The old school buildings were demolished in 1844, the new buildings in Jesmond being occupied in 1906. King's College was constituted in 1937, as the Newcastle div. of the univ. of Durham, by the merger of Armstrong College with the College of Medicine. Armstrong College was founded in 1871 as the Univ. of Durham College of Physical Science; the College of Medicine was founded in 1834 as the N. upon Tyne School of Medicine and Surgery. The main block of buildings was opened by King Edward VII in 1906, the new medical school by King George VI in 1939. The central public library contains over 200,000 vols., apart from MSS. Near by is the Laing Art Gallery.

During the 19th cent. Richard Grainger (1798-1861), a native of N., together with John Dobson, architect, and John Clayton, tn clerk, laid out a number of streets as part of his scheme for the development of the tn centre. Grey Street and Grainger

Street are the most important of these; the street plan being laid out before the building of the Central station (designed by John Dobson, and opened by Queen Victoria in 1850). Grey Street was made the widest as being the chief approach to the town from the S. The new buildings of the Royal Victoria Infirmary (founded 1751) were opened by King Edward VII in 1906. More recent buildings include Carlisle House (N.E. Electricity Board), Central Police Station, and Prudhoe

engineering and boiler-making shops, locomotives, chemical works, and lead and copper works. The exports, apart from coal, are iron and steel goods, machinery, chemicals, copper, cotton, canvas, linen, woollen and jute goods, firebricks and fireclay goods, oils, oil fuel (as cargo and bunkers), pitch, tar, and resin; the chief imports are burnt ore, sulphur ore, chemicals, cement, grain, fruit and vegetables, iron manufs., iron ore, petroleum, steel manufs., and timber.

Turners (Photography) Ltd

THE TYNE BRIDGE, NEWCASTLE UPON TYNE

House (Ministry of Labour). In Eldon Square near by is the city war memorial (1914-18).

N.'s commercial prosperity is due to its position on a tidal riv., and to the large quantity of excellent coal found in the neighbourhood. The quay (2436 yds long), which is equipped with all mechanical appliances and communicates with Brit. Railways, forms a fine thoroughfare (Quayside) over a m. in length. It is the property of the corporation and some of the berths are of a depth of 30 ft at low water. The banks on both sides of the Tyne are lined with wharves, factories, warehouses, and shipbuilding yards. Between the Scotswood Road and the riv. are the Elswick shipyard, ordnance, and engineering works of Vickers-Armstrong Ltd (see also ARMSTRONG, SIR WILLIAM GEORGE, 1st BARON). The chief industries, apart from shipbuilding and ship repairing, are iron and steel manufs.,

There are a number of parks, recreation grounds, and open spaces, including Jesmond Dene, Brandling, Armstrong, and Heaton Parks, the Tn Moor (927 ac.), and Castle Leazes. Among the societies founded in N. are the Tyne-side Naturalists' Field Club (1846), the N. of England Institute of Mining Engineers (1852), the N. Society of Antiquaries (1813), and the Literary and Philosophical Society (1793). Pop. 291,724 (1951 census); 275,100 (1957 estimate). See J. Brand, *History and Antiquities of Newcastle*, 1789; R. J. Charlton, *History of Newcastle upon Tyne*, 1950; S. Middlebrook, *Newcastle upon Tyne: its growth and achievement*, 1950; R. Hugill, *Official Guide to Newcastle upon Tyne*, 1956.

Newchwang, or Yingkow a former treaty port in S. Manchuria, China. The town proper stands on the Liao R., 40 m. from the coast, but the name is usually applied to the port, 30 m. nearer the coast

of the Gulf of Laotung, which was originally called Muh-kow-ying. The Liao It. is here about $\frac{1}{2}$ m. wide, but the port is ice-bound in winter. The surrounding country is flat and marshy. The chief industry is the manuf. of bean oil and bean cake which form the chief exports, with raw beans, ginseng, and raw silk. There are gold, iron, and silver mines. The U.S.A. and Great Britain abrogated their extra-territorial rights in 1943. Pop. 106,000.

Newcomb, Simon (1835-1909), Amer. astronomer, b. Nova Scotia. In 1861 he was appointed prof. of mathematics to the U.S. Navy, and later astronomer at the naval observatory, Washington, where he superintended the erection of the 26-in. equatorial telescope. From 1871 to 1874 he was secretary to the U.S. commission for observing the transit of Venus, and in 1882 observed the same at the Cape of Good Hope. In 1894 he was appointed prof. of mathematics and astronomy to Johns Hopkins Univ., but continued to reside in Washington, where he remained director of the *American Nautical Almanac* till 1897. N. studied chiefly the problems of gravitational astronomy. His *Reminiscences of an Astronomer* was pub. in 1903.

Newcomen, Thomas (1663-1729), inventor of the atmospheric steam-engine, b. Dartmouth. In 1705, together with Savery and John Calley, he took out a patent for a 'fire-engine' notable for its safety and economy. The engine of James Watt improved upon this by the use of a separate condenser. In 1723 he set up an engine for drawing water at Griff, near Coventry.

Newdigate, Sir Roger, 5th Baronet (1719-1806), antiquary, was a collector of ant. marbles, vases, and books. He is now principally remembered as the founder of the N. prize for Eng. verse at Oxford.

Newel, or **Newel-post**, in a wooden staircase: a post fixed at the top and bottom of each flight, to carry the hand-rail and strings, which are framed into the posts. In Elizabethan and Jacobean mansions, newel-posts were often richly carved.

Newell, Robert Henry (1836-1901), Amer. humorist, b. New York. Taking up journalism, in 1858 he became assistant editor of the New York *Sunday Mercury*, and during the Civil war wrote the *Orpheus C. Kerr Papers*, which with typical Amer. humour satirised humbug and pretentiousness, the chosen pseudonym being a pun on 'office seeker,' a type then very common. In 1870 N. pub. *The Cloven Foot*, one of many attempts to complete Dickens's unfinished *Edwin Drood*.

Newfoundland, is. prov. of Canada, formerly a Brit. dominion, situated between 46° 37' and 51° 39' N. lat., and 52° 35' and 59° 25' W. long., on the NE. side of the Gulf of St. Lawrence; the greatest length from N. to S. is 350 m., and average breadth about 130 m. Its estimated area is 42,734 sq. m. and the pop. (1956), including Labrador, is 420,000. In shape

it resembles an equilateral triangle, of which Cape Bauld on the N., Cape Race on the SE., and Cape Ray on the SW. form the angles. By the decision, on 1 Mar. 1927, of the Judicial Committee of the Privy Council, the Atlantic watershed of the Labrador peninsula, including the basin of the Hamilton, was awarded to Newfoundland (see LABRADOR). The remainder of the Labrador peninsula forms part of Quebec prov. The boundary was fixed as follows: a line drawn due N. from the E. boundary of the Bay of Ance Sablon as far as 52° N. lat., thence W. up to the Romaine R., and then N. along the l. b. of that riv. and its head waters to their source, thence due N. to the crest of the watershed, and thence W. and N. along the crest of the watershed of the rivs. flowing into the Atlantic until it reaches Cape Chidley, at the entrance to Hudson Strait. The is., as seen from the sea, presents a wild and sterile appearance. Its surface is diversified by mts, marshes, barrens, ponds, and lakes. The mts in the Avalon Peninsula (stretching SE. from the main portion of the is., and connected with it by an isthmus of only about 3 m. in width) rise, in some cases, to 1400 ft above sea level; and along the W. shore the height of 2500 ft is frequently reached. The number of lakes is remarkable, and it has been estimated, though perhaps with some exaggeration, that about one-third of the whole surface is covered with fresh water. The 'barrens' occupy the tops of hills. The coast-line is everywhere deeply indented with bays and estuaries affording safe harbours. Of these inlets the prin., beginning from the N. extremity of the is., are Hare, White, Notre Dame, Bonavista, Trinity, Conception, St. Mary's, Placentia, Fortune, St. George's, Bay of Is., and St. John's Bays. The rivs., none of which is navigable for any distance, link the lakes of the interior with the shore, and are narrow and winding; occasionally they are used to drive machinery. The main streams are the Exploits, with its tribs. the Great Rattling and the Badger, Gander Gambo, Terra Nova, and the Humber. The soil is to a great part sterile and unproductive, although there is considerable cultivation along the seaboard of the settled dists. As regards the coast of Labrador assigned to Newfoundland in 1927, the outside coastline is bleak, but the shores of the bay and rivs. are well wooded, and in some cases densely so, the timber being high and sound. The temp. of the interior is similar to that of N. Canada.

There are in Labrador about 8000 permanent inhab. (1500 Eskimos, the remainder being of Brit. descent), occupied in the fisheries and in trapping. The pop. is greatly increased in summer by fishermen and sportsmen. The Newfoundland cod fishery is world famous and was the mainstay of the is. when first it became permanently settled. Salmon, halibut, lobster, herring, caplin, and seal are also caught; the whale fishing has declined. Goose Bay (Hamilton Inlet) is the chief port. The 1955 mineral

production was valued at \$70,317,255; production of the forests was valued at \$85,000,000; and estimated value of the fisheries was \$25,000,000.

The chief export to the U.K. and the U.S.A. is paper; to Europe iron ore. The total value of exports, 1955, was \$148,000,000. Great beds of haematite iron ore have been found at Bell Is., Conception Bay, and large quantities are being exported. Buchan's Mine, Red Indian Lake, produces lead and zinc concentrates. Copper is worked in Notre Dame Bay, and silver, nickel, chromium, antimony, asbestos, and vanadium are also found, but they have not yet been shown to be commercially workable. Over 131,000 tons of fluorspar were exported in 1955. The estab. of large and well-equipped paper mills at Grand Falls by the Anglo-Newfoundland Development Co. opened up a very large industry. The paper is shipped to the U.K., Australia, and the U.S.A., and used in the prin. London printing offices. A model tn has been laid out with all necessary public utility services. Botwood is the prin. port for summer shipments from the Grand Falls mills. There are also large paper- and pulp-mills at Corner Brook. These were formerly owned and operated by the International Power and Paper Co., but were taken over by a subsidiary of Bowater's Paper Mills. The total export of newsprint in 1955 was 533,285 tons, and of pulpwood 100,000 cords. Local secondary industries carried on at St John's and outposts include gypsum wallboard, knitting-mills, tanneries, cement, textiles, cotton-mills, aerated waters, breweries, boots and shoes, leather, and mattresses. By the Education Act, 1949, the central administration is vested in the Dept. of Education, presided over by the minister of education. A general training school for teachers was opened in 1921, and in 1925 the Newfoundland Memorial Univ. College was opened. It was incorporated as the Newfoundland Memorial Univ. in 1949. Lord Rothermere is the chancellor. The chief tns are St John's, the cap. city. Corner Brook, Wabana, Grand Falls, Windsor, Carbonear, Stephenville, Channel-Port aux Basques, and Deer Lake.

History. The early hist. of Newfoundland is somewhat obscure. It was discovered on 24 June 1497 by John Cabot. It was visited by the Portuguese navigator, Gaspar de Cortereal, in 1500, and within 2 years regular fisheries had been estab. on its shores by the Portuguese, Biscayans, and French. Sir Humphrey Gilbert, with his ill-fated expedition, arrived in St John's harbour, Aug. 1583, and formally took possession of the is. in the name of Queen Elizabeth. On the return voyage the expedition was scattered by a storm, and the commander lost. The hist. of the is. during the 17th and part of the 18th cents. is little more than a record of rivalries and feuds between the Eng. and Fr. fishermen; but by the treaty of Utrecht (1713) the is. was ceded wholly to England. A representa-

tive assembly was created in Newfoundland in 1832. In 1846 a terrible fire destroyed half the cap., a hurricane overwhelmed a large number of fishing craft, and the potato crop failed through blight. In 1855 the is. was given responsible gov. In 1860 the fishery partly failed, a reminder that Newfoundland depended primarily on the bounty of nature, and this period of adversity only ended in 1869. Two years previously Newfoundland seemed to be enthusiastic for membership of the Canadian Confederation and provision to that effect was actually made in the draft of the British North America Act. Opposition to the Federal party in Newfoundland, however, resulted in the is. refusing to join, the reasons being a fear of Canadian dominance, the is.'s interests as a fish producer, and the vagueness of the terms offered. In 1880 the first Railway Bill was passed for the construction of a light railway from the cap. to Hall's Bay, and by 1884 the line was completed as far as Harbour Grace, but it was not until 1891 that it was extended to Trinity and Bonavista Bays. In the eighties there were difficulties with the U.S.A. over fishing rights in Brit. N. Amer. waters and the ensuing negotiations resulted in a treaty which provided for delimitation; but it was only in 1912 that this question was finally settled by a new treaty. Meanwhile Amer. fishing vessels had been given, as from 1888, the right to facilities and amenities by ann. licence at a fee of \$1.50 a ton. In 1894 the banks failed owing to the failure of customers to realise on their catches of fish, and one effect of this crisis was to expose the weakness of the credit system on which the fishing industry was conducted, and the distrust engendered in the confused conditions of this period has never been wholly dispelled. In this period of economic adversity Newfoundland sought admission to the Dominion of Canada (see also *Federal Union with Canada* below).

The period from 1895 to 1914 was one of abundant promise, marred at first by a lack of statesmanship which nearly prejudiced the future of the is., and in its final stages by a programme of public expenditure which, if well intentioned, was economically unsound. Long previously the is.'s gov. might have realised the disadvantages resulting from dependence on a single industry, the fisheries. With the estab. of the Anglo-Newfoundland Development Co.'s pulp-mill at Grand Falls, the development of the iron-ore mine at Bell Is., the completion of the railway, and the opening up of the W. coast to settlement, it was felt that Newfoundland had gone far towards freeing itself from complete dependence on the fishery, but this could only be the case if the price of the chief fish, the cod, remained high in the world's markets. After the First World War an illusory prosperity from the high price of cod was to prove the undoing of the is.'s whole economy when the world depression of the 1930's hit Newfoundland. Newfoundland had lived beyond its means and continued

to do so in spite of the fall in the price of its fish. Furthermore, the natural resources of the is. had been recklessly dissipated, the land mostly being held for speculative purposes instead of being developed. Moreover there were political malpractices, and it was the rule rather than the exception that members of an administration and their supporters obtained what benefits they could during their party's tenure of office. Hence the budget remained unbalanced for 12 successive years, and the interest charges on

finances until such time as Newfoundland might again become self-supporting. The Brit. Gov. then appointed a commission of gov. of 6 (3 from Newfoundland and 3 not ordinarily resident in Newfoundland) under the chairmanship of the governor, and this new form of gov. assumed office on 16 Feb. 1934, and was still in being, albeit with changes in personnel, when the Second World War broke out.

The loyalty of the Newfoundlanders is proverbial. They are almost exclusively

NEWFOUNDLAND: DRYING COD IN WITLESS BAY

the public debt amounted to over 50 per cent of the average ann. revenue, there being no provision for a sinking fund. In 1928 Newfoundland was rapidly approaching insolvency, but there was no change in policy and further external loans were raised in 1928, 1929, and 1930. There was in fact a continuance of misgov. which only served to increase the burden on the fisherman and on the poorer members of the community (see the report of the Amulree Royal Commission, 1933). This commission was sent out to investigate the financial situation. Its report recommended that the existing form of gov. should be suspended and that a special commission of gov. should be formed with full legislative and executive authority, subject to the supervisory control of the Imperial Gov. in London. In fact, the Brit. Gov. assumed responsibility for the is's

Brit. and native born, and the overwhelming majority are of Eng. or Irish descent, not more than 3 or 4 generations removed from those born in the mother country. The outstanding seamanship of their fishermen has long been known in the R.N., and the special branch of the R.N.R., recruited exclusively from the is. seamen, was formed at the beginning of this cent. Newfoundlanders were present at the historic exploit of the *Vindictive* at Zeebrugge and at Suvla Bay in the First World War. On the W. front in that war they fought at Beaumont-Hamel, Monchy-le-Preux, and Ypres. At Beaumont-Hamel—where there is a memorial to them—on 1 July 1916 they went into action 753 strong, but next day only 68 answered the roll-call. In the Second World War men were recruited for heavy artillery brigades, for the Newfoundland Regiment, and as air pilots. Owing to

wartime employment revenue became more buoyant, but the surplus of \$2,250,000 owed something to the suspension of expenditure on the gov.'s plan for rural reconstruction.

In the Second World War some 7000 men joined the Brit. forces, in addition to 2000 enlisted in other dominion contingents and 3600 who served as lumberjacks in the forestry unit in Great Britain. Many of the islanders enlisted in brigades of heavy artillery, rendering distinguished service. Facilities for the estab., use, and protection of naval and air bases on the Avalon Peninsula and on the S. coast of Newfoundland were granted to the gov. of the U.S.A. in Sept. 1940. Under an agreement made in May 1946 between the gov.s. of Canada, Newfoundland, and the U.K. respecting defence installations constructed in the is. during the war, Canada gave back the control and operation of the airport at Gander and the seaplane bases at Glenegles and Botwood to Newfoundland; and with a view to facilitating the development of the Gander airport as a civil airport, Canada gave up its rights under the lease granted in 1941. In consideration of taking over all the buildings, hangars, and works constructed by Canada at Gander the Newfoundland Gov. agreed to pay by instalments the sum of \$1,000,000. Under the same agreement the title to the lands of Torbay airport, in accordance with the understanding between the 2 gov.s. at the time that airport was constructed, was vested in the gov. of Canada for operation as a commercial airport for the air service between Newfoundland and Canada, but with equal facilities to the civil and military aircraft of both countries. The last article of this agreement provided for joint consultation between all 3 parties to the agreement on the co-ordination of defence requirements in the is. Canadian and U.K. military aircraft have the right to fly over Newfoundland and use its airports without payment of landing fees.

Federal Union with Canada. In 1947 representatives of the Canadian Gov. and of the Newfoundland National Gov. met at Ottawa to determine whether an equitable basis could be found for federal union between the 2 countries. During the war, in July 1943, Mackenzie King (q.v.) in the Canadian House of Commons stated that his gov. would give sympathetic consideration to any request by Newfoundland for incorporation in the dominion. The door was thus reopened for consideration of an old and difficult controversy, perhaps under more hopeful auspices than on previous occasions. In 1864 Newfoundland had been invited to join the provs. of Brit. N. America, which, in view of their strategic situation during the Amer. Civil War, were then contemplating the federal union that subsequently evolved into the dominion of Canada; but after attending the preliminary negotiations Newfoundland withdrew. Thirty years later (1894) the position was reversed. Canada was advancing in pop.

and wealth, and a delegation went to Ottawa to discuss the possibility of terms of admission; but when Canada was asked to assume the whole public debt of Newfoundland, which was then standing at \$16,000,000, the negotiations again broke down. Thirty years later still the position was again reversed following the Privy Council award in 1927 to Newfoundland of the coast of Labrador. Newfoundland thus technically became a continental power and Canada suggested union, but this time Newfoundland objected. Within 10 years the is. was again approaching insolvency, as shown earlier in this article. From 1934 Newfoundland was administered by a commission appointed from London, and under this body the economic position improved, but politically it could hardly be more than an interim solution and the time therefore seemed opportune for a renewal of the discussion. The public debt had by 1943 increased from \$16,000,000 to \$100,000,000, but what was an insuperable objection in 1894 appeared less in proportion to the dominion of 1943; while on the other hand the potential resources of Newfoundland in timber, fish, and minerals are considerable, but their development may be beyond the power of the islanders alone.

Question of the status of Newfoundland. From 1941 there was a decided change in the employment situation and this was reflected in the revenue returns, which showed a surplus for the first time for many years, the surplus in 1943-4 being nearly \$10,000,000 on a revenue of \$28,601,000. This change was not due to any industrial revival but merely because of the Allies' use of the strategical advantages of Newfoundland as a defence base, which meant remunerative work in almost every class of employment. It was realised that this prosperity was transitory, though it had not ended in 1947-8 when the estimated revenue of \$35,702,500 was higher than in any year except 1946-7, basic industries operating to capacity, while there was still full employment at the airports and the Amer. bases. In these circumstances a movement was started to urge the redemption of the pledge made by Britain in 1934 that, when the is. was again self-supporting, the former constitution would be restored. To ascertain whether Newfoundland was restored to a self-supporting basis and what form of gov. the people desired, the Brit. Gov. in Oct. 1946 set up an elected National Convention of 45 members to make recommendations on possible future forms of gov. which should be placed before the people in a referendum. The Convention was in session for 15 months and cost over a million dollars. It was interested at first in one thing only, the restoration of responsible gov. or the retention of commission gov. The deliberations were protracted by reason of the fact that in the meantime the question of union with Canada was under discussion between the Canadian Gov. and a delegation who went to Ottawa to ascertain 'what fair and equitable basis might exist for

federal union with Canada.' Three months later the delegation returned with terms which seemed adequate and even generous; but there were fears in Newfoundland about income tax and Canadian competition in trade. The anti-Confederates suggested that the terms had not been negotiated (the members of the Convention were ordinary citizens and in most cases lacked the knowledge necessary to deal with involved financial and economic matters) and that in any case terms should only be discussed by a properly constituted Newfoundland Gov. In its final vote (28 Jan. 1948) the Convention decided by 29 votes to 16 that union with Canada should not be recommended as a possible choice. Instead the Convention recommended 2 choices only for the ballot paper, the continuation of commission gov. and the return of responsible gov. But the Convention did not have the last word. It merely made recommendations to the Brit. Gov. and the latter decided that 3 choices should be placed before the people, including union with Canada, added because there was a substantial minority in the Convention in favour of considering it. There were manifest advantages in joining Canada, including substantial financial grants and social service benefits. The result of the first referendum showed over 60,000 votes each for confederation with Canada and a return to responsible gov. and only 22,000 for the retention of gov. by commission. As none of the 3 choices secured a vote greater than the combined total of the other 2 a second referendum was thought to be necessary. But on 22 July a referendum was held only as between a return to responsible gov. and union with Canada. At this referendum a clear vote was secured in favour of Canadian confederation, despite much bitter feeling among a large section of Newfoundlanders. It then only remained for Newfoundland representatives to negotiate with the Canadian Gov. for the final terms of union for submission to the Canadian Parliament, with whom the final decision rested.

The terms of the agreement for taking Newfoundland into the Canadian confederation were signed in Ottawa on 11 Dec. 1948 by representatives of the Canadian Gov. and the Newfoundland delegation, the operative date for union being 31 Mar. 1949, subject to the approval of the terms by the Canadian Parliament and the Newfoundland Gov. The Canadian Commons having passed the necessary resolution, and the Newfoundland Gov. also assenting to the terms, the Brit. Gov., in accordance with the joint request of Canada and Newfoundland, gave its assent to union by an Act of Parliament confirming the agreement. Under the agreement the services taken over by the dominion gov., thereby relieving the new prov. (now the tenth prov. of Canada) of the public costs incurred in respect of them after they had been taken over, were: the Newfoundland railway, including some shipping and other marine services; the Newfoundland Hotel;

telegraphic services; civil aviation; customs and excise; defence; protection of fisheries; geological, topographical, geodetic, and hydrographic surveys; light-houses, buoys, and beacons; radio broadcasting system; and some other public services.

T. Fall

NEWFOUNDLAND DOG

Newfoundland Dog. Few breeds of dog are associated with so many accounts of canine instinct, devotion, and sagacity as the N. D., which was introduced, probably in the late 18th cent., from Brit. N. America, where it had been accustomed to a very hard life on rough fare, and had long been bred for intelligence and taught to take to water without hesitation. It is in fact unrivalled as a water dog, and is much assisted by the oily nature of its dense, straight coat and by its partly webbed feet. Newfoundlands of the time when Sir Edwin Landseer immortalised the breed by his painting, 'A Distinguished Member of the Humane Society,' were of various colours. But there are

now 2 estab. varieties, the black and the white and black. Other colours, such as bronze or red and white, are not favoured. In both varieties the head is broad and massive, with short and square muzzle, small ears, and small deep-set eyes without haws. The back is broad, neck strong and short, legs very strong, and the feet large and round. The chest is deep and broad, and the tail thick and long enough to reach just below the hock. The general appearance is that of a dog of great strength and activity for its build and size. The movement is free, and the loose swinging of the body between the legs, giving a slight roll to the gait, is characteristic. According to the Newfoundland Club's standard, the weight should not be less than 110 lb. for a bitch and not more than 140 lb. for a dog, while the average height is put at 25 to 27 in. respectively, although somewhat larger animals are not uncommon. Newfoundland puppies need plenty of lean meat, both raw and cooked, as soon as they are able to take it, and they must have regular and frequent exercise.

Newgate Prison, former prison in London, situated at the W. end of Newgate Street. The date of its origin is not known, but it was in existence by 1190. It was common practice in walled cities to use gates as prisons (in London, Cripple-gate and Ludgate were also used), but N. P. was reserved for the worst class of criminals. It became notorious for overcrowding, lack of air and water, and for epidemics. About 1425 the executors of Richard Whittington, at his request, applied part of his property for the rebuilding of the jail, and this building, although damaged in the Great Fire, was used until 1767, when another rebuilding began. Before this was complete (1783) the prison was attacked and set on fire by the Gordon Rioters, when 300 prisoners were let loose (see Dickens's *Barnaby Rudge*). When the place of execution was moved here from Tyburn (1783) it became one of the shows of London to see the executions outside N. P., until all public executions were stopped in 1868. It was at Newgate in 1813 that Elizabeth Fry (q.v.) began her work of prison reform. Debtors, who had latterly been admitted, were no longer allowed in N. P. after 1815. In 1881 it ceased to be a prison except for those awaiting trial at the Central Criminal Court, and in 1902-3 it was demolished. The large list of well-known persons who have been imprisoned at N. P. includes Titus Oates, Defoe, Wm Penn, Jack Sheppard, and John Wilkes. See also OLD BAILEY. See ARTHUR GRIFITHS, *The Chronicles of Newgate*, 1902.

Newhaven: 1. Seaport tn of Sussex, England, 6½ m. S. of Lewes, on the Eng. Channel at the mouth of the R. Ouse, protected by a breakwater extending 2400 ft seawards. N. is a bonding port, with a daily cross-channel service to Dieppe, and coastguard and lifeboat stations. Places of interest include a 12th-cent. Norman church, a fort dominating the entrance to the harbour, and

buildings of old walling made from boulders collected on the shore. Pop. 7832.

2. Scottish fishing tn, part of the city of Edinburgh (q.v.), on the Firth of Forth.

Ne Win (1910-), Burmese soldier and politician, one of the 'Thirty Comrades' who went to Japan. He was commander of the Burma National Army, 1943-5, a Jap. colonel, and commander of Patriotic Burmese forces. M.P., 1947, brigadier, 1948, commander-in-chief, major general, 1949, defence minister, 1949-50.

Newlands, John Alexander Reina (1838-1898), Eng. chemist. After 1865 he practised as an analytical and consulting chemist. His name is associated with the conception of the theory of periodicity among the chemical elements—the law of octaves—later developed by Mendeleeff and Lothar Meyer. His papers on the subject were collected in *The Discovery of the Periodic Law*, 1884.

Newlands, suburb of Cape Town, S. Africa, on S. slopes of Table Mt. Favourite residential area with famous cricket and Rugby football grounds.

Newlyn, see PENZANCE.

Newmains, tn of Lanarkshire, Scotland, 2 m. N.E. of Wishaw, with ironworks and steelworks, and a large factory for pre-cast concrete. Pop. 6396.

Newman, Ernest (1868-), music critic, b. Liverpool. He was music critic for the *Manchester Guardian*, 1905-6, the *Birmingham Post*, 1906-19, and then, having settled in London, for the *Observer* at first, soon going over to the *Sunday Times*, to which he has remained attached. N. has pub. important books on music; the first to attract attention being *Gluck and the Opera*, 1895. A short book on Wagner first showed his special interest in that master, 1904. Similar works on Elgar, 1906, and Richard Strauss, 1908, are necessarily limited by their dates, but *Hugo Wolf*, 1907, has remained a standard work on the subject. Later works were *Wagner as Man and Artist*, 1914, a collection of essays *A Musical Molley*, 1919, *A Musical Critic's Holiday*, 1925, *Fact and Fiction about Wagner*, 1931, and *The Man Liszt*, 1934. All the earlier Wagner books, however, were in the nature of studies for his monumental *Life of Richard Wagner*, 1933-47, a biography in 4 vols. in which all the accessible facts are marshalled with masterly lucidity and discussed with incomparable psychological insight; *Wagner Nights*, *Opera Nights*, and *More Opera Nights* were the later vols. in the nature of very superior guide-books for opera-goers. N. trans. most of Wagner's music-dramas as well as Schweitzer's *J. S. Bach*, 1911, and Romain Rolland's *Beethoven the Creator*, 1929. See *Fanfare for Ernest Newman*, 1955.

Newman, Francis William (1805-87), scholar and man of letters, younger brother of Cardinal N., b. London. Educ. at Oxford, in 1826 he became a fellow of Balliol, but resigned in 1830 through conscientious scruples, and travelled in the E., joining a Baptist mission at Bagdad. He returned to England in 1833,

and was classical tutor at Bristol College, 1834-40, prof. of classics at Manchester New College, 1840-6, and prof. of Latin at Univ. College, London, 1846-63. He then devoted himself entirely to literature. His divergence from the Church of England in the direction of theism and free thought forms a curious contrast to the religious development of his brother. His works include *Catholic Union*, 1844, *History of the Hebrew Monarchy*, 1847, *The Soul, her Sorrows and Aspirations*, 1849, *Phases of Faith, or Passages from the History of my Creed*, 1850, *The Odes of Horace translated into Unrhymed English Metres*, 1853, *The Iliad of Homer*, 1856, and *Theism. Doctrinal and Practical*, 1858. See M. Arnold, *Last Words on Translating Homer*, 1862, and J. G. Slevelling, *Memoir and Letters of Francis W. Newman*, 1909.

Newman, Sir George (1870-1948), public health administrator, b. Leominster, educ. at Edinburgh Univ. (M.B., 1892), and at King's College, London. At Edinburgh he won the Gunning scholarship in public health, and took the diploma of D.P.H. at Cambridge in the same year (1895). He was senior demonstrator of bacteriology and lecturer on infectious diseases at King's College, London, 1896-1900. For a short time he was medical officer of health to Finsbury and to Beds, was chief medical officer of the Board of Education, 1907-35, and of the Ministry of Health from 1919 to 1935, in which latter year he retired. One of the chief architects of the modern system of public health administration, in addition to writing numerous official reports he was the author of books on *Bacteriology and the Public Health*, 1904, *Infant Mortality*, 1906, *Bacteriology of Milk*, 1908, *Hygiene and Public Health*, 1917, *An Outline of the Practice of Preventive Medicine*, 1919, and *Recent Advances in Medical Education in England*, 1923. Late in his career he wrote *Interpreters of Nature*, 1927, a series of biographies of leading figures in medical hist. His Hailey-Stewart lectures on 'Health and Social Evolution' were pub. in book form in 1930; *The Rise of Preventive Medicine* appeared in 1932, and *The Building of a Nation's Health* in 1939. He was knighted in 1911.

Newman, John Henry (1801-90), Eng. cardinal, was the eldest child of John N., a banker. In 1816 he entered Trinity College, Oxford; 2 years later he gained a scholarship, and in 1820 he took his B.A. degree, having failed to obtain any high academic distinction. In 1822 he was awarded a fellowship at Oriel, the acknowledged centre of Oxford intellectualism, and in the following year the same honour fell to Pusey (q.v.). In 1826, when N. obtained a tutorship, Richard Froude became fellow. Having assisted Hawkins to the provostship of Oriel, N. was appointed to the vicarage of St Mary's, Oxford, which Hawkins had just vacated. After resigning their fellowships because Hawkins failed to recognise 'the substantially religious nature' of their office, N. and Froude went abroad to the Mediterranean and to Rome, where they composed many

of the short poems afterwards collected in the *Lyra Apostolica*, 1834. It was during this tour, whilst he lay becalmed in the straits of Bonifacio, that N. wrote the beautiful hymn, 'Lead, Kindly Light.' The Oxford Movement dates from N.'s return home. In July 1833 he resolved with Froude and a few other friends and thinkers to uphold the integrity of the Prayer Book, and to defend the doctrine of apostolic succession. In Sept. of the same year he began his *Tracts for the Times*, and whilst publishing these, he was expounding from the pulpit of St Mary's

CARDINAL NEWMAN

the doctrines therein expressed. A chief source of that torrent of religious feeling which passed forth from Oxford to all parts of the kingdom must be looked for in the intense spiritual conviction, the magnetic and fascinating personality, the eager intellectualism and singular dialectical faculty of N., at that time a leading Tractarian. It was his study of the early fathers, of Athanasius, Origen, and Clement, and of the Monophysite controversy, that first filled his mind with doubts as to the justice of his claims for Anglicanism. In 1841 he raised a storm of indignation against himself by his *Tract 90*, in which he argued that the Articles do not disavow Catholicism. He retired to Littlemore near Oxford in 1842, renounced the living of St Mary's in 1843, and at the same time recanted all his earlier adverse criticism of the Rom. Church. After three years of strict seclusion at Littlemore he was received into the Rom. Catholic Church in 1845. He was ordained in Rome in 1846 and returned to England as a member of the Congregation of the Oratory (see ORATORY or St PHILIP NERI). He founded the oratories at Birmingham (1847) and London (1850). In 1852 he was fined £100 for libelling an apostate monk, Achilli, notwithstanding his ample demonstration of the truth of his accusations. His splendid and dignified *Apologia pro vita sua* was a reply to the 'grave and gratuitous slander' which Charles Kingsley set down against him in *Macmillan's Magazine*, 1864. In it the author traces

his mental development with a frankness which must have been repellent to so sensitive a nature, but which must for ever silence any who are inclined to question the transparent purity of his motives or the singleness of his aims. From this 'Apology' it is clear that N. was from the first actuated by his conception of an infallible church, and that a longing to attain, or at least approach to this ideal alone induced him to transfer his allegiance to the Rom. Church, which seemed the one 'divine kingdom' on this earth. The 3 years of fasting, prayer, and meditation which he passed in comparative seclusion at Littlemore (1842-5) are a sufficient indication of the grave and earnest spirit in which he took this step. In 1878 he was elected honorary fellow of Trinity and in 1879 he was created cardinal by Leo XIII. The diocesan process with a view to his beatification was begun in 1958. One of the great masters of Eng. prose style, N.'s works include *Sermons*, *Lectures*, *Grammar of Assent*, 1870. See lives by W. Meynell, 1887; R. H. Hutton, 1891; W. P. Ward (2 vols.), 1912; G. G. Atkins, 1931; H. Tristram, 1948. See also T. Mosley, *Reminiscences* (2 vols.), 1882; R. W. Church, *The Oxford Movement*, 1891; Anne Mosley (ed.), *Letters and Correspondence*, 1891; I. Williams, *Autobiography*, ed. Sir G. Prevost, 1892; W. E. Bloss, *Twist the Old and the New: a Study in the Life and Times of Cardinal Newman*, 1916; J. J. Reilly, *Newman as a Man of Letters*, 1925; J. M. Flood, *Cardinal Newman and Oxford*, 1933; F. R. Cronin, *Cardinal Newman, his Theory of Knowledge*, 1935; R. D. Middleton, *Newman and Bloxham: An Oxford Friendship*, 1947; M. Ward, *Young Mr Newman*, 1948; L. Bonyer, *Newman*, 1958.

Newmarket: 1. Mkt tn of Suffolk, England, 13 m. NE. of Cambridge. The fame of the tn rests on its races, racecourse, training and racing establs. The racecourse, adjoining the tn on the N., is owned by the Jockey Club and is said to be the finest in the world. The Jockey Club was founded between 1727 and 1760, when extensive buildings were erected. The horses are trained on the heath, where there is a great prehistoric earthwork known as the Devil's Dyke—40 ft wide and sev. m. long. In the tn is a house reputed to have been occupied by Nell Gwynne. Pop. 11,000.

2. Mkt tn in NW. co. Cork, Rep. of Ireland. John Philpot Curran (1750-1817), (q.v.) was b. here, and his daughter, Sarah, fiancée of Robert Emmet, is buried here. Pop. 1450.

Newmarket Stakes, see HORSE-RACING.

Newmilns, burgh of Ayrshire, Scotland, on the Irvine, 7 m. E. of Kilmarnock. The burgh includes Greenholm on the other side of the riv. There are lace and Madras manufs. Pop. 4000.

Newnes, Sir George (1851-1910), magazine and newspaper publisher, b. Matlock, Derbyshire. He ensured his first success in the publishing world by his production of *Tat-Bits* in 1881. In 1885 he became a Member of Parliament, sitting for

Newmarket on the Liberal benches until 1895. In the latter year he was made a baronet, and 5 years later he became M.P. for Swansea. Among other magazines and papers which he founded or ed. are the *Strand Magazine*, the *Ladies' Field*, the *Wide World Magazine*, *Country Life*, and *C. B. Fry's Magazine*.

Newnham College, Cambridge, for the higher education of women, organised in 1873 and opened in 1875. The college was incorporated in 1880, and for 30 years the students enjoyed most of the scholastic privileges offered by the univ.; their names appeared in the tripos or honours lists, but they were not allowed to hold degrees. In 1917 a royal charter was obtained, and in 1923 women were admitted to degrees. In Dec. 1947 full membership of the univ. was granted. The buildings include Old Hall (1875), Sidwick Hall (1880), Clough Hall (1888), Pfeiffer Building (1893), Kennedy Buildings (1906), Pelle Hall (1910), Fawcett Building (1938), and the library. See Mary A. Hamilton, *Newnham*, 1936.

Newport: 1. Municipal and only co. bor. in Monmouthshire, England, situated at the mouth of the Usk, a parl. constituency and a mkt and assize tn. The inhab. are engaged in shipbuilding, shipbreaking and repairing, iron, steel, and aluminium undertakings, the manuf. of chemicals, clothing, confectionery, rubber goods, and electrical equipment, and the shipping of coal and general merchandise. The dockage and wharfare are extensive. It was formerly a walled town defended by a castle, the ruins of which still stand. St Woolos Church, the cathedral of the diocese of Monmouth, dates from Saxon times. One of the few transporter bridges in the world spans the Usk. Pop. 105,000.

2. Municipal bor., mkt tn, and riv.-port of England, chief tn of the Isle of Wight, situated near the centre of that is., on the R. Medina, which is navigable up to this point. Vessels of considerable tonnage can berth at the quays at high tides. St Thomas's Church, erected in 1854 on the site of an earlier church built in the reign of Henry II, contains a monument erected by Queen Victoria in memory of the Princess Elizabeth, daughter of Charles I, who d. at Carisbrooke (q.v.) Castle, 8 Sept. 1650. Carisbrooke is in the bor., and also Parkhurst, a growing residential dist., with the Albany Barracks, depot of many well-known regiments; Parkhurst Prison, the famous penal institution, and Camp Hill Prison; also St Mary's Hospital. N. has a number of light industries. Pop. 19,840.

3. Seaport and burgh of Fifeshire, Scotland, on the Firth of Tay, opposite Dundee. Pop. 3400.

4. City and co. seat of N. co., Rhode Is., U.S.A. It is a very fashionable summer resort, and has a good harbour and a naval training station and war college. Close by is situated the U.S. torpedo station and coastguard station. It has a fishery and manufs. of precision instruments, rubber goods, medical supplies, electrical equipment, and jewellery; there

is also a shipbuilding industry. It is the site of Touro Park and the seat of Salve Regina College. Pop. 37,564.

5. City and co. seat of Campbell co., Kentucky, U.S.A., on the Ohio R., opposite Cincinnati. There are flour-mills and iron foundries, and manufs. of machinery. Pop. 31,044.

Newport News, city and port in, but independent of, Warwick co., Virginia, U.S.A., on the James R. It has an excellent harbour, one of the world's largest shipbuilding yards, iron works, coal wharves, lumber mills, and dry docks. It has been the tidewater terminus since 1880 of the Chesapeake and Ohio R.s. Pop. 42,458.

Newport Pagnell, mkt tn of Bucks, England, 14 m. from Buckingham, on the Great Ouse, where it is joined by the Ousel. There is a 14th-cent. church. The main occupation is agriculture, and there are light industries. Pop. 5000.

Newquay, holiday resort on the N. coast of Cornwall, England, about 11 m. N. of Truro. Pop. 9600.

Newry, seaport of Down and Armagh cos., N. Ireland, one of the chief ports of Ulster, on Newry Water, near Carlingford Lough, 33 m. SSW. of Belfast. There are corn, flour, and spinning mills, and potato processing, textile, wheelbarrow, clothing, knitting, and tobacco factories; also breweries, with granite quarries near by. Pop. 14,000.

News Agency, for gathering news and supplying it to newspapers and for broadcasting, and also to private subscribers. To a certain extent the N. A. reporter has supplanted the newspaper reporter, the latter being now more often employed in 'descriptive' reports or on 'stories' which are of special interest to his particular newspaper. In practice the great London newspapers use foreign cables of the N. A. s merely to supplement their own services, the N. A. service (apart from Reuters) being useful mainly for home news. In England the most important N. A. is the Press Association, which was formed in 1868 when Parliament passed an Act empowering the state to take over the telegraphs. Its members are the prin. proprietors of the prov. newspapers (see PRESS ASSOCIATION). Another leading Brit. N. A. is the Exchange Telegraph Co., notable for its 'tape' service. Reuters is the chief agency in Britain for foreign news, and has correspondents in all parts of the world. The Press Association has the sole right of circulating Reuter telegrams in the provs. Besides general news the N. A. s also cover parl. reports, market news, and sport. The chief N. A. s of the U.S.A. are the Associated Press of America and the United Press Association of America, both with London branches.

'**News Chronicle**,' founded as the *Daily News* in 1846, under the editorship of Charles Dickens. From 1869 it was the recognised organ of the Liberal party in England. The *Daily News* was among the earliest papers to publish foreign telegrams. For years its only serious London rival in Liberal journalism was the *Morning Star*, which it bought up in 1870.

Later it became identified with Liberal imperialism; but after it was taken over by George Cadbury it became more 'progressive.' In 1928 the *Daily News* absorbed the *Westminster Gazette* (q.v.), and in 1930 the *Daily Chronicle* was also amalgamated with the *Daily News* under the present title *News Chronicle*, the sole Liberal daily paper in London. It incorporated the *Daily Dispatch* (q.v.), Nov. 1955.

'**News of the World**,' Eng. Sunday newspaper, founded in 1843. It was acquired in 1891 by the syndicate which still controls it, and is the only Eng. newspaper to be independently owned. The policy of the paper was admittedly sensational, giving more space than did any other to police court and divorce proceedings, and this has been maintained except for the restrictions in the latter subject enforced by the Judicial Proceedings (Regulation of Reports) Act of 1906. In addition a most comprehensive sports review is provided. Even in 1906 the sales of the *News of the World* exceeded 1,000,000; its present circulation is about 7,000,000.

Newspapers. History. It is not easy to trace the origin of the newspaper press, but at least it is clear that analogies with the Rom. *Acta Diurna* or the Venetian *Gazzetas* are very remote, and hardly less so with the old Eng. news-letters of the 16th cent. It was, in fact, essentially the invention of printing and the more or less accidental removal of restrictions on the liberty of the press that favoured the growth of modern N. According to Cicero, Petronius, and other writers, the *Acta Diurna* (called also *Acta Urbana* or *Publica*) pub. an account of anything worthy of note. But they are rather to be regarded as the official notification or registration of important public events than the voluntary presentation of news as a commercial speculation. It is recorded that the rep. of St Mark had its N., and it is very probable that we borrowed, if not the idea of a newspaper, many of the terms in familiar use to-day in connection with N. from the Venetians, e.g. the word 'gazette,' which word is apparently derived from the name of the coin charged for reading it. Like the *Acta Diurna* the Venetian gazettes were hung up in public places. The first man to print all the news of the day upon a single sheet, in a regular weekly pub. with a distinctive title, was Nathaniel Butter, who brought out the *Weekly News* in 1622. Up to that time the only means of circulating news was the news-letters, which were the MS. productions of professional London news-writers who collected the gossip and rumour of the city (see also JOURNALISM). There were, however, during the Civil war and the Commonwealth a great number of N., but their pub. was only by leave of the Star Chamber. The press became temporarily free on the abolition of the Star Chamber, but the Long Parliament, becoming frightened by the mass of pamphlets which were soon broadcast over the country, again subjected books and other reading matter to licensing regulations. At the Restoration

a most retrogressive step was taken in the passing of the Licensing Act, which vested in the gov. the entire control of printing. It was the non-renewal of this Act in 1695 on its automatic expiration that paved the way for the freedom of the press.

Among the earliest of Eng. N. after the Restoration were the *Protestant Intelligence*, the *Current Intelligence*, the *Domestic Intelligence*, the *True News*, and the *London Mercury*. But none of them printed debates in Parliament, and none exceeded in size a single small leaf, or was pub. oftener than twice a week. The first daily newspaper, the *Daily Courant*, was not pub. till the accession of Queen Anne in 1702. Even after the abolition of the licenser of books (including N.) there was another obstacle to the free pub. of N. in the shape of the Newspaper Tax, the Bill for which was passed as the Stamp Act in 1712. It was the old bugbear of sedition which prompted this device for killing the N., a device which was eminently successful, for not one penny paper survived, and even Addison's *Spectator* collapsed, while Steele incurred the wrath of the attorney-general for articles in the *Englishman* and the *Crisis*, which were held to be 'aspersions upon the character of Queen Anne, and assaults upon the conduct of the administration.' But the printers soon evolved means of evading the Stamp Act; and in this they were aided and abetted by the leaders of the opposition, to whose often scurrilous and venomous attacks on their political rivals we owe the beginning of the pub. of proceedings in Parliament. In 1738 Parliament seems to have taken steps to stop the practice of reporting, for the debates were thereafter pub. as if they had taken place in a fictitious assembly. But at the end of the 18th cent. public sympathy for reporting became too strong for parl. privilege, with the result that reporting gradually became recognised as lawful. Parl. reporting laid the seeds of the future prosperity of the *Morning Chronicle*. Thereafter N. quickly developed into a form more or less similar to that of to-day. The Stamp Act was finally repealed in 1855.

British. A modern newspaper derives its news from 2 main sources: its own staff of reporters and correspondents and the news agencies (q.v.). Inasmuch as the material sent out by the news agencies is common to all their newspaper subscribers, N. would differ little from each other if they did not import individuality and colour through their own staffs. The staff of a newspaper consists of a body of full-time reporters at the head office, who receive their daily assignments from the news editor, and the political, diplomatic, dramatic, and other correspondents, who are really reporters in a special sphere and often enjoy the confidence of influential persons. *The Times* is to-day the only newspaper to maintain its own press gallery staff in the House of Commons; other N. depend on agency reports and sketch writers, while lobby correspondents keep close contact with ministers and other Members of Parliament and

write on expected political and administrative developments. A staff of reporters is also kept at the law courts. The law reporters of *The Times* are required to be barristers and the pub. vols. of *The Times Law Reports* are accepted as authentic records of judgments. Under the news editor there are also correspondents in prov. tns who send in their copy by telegraph or telephone. The foreign news editor deals with the messages sent by the newspaper's correspondents abroad; distant messages are sent in by cable or radio-gram, but those from European caps. are normally sent over the telephone and taken down by dictaphone or in shorthand. A newspaper's correspondents, whether home or overseas, may be full-time staff men and required to work exclusively for the newspaper; others, in less important centres, may do other work and are paid a retaining fee and space rated. Distinctions such as 'our special correspondent,' 'a correspondent,' 'a special correspondent,' 'our correspondent,' 'our own correspondent,' are all well understood in Fleet Street; the first and last of these only are staff men as opposed to outside contributors and mostly their remuneration is much higher. The miscellaneous mass of news from whatever source received is prepared for the press by subeditors, whose function is to select, compress, and correct and also to indicate the type and appropriate headings and subheadings. The selection among the copy is done by a copy-taster, who 'spikes' (i.e. defers indefinitely) some and passes the remainder to his colleagues with a symbol indicative of its importance; the selection within the copy itself is done by the subeditors, while the chief subeditor approves and revises the sub-ed. copy.

A modern newspaper is not, however, made up exclusively of news, and a large though very varying place is taken by 'features.' Thus the correspondence columns and the 'turnover' article are features of *The Times*, while birth, marriage, and obituary notices are a feature of both *The Times* and the *Manchester Guardian*. These are admitted in proof of pedigree at the College of Heralds. Social and political gossip is also a feature; others are political cartoons, and 'strip' cartoons, and cross-word puzzles. Apart from news and features, a newspaper should have leading articles or editorials. These may be important and influential, such as those in *The Times*, *Manchester Guardian*, *Daily Telegraph*, and *Yorkshire Post*, which are always closely studied by the politicians, and in the Brit. press 'leaders' are unsigned because they are the views or policy of the paper and not of an individual.

It is often said that advertisers exert an undue influence over editorial matter; but although a great part of the revenue of a newspaper comes from advertising, most Brit. N. now carry news on the front page, though *The Times* still devotes the whole front page to advertisements. Illustrations may be given to show that direct or indirect control by advertisers

might tend to become dangerous, but the danger may, on the whole, be said to be hypothetical. Again, though a high circulation enables advertising rates to be increased, nothing so damages the tone of a newspaper as competition for big circulation, and, generally speaking, the N. which have the greatest influence on public opinion have comparatively low but steady circulations among sections of the public whose support is politically valuable. It has been well said that in Britain the power of the N. to influence opinion and policy is, in fact, almost in inverse proportion to circulation, though the rule is, of course, not mathematically exact (cf. Ivor Thomas, *The Newspaper*, Oxford Univ. Press pamphlets on Home Affairs, No. II.2, 1943). For the outstanding features of novelty in modern journalism, and some remarks on Fr. and Amer. N., see JOURNALISM; for the hist. of individual N. see under the name of the newspaper, and for the hist. of advertisements in N. and their bearing on them see ADVERTISEMENT.

The outstanding feature of newspaper finance in more recent years has been the growth of combines controlling chains of N. One of the prin. groups is Associated N. Ltd, which owns the *Daily Mail*, *Daily Sketch*, *Sunday Dispatch* (qq.v.), *Evening News*, and a chain of prov. N. This company has a large holding in Anglo-Newfoundland Development Co. Ltd (see under NEWFOUNDLAND). Another large group was the Berry group, but the brothers Wm and Gomer Berry (Lords Camrose and Kensley, qq.v.) in 1937 divided their interests. Lord Camrose became owner of the *Daily Telegraph* (qq.v.), and Lord Kensley of the *Sunday Times*, *Sunday Graphic*, *Empire News* (qq.v.), and sev. prov. N. The Westminster Press Prov. N. Ltd, formerly known as the Starmer group, controls 3 morning, 9 evening, 1 bi-weekly, and 42 weekly N., all these being mainly in the Midlands, Durham, and Yorks. But the Brit. press shows most conceivable types of ownership. Most London N. used to be family properties and many prov. N. still are. *The Times* (qq.v.) since 1922 has been held by Lord Astor of Hever and John Walter (see 'TIMES, THE'), but to prevent the paper from falling into undesirable hands the owners entered into an arrangement whereby any transfer of shares in the Times Holding Co. requires the consent of a body of trustees consisting of the lord chief justice, the president of the Royal Society, the governor of the Bank of England, and others. The control of the *Daily Express*, *Evening Standard*, and *Sunday Express* (qq.v.) is held by the Beaverbrook Trust. The *Daily Herald* (qq.v.) is owned as to 49 per cent of its shares by the general council of the Trades Union Congress and as to 51 per cent by Odhams Press Ltd, who own entirely the *Sunday People*. The *News of the World*, credited with the largest newspaper circulation in the world, has prov. newspaper interests in the W. of England. The *Daily Mirror* and the *Sunday Pictorial* (qq.v.) are owned by interlocked

companies. The *News Chronicle* and the *Star* (qq.v.) are owned by the Cadbury family, the *Observer* (qq.v.) by Viscount Astor, now under a trust formed in 1945; and *Reynolds News* (qq.v.) by the Co-operative movement. The *Morning Advertiser* is the one example of a newspaper owned on behalf of a trade—the Licensed Victuallers. The *Daily Worker* (qq.v.) is the organ of the Communist party. In Oct. 1953 Mr W. J. Brittain launched the *Recorder*, the first new daily newspaper, apart from the *Daily Worker*, to be put on the market for 41 years; unfortunately it ceased pub. in 1955.

European. The most important continental European daily papers (1957-8) are as follows (arranged in descending order of circulation within each country):

Austria. *Arbeiter-Zeitung*, Vienna, socialist, 235,000; *Die Presse*, Vienna, independent, 50,000.

Belgium. *Le Soir*, Brussels, independent, 310,000; *De Laatste Nieuws*, Brussels, liberal, 310,000.

Denmark. *Bertlingske Tidende*, Copenhagen, conservative, 180,000; *Politiken*, Copenhagen, liberal, 150,000.

Finland. *Helsingin Sanomat*, Helsinki, conservative-independent, 245,000.

France. *France-soir*, Paris, independent, 1,400,000; *Le Figaro*, Paris, moderate right, 500,000; *Le Monde*, Paris, independent, 210,000.

Germany (Federal Republic). *West-deutsche Allgemeine*, Essen, independent, 375,000; *Süddeutsche Zeitung*, Munich, independent, 250,000; *Die Welt*, Hamburg, independent, 200,000; *Frankfurter Allgemeine*, Frankfurt, independent, 160,000; *Der Tagesspiegel*, Berlin, independent, 100,000.

Greece. *Kathimerini*, Athens, conservative, 70,000; *Vradyni*, Athens, conservative, 60,000.

Italy. *Corriere della Sera*, Milan, independent, 500,000; *La Stampa*, Turin, independent, 250,000; *Il Messaggero*, Rome, independent, 180,000; *Il Tempo*, Rome, democratic, 175,000.

Netherlands. *De Vrije Volk*, Amsterdam, socialist, 350,000; *De Volkskrant*, Amsterdam, Catholic, 160,000; *Nieuwe Rotterdamse Courant*, liberal, 55,000.

Norway. *Aftenposten*, Oslo, conservative, 150,000.

Portugal. *Diário de Notícias*, Lisbon, 140,000; *O Século*, Lisbon, 75,000.

Russia. *Pravda*, Moscow, communist, 5,000,000; *Izvestiya*, Moscow, communist, 2,000,000.

Spain. *A.B.C.*, Madrid, royalist, 100,000; *La Vanguardia Española*, Barcelona, 100,000.

Sweden. *Dagens Nyheter*, Stockholm, liberal, 300,000; *Aftonbladet*, Stockholm, 175,000; *Svenska Dagbladet*, Stockholm, conservative, 100,000.

Switzerland. *Tages Anzeiger*, Zürich, independent, 140,000; *Neue Zürcher Zeitung*, Zürich, liberal, 72,000; *Tribune de Genève*, Geneva, independent, 52,000; *National Zeitung*, Basel, radical, 50,000.

Turkey. *Hürriyet*, Istanbul, independent, 125,000; *Valan*, Istanbul, liberal, 30,000.

American. Since the Franco-Ger. war the Amer. press has greatly influenced Brit. and European journalism. The use of the electric telegraph was without doubt first proved by Amer. correspondents in Europe at this time. A number of circumstances—the cheapening of paper, the development of setting and printing machinery, the reproduction of photographs to illustrate news items, and the estab. of powerful news agencies—tended to make N. in the U.S.A. of greater influence. It was also found convenient by wealthy men to be able to control a newspaper, or syndicate of N., for their own political or social advantage. The first Amer. newspaper was pub. in Boston, Massachusetts, under the title of *Public Occurrences*; 2 copies were issued, 1689 and 1690; both were suppressed by the gov. of Massachusetts. Next was the *Boston News Letter*, 1709, followed by the *Boston Gazette*, 1719. Further Massachusetts N. were the *New England Courant*, 1721, *Massachusetts Spy*, 1770, and the *Boston Sentinel*, 1784. The *Liberator* of Wm L. Garrison was pub. in Boston, 1831. Among modern Massachusetts N. may be mentioned the *Boston Record and American Post*, 1831, *Herald*, 1846, *Daily Globe*, 1872, and the *Christian Science Monitor*, 1908. The prin. N. in New York include *New York Journal-American*, 1788, *New York Post*, 1801, *World-Telegram and Sun* (q.v.), 1833, *New York Mirror*, *New York Herald Tribune* (q.v.), *New York Times* (q.v.), 1851, and *Wall Street Journal*, 1882. Chicago N. include *Chicago Tribune* (q.v.), 1847, *Herald American* (see HEARST) and *Chicago Daily News*, 1875, and *Chicago Sun-Times*, 1929. As an example of the growth of N. may be mentioned those in Pennsylvania, including *Pittsburgh Press*, 1824, *Philadelphia Inquirer*, 1829, *Philadelphia Bulletin* and *Bulletin*, 1847, *Altoona Mirror*, 1874, *Philadelphia Daily News*, 1925, and *Pittsburgh Post-Gazette*, 1927. Ohio N. include *Cincinnati Enquirer* and *Cleveland Plain Dealer*, 1841, and *Cleveland Press*, 1878. Other well-known N. include the *Kansas City Star-Times* and *Detroit Free Press*, 1831, *Baltimore Sun*, 1837, *Washington Post*, 1877 (*Washington Post and Times Herald*, 1954), and *Los Angeles Illustrated Daily News*, 1895. The 1957 ed. of Messrs N. W. Ayer & Son's *Directory of Newspapers and Periodicals in the U.S.A.* lists 334 morning papers with a total circulation of 21,576,000, 1482 evening papers (34,211,000), 8 all-day papers (809,000), and 536 Sunday papers (46,670,000). Amer. N., with very few exceptions, do not have a nation-wide circulation, and indeed they are not designed for that purpose. The exceptions are the *New York Times* and the *New York Herald Tribune*, which circulate into the Far W., even as far as California. Important Canadian N. include the *Halifax Chronicle-Herald*, 1875, *Montreal Gazette*, 1878, and the *Toronto Globe and Mail* (q.v.), 1844, *Evening Telegram*, 1876, and *Star* (q.v.), 1892. A leading S. Amer. paper is *La Prensa* (q.v.).

Radio-facsimile newspapers. Transmission of news by radio facsimile has made some progress in America since the Second World War. Before the war miniature N. were transmitted by nearby radio stations during the night and printed by a small unit fixed in place of a loud-speaker to an ordinary radio set which contained a device to shut off the machine automatically. By 1939 about a score of radio stations had estab. regular radio facsimile services. During the war these experiments had to yield to war work, though the armed services used the radio-facsimile process for transmitting orders. W. G. H. Finch is the pioneer of this process in America. The Finch transmitter consists of a scanning machine into which copy to be broadcast is inserted. The copy, printed or typewritten or drawn, is automatically wrapped round the surface of a spinning cylinder. Beside the cylinder is mounted a device called the scanning head, which consists of an electric bulb, lens system, and photo-electric cell. The lens focuses a spot of light which traces a closely spaced spiral line on the surface of the paper. This causes the lights and darks of the copy, made by letters or pictures, to reflect from the paper with the varying intensity of the photo-electric cell. From this impact of reflected light issues a high-pitched soft note, known as the facsimile carrier, which is applied to an ordinary amplifier and delivered to the radio transmitter in the same way as if it issued from a studio microphone instead of from a photo-electric cell. The home receiver picks up these signals and passes them to the attached recorder instead of to a loud-speaker. The recording instrument prints the incoming news and pictures on a continuous sheet of electro-sensitised paper, which reacts to the facsimile signal and shuts itself off when the printing is completed. It is now possible to use paper 5 columns wide, the size of a small newspaper, and to transmit at the rate of 48 sq. in. a minute, or more than 550 words of copy. An entire 4-page small-size newspaper has been transmitted in 8 min. Departmental stores have used the radio facsimile to send illustrations and copy in their advertisements directly into the home. It is possible to equip ships at sea with the service. One present difficulty is that it is not yet possible to transmit the regular 8-point type size clearly. The 12-point type, which is used, cuts down the number of words the paper can carry. Another difficulty is the high cost of the electrolytic paper required for radio-facsimile transmission. It is feared by some that even greater standardisation and monopolisation of news production may result from radio-facsimile N. But the fear that radio facsimile may make the regular newspaper obsolete is considered groundless.

Royal Commission on the Press, 1947. In response to a persistent demand of its supporters, the gov., in 1946, allowed a private member of the Labour party to bring forward a motion asking for the appointment of a royal commission to

inquire into the finance, control, management, and ownership of the press. The chairman of the commission, appointed in 1947, was Sir David Ross, provost of Oriel College, Oxford. The other members were M. E. Aubrey, general secretary of the Baptist Union; John Benstead, general secretary of the National Union of Railwaymen; Neil Beaton, chairman of the Scottish Co-operative Wholesale Society; Lady Violet Bonham-Carter, president of the Liberal party organisation; R. C. K. Ensor, historian and journalist; Eirwen Mary Owen, deputy regional commissioner for Welsh civil defence region during the Second World War; Hubert Hull, lawyer; J. B. Priestley, author; Wright Robinson, former lord mayor of Manchester; Gilbert Granville Sharp, recorder of King's Lynn; Lord Simon of Wythenshawe, chairman of the council of Manchester Univ.; Sir Geoffrey Vickers, legal adviser to the National Coal Board; Sir George Waters, formerly editor of the *Scotsman*; H. W. Wilson, chartered accountant; Barbara Wootton, reader in social studies, London Univ.; and G. M. Young, historian and author. The terms of reference were: 'With the object of furthering the expression of opinion through the press and the greatest practicable accuracy in the presentation of news, to inquire into the control, management, and ownership of the newspaper and periodical press and the news agencies, including the financial structure and monopolistic tendencies in control, and to make recommendations thereon.'

The report of the commission, issued on 29 June 1949, recommended the estab., by the press itself, of a general council of the press, 'to safeguard the freedom of the press; to encourage the growth of the sense of public responsibility and public service among all engaged in the profession of journalism—that is in the editorial production of newspapers—whether as directors, editors, or other journalists; and to further the efficiency of the profession and the well-being of those who practise it.'

Regarding chain N. the commission thought that such N. should carry a front-page formula indicating their common ownership; but concerning the allegations about monopoly, due to the growth in the series of chains, the assertion that the process had gone so far that a monopoly existed and that the chains were deliberately driving independent N. out of existence was wholly disproved by the commission's findings. Of the 5 chains (Prov. N. Ltd, Harnsworth chain, Associated N. Ltd, Westminster Press Prov. N. Ltd, and Kemsley N. Ltd) the Kemsley is the largest, its percentage of the total number of daily and Sunday papers being 17.18 in 1948. There were fewer daily and Sunday N. in the 5 chains in 1948 than in 1929. With the exception of 2 papers, whose lack of success could be attributed to other causes, no independent daily competing with a chain daily had ceased pub. since 1932. The commission found that the present degree of concentration of ownership in the press

as a whole or in any important part of it 'is not so great as to prejudice the free expression of opinion or the accurate presentation of news, or to be contrary to the best interests of the public.' It was suggested in evidence that individual or joint-stock ownership should be prohibited and papers be owned by gov.-licensed corporations. This the commission rejected as an 'unwarrantable interference with the liberty of the individual and the freedom of the press.' The commission saw no reason to believe that N. attached to the interests of political parties, trade unions, or other organisations would be better or have greater regard for truth and fairness than those N. pub. by private undertakings. It is generally agreed, the report states, that the Brit. press is inferior to none in the world. 'It is free from corruption; both those who own the press and those who are employed on it would universally condemn the acceptance or soliciting of bribes.'

It has been claimed that the report of the commission was a complete vindication of the press generally. But the commission gave reasons why in their opinion N., with a few exceptions, failed to supply the electorate with adequate materials for sound political judgment. On this the report stated: 'In the popular papers consideration of news value acts as a distorting medium even apart from any political considerations: it attaches, as we have shown, supreme importance to the new, the exceptional, and the "human," and it emphasises these elements in the news to the detriment or even exclusion of the normal and the continuing. Consequently the picture is always out of focus. The combination, day after day, of distortion due to these factors with the distortion arising from political partisanship has a cumulative effect upon the reader. It results, where it is carried furthest, not only in a debasement in the standards of taste, but also in a further weakening of the foundations of intelligent judgment in public affairs. Political partisanship alone, as we have indicated, deprives the citizen of the evidence on which conclusions should be based. Political partisanship in conjunction with a high degree of distortion for news value may lead him to forget that conclusions are, or should be, grounded on evidence.' Discussing the standards by which the press should be judged, the commission set down two requirements: firstly, that while the selection of news may be affected by a newspaper's political and other opinions the news it reports should be reported truthfully and without excessive bias; and, secondly, that the number and variety of N. should be such that the press gives an opportunity for all important points of view to be effectively presented. 'The first requirement is satisfied in very different measure by different papers. A number of quality papers do fully or almost fully meet its demands. But all the popular papers and certain of the quality fall short of the standard achieved by the best, either through excessive

partisanship or through distortion for the sake of news value. The provincial newspapers generally fall short to a lesser extent than the popular national newspapers. As to the second requirement, the press provides for a sufficient variety of political opinion but not for a sufficient variety of intellectual levels. The gap between the best of the quality papers and the general run of the popular press is too wide, and the number of papers of an intermediate type is too small. The causes of these shortcomings do not lie in any external influences upon the press (other than those exerted by public demand). The policy of the press is dictated neither by the advertisers, nor by the government, nor by any outside financial interests. . . . Nor do the causes of the shortcomings lie in any particular form of ownership. . . . We do not see a solution to the problems we have indicated in major changes in the ownership and control of the industry. Free enterprise is a prerequisite of a free press, and free enterprise in the case of newspapers of any considerable circulation will generally mean commercially profitable enterprise. The commission's report was debated in Parliament and by the newspaper proprietors (see First Annual Report of the General Council of the Press, 1954). In July 1953 the council was constituted, its objects being (i) to preserve the establishment of the press, (ii) to maintain the character of the British press in accordance with the highest professional and commercial standards, (iii) to keep under review any developments likely to restrict the supply of information of public interest and importance, (iv) to promote a proper functional relation among all sections of the profession, (v) to promote and encourage methods of recruitment, education, and training of journalists, (vi) to promote technical and other research, (vii) to study developments in the press which may tend towards greater concentration or monopoly, (viii) to publish periodical reports recording its own work and reviewing from time to time the factors affecting it. The council consists of 25 members, all directors or employees of N., periodicals, or news agencies. See also JOURNALISM; MAGAZINES; PRINTING.

Newstead: 1. Vil. of Roxburghshire, Scotland, on the Tweed, 1 m. E. of Melrose. Remains of a Rom. camp (Trimontium) built by the troops of Agricola were excavated in 1910, and in 1928 a monument was erected to mark the site. Weapons, armour, and coins (Augustus to M. Aurelius) were found. Pop. 175.

2. Or **Newstead Colliery**, par. and vil. in Notts, England, 9 m. N. of Nottingham, near the outskirts of Sherwood Forest. Its famous abbey was founded by Henry II in the latter half of the 12th cent., and it was granted by Henry VIII to the Byron family, who held it until 1818, when the 6th Lord Byron (the poet) sold it. It has since been restored and, with the gardens, was vested in the corporation of Nottingham in 1946. Pop. 2586.

NEWT

Newt, Eft, Asker, certain tailed amphibians of the family Salamandridae. Three species occur in Britain, viz. the common or spotted N. (*Triton vulgaris*), the great or crested N. (*T. cristatus*), and the rare webbed N. (*T. palmatus*). Of them, the crested N. is the most aquatic. Its head is flat and the upper lip overhangs the lower one. The upper parts of the body are blackish-brown with darker brown spots. The under parts are reddish-orange, with black spots. The sides are dotted with white, and in spring the colours of the rough skin brighten and the

notched crest comes into prominence. The male reaches a length of 5 or 6 in., while the common N. rarely exceeds half that length and the skin is smooth, though its colouring resembles the other.

Newton, Alfred (1829-1907), Eng. ornithologist, *b.* Geneva. In 1854 he was elected travelling fellow of Magdalene College, Cambridge, and visited many parts of the world. He pub. *Zoology of Ancient Europe*, 1862, *Ootheca Wolcyana*, 1864-1902, *Zoology*, 1872, and a *Dictionary of Birds*, 1893-6.

Newton, Sir Charles Thomas (1816-94), archaeologist, *b.* Bredwardine in Herefordshire. In 1852 he became vice-consul at Mitylene, and in 1853-4 consul at Rhodes. In 1854-5, aided by funds supplied by Lord Stratford de Redcliffe, he discovered an important series of inscriptions at the is. of Calymnos, and in 1856-7 he discovered the remains of the Mausoleum at Halicarnassus. In 1861 he was appointed keeper of Gk and Rom. antiquities at the Brit. Museum.

Newton, Gilbert Stuart (1794-1835), painter, *b.* Halifax, Nova Scotia. He first exhibited at the Royal Academy in 1818, becoming an associate in 1829, and an academician in 1832. His pictures include 'Don Quixote in his Study,' 1823, 'Captain Macheath upbraided by Polly and Lucy,' 1826, 'Yorick and the Grisetite,' 1830, and 'Portia and Bassanio,' 1831.

Newton, Sir Isaac (1642-1727), mathematician and scientist, *b.* in the manor-house of Woolsthorpe-by-Colsterworth, near Grantham, Lincs, on 25 Dec., posthumous son of a farmer, Isaac N., and Hannah Ayscough. Educ. at the King's School, Grantham, and entered Trinity College, Cambridge, in June 1661, graduating in 1665. His great discoveries of the differential calculus, many of the properties of light, and the law of universal gravitation were all made in his twenty-third and twenty-fourth years while he was spending an enforced vacation at home owing to an outbreak of the plague. Returning to Trinity College he was elected a fellow, took his M.A. degree, and in 1669 was appointed Lucasian prof. of mathematics in succession to his teacher, Isaac Barrow. His election as a fellow of the Royal Society in Jan. 1672 led to controversies extremely wearisome to N. Previous to this, from 1665 to 1667, he was engaged largely in mathematics, having studied Descartes's geometry, and invented the binomial theorem, the method of tangents, and the fluxional calculus (the discovery of fluxions, which he claimed, was contested by Leibnitz, and led to a long and bitter controversy between the 2 philosophers), his paper *Analysis per Equationes Numero Terminorum Infinitas* leading to his professorship. In 1666 his thoughts were directed by the falling of an apple, according to Voltaire, to universal gravitation. From Kepler's second law he deduced the law of inverse squares and applied it to the motions of the moon; but did not complete his verification till he had Picard's new value (69.1 m.) for the length of a degree of lat., which was found in 1672. In 1684 he

wrote *De Motu*, which was presented to the Royal Society. This was the germ of his great work, and with additions formed the first book of his *Philosophiæ Naturalis Principia Mathematica*, written 1685-6, during which time he was in constant correspondence with the astronomer royal, Flamsteed, chiefly on the subject of measurements of planetary orbits. The whole work was pub. in 1687. In 1689 N. was elected to represent his univ. in the Convention Parliament. During 1692-3 he passed through a period of serious illness, with loss of appetite and marked

SIR ISAAC NEWTON

Engraving after the original picture by Vanderbank, in the possession of the Royal Society.

insomnia. He was at last, in 1694, largely owing to the efforts of John Locke, appointed by Charles Montagu warden of the Mint, and 3 years later master. The year 1701 saw him again in Parliament, but he was defeated at the polls in 1705. He became president of the Royal Society in 1703, and was annually re-elected for the remainder of his life. He was knighted by Queen Anne in 1705. His *Optics* was pub. in 1704. In 1714 N. gave evidence before a committee of the House of Commons on the question of finding long, at sea. He was interested in theological studies and the anct prophecies. After his death his *Observations upon the Prophecies of Daniel and the Apocalypse of St John* and his *Chronology of the Ancient Kingdoms Amended* were pub., but nothing explicit concerning his views on the Trinity, which were believed to be Aryan and unorthodox, ever appeared. Amongst his great friends must be reckoned Halley, who persuaded and cajoled N. into writing his *Principia*; had not Halley exercised the greatest tact, the crowning part of the book would have been suppressed by N., for fear of controversy. Yet the work has been described as one of the greatest feats of the human intellect, for it contains not only the explanation of the planetary

orbits, worked out in terms of universal gravitation and N.'s laws of motion, and of the behaviour of comets, but a host of other achievements of the first importance. It also gives the basis of mathematical physics, in particular of the science of fluid movements. It has been remarked that science was N.'s supreme interest only for short and separated periods, and in the intervals he displayed not only a lack of interest in physical science but sometimes even an actual distaste for it. It is certainly significant that he made no attempt to publish his great discoveries of the calculus, universal gravitation, and prismatic decomposition of light, and nothing on the calculus or on gravity appeared for some 20 years. N., far from being a man of remote academic interests, had a very practical mind. In his boyhood he made mechanical toys, clocks, and sundials. His interest in chem. began when he was boarding at the house of the apothecary, Clark, during his schooldays in Grantham, and this interest continued after he went to Cambridge. He took his chem. from Baptist van Helmont (q.v.), who discovered the materiality of gases, and from Boyle. The views in the *Principia* are akin to those of Boyle, Hooke, and Mayow on the existence of a vital constituent in the atmosphere, isolated by Priestley long afterwards and named oxygen by Lavoisier. In 1692 he drew up a paper, entitled *De natura acidorum*, dealing with chemical affinity (pub. 1710), but it was in the queries appended to his *Optics* that he approached this problem more closely. Though he achieved the unique triumph of formulating the mathematical law of gravitational attraction, he was not able to extort from nature the laws of chemical action or to reach any corresponding simple numerical relationship. Yet it seems that here was the great object of N.'s chemical speculations and researches and that 'here in the microcosm of chemistry he sought to parallel his discoveries in the macrocosm of mechanics' (Douglas McKie). N. was welcomed at the court of George I and held in increasing reverence and honour—though his mind shrank from contact with worldly society. He d. at Kensington and was buried in Westminster Abbey near the entrance to the choir. Among Eng. scientists he stands foremost, and he left such a mark upon science that, until the beginning of the 20th cent., what was done in celestial mechanics and in general investigations of the properties of matter followed the lines he laid down. See S. Horsley, *Isaac Newtoni Opera quae exstant Omnia*, 1779; Sir D. Brewster, *Memoirs of the Life, Writings, and Discoveries of Sir Isaac Newton*, 1855; G. J. Gray, *Bibliography of Sir Isaac Newton*, 1907; L. T. More, *Isaac Newton*, 1934; E. N. da C. Andrade, *Sir Isaac Newton*, 1954. In 1942 (tercentenary of his birth) the Royal Society (of which N. was president for 25 years), with the financial help of the Pilgrim Trust, acquired N.'s bp. at Woolsthorpe-by-Colsterworth for the nation. The room in which N. was b. has a simple

marble tablet on the wall, inscribed with Pope's well-known couplet,

'Nature and Nature's laws lay hid in night:
God said, *Let Newton be!* and all was light.'

See the essays by E. N. da C. Andrade and others in the Royal Society pub. *Newton Tercentenary Celebrations*, 1947.

Newton, John (1725–1807), clergyman and hymn-writer, b. London. First a sailor and slave-trader, from 1755 to 1760 he was tide surveyor at Liverpool. In 1758 the Archbishop of York refused him ordination, but in 1764 he was ordained by the Bishop of London; he was curate of Olney till 1780, when he became rector of St Mary Woolnoth, Lombard Street, London. He formed an intimate friendship with Cowper (q.v.) and together they produced the *Olney Hymns* in 1779. See J. Bull, *John Newton: an Autobiography and Narrative*, 1868, and *John Newton: Centenary Memorials*, ed. by J. Callis, 1908. There is also a contemporary life by R. Cecil, dated 1808, which was prefixed to a collected ed. of N.'s works, 1816.

Newton, Thomas (1704–82), bishop of Bristol, b. Lichfield. He was ordained in 1730. After holding various minor appointments he became Bishop of Bristol in 1761. He ed. *Milton's Paradise Lost*, 1749, and pub. *Dissertations on the Prophecies*, 1754, 1758.

Newton: 1. Tn of Scotland, see CAM-BUSLANG.

2. City of Massachusetts, U.S.A., in Middlesex co., on the Charles R., 10 m. W. of Boston, and a residential suburb of that city. There are foundries and machine factories, and manufs. of electrical apparatus. Pop. 81,994.

Newton Abbot, mrkt tn of Devon, England, on the estuary of the R. Teign, 16 m. SW. of Exeter. There are large engine works here. Pipeclay and fine china clay are obtained in the neighbourhood. William of Orange was proclaimed King of England here in 1688, at the market cross. Bradley Manor, W. of the tn, is an admirable specimen of 15th-cent. architecture. Pop. 17,000.

Newton Grange, vil. of Midlothian, Scotland, 2 m. S. of Dalkeith, with coal-mines, brick and tile works, and paper-mills. Pop. 6000.

Newton Heath, see MANCHESTER.

Newton-le-Willows, urb. dist. and tn of Lancs, England, 15 m. both from Manchester in the E. and Liverpool in the W., known until 1938 as Newton-in-Makerfield. The W. part of the dist., known as Earlestown, has the chief wagon repair shops of the Brit. railways, biscuit machinery works and a sugar refinery, and clothing manufs. In the E. part of the tn are railway locomotive and general engineering works, printing and calico printing works. Pop. 21,950 (1951).

Newton Stewart, burgh and mrkt tn of Wigtownshire, Scotland, on the R. Cree, 6½ m. NNW. of Wigtown. Cattle markets and horse fairs are held. Pop. 2060.

Newton-upon-Ayr, suburb of Ayr (q.v.).

Newton's Rings. Set of concentric, circular interference fringes formed around

the point of contact of a convex lens resting on a plane polished surface. Newton took 2 lenses of very slight curvature and pressed them together to form a wedge of air, thinnest near the point of contact and thickening gradually outwards. On pressing, a number of concentric coloured rings could be seen when the eye was focused on the air wedge. They varied in colour and arrangement, but all exhibited colours of the spectrum, and the area at the point of contact appeared black. When the light is transmitted instead of reflected, the colours are complementary and the central spot becomes white. The thickness of the air wedge varies as the square of the distance from the centre. The light is reflected from each surface and arrives at the eye after having traversed paths differing minutely in length. The rays reflected from the 2 surfaces of the air wedge are thus seen simultaneously with a difference of phase which depends on the thickness of air, and on a reversal of phase which takes place on reflection at the air-glass surface. If the total difference of phase is equivalent to a whole number of wavelengths the rays reinforce each other and produce brightness. The circular symmetry leads to the observation of a bright ring. Near by, the thickness of the air wedge leads to 2 rays of opposite phase, and destructive interference takes place with the formation of a dark ring. If R is the radius of curvature of a convex lens resting on a plane surface, the relation between the wavelength of the light (λ) and the radius (a_n) of the n th dark ring is $\lambda = a_n^2/nR$.

Newtown: 1. Manufacturing and co. tn of N. Wales, in the co. of Montgomery, 8 m. SW. of the tn of that name on the r. b. of the Severn, and on the Montgomery Canal, which connects it with the inland navigation of the country. It is the centre of the flannel manu. of the co. Pop., with Llanllwchaearn, 5540.

2. Suburb of Hobart (q.v.), Tasmania.

Newtown Stewart, mkt tn of co. Tyrone, N. Ireland, on the Mourne, 10 m. S. of Omagh, a well-known angling centre. Pop. 300.

Newtownards, tn of co. Down, N. Ireland, near the head of Strangford Lough. Embroidered muslin, gingham, linen goods, hosiery, and handkerchiefs are manu. In the neighbourhood are the ruins of Movilla Abbey. Pop. 12,500.

Newtownbutler, vil. of co. Fermanagh, N. Ireland, in the rural dist. of Lisnaskea (q.v.).

Newtownhamilton, mkt tn of co. Armagh, N. Ireland, 11 m. W. of Newry. Pop. 750.

Nexø, Martin Andersen (1869-1954), Dan. novelist, b. in the slums of Copenhagen. After a variety of occupations ranging from bricklaying to teaching, he devoted himself to literature. He spent some time in Germany and Russia, and finally became a Communist, convinced of the goodness of the primitive man. His fame rests on his 2 great novel cycles *Pelle Erobreren* (4 vols.), 1906-10, a picture of the working class at the turn of the

cent., and *Ditte Menneskebarn* (5 vols.), 1917-21, the life-story of a proletarian girl. Both have been trans. into many languages, as also his very interesting memoirs. See W. A. Berendssohn, *M. A. Nexø*, 1948.

Next Friend, in law, a phrase used to denote the person who in any transaction acts on behalf of another, where that other, whether from youth, mental infirmity, coverture (q.v.), or from some other cause entailing legal incapacity, cannot act for himself (see also CAPACITY; INFANT; MAJORITY). The N. F. of an infant or minor is not necessarily his parent or legal guardian, for the court will in its discretion allow anyone to represent an infant in an action.

Next-of-Kin, see KIN, NEXT OF, and DISTRIBUTION, STATUTES OF.

MARSHAL NEY

Ney, Michel (1769-1815), marshal of the first Fr. Empire, b. Saarlouis, the son of a cooper. He was a non-commissioned officer in a hussar regiment when the revolution began, and soon became famous for his personal courage. For the capture of Mannheim he was made a general of div. in 1799. After the peace of Lunéville, Bonaparte, anxious to win N. to his party, brought about his marriage with a young aristocratic friend of Hortense Beauharnais, and appointed him inspector-general of cavalry. On the estab. of the empire he was made a marshal. In 1805 he stormed the entrenchment of Elchingen, and was created Duke of Elchingen. He afterwards rendered important services in the Tirol; contributed much to the Fr. successes of 1806 and 1807; and served in Spain with great ability in 1808 and 1809, but quarrelled violently with Masséna, his superior officer in the invasion of Portugal of 1810-11. His relations with his fellow officers were generally difficult,

but his popularity with the ordinary soldiers was enormous. In 1812 he received the command of the third *corps d'armée*, and greatly distinguished himself at Smolensk and the Moskwa, in consequence of which he was created Prince of the Moskwa. It was largely due to his devotion in command of the rearguard that some remnants were saved in the 1812 retreat. He had a prin. part in the campaigns of 1813 and 1814, and subsequently went over to the Bourbons. On Napoleon's return from Elba, N. was sent against Napoleon at the head of 4000 men, but went over to his side. He commanded at Quatre-bras, and in the battle of Waterloo commanded the centre, and had 5 horses shot under him. After the capitulation of Paris he tried to escape to Switzerland; but was arrested, condemned to death for high treason, and shot. N. was fundamentally a simple soldier, at his best in the height of battle, or in moments of military crisis (as in 1812), when his great bravery acted as an inspiration to all around him: he was, however, a quarrelsome officer, and an indifferent strategist. His 'double desertion' (1814-15) was possibly the result of mental panic, and was unpremeditated and unactuated by personal ambition. His sons pub. his *Mémoires*, 1833. See lives by H. Welschinger, 1893; L. Blythe, 1937; P. Compton, 1937; also H. Bonnal, *La Vie militaire du maréchal Ney*, 1910-14.

Nez Percés (so called from their custom of wearing nose rings), tribe of N. Amer. Indians. After the N. P. war with the whites in 1877 the survivors were sent to Oklahoma, but have now been transferred to Idaho. There are now about 1500.

Nezametnyy, see ALDAN.

Ngami Lake, former lake of Bechuana-land. It was discovered by David Livingstone in 1849. It was 70 m. in length, with a breadth of 20 m., but now it is only a swamp.

Ngo Dinh Diem, President of the Rep. of Viet Nam (see VIET NAM, and VIET NAM, REPUBLIC OF). Son of a prominent Vietnamese Rom. Catholic family in Hue (q.v.), Ngo Dinh Diem entered the mandarin and in 1933 was appointed chief minister when only 32. An uncompromising nationalist, he resigned his high office when France refused to make any concessions to Vietnamese independence. Captured by the Viet Minh (q.v.) in 1946, he was offered a post in their Communist gov., which he refused. He went into exile in 1950, first to Japan and later to the U.S.A. He returned, at the invitation of Bao Dai (q.v.), to become prime minister in 1954, but has since deposed Bao Dai after holding a plebiscite, and has created the Rep. of Viet Nam of which he is president.

Ngolo-Setas, people of SE. Chinghai. The N.-S. ter. includes the drainage area of the Upper Tong R. The ter. lies between 2 mt. systems, the extreme of the E. end of the Bayen-Khara Mts on the NW., and the complex formed by the chain which extends from the Tao Fu Mts to Mynia Gonka, and by the Szechwan Alps, on the E. and SE. It is a plateau whose

highest level is 16,000 ft; in addition there are wide, deep valleys. The herdsmen of the former and the settlers of the latter communicate by means of the secondary valleys of the trib. streams, each being the economic supplement of the other, trade being controlled by the monasteries. The collection of nomads in NE. Tibet is a loosely organised confederation of tribes, the Ngolos and Setas being the most important. Their independence of the Chinese authority in Szechwan prov., and of the temporal power of Lhasa, explains the superficial cohesion of the ensemble, and the slight knowledge which the outside world has of them. It would appear that the Setas are but a tribe of the Ngolos, and the relationship of the two is close enough to justify the hyphenated name. The nomads of the plateau, the N.-S. proper, have the social conditions of all pastoral peoples, in which most of the work is done by the women. The duty of the adult males is to protect the camp, which leaves them enough time and energy for raiding. Sometimes expeditions are directed against the valley peoples, but the usual target is the caravans of strangers; the salt caravans from the Koko-bor are seemingly immune. The strong influence of the magical superstition of Lamaism tends to provoke battle and bloodshed on the plateau. The N.-S. warriors have long hair falling to the shoulders, wear ear-rings of silver, and dress in sheepskins with the wool inside. Apart from their different modes of life, it is probable that anthropological research would reveal important morphological differences between the inhab. of the plateaux and those of the valleys. The N.-S. were first mentioned by Père Hue, and descriptions may be found in his *Souvenirs d'un voyage dans le Tartarie, le Thibet et la Chine pendant les années 1844-6, 1850*. See also A. Guibaut, *Tibetan Venture*, 1947.

Nguni, name given to many Bantu-speaking tribes of S. Africa. The N. tribes once lived in what is now Natal, but dispersed about the time of the rise to power of Chaka, King of the Zulu, and of Sobhuza I, King of the Swazi, in the first decades of the 19th cent. To-day the main N. tribes are the Zulu, Swazi, Basuto, and the Cape N. (Pondo, Xosa, etc.) of SE. Africa; the Ndebele (Matabele) of S. Rhodesia and the Transvaal; and the N. of Nyasaland and Tanganyika. These latter groups emigrated from S. Africa, conquering other tribes as they went and forming their own empires. They are often, incorrectly, called 'Kaffirs.' See J. A. Barnes, *Politics in a Changing Society*, 1954, and I. Schapera, *Government and Politics in Tribal Societies*, 1956. See also under tribal names.

Nguyen Du (1765-1820), Vietnamese poet who composed the *Kim Van Kieu* (q.v.) during the reign of the Emperor Gia Long (see VIET NAM). B. of a prominent family, Nguyen Du won early fame as a poet and scholar. He became a high mandarin in the Ministry of Rites and travelled on embassies to China. His masterpiece, the *Kim Van Kieu*, won immediate acclaim at court and among

scholars, and its popularity has never waned in Viet Nam since that time.

Nhe-trang, tn of S. Annam (q.v.), standing on r. b. of R. Cai at its mouth, 255 m. N.E. of Saigon (q.v.). N. possesses an excellent bathing beach, and is a popular holiday resort with sev. hotels. On the opposite bank of the riv. stands the group of Cham shrines known as Po-nagar (Lady of the City), dating from the 7th to the 12th cents. AD. These are remarkable both for their architecture and their excellent state of preservation.

KWENA MAN, NGUNI TRIBE

Niagara (formerly Newark), tn and summer resort of Ontario, Canada, in Lincoln co., on Lake Ontario, at the mouth of the N. R., 15 m. from the falls. Pop. 2108.

Niagara Falls: 1. On lower Niagara R., which is 20 m. in length, and connects Lake Erie with Lake Ontario. The falls are the greatest in the world in volume of water. At Goat Is. the riv. divides. There are 2 distinct falls, side by side: the Amer. Fall, a sheer descent of 167 ft, and 1060 ft wide; and the Horse-shoe Fall, on the Canadian side. The volume of water of this fall is terrific, and a depth of 158 ft is taken in a leap; the spray is like heavy rain. It has been estimated that the water is at least 20 ft in thickness. The fall is over a grand curve of rock measuring 3010 ft. The whirlpool is just below the falls, a raging mass of turbulent water. The riv., now a quiet, gently flowing stream, enters the lake of Ontario at Lewiston. The drop between Lakes

Erie and Ontario is 326 ft. The edge of the Horse-shoe Fall has been receding to the extent of 5 ft each year, but the erection of remedial works is checking further erosion. It is believed that the original falls were at Lewiston. The Gov. Reservations, on both sides of the falls, have been turned into fine parks. One of the best points of view of the fine Horse-shoe Falls is from the railway track, and observation cars are run, and the trains are stopped for some minutes for the benefit of tourists. The falls were discovered in 1678 by a Fr. priest, but his description was laughed at as a traveller's tale. For over half a century the water has been used for industrial purposes, many manufacturing plants being worked by its power. The largest of the plants constructed is the Queenston-Chippawa development on the Niagara R. Construction was begun in 1917 and the first unit was in commercial operation in 1922. Many thousands of tourists visit the falls every summer. The sight is even more wonderful in winter, when the gigantic falls are in the grip of frost and snow, and huge icicles hang glistening in the sunshine. Three bridges span the riv. The view from the suspension bridge is magnificent, whilst the fine culvert bridge is a triumph of modern engineering. The Rainbow Bridge (replacing a former bridge destroyed by ice-jams) was opened to traffic in 1941. This bridge is 950 ft long and cost about £1,000,000. It is the longest fixed-end steel arch span in the world, was dedicated by King George VI and Queen Elizabeth in June 1939, and has a 10-ft footway which gives wonderful views of the cataracts. See H. Hulbert, *The Niagara Falls*, 1908, and R. L. Way, *Ontario's National Parks*, 1946. (See illustration on p. 226.)

2. City of Ontario (formerly Clifton), Canada, in Welland, on the W. bank of the Niagara R., opposite the N. F. It is connected with N. F., New York, by 3 bridges. There are sev. factories which utilise the water-power from the falls. The total installed capacity of the generating plants on the Canadian side of the riv. is about 2,500,000 h.p. There is a beautiful park along the riv. bank. Pop. 24,667.

3. City of New York state, U.S.A., in Niagara co., on the E. bank of the Niagara R., at the falls, 18 m. NNW. of Buffalo. The Rainbow Bridge (1941) replaces the span destroyed by ice in 1938. The falls supply water-power for the city, which is a shipping centre, with important manufs. of chemicals, paper, abrasives, machinery, aeroplanes, metals and metal products, graphite, grease, and electrical equipment. It is the seat of Niagara Univ. N. F. is the site of the largest electric power plant in the world, and is a summer and winter resort. Pop. 90,872.

Niaméy, cap. of the Niger colony, Fr. W. Africa, on the E. bank of the Niger R. Two trans-Saharan motor routes end at N., where there is an airfield. Pop. 10,000.

Niam-Niam, see AZANDE.

Nias, is. off the W. coast of Sumatra,

Indonesia, with an area of 1500 sq. m. Its surface is mountainous. Rice, coconuts, nutmeg, and sago are grown. Pop. about 187,200.

Nibelungenlied, see NIBELUNGS.

Nibelungs, Scandinavian race of dwarfs, ruled by Nibelung, King of Nibelheim (land of mists), and owners of a hoard of gold and magic treasures guarded by the dwarf Alberic. The name N. passed to the later owners of the hoard, the supporters of Siegfried, and the Burgundians who stole it from them. They sank it in the Rhine, and the secret of its whereabouts died with them; it is now

he is magically bound in love and marriage to Gudrun. He disguises himself as her brother Gunnar, and passes through the magic fire again to secure Brunhild to be Gunnar's wife, exchanging his Nibelungen ring for hers, which he gives to Gudrun. Later the wives quarrel, and Gudrun shows Brunhild her ring, to prove that Sigurd had tricked her. Brunhild gets the deceiver killed, then slays herself upon his funeral pyre. In the *Nibelungenlied*, Sigurd becomes Siegfried, prince of the Netherlands, who has killed the Nibelungs and stolen their treasure; he seeks at Worms the hand of the Burgundian

National Film Board, Canada

THE NIAGARA FALLS, ONTARIO

known only to the Rhine maidens. Wagner's operatic cycle *The Ring of the Nibelungs* is written upon a conflation of the *Nibelungenlied* (surviving in a middle German version), which is a legend about human characters supposed by some to be derived originally from the overthrow of the Burgundian kingdom of Gundarhar by the Huns in 436, with an anct Teutonic saga telling much the same myth about the gods. In the Icelandic Eddas is recounted the story of how Odin, Loki, and Horner have to pay wergild (q.v.), or compensation, to a giant Rodman for killing his son. Loki forces Andvari, a deity in the form of a pike, to give up his hoard of gold, and his magic ring which breeds gold, and gives these to Rodman. But on them is Andvari's curse which causes the death of Rodman and his 2 sons Fafner and Regin, after the gold has passed to each in turn. Finally the gold passes to Sigurd, son of Sigismund the Volsung. Sigurd finds Brunhild (q.v.) asleep amid the magic fire, frees her, and pledges her his troth. But in Rhineland

Princess Kriemhild. To obtain her he has to secure Brunhild, Queen of Iceland, for Gunter. Brunhild has a magic ring which gives her superhuman strength, and will only wed one who can carry her off by force. This Siegfried helps Gunter to do, wrestling with her while wearing Alberic's cape of invisibility, but at the same time he steals her talismanic ring. The quarrel between the wives follows, Siegfried is killed, and Kriemhild, in revenge, marries Attila, and lures the Burgundians to their doom in Hungary.

Nicaea (modern Isnik), city of anct Bithynia, in Asia Minor, on the E. shore of Lake Ascania. It was built by Antigonus, the son of Philip, in 316 BC, and named Antigonea, but the name was changed by Lysimachus to N. in honour of his wife. N. was of great importance under the Rom. and Byzantine emperors, having fine streets and monuments. The sultan Solymann had his cap. here in 1078, and after the Latins conquered Constantinople in 1204 N. was the cap. of an E. empire. It was besieged and taken by

the crusaders during the First Crusade (1096).

In eccles. hist. it is noted as the scene of 2 councils; the first oecumenical council, consisting of 300 bishops and the Emperor Constantine, was held here in AD 325 to discuss, among other things, the Arian question and the Meletian schism, and to fix the date of Easter; the Nicene Creed (q.v.) had its first formulation. The seventh oecumenical council, held here in 787, discussed mainly the question of image worship. See also NICE (for which a former name was N.).

Managua and the N., are situated in Central N. The latter is 100 m. long and has an area of 2900 sq. m. There are 5 rapids on the San Juan R., and they greatly impede navigation. The climate is tropical except on the highlands. Cotton, coffee, rubber, and hides are the chief products; coffee formed 34 and cotton 39 per cent of the 1955 exports. Sugar, timber, maize, rice, bananas, and cocoa are also produced. There are rich, undeveloped resources. Gold is mined on the Caribbean coast. The forests yield mahogany and cedars, and form a valu-

THE SEBACO RIVER BRIDGE, NICARAGUA

This was given by the U.S.A. to Nicaragua, and is on the route of the Pan-American highway.

Nicander, Karl August (1799-1839), Swedish poet, b. Strengnäs. In 1820 he pub. his first vol. of poems, and his powerful tragedy *Runesvarden* (The Runic Sword). He also wrote *Ragnar* (The Runes) and *The Death of Tasso*, for which he was awarded a medal by the Swedish Academy. See G. Lokrantz, K. A. Nicander, 1939.

Nicaragua, rep. of Central America, between the Caribbean Sea and the Pacific Ocean. Area 57,143 sq. m.; pop. (1955 estimate) 1,266,429. Along the Caribbean coast there are lagoons, estuaries, and swamp lands, but the Pacific coast is rocky. The prin. ports are Corinto, Puerto Somoza, Puerto Morazán, and San Juan del Sur on the Pacific side, and Bluefields, Puerto Cabezas, and Greytown (San Juan del Norte) on the Caribbean. The Cordillera de los Andes, a volcanic range, crosses the N. half, Cosigüina (2776 ft) and El Viejo (5839 ft) being the highest summits. There are 16 Depts and a National Dist. (cap.). The cap. of the rep. is Managua (q.v.); among other tns are Matagalpa, León, Jinotega, Granada, Masaya, Chinandega, and Bluefields (qq.v.). Two large lakes, the

able part of the exports. There are other excellent timber trees, rosewoods, guaiacum (or lignum vitae), gums, and dye-woods. Rubber is produced. In 1955 the imports were valued at \$9,646,000 Amer. dollars, and exports at \$80,282,000. Exports to the U.K. totalled \$4,928,000, and imports from the U.K. \$2,282,000.

There are 431 km. of railway, a new stretch joining Puerto Morazán and Chinandega. The roads for the most part are mere tracks, and the want of an adequate network has hindered the exploitation of large areas of agric. and forest land. The one important all-weather road is the Inter-Amer. (or Pan-Amer.) highway, which runs for 240 m. from the Costa Rican frontier, through Managua, and north to the Honduran frontier. A concrete highway, 19 m. long, from Las Conchitas is open to Masachapa, on the Pacific. A branch road (240 m.) of the Inter-Amer. highway is being built from San Benito, on the highway, to Rama, 60 m. from Bluefields, on the Atlantic. There are air services to the U.S.A. and the Central and S. Amer. reps. There are 47 national radio stations, and about 100 others. Most of the people are of mixed Indian

and European blood. Primary education is free and compulsory, but the masses are ignorant; illiteracy amounts to about 65 percent. There are 2000 state elementary schools and 42 secondary, but the latter are carried on by private individuals. There are univs. at Managua, León, and Granada. Rubén Darío (q.v.), the greatest of all Sp. Amer. poets, was a native of León. The prevailing religion is Rom. Catholic, and N. constitutes one archbishopric and eccles. prov., the seat of the archbishop being Managua, with bishoprics at León, Bluefields, Granada, and Matagalpa. The gov. consists of a president elected for 6 years, and a Congress composed of 2 houses, the Chamber of Deputies having 42 members, and the Senate 16, all elected for 6 years by popular vote of all males over 21, and those over 18 who can read and write. The present constitution dates from May 1951. The judicial power is vested in the supreme court at Managua, 5 chambers of second instance (León, Granada, Bluefields, Masaya, and Matagalpa), and about 150 judges of inferior tribunals. There is a national guard of 220 officers and 3000 other ranks, and a coastguard service.

History. N. was part of the Maya (q.v.) empire until overrun by the Aztecs (q.v.), who, however, made no permanent settlement there. Columbus sighted the E. coast in 1502. The first European to explore the area (1522) was Gil González de Avila, who converted the chief of the leading Indian tribe to Christianity, and with the chief's help the Sp. forces conquered the other tribes, and estab. the area as a prov. of Spain. Gil González's successor, Hernán de Córdoba, founded Granada (q.v.) in 1524. During its hist. as a part of the Sp. dominions N. was administratively a part of Guatemala. During 1822-3 it was part of the Mexican empire; on the fall of that empire in the latter year it joined the Central Amer. Union until 1838, when an independent gov. was estab. N. was separated from Spain in 1865, and its subsequent hist. for many years was a troubled one. There was friction with Britain over the Mosquito Coast, the name by which its E. coastlands were known (see CLAYTON-BULWER TREATY and MOSQUITOS), and disputes with Guatemala and Costa Rica.

In 1909 a revolution broke out against the gov. of President Zelaya, and 2 Americans who joined the insurgents were shot on Zelaya's orders. The U.S.A. sent warships and broke off diplomatic relations. In 1912, at the invitation of President Adolfo Díaz, Amer. forces were stationed in N. In spite of revolutionary outbreaks at various times, the presence of Amer. forces undoubtedly helped the country towards internal peace and prosperity. On the withdrawal of the forces in 1925 revolution broke out again, and the insurgent general became president in 1926. Faction fights continued; the Amer. president (Coolidge) sent out a representative who, with U.S. marines, supervised the elections of 1928, 1930, and 1932, and a quieter political atmosphere has since prevailed. The U.S.A.

acquired naval bases, and the option for a canal route (see next article). There are also plans to canalise the R. San Juan, and thus provide a Caribbean-Pacific link for N. and Costa Rica. N. declared war on the Axis powers in Dec. 1941, attended the San Francisco Conference of 1945, and joined the U.N. See J. Gámez, *History of Nicaragua*, 1889; S. J. Bernado Portas, *Compendio de la historia de Nicaragua*, 1918; C. R. Enock, *The Republics of South and Central America*, 1922; H. L. Stimson, *American Policy in Nicaragua*, 1927; T. Gann, *Discoveries and Adventures in Central America*, 1928; R. de Nogales, *The Looking of Nicaragua*, 1932; M. Tweedy, *This is Nicaragua*, 1953; International Bank, *Economic Development of Nicaragua*, 1953.

Nicaragua Canal. In 1884 a treaty was made between the gov. of U.S.A. and Nicaragua with the object of cutting a ship canal to link up the Atlantic and Pacific oceans. The canal was begun at Greytown in 1889, and its total length would have been about 170 m., including Lake Nicaragua and the San Juan R. Less than 30 m. would have had to be excavated. Operations were, however, suspended in 1893, and attention was directed to the Panama Canal, whose last barrier was blown away by dynamite in Oct. 1913, and the waters of the Pacific mingled with those of the Atlantic. The N. C., though it would have been a longer route, presented fewer difficulties in the way of natural barriers and fewer gigantic rocks to engineer and blast. The scheme was abandoned owing principally to the political unrest of the country. By a treaty in 1916 the U.S. Gov. for 3 million dollars acquired the option for a canal route through Nicaragua and also for naval bases in the Bay of Fonseca on the Pacific coast, and Corn Is. on the Atlantic coast. The treaty was ratified by Nicaragua in 1916 and by the U.S.A. in 1926. In 1931 Amer. military engineers reported to Congress that a Nicaraguan canal would cost fivefold that of a third set of locks on the Panama Canal, but a later estimate was much lower. Inconclusive surveys of the route recommenced in 1939.

Nicarao, see NIQUIRAN.

Nicastro, It. tn in Calabria (q.v.), 18 m. WNW. of Catanzaro (q.v.). It has a cathedral, and a ruined castle in which the Emperor Frederick II (q.v.) was confined. There is a trade in agric. produce. Pop. 30,200.

Niccolini, Giovanni Battista (1782-1861), It. poet and dramatist, b. near Pisa. N.'s first poem, *La Pietà*, 1804, was influenced by Foscolo. From 1807 to 1808 he was prof. of hist. and mythology at the Florentine Academy of Fine Arts. His first dramatic work was the tragedy of *Polissena*, 1810, followed by *Ino e Temisto*, 1825, *Edipo*, and *Medea*, 1825. The first of his political dramas, *Nabucco*, appeared in 1815; another invective against absolute power is *Antonio Foscari*, 1827. *Arnoldo da Brescia*, 1843, is generally considered his masterpiece (Eng. trans. by T. Garrow, 1846). His pub. and unpub.

works were ed. by Gargioli, 1863-80. See R. Guastalla, *La vita e le opere di G. B. Niccolini*, 1917.

Niccolò Alunno (c. 1430-1502), see FOLIGNO, NICCOLÒ DA.

Niccolò Pisano, see PISANO.

Nice (It. *Nizza*; anct. *Nicaea*), Fr. city, cap. of the dept. of Alpes-Maritimes, at the mouth of the R. Paillon on the Baie des Anges, near the It. frontier, 420 m. S.E. of Paris. It is one of the leading resorts of the Riviera (q.v.). The city was probably founded by Phocaeans from Massalia (see MARSEILLES). The coast was occupied by the Romans in 154 BC, who estab. the settlement of Cemenelum (Cimiez, q.v.) 2 m. inland. In the 3rd cent. AD a bishopric was founded at N. The co. of N. shared the hist. of Provence (q.v.) until 1388, in which year it attached itself to Savoy (q.v.). It was ceded to France by Sardinia in 1796, was restored to Sardinia in 1814, and was again ceded to France after a plebiscite in 1860. The city is finely situated in a small coastal plain, sheltered on the N. by an arc of hills on which are numerous villas. In the centre of the tn is a hill, 'c Châteaueu,' where the original settlement stood, and which has the remains of a citadel (destroyed by the Duke of Berwick in 1706) and of a Romanesque cathedral. Along the shore, and around the base of the hill, stretch fine promenades, of which the most celebrated is the *Promenade des Anglais*. At the E. end of the *Promenade des Anglais* is the garden of Albert I and the *Place Masséna*, which is the centre of the city. There are sev. churches of note, including the cathedral of Ste-Réparate (1650). The Musée Masséna and the Musée Jules Chéret contain fine collections of tapestries, pictures, jewels, and arms. Many carnivals and fêtes are held in the city; the Mardi Gras at N. marks the height of the Riviera festivals. Scents, olive-oil, soaps, liqueurs, and textiles are manuf., and there is a trade in fruit, flowers, and essences. Masséna and Garibaldi (qq.v.) were natives. Pop. 244,400. See E. Berl, *Le Port franc de Nice*, 1924, and M. Malingue, *Les Primitifs nicois*, 1941.

Nicene Creed, the only creed of the Church which has received oecumenical sanction, was originally drawn up at the Council of Nicaea in AD 325. It was in the form familiar to Westerns in the Rom. mass and the Anglican communion service, but terminated at the words 'And I believe in the Holy Ghost.' It was reaffirmed at the Council of Constantinople (381), and the rest of the creed, as we have it, was then added, with the exception of the word *filioque* (q.v.) ('and the Son'). See also ARIUS and CREED.

Nicephorus, St (c. 758-829), patriarch of Constantinople (806), defended the use and veneration of images against the Iconoclasts (q.v.), and was banished to a convent in Asia by Leo the Armenian (816). He wrote *Chronographia Brevis* and *Breviarium Historicum*, with other historical works.

Nicephorus, name of 3 Byzantine emperors:

Nicephorus I was emperor from 802 to

811. He made a treaty with Charlemagne, but in a war with the Saracens and Bulgarians was surprised and killed.

Nicephorus II was emperor from 963 to 969. In a series of campaigns against the Saracens (960-3) he captured Candia and Aleppo. He was assassinated by his wife and nephew.

Nicephorus III (Botaniates), last of the Armenian dynasty, was emperor from 1078 to 1081. During his reign the Seljuks advanced into Asia Minor and Norman power in Italy increased. His general, Alexius Comnenus, finally deposed him, and he retired to a monastery.

Nichol, John (1833-94), scholar and author, b. Montrose. He was educ. at Glasgow Univ. and Balliol College, Oxford, where he was president of the Old Mortality Club, to which belonged T. H. Green the philosopher, Bryce the historian, and the poet Swinburne. From 1862 to 1889 he was the first prof. of Eng. literature at Glasgow. Among his works are *Hannibal*, 1873, a drama; *The Death of Themistocles and other Poems*, 1881; *Fragments of Criticism*; and a hist. of Amer. literature, 1882. He also wrote lives of Byron, 1881, Burns, 1882, and Carlyle, 1892. See life by W. A. Knight, 1896.

Nicholas, St (d. c. 350), Bishop of Myra in Lycia and patron saint of Russia. He is specially honoured as the guardian and patron of children and of scholars, as also of travellers by sea and land, and merchants. He is a prominent saint of the Gk Church, and there are many legends illustrating his benevolence. His memory still survives in the Santa Claus of Christmas rejoicings. His festival is on 6 Dec. See E. Crozier, *The Life and Legends of St Nicholas*, 1949.

Nicholas, name of 5 popes and 1 anti-pope.

Nicholas I, St, sometimes called the Great, succeeded Benedict III in 858. His pontificate was marked by 3 great contests: those in connection with the degraded patriarch, Ignatius of Constantinople, the divorce of Lothair, King of Lorraine, and with the right of bishops to appeal to Rome against the verdict of their metropolitan. He d. in 867. See E. Amann, *L'Époque carolingienne*, 1937.

Nicholas II (Gerard, a Burgundian) was Pope from 1058 to 1061; he owed his importance to the counsel and influence of Hildebrand, whose policy of reform he pursued. See A. Fliche, *La Réforme grégorienne*, 1924-37.

Nicholas III (Giovanni Gaetano Orsini), b. Soriano, was Pope from 1277 to 1280; he strengthened the papal power in Italy and made the Vatican the official residence.

Nicholas IV (Girolamo Masci), b. Ascoli, was Pope from 1288 to 1292; a member of the Franciscan order, his main object was the recovery of the Holy Land by crusades. The college of cardinals acquired independence by his financial reforms. See O. Schiff, *Studien zur Geschichte Nikolaus IV*, 1897.

Nicholas V (Tommaso Parentucelli), b. Sarzana, was Pope from 1447 to 1455.

During his pontificate, in 1449, the resignation of the antipope, Felix V, put an end to the papal schism. The fall of Constantinople in 1453 was a great blow to him. He inspired many architectural projects in Rome, and founded the Vatican library.

Nicholas V (Pietro Rainalducci) was antipope in Italy from 1328 to 1330 during the pontificate of John XXII at Avignon. He resigned in 1330, having been excommunicated by John in 1329, received pardon for his sins, and was kept in honourable imprisonment in the papal palace until his death in 1333.

Nicholas I (1796-1855), Russian emperor, third son of Paul I. Succeeded Alexander I, 1825. His accession was followed by the uprising of the Decembrists (q.v.). He had no aptitude for learning and was badly educ., but was honest and possessed a strong sense of duty. The main events of his reign were the codification of existing laws by Speransky (q.v.), the prohibition of selling serfs separately from their families, and a great improvement in the position of Crown peasants; successful wars with Persia, 1826-8, and Turkey, 1827-9; Polish uprising, 1830-1; and the Crimean War, during which N. died. See C. de Grunwald, *Tsar Nicholas I* (trans.), 1954.

NICHOLAS II

Nicholas II (1868-1918), last Russian emperor, first cousin of King George V, son of Alexander III, whom he succeeded in 1894. He had considerable personal charm and natural intelligence, and loved his family and country, but he was reactionary in his outlook and of a weak and irresolute character. In reply to an address on his accession by the Tver' (q.v.) Zemstvo he spoke of 'senseless dreams of the participation of Zemstvo representatives in the affairs of internal administration' and stated his resolve to maintain the principle of autocracy. However, he was forced by the revolution of 1905 (q.v.) to grant a constitution providing for a legislative assembly (see DUMA). The main events of his reign in external affairs were the strengthening of the Franco-Russian alliance, the convening by N. (on the initiative of Witte, q.v.) of The Hague conference in 1898

which set up the International Court of Arbitration, the occupation of Port Arthur in 1896 and of Manchuria in 1900, and the Russo-Jap. war in 1904-5. Soon after the beginning of the First World War N. dismissed his uncle, the Grand Duke Nikolay Nikolayevich (q.v.), and himself became commander-in-chief of the armed forces, leaving the gov. of the country to the empress (see ALEXANDRA FEODOROVNA) and in fact to Rasputin (q.v.). At the beginning of the Feb. revolution (q.v.) in 1917 he immediately followed the advice of the Duma leaders and the military commanders to abdicate. He was at first confined to the palace at Tsarskoye Selo, then banished to Tobolsk in Siberia. After the Bolshevik seizure of power N. was brought to Yekaterinburg and, together with his family, was shot by the Cheka (q.v.) on the decision of the local Soviet (q.v.). See Eng. trans. of the correspondence with his wife, 1929, and Sir B. Pares, *The Fall of the Russian Monarchy*, 1939.

Nicholas (Russian, Nikolay Nikolayevich) (1856-1929), Grand Duke, Russian general, cousin of Tsar Nicholas II. In Oct. 1905 he urged Nicholas II to issue a Constitutional Manifesto. After the outbreak of the First World War, as supreme commander-in-chief of the Russian armies, he promised self-gov. to the Poles, thus winning many of them for the allied cause. He showed himself an able and courageous commander, but as a result of court intrigues was dismissed by Nicholas II in Sept. 1915 and appointed Viceroy of the Caucasus and commander-in-chief of the Caucasian army. After the 1917 revolution N. emigrated and was considered candidate to the Russian throne by the non-legitimist monarchists among émigrés.

Nicholas of Damascus (fl. 16-8 BC), see DAMASCENUS, NICOLAUS.

Nicholas of Hereford (fl. 1390), Lollard preacher and author, was b. probably in Hereford. A close friend and supporter of Wycliffe, he was excommunicated in 1382 for his support of the Lollard doctrines. An appeal to the Pope against his sentence led to his imprisonment in Rome. He escaped, but was captured in England. In 1391 he recanted, and after holding sev. offices under the crown retired to a monastery. He aided Wycliffe in his trans. of the Bible.

Nicholas I of Montenegro (1841-1921), King of Montenegro, b. Njegoš. He was proclaimed prince in 1860. Montenegrin independence was recognised in 1878, and in 1900 N. took the title of royal highness. Ten years later he styled himself king. N. joined in the First World War on the side of Serbia, but by 20 Jan. 1916 he had capitulated, proclaiming that unconditional surrender was necessary to avert the ruin of his country. N. retired to France, where he d. The Montenegrin Grand Assembly in April 1919 affirmed his dethronement and that of his dynasty, and proclaimed the union of Montenegro with the kingdom of the Serbs, Croats, and Slovenes.

Nichols, Anne, Amer. actress and playwright. She was famous for her play

Abie's Irish Rose, which ran continuously in New York from 1922 to 1927 for a total of 2327 performances, the longest run up to that time in the hist. of the Amer. theatre. It has since been surpassed only by Erskine Caldwell's *Tobacco Road*, with 3182 performances, and Lindsay and Crouse's *Life with Father*, with 3224. Miss N. also wrote *The Gilded Cage*, 1920, *Love Dreams*, 1921, and (with Adelaide Matthews) *Just Married*, 1921.

Nichols, John (1745-1826), historian and biographer, b. Islington. When 13 he was placed with Wm Bowyer, the printer, to whose business he succeeded in 1777. He pub. in 1778 *Anecdotes, Biographical and Literary of William Bowyer, Printer*. Other works of which he was either editor or author are *The Progresses and Public Processions of Queen Elizabeth*, 1788, and *Illustrations of the Manners and Expenses of Ancient Times in England*, 1791. He owned the *Gentleman's Magazine* from 1792 till his death. He was succeeded by his son, John Bowyer Nichols (1779-1863), who also pub. sev. hist., and was a fellow of the Society of Antiquaries, and of the Linnean Society. See J. Nichols, *Brief Memoirs of John Nichols*, 1804.

Nichols, John Beverley (1898-), author and journalist, b. Bristol. He was educ. at Marlborough and Oxford, where he ed. the undergraduate magazine *Isis*, founded and ed. the *Oxford Outlook*, was president of the Union, and pub. his first novel. Taking up journalism, he estab. a reputation as a brilliant and unorthodox interviewer with his books *Are They the Same at Home?*, 1927, *The Star Spangled Manner*, 1928, and *Oxford-London-Hollywood*, 1931. Later he settled in Hunts, where he wrote *Down the Garden Path*, 1932. Others of his books are *For Adults Only*, 1932, *Cry Havoc*, 1933, *The Fool Hath Said*, 1936, *News of England*, 1938, and his autobiography, *Twenty-Five*, 1926, later continued in *All I Could Never Be*, 1949, and *The Sweet and Twenties*, 1958. He also wrote a number of plays, and a weekly column which was for long a popular feature of the *Sunday Chronicle*.

Nichols, Robert Malise Bowyer (1893-1944), poet, b. Shanklin, Isle of Wight. He was educ. at Winchester and Trinity College, Oxford. At the beginning of the First World War he obtained a commission in the Royal Field Artillery, and while serving in France pub. *Invocation*, a book of war poems. In 1917 his second book, *Ardours and Endurances*, was very successful. *Aurelia*, 1920, contains the finest of his poems. His later works, such as the drama *Guilty Souls*, written while he held the Lafcadio Hearn chair of Eng. literature in the Imperial Univ. of Tokyo, tend to be overlong and grandiose. His only publicly performed drama, *Wings over Europe* (in co-operation with Maurice Browne), produced in London and New York, foresaw the problems of the Atomic Age. In 1934, *Fisbo*, a long satire, was the last of his poetry, save for a few pieces in 1942, in *Such was my Singing*.

Nicholson, John (1821-57), general, b. Ireland. In 1841 he assisted in the

defence of Ghazni, and greatly distinguished himself, but was ultimately captured and imprisoned at Kabul. He was rescued by Gen. Pollock after some months' incarceration. He saw active service during the second Sikh war. After the annexation of the Punjab he served in the Punjab Commission. At the outbreak of the mutiny N. was brigadier-general. On 14 Sept. 1857 he commanded the main storming party in the assault on Delhi, but was mortally wounded. See lives by J. L. Trotter, 1904, and H. Pearson, 1939.

Nicholson, Norman Cornthwaite (1914-), poet, b. Millom, Cumberland. In 1944 he pub. his first book of verse, *Fire River*, and in 1948 *Rock Face*. His play, *The Old Man of the Mountains*, 1945, tells the story of Elijah and the ravens. He also wrote a guide to Cumberland, and ed. a selection of Wordsworth's poems.

Nicholson, William (1753-1815), scientist, specialised in physics and chem., b. London. He turned to scientific research after a commercial career with the E. India Co., and made the historic discovery that water could be decomposed by passing an electric current through it. This is an example of electrolysis which is the foundation of many important industrial and scientific operations. Working in company with another Eng. chemist, Carlisle, in 1800, N. constructed an electric battery (known at that time as a 'voltaic pile') from 36 half-crowns and a number of zinc disks and pieces of pasteboard. Though the current produced by this crude apparatus was so minute that only a few thimblefuls of gas were collected over a period of 13 hrs, N. showed not only that water could be electrolysed, but that the 2 gases of which it is composed appear at different places, the oxygen being evolved where the electric current enters the water and hydrogen where it leaves. N. made many other scientific discoveries after his return from India in 1786. He invented a hydrometer, took out patents for textile printing machinery, planned and carried out a scheme for the water supply to Portsmouth. He was a scientific writer of great contemporary eminence and founded and, until his death, ed. the *Journal of Natural Philosophy*.

Nicholson, William (c. 1782-1849), the 'bard of Galloway,' b. near Borgue, Kirkcudbrightshire. He became a pedlar and wrote verses on his wanderings. The preface to his *Tales in Verse and Miscellaneous Poems, descriptive of Rural Life and Manners*, 1814, acknowledges his indebtedness to Hogg. His best poem is 'The Brownie of Blednock,' a folk-lore ballad.

Nicholson, Sir William Newzam Prior (1872-1949), painter and designer, b. Newark-on-Trent, was educ. at the Magnus School there, and trained under Wm Cubley of Newark, a pupil of Sir Wm Beechey, R.A., and in Paris. He collaborated with his brother-in-law, James Pryde (q.v.) in producing the 'Beggars' posters, which owed their inspiration to Whistler and Toulouse-Lautrec and were noted for their effective

simplicity. N. next produced woodcuts in colour, which were pub. in collections under the titles *London Types*, *Characters of Romance*, *Twelve Portraits*, etc. Unlike many W. woodcutters, N.'s work is completely free from the influence of Jap. colour-prints. His first appearance as a painter in oils was in exhibitions of the International Society (of which Whistler was president). He never exhibited in the Royal Academy, but one-man shows of his work were held at the Leicester and the Beaux Arts Galleries, London. In 1933 an exhibition of his work was held in Nottingham in recognition of his birth in that co. The Tate Gallery has 2 of his best portraits: 'Portrait of W. E. Henley,' bequeathed by Mrs W. E. Henley (1925), and 'Portrait of Miss Jekyll,' presented by Lutyens (1922); also 'Lady in Furs' and a still-life study, 'The Lowestoft Bowl.' He is well represented in Brit. city municipal galleries, e.g. 'The Landlord' in the Manchester City Art Gallery, and other works in the galleries of Liverpool and Nottingham. In the Fitzwilliam Museum are his portraits of Gen. Smuts and of A. C. Benson; and his 'Portrait Group of Mr and Mrs Sidney Webb,' 1929 (London School of Economics), is an outstanding conversation piece. He excelled in still-life, and also designed costumes and settings for the stage, e.g. the costumes in *Peter Pan* and the settings and costumes for Massine's ballet *The Rake*. See life by Marguerite Stein, 1943.

Nicias, Gk painter, son of Nicomedes b. Athens, and fl. probably between 350 and 300 bc. According to Pliny, he was employed by Praxiteles to colour marble statues.

Nicias (c. 470–414 bc), Athenian statesman and general, belonging to the aristocratic party. He was sev. times a colleague of Pericles in the strategia, and on the death of the latter became leader of the aristocrats, and opposed Cleon. Prior to the Sicilian expedition he achieved a number of minor successes, and in 421 took a prominent part in the peace of N., which terminated the first part of the Peloponnesian war. In 415 he was one of the commanders in the naval expedition against Sicily, and after the flight of Alcibiades was practically the sole commander. In 414 bc he led the great expedition to Syracuse; but the enterprise terminated in disaster, and he was put to death by the Syracusans. See Plutarch's *Nicias* and Thucydides vii.

Nickel, one of the transitional elements of the first long period of the periodic table. The primary physical constants are electron configuration, 2, 8, 16, 2, i.e. atomic number 28; atomic weight 58.69; density 8.9; melting point 1452°C.; electrical conductivity 12.9 (silver = 100); thermal conductivity 0.14 cal./cm.²/cm./°C./sec.; crystal structure: α-nickel, hexagonal close-packed; β-nickel, face-centred cubic; symbol Ni.

The name N. is derived from the term 'kupfer-nickel' applied derisively by the old Westphalian miners to an ore resembling copper, actually N. arsenide, from

which no copper could be extracted and was therefore believed to be 'bedevilled.' In 1751 Cronstedt obtained impure malleable N. from this ore. The 2 most important sources are New Caledonia in the S. Pacific, and near Sudbury in Ontario. The New Caledonian ore is garnierite, (MgNi)OSiO₃·H₂O, containing up to 35 per cent of N. but averaging about 6 to 7 per cent; 6000 short tons were produced in 1937. The Sudbury ore is pentlandite, (FeNi)S to NiS·2FeS, averaging 2 to 3 per cent; 102,000 short tons were produced in 1937. The method of extracting the N. from the ore depends upon the type of ore. The Sudbury ore, being associated with copper, is smelted to a copper-N. matte from which the N. is extracted by the Orford 'tops and bottoms' process of the International N. Co., and may be refined by the Mond carbonyl process or by electro-deposition. The New Caledonian ore is simpler to deal with since no separation from copper is necessary, but iron has to be removed by conversion before the matte is roasted to oxide which is reduced to metal by coal.

Details of the processes are as follows: The Canadian ore analyses at copper, 1–2 per cent; N., 3–4 per cent; iron, 40 per cent; silicon, 25 per cent; sulphur, 20 per cent; alumina, etc., 10 per cent. The stages of extraction are: (i) By differential froth flotation it is possible to obtain 2 concentrates. The first to rise to the surface is mainly copper and is treated for extraction of this. After adjustment of the conditions most of the N. plus the remaining copper comes up. (ii) The copper-N. concentrate is roasted in a multi-hearth MacDougall furnace, the reaction being self-supporting, which reduces the sulphur content from 28 per cent to 16 per cent. (iii) Smelting in a reverberatory furnace follows; the product is copper-N.-iron matte, containing 25 per cent N., on which the gangue floats and can be tapped off. (iv) The matte is converted to oxidise the iron and flux it off as a ferro-silicate slag. The blow is not continued any longer than is required to remove the iron, because over-conversion would oxidise the N. sulphide to oxide which would be lost in the slag. The resulting matte, containing 80 per cent N. together with copper, is the raw material of the Orford process, which is based on the fact that if mixed copper and N. sulphides are fused with sodium sulphide the mass separates, on solidification, into 2 layers, the 'bottoms' being mainly N. sulphide and the 'tops' a mixture of sodium and copper sulphides. The reaction takes place in a blast furnace in the presence of coke, the product being allowed to separate in 6-ton pots. The 'bottoms' are ground, washed, and sintered to oxide: 2NiS + 3O₂ → 2NiO + 2SO₂. The oxide is reduced to metallic N. by coal in a reverberatory furnace: 2NiO + C → 2Ni + CO₂. In the Mond refining process, originated by Mond, Lauer, and Herz, and used by the International N. Co. near Swansea, the Orford 'bottoms' are crushed, ground, washed, and roasted at 700° C. to produce N. oxide.

This is reduced to metal by heating it at 350–400° C. in an atmosphere of water-gas; 97 per cent of the reduction is done by the hydrogen and only 3 per cent by the carbon monoxide: $\text{NiO} + \text{H}_2 \rightarrow \text{Ni} + \text{H}_2\text{O}$. Next carbon monoxide is passed over the N. and forms volatile N. carbonyl: $\text{Ni} + 4\text{CO} \rightarrow \text{Ni}(\text{CO})_4$. The temp. is 60° C., maintained by the exothermic nature of the reaction. Finally the carbonyl is decomposed by passing it over N. pellets at 180° C., the newly formed N. deposits on the pellets releasing carbon monoxide for further use. The product of the Orford process may also be purified by electrolysis in a N. sulphate solution containing also sodium sulphate and boric acid. The copper which goes into solution from the impure N. anodes is kept from the cathodes by placing the latter in a canvas compartment and maintaining a head of copper-free solution round them. The copper-contaminated solution is pumped into a separate tank, where copper and iron are precipitated and removed before the solution is recirculated to the cathode compartment.

The New Caledonian garnierite is first smelted with gypsum and coke in a blast furnace, the product being a N.-iron matte containing 30–45 per cent of N. as sulphide. This is treated in a Bessemer converter in which the iron is removed as a silicate slag and the sulphur partially oxidised away. The N. sulphide is roasted to oxide, which in turn is reduced to metal by mixing it with coal and heating in either retorts or reverberatory furnaces.

Pure N. is used as a catalyst, for plating, and for some laboratory apparatus such as crucibles, spatulas, etc., where its resistance to oxidation is useful. N. is ferro-magnetic at room temp. but becomes non-magnetic when heated above 365° C. When N. is alloyed with iron the magnetic change temp. of the resulting solid solution decreases as the percentage of N. increases until at about 30 per cent N. the alloy is non-magnetic at room temp. With further addition of N. the magnetic permeability increases again and reaches a peak at about 78 per cent of N. The alloy of this composition is called permalloy. A similar alloy is mu-metal: 74 per cent N., 20 per cent iron, 5.3 per cent copper, 0.7 per cent manganese. Both are used where high permeability at low field strength is required. The addition of N. to iron also gives rise to a reduction of thermal expansion until at 36 per cent N. the alloy invar is produced which has zero coefficient of expansion. The alloy of 80 per cent N. with 20 per cent chromium is widely used as electrical resistance heating elements in furnaces because of its resistance to scaling at temps. up to 1000° C. A development of this basic composition is nimonic, a standard alloy for the blades and other high temp. parts of the gas turbine where creep resistance at high temps. is required.

All alloys of N. with copper are of the solid solution type, hence they are all particularly amenable to cold-rolling,

-drawing, -forging, etc. Examples include Monel metal, 70 per cent N., 30 per cent copper, with small amounts of iron and manganese, noted for its high resistance to many corrosive agencies; 80/20 cupro-N. is extensively used for marine condensers because of its freedom from corrosion and season cracking. The term 'N. silver' applies to a wide range of alloys which contain no silver whatever; they are essentially 70/30 brass with the addition of up to 30 per cent of N. The higher the N. content the whiter the colour. The N. silvers also have good corrosion resistance and are used for spoons, forks, tureens, etc., generally in the electro-plated condition (E.P.N.S.). Alnico is an aluminium-cobalt-N. alloy developed to give the high B-H values required for permanent magnets. N. is also present in small percentages in many other alloys, e.g. up to 2 per cent in bronzes and aluminium alloys, and is a valuable constituent of many alloy steels.

Nickel steels. N., when added to a plain carbon steel in small percentages, dissolves in the ferrite, which it stiffens and so increases the tensile strength of the steel at the rate of about 2 tons/in.² for every 1 per cent added, but there is hardly any loss of ductility, e.g. 3½ per cent N. in an annealed 0.30 per cent carbon steel increased the tensile strength from 30 tons/in.² to 40 tons/in.², with a slight improvement in ductility. Further additions of N., however, render the gamma-alpha change so sluggish that, depending upon the carbon content, some of the brittle constituent, martensite, begins to appear in the structure of even the annealed steel at about 8 per cent N. and the ductility falls off markedly. At about 15 per cent N. the ductility begins to improve again, accompanied by a fall in tensile strength, because the softer gamma constituent, austenite, begins to appear. At 30 per cent N. the transformation has become depressed to below room temp. and the alloy is wholly austenitic and non-magnetic. For ordinary structural purposes the N. content seldom exceeds 5 per cent because (a) N. is an expensive metal and the improvement in properties is more rapid for the first 5 per cent than for subsequent additions, and (b) steels containing much more than 5 per cent N. are more difficult to forge. The effect of N. on the properties is illustrated by the figures given in the table on p. 234.

In addition to the enhanced combination of strength and ductility which up to 5 per cent of N. confers upon steel, another property, resistance to shock as measured by the Izod impact value, is also improved as shown in the above table. In another example a 3½ per cent N. steel and a carbon steel were both heat-treated to 50 tons/in.² tensile strength; the impact values were 58 and 45 foot-pounds respectively.

N. steels permit a much slower rate of cooling from hardening temp. without loss of hardness, and the depth to which the steel hardens is much greater than in carbon steels. For this reason oil may be used as the quenching medium and the

	Carbon per cent	Nickel per cent	Tensile strength tons/in. ²	Yield Point tons/in. ²	Elongation per cent	Reduction of area per cent	Isod Impact ft.-lb.
Carbon steel	0.31	nil	39	29	28	66	55
Nickel steel	0.31	3.25	53	43	22	56	61

(Both steels had been quenched and then tempered at 600° C.)

risk of distortion of complicated structures is minimised. At the same time, large bars 6 in. in diameter or more will attain almost the same hardness at the centre as at the outside, a condition impossible with a carbon steel. On account of the slow rate of grain growth of N. steels excessive grain size does not result from high forging and hardening temps. These properties are the result of the slow rate of diffusion of N. in the solid state and the consequent sluggishness of the steel transformations. The austenitic 30 per cent N. steels find application, with the addition of other alloys, where hot strength and resistance to high temp. scaling are important, e.g. gas and steam turbine blading and engine valves.

Nickel-chrome steels. The combination of N. and chromium together in structural steels offers advantages which cannot be obtained with equivalent amounts of either of these elements alone. A few of these advantages are higher elastic ratio, greater hardness and higher impact and fatigue resistance, and resistance to abrasion. Chromium inhibits the tendency of N. to graphitise the iron carbide, a function performed by manganese in N. steels, and therefore less manganese is used in N.-chrome steels. Chromium, like N., also suppresses the transformation temp. of the steel and therefore increases the deep-hardening and air-hardening properties. The latter is influenced by the N. content, e.g. a steel containing 1 per cent chromium and 3 per cent N. air-hardens markedly, while with the same amount of chromium and only 1-2 per cent of N. present air-hardening is not appreciable. A 4½ per cent N., 1-1½ per cent chromium steel is fully air-hardening. A popular range of N.-chrome steels contains 0.25-0.4 per cent carbon, 1 per cent chromium, and 2.5-3.5 per cent N. By oil quenching and tempering at appropriate temps. a wide range of properties is possible. Despite the high tensile strength range of 50-65 tons/in.² the steels machine well in the fully heat-treated condition and can therefore be put into service as connecting-rods, axles, gears, crankshafts, etc., without further heat-treatment. Stainless steel is an 18 per cent N., 8 per cent chromium steel which has very high resistance to corrosion. Being austenitic it cannot be hardened and tempered.

Nickel-chrome-molybdenum steels. N.-chrome steels suffer from temper brittleness if air-cooled from tempering. To avoid this oil-cooling is necessary. Alternatively the incorporation of small

amounts of molybdenum achieves the same object; 0.25-0.30 per cent is usual.

Nickel Silver, see GERMAN SILVER.

Nicobar Islands, group of 19 is. in the Bay of Bengal, between 6° 45' and 9° 15' N. and 93° and 94° E., between Sumatra and the Andaman Is., and under the administration of the Gov. of India. The Dutch ceded the group to the British in 1869. The is., of which only 12 are inhab., have an aggregate area of about 635 sq. m. There are 2 groups, Great and Little Nicobar, and sev. others to the S., and Car Nicobar, Camorta, and the remainder to the N., separated by Sombro Channel, 36 m. broad. Great Nicobar is the largest is., with an area of 333 sq. m., and Car Nicobar (49 sq. m.) is the most densely pop. (4000). The best harbour is Nankauri, formed by Camorta and Nankauri. The coco-nut is the prin. tree grown, 3,000,000 nuts being produced annually; betel nuts are also found. The inhab. are a Far E. race and speak varieties of the Mon-Annam group of languages. The is. were occupied by Jap. forces from Mar. 1942 until 1945.

Nicodemus, Pharisee and member of the Sanhedrin, a 'man of authority among the Jews' (John iii). Jesus early won his secret allegiance and gave him the memorable discourse on the new birth. Jesus styles him 'the teacher of Israel,' probably meaning a Rabbi as interpreter of the law. Cautious, even timid, N. sought Jesus by night to avoid critical eyes. Yet in the Sanhedrin, when his colleagues proposed to condemn Jesus unheard, N. had the courage to risk suspicion by contending for a fair and legal procedure. In the end he joined Joseph of Arimathea in providing honourable burial for Jesus in the rock-hewn garden grave of Joseph.

Nicodemus, The Gospel of, Apocryphal writing which had much influence on the religious thought of medieval times, consisted of 2 distinct works. The first contains an account of the trial of Christ before Pilate, a work which seems to have been extant separately under the title of *Acta Pilati*. It is for the most part a compilation of excerpts from the accounts of Christ's trial in the canonical gospels. This work exists in sev. forms, both in Greek and Latin, in some of which N. writes the work in Hebrew; in others he is represented as translating it into Greek. In style it appears to be the work of a Jew. The 2 Gk forms seem to have emanated from a common source composed early in the 2nd cent. The second part, *Descensus ad Inferos*, is a much more rhetorical product. It purports

to be by Simeon and his 2 sons who had risen from the dead at Christ's resurrection. They describe what took place in Hades when Christ descended there, the Harrowing of Hell. It was written, possibly, in the 3rd cent. The old legend that Joseph of Arimathea brought Christianity to Britain in the time of Vespasian, on which Robert de Boron based his poem about the holy grail and the table of the Last Supper, is in some way connected with the G. of N.

Nicol, Erskine (1825-1904), painter, was b. Leith. He lived in Ireland from 1845 to 1849, and returning to Edinburgh was elected a member of the Scottish Academy. In 1862 he settled in London. His paintings, the best of which are scenes of Irish life and customs, include 'Among the Old Masters,' 'Both Puzzled,' 'Paying the Rent,' 'The Trio,' and 'Interviewing the Member.'

Nicol Frism, see POLARISATION OF LIGHT.

Nicolai, Christoph Friedrich (1733-1811), Ger. author and bookseller, b. Berlin. In his youth he was a friend of Lessing and Moses Mendelssohn, and in conjunction with the former he estab. the famous *Briefe, die neueste Literatur betreffend*, 1759-65. Later his reactionary attitude against the new literary tendencies caused him to be bitterly attacked by Herder, and by Goethe and Schiller in their *Xenien*; so that his real merit came to be overlooked. His works include *Beschreibung einer Reise durch Deutschland und die Schweiz*, 1783-97, *Anekdoten von Friedrich II.*, 1788-92, and a rationalistic novel, entitled *Sebalus Nothanker*, 1773-1776. See lives by R. Amer, 1912, and F. C. A. Phillips, 1926.

Nicolai, Otto (1810-49), Ger. composer, b. Königsberg. He lived in Italy in 1838-1841 and produced sev. It. operas there. From 1841 to 1847 he was first *Kapellmeister* of the Court Opera at Vienna, and was the founder of the Philharmonic concerts there. In 1847 he was appointed conductor of the cathedral choir and the opera in Berlin, where 2 months before his death, his comic opera *The Merry Wives of Windsor* was produced, a sparkling work by which alone he is now known.

Nicolaitans, heretical sect of the Christian Church flourished in the 2nd cent. Their cult of libertinism was probably evolved from pagan rites and a rejection of the rules of Deuteronomy xxiii. There are links with the doctrines of Balaam (Rev. ii. 14; Jude; 2 Peter i.).

Nicolas, St., see NICHOLAS.

Nicolas, Sir Nicholas Harris (1799-1848), antiquary and biographical writer, b. Dartmouth, Devon (though his family, originally Breton, had been settled in Looe, Cornwall, since 1685). In 1823 he pub. his *Index to the Herald's Visitations in the British Museum*. Among his most important works are *Notitia Historica*, 1824 (pub. as *Chronology of History*, 1833), *Despatches and Letters of Lord Nelson*, 1844-6, *History of the Battle of Agincourt*, 1827, and an unfinished *History of the Royal Navy*, 1847.

Nicole, Pierre (1625-95), Fr. theologian

and philosopher, b. Chartres. His most important works, *Moral Essays and Theological Instructions*, 1671-8, *Treatise on Human Faith*, and *The Perpetuity of Faith in the Catholic Church concerning the Eucharist*, 1669-74, the last written in conjunction with Arnauld. With Arnauld, Le Maistre, Lancelot, and others of the most distinguished scholars of the age, N. was a permanent inmate of the community of Port Royal, famous for its adhesion to the Jansenist movement.

Nicoll, John Ramsay Allardye (1894-), literary historian, b. Glasgow. Educ. at Stirling High School and Glasgow Univ., he became lecturer, and then prof. of English at King's College, London. After holding the chair of drama at Yale for a time he became prof. of English at Birmingham in 1945. A leading authority on the development of the drama, he wrote histories of *Restoration Drama*, 1923, *Eighteenth Century Drama*, 1925, *Late Eighteenth Century Drama*, 1927, *Early Nineteenth Century Drama*, 1930, and *Late Nineteenth Century Drama*, 1939, as well as *The Development of the Theatre*, 1948, and *World Drama*, 1949. He also pub. biographies of Blake, 1922, and Dryden, 1923, and ed. the *Annual Shakespeare Survey* from its inception in 1948.

Nicoll, Robert (1814-37), poet, b. Auchtermargan, Perthshire. His first poems were printed in 1835. He successfully ed. the *Leeds Times* from 1836, but is chiefly remembered as a Scottish poet. Had his life not been cut short, N. would probably have attained great distinction. See life by P. R. Drummond, 1884.

Nicoll, Sir William Robertson (1851-1923), clergyman and journalist, b. Lumsden, Aberdeenshire. Educ. at Aberdeen Grammar School and Univ., he was Free Church minister of Dufftown, 1874-7, and later of Kelso. He then came to London and ed. the *Expositor* and *British Weekly*, together with the *Bookman*, estab. by him in 1891, and *The Woman at Home*, which he founded in 1893. He was editor of the *British Weekly* for the rest of his life. His pub. include *Songs of Rest*, 1879, *Life of James Macdonnell*, 1890, *Anecdotes of the Nineteenth Century*, 1895-6, *The Expositor's Dictionary of Texts*, 1897, *Letters on Life*, 1901, *The Church's One Foundation*, 1901, a life of 'Ian Maclaren', 1908, and *Professor Elmslie*, 1911. He also ed. the complete works of Emily Brontë, 1910. He was knighted in 1909 and made a companion of honour in 1921. His *Life and Letters*, by T. H. Darlow, appeared in 1925.

Nicollie, Charles Jules Henry (1866-1936), Fr. bacteriologist, b. Rouen. Appointed director of the Pasteur Institute at Tunis, he studied N. African infectious diseases, discovering the transmission of typhus by lice, and leishmaniasis by the dog flea. In 1928 he received the Nobel prize for medicine. In 1932 he became prof. at the Collège de France in Paris.

Nicolson, Hon. Sir Harold George

(1886-), diplomat, historian, and biographer, b. Teheran, where his father, who later became Baron Carnock, permanent under-secretary at the Foreign Office, was minister. Educ. at Wellington and Balliol College, Oxford, N. entered the Foreign Office in 1909 and served in the embassies at Madrid and Constantinople. He married in 1913 Victoria Sackville-West (q.v.). He was a member of the Brit. delegation to Versailles in 1919, and was lent to the League of Nations staff from 1919 to 1920. He accompanied Lord Curzon to Lausanne, and subsequently became counsellor to the legation at Teheran until his transfer to Berlin in 1927. In 1929 he retired from the diplomatic service to devote himself to politics. He was one of the early members of Sir O. Mosley's (q.v.) new party in 1931, but left the party when its Fascist tendencies became more overt. At the general election of 1935 he was returned as National Labour member for W. Leicester, and became a junior minister in the Churchill gov. of 1940. He joined the Labour party in 1947 and stood unsuccessfully for N. Croydon in the by-election in that year. He was entrusted with the official biography of George V, which was pub. in 1953. His wide culture and sympathy has enabled him to present a diverse selection of subjects, enlightened by a capacity for sharp impressions and built by strong powers of construction. His publs. include the novels *Some People*, 1927, *Sweet Waters*, 1932, *Public Faces*, 1932, and *The Desire to Please*, 1943; the biographies *Paul Verlaine*, 1921, *Tennyson*, 1923, *Byron: the Last Journey, 1823-4*, 1924, *Swinburne*, 1926, *Lord Carnock*, 1930, *Curzon: the Last Phase*, 1934, *Dwight Morrow*, 1935, *Benjamin Constant*, 1949, and *King George V*, 1952; the historical works *Peacemaking*, 1933, and *The Congress of Vienna*, 1946; and sev. vols. of essays, including *The English Sense of Humour*, 1956. He was knighted in 1953. His *Good Behaviour* was pub. in 1955.

Nicolson, William (1655-1727), prelate and antiquary, b. Cumberland. He occupied the sees of Carlisle and Derry, and finally rose to be Archbishop of Cashel in Ireland. His prin. work was the 'Historical Library,' consisting of Eng., Scottish, and Irish sections. He also contributed a *Glossarium North-hymbriticum* to Ray's *Collection of English Words*.

Nicomachus (fl. c. 400 BC), Gk physician of Macedonia, was the father of Aristotle. He was patronised by Amyntas II, King of Macedonia.

Nicomachus of Thebes (fl. c. 400 BC), celebrated Gk painter, son of Aristodemus (q.v.), whose pupil he became. He is spoken of as one of the most remarkable of the painters of antiquity. His skill is praised by Cicero, and he was renowned for his rapidity of execution. Pliny lists his works which included an 'Apollo and Artemis' and 'The Rape of Proserpine'.

Nicomedes, name of 4 kings of Bithynia:
(1) Reigned 278-250 BC, was the eldest son and successor of Zipoëtes. He

founded the city of Nicomedia (q.v.). (2) *Nicomedes Euphranes*, reigned 148-128 BC, son and successor of Prusias II whom he dethroned and put to death. He was a faithful ally of Rome. (3) *Nicomedes Euergetes*, son and successor of the last, reigned 128-94 BC. (4) *Nicomedes Philopator*, son of the foregoing. He d. after a troubled reign, in 74 BC, and, having no issue, bequeathed his kingdom to the Rom. people.

Nicomedia (modern Izmit), anct city of Bithynia, Asia Minor, at the N.E. corner of the gulf of that name, an arm of the sea of Marmora. It was the seat of the Bithynian kings, and the abode of Hannibal, Diocletian, Constantine, and Arrian the historian. *See further under* BITHYNIA and IZMIT.

Nicopolis: 1. (Gk. 'city of victory'), anct city of Epirus, Greece. It was situated on the Gulf of Arta, and was founded by Octavian to commemorate his victory at Actium in 31 bc. Many Rom. antiquities are to be seen on the site.

2. Tn of Bulgaria, see NIKOPOL.

Nicosia (Gk *Lefkosta*), cap. of the is. of Cyprus and a Gk Orthodox archbishopric, lies near the centre of the great plain of the Mesaoria, on the r. b. of the R. Pedias, 37 m. from the port of Famagusta. The old tn has interesting memorials of its medieval rulers in the shape of its anct cathedral and bastion walls. Textile goods and leather are the prin. manufs. It is the seat of the Brit. governor. Modern suburbs are extending rapidly beyond the walls. The airport is of growing importance. The railway is now disused. Estimated pop. (1954) 42,000, of whom about a third are Turks.

N. does not appear as the cap. until the Lusignan dynasty, but the great number of anct tombs going back to 3000 n.c indicate that this was the site of a city from remote times. It is suggested that the site of the present tn may have been the city of Ledra, founded by Lefcon, son of Ptolemy Soter (280 bc). The earliest mention of N. (as Cossia) is that made by Willbrand, Count of Oldenburg, in 1211 (see Coghlan, *Excerpta Cyprica*, 1908). Dante, in *Paradiso*, refers to its luxurious life under its king, Henry II, and it was here that St Louis of France estab. himself with that monarch when on his way to the fourth crusade. The period of luxury ended in the early 15th cent. when the Mamelukes landed in the is. and marched on N., which they pillaged in 1426. At the end of the 15th cent. N. had 250 churches and 50,000 inhab., chiefly Italians, French, Greeks, and various peoples of the middle E. countries, and the circuit of the city extended for 7 m. The Venetians, who were then in military occupation, began to fortify the is. against an expected Turkish assault (1567). In fortifying the city they destroyed everything outside their new circumvallation, including the monastery and royal castle of St Domenico. In 1570 the long-expected siege of N. was launched by Mustapha Pasha, whose army spent 2 months in reducing the place. It is said that 20,000 Christians

were slain in the street fighting which followed the fall. The 300 years of Turkish occupation were, generally, uneventful.

In 1741 N. was damaged by an earthquake and a minaret of St Sophia Mosque fell to the ground. In 1878 the Brit. Admiralty ordered Vice-Adm. Lord John Hay, then off Crete, to take over Cyprus and to raise the Brit. flag over N. These instructions were carried out. The Paphos Gate, known in the Middle Ages as the Porta Domenico, was closed by the

The Kyrenia Gate, also erected by the Venetians, has in recent years been isolated and new entrances cut in the walls on each side of it. St Sophia, once the cathedral and now the prin. mosque of N., stands in the centre of N. and its twin minarets are a prominent landmark. It is built after the plan of a Fr. cathedral of the 13th cent. and its chief feature is the parvis, with its 3 splendidly decorated doorways comparable with any in Europe. Opposite the E. door of the mosque is the Turkish

Camera Press

ST SOPHIA MOSQUE, NICOSIA

This was originally a Roman Catholic cathedral, but became the chief place of worship for the Muslims when Cyprus was occupied by the Turks in the sixteenth century. Two tall minarets were then added.

British when they made a new entrance through the city walls. The anct Franciscan church was destroyed in the great siege, but a new church, the Rom. Catholic church of the Holy Cross, took its place. The Armenian church of the Blessed Virgin Mary was formerly the Benedictine abbey of our Lady of Tyre. During the siege of 1570 the Armenians, out of hatred for the Latins, helped the Turks, and received this church as a reward. Near the law courts and in the centre of the Konak Square is the Venetian column, the symbol of Venetian domination erected in the various colonies held by the rep., which was once crowned by the Lion of St Mark. It was taken down by the Turks, but restored to its present position in 1917. It is a monolith of grey granite and probably came from a temple of Salamis.

library founded by Sultan Mahmud in the last cent. Another notable building is the Bedestan, which has been erroneously supposed to be the church of St Nicholas founded in memory of Thomas à Becket, and which was, prior to 1570, the Orthodox metropolis of the Venetian period in N. St Catherine's, now known as Hajdar Pasha, after the mosque the most important Gothic building remaining in N., was erected towards the end of the 14th cent. The Famagusta Gate was the chief gate of the city and is the prin. monument of the Venetian era in N. It is built as a copy of the Lazaretto Gate at Candia. The Orthodox bishopric, or church of St John, is probably built on the same site as the old abbey of St John the Evangelist, which belonged to the Benedictines. For other monuments see Sir E. Storrs and

B. J. O'Brien, *Handbook of Cyprus*, 1930, and R. Gunns, *Historic Cyprus*, 1936. During the riots of 1931, which were fomented by agitators for union with Greece (*enosis*), Gov. House was burned down; further rioting began in 1955 after the formation of the organisation called EOKA which, in support of *enosis*, opened a campaign of violence (see CYPRUS).

Nicosia, tn in Sicily (q.v.), built on rocky hills nearly 3000 ft above sea level, 15 m. NNE. of Enna (q.v.). It has a cathedral (13th-17th cents.) and other anct churches. The numerous Crusaders' tombs in N. include many inscribed with Eng. names. There are salt-mines and sulphur springs near by. Pop. 19,200.

Nicot, Jean, Sieur de Villemain (1630-1690), Fr. diplomat and philologist, b. Nîmes, became a lawyer. In 1660, during the reign of Henry II, he was sent as ambas. to Lisbon. On his return from Portugal he introduced the tobacco plant into France (hence the name nicotine). N. was the author of a *Historia Francorum* and *Le Trésor de la langue française*.

Nicotiana, genus of plants (family Solanaceae), a number of which are grown in the garden as half-hardy annuals. *N. alba*, the sweet-scented tobacco plant, bears panicles of white funnel and star-shaped flowers. *N. tabacum* is the tobacco plant of commerce.

Nicotianin, volatile oil to which tobacco owes its flavour. It contains 4 alkaloids: nicotine, nicotimine, nicotine, and nicotelline.

Nicotinamide, see NICOTINIC ACID.

Nicotine ($C_{10}H_{11}N_2$), alkaloid found in the leaves of the tobacco plant in the form of the malate and citrate. It may be prepared by extracting the oil from the leaves with boiling water, mixing it with milk of lime, and distilling; the distillate is treated with oxalic acid, concentrated, treated with potash, and the N. extracted with ether. N. is a colourless oil, but rapidly turns brown on exposure to air. It boils at 246-273° C. and readily dissolves in water and alcohol. It has a pungent odour, similar to that of a foul tobacco pipe. N. is exceedingly poisonous, a few drops in the stomach being sufficient to cause death, while a grain has been known to cause symptoms of poisoning. N. is used as an insecticide in greenhouses, etc. It was synthesised in 1904.

Nicotinic Acid and Nicotinamide. N. A., oxidation product of nicotine, is the β monocarboxylic acid of pyridine (C_5H_5N) and has the formula $N-C_5H_4-COOH$. It is one of the vitamins of the B₃ complex. It occurs in liver, yeast, wheat, rice, etc., and is said to be so stable that it has been detected in barley taken from the tomb of Tutankh-Amen (1350 BC). Shortage of N. A. in the diet is responsible for the skin disease of pellagra (q.v.), which is common in peoples living chiefly on maize. Nicotinamide ($NC_5H_4CO-NH_2$) is the acid amide of N. A. and has similar physiological properties to the acid itself. Diethylnicotinamide ($NC_5H_4CO-N(C_2H_5)_2$) is used in medicine (under the trade name of 'Coramine') for its action on the

medulla of the brain, where by stimulating the respiratory centre it accelerates breathing and by its action on the vasomotor centre it raises the blood pressure; hence it is useful in reviving people who have collapsed, e.g. on the operating table.

Nidaros, see TRONDHEIM.

Nidderdale, picturesque vale of Yorks, England, situated in the W. Riding, traversed by the Nidd, which issues from the base of Wharfedale, and after a generally SE. course empties into the Ouse near York. Water is supplied to Bradford from a dam above Pateley Bridge.

Nidwalden (Switzerland), see UNTERWALDEN.

Niebuhr, Barthold Georg (1776-1831), Ger. statesman and historian, b. Copenhagen, son of the traveller, Carsten N. (q.v.). In 1810 he became royal historiographer and prof. at Berlin, and by a course of lectures on Rom. hist. estab. his position as one of the then most original and philosophical of modern historians. In 1816 he went to Rome as Prussian ambas., and during his residence there discovered and pub. fragments of Cicero and Livy, and contributed to the great work on the topography of anct Rome by C. C. von Bunsen and E. Platner (1773-1855). He resigned the embassy in 1823 and settled at Bonn, where he spent practically the whole of the remainder of his life. Here he rewrote and pub. the first 2 vols. of his *Roman History* (first pub. 1811-12) and delivered lectures on the Fr. Revolution, geography, ethnography, and anct hist. The first 2 vols. were trans. (1822) by J. C. Hare and C. Thirwall, and the third (bringing the narrative down to the end of the first Punic war) by Smith and L. Schmitz, 1832.

See D. Hensler, *Lebensnachrichten*, 1838-9; and lives by J. Classen, 1876; Eissenhart, 1886; F. Schnabel, 1931.

Niebuhr, Carsten (1733-1815), Ger. traveller and author, b. Luddingworth, Hanover. In 1761 he joined an expedition sent out by the King of Denmark for the scientific exploration of Egypt, Arabia, and Syria. He returned in 1767 as the sole survivor. In 1778 he accepted a position in the civil service of Holstein and went to live at Meldorf. The result of his travels appeared in his *Beschreibung von Arabien*, 1772, followed by *Reisebeschreibung von Arabien und andern umliegenden Ländern*, 1774-8, and *Reisen durch Syrien und Palästina*, 1837. See life by his son, B. G. Niebuhr, 1817 (Eng. trans., 1828, by Mrs Austin in the lives of Eminent Men series).

Niebuhr, Reinhold (1892-), Amer. Protestant theologian, b. Wright City, Missouri. Prof. of Applied Christianity (Christian ethics) at the Union Theological Seminary, New York, since 1930. He expounds a biblical theology, orientated to the present day, which has found some acceptance outside the U.S.A. See E. L. Allen, *Christianity and Society: a Guide to the Thought of Reinhold Niebuhr*, 1950.

Niederösterreich, see AUSTRIA, LOWER.

Niedersachsen, see LOWER SAXONY.

Niederwald, mt ridge in the *Land of Hesse* (q.v.), Germany. It is the W. end of the Taunus (q.v.) range, and rises above the Rhine opposite Bingen (qq.v.). Its S. slopes are noted for their vineyards. It is crowned by a monument erected in 1883 to commemorate the estab. of the Ger. Empire in 1871 (see GERMANY, *History*).

Niegos, Petrovic, see **DANILO I.**

Niel, Adolphe (1802-69), Fr. marshal, b. Muret, Haute-Garonne, France. He served in Africa, and distinguished himself at the capture of Constantine in 1837. In 1849 he was engaged in the siege of Rome, and took the Malakoff redoubt near Sebastopol in 1855; 3 years later he pub. *Le Siège de Sébastopol*. He again distinguished himself in the battle of Solferino, 1859, when Napoleon III made him marshal. N. was appointed minister of war in 1867.

Niel, tn in Belgium, on the R. Rupel, 9 m. SSW. of Antwerp. There are brick kilns and manufs. of pantiles, floor tiles, cement, and pottery. N. has some small shipyards. Pop. 10,800.

Niello (It. form of Lat. *nigellum*, diminutive of *niger*, black), name of the method of ornamenting a polished metal surface by filling in incised lines with a black metallic amalgam, which has been practised from very early times up to the present day. The amalgam is made up of silver, copper, and lead, heated and then poured into flowers of sulphur. The earliest specimens of N. date from Rom. times. The use of N. has also been revived by a few Eng. craftsmen. The invention of printing from engravings on metal plates was undoubtedly suggested in great measure by N. See A. M. Hind, *Nielli, chiefly Italian of the fifteenth century, in the British Museum*, 1936.

Nielsen, Carl (1865-1931), Dan. composer, b. Nørre-Lyndøse. Being poor as a youth, he joined a military band at the age of 14, but at 18 succeeded in entering the Copenhagen Conservatory as a pupil of Gade. In 1891 he entered the royal orchestra and was its conductor in 1908-1914. He also became conductor of the Musical Society and director of the Conservatory. With an independent style and a strong sense of counterpoint and melody, N. is one of the most important of Scandinavian composers. Works include (operas) *Saul og David*, 1903, *Maskerade* (after Holberg), 1907, and others; incidental music for Oehlenschläger's *Aladdin*; 6 symphonies (II. *The Four Temperaments*, III. *Espania*, VI. *Sinfonia semplice*), *Saga-Dream* for orchestra; chamber and piano music, songs, etc. See R. Simpson, *Carl Nielsen*, 1952.

Nielsen, Holger, see **ARTIFICIAL RESPIRATION**.

Nielsen, Haraldur (1868-1928), prof. of theology in the univ. of Iceland. In the revised version of the Icelandic Bible (1908) the trans. of the O.T. is his work. Together with his friend, E. H. Kvaran (q.v.), he initiated the spiritualist move-

ment in Iceland (1904) and was a keen psychical researcher. He was an eloquent preacher in the Church of Iceland. See his collected sermons, *Árin og eilífið* (Time and Eternity).

Niemsch (or **Niemsch**), **Nikolaus von Strehlenau**, see **LENAU, NIKOLAUS**.

Niemcewicz, Julian Ursin (1757-1841), Polish scholar and statesman, b. in Lithuania. He served for a short time in the army and became acquainted with Kosciusko, with whom he was taken prisoner at the battle of Maciejowice in 1794, and was secretary of state and president of the Constitutional Committee in Poland after the Congress of Vienna. Of his works the *Historical Ballads*, 1816, are the most popular, but he also wrote *The Return of the Deputy*, a comedy; *John of Tenczyn*, a novel in the style of Scott; and a *History of the Reign of Sigismund III* (3 vols.), 1819.

Niemen (Russian **Neman**, Lithuanian **Nemunas**, Ger. **Memel**), navigable riv. in Belorussia and Lithuania, rising near Minsk and flowing NW. into the Kurisches Haff of the Baltic Sea. Length 590 m.; chief port, Kaunas.

Niernöller, Martin (1892-), Ger. pastor of the Protestant Evangelical Church and theologian, b. Lippstadt, Westphalia. Served in the First World War as a naval lieutenant and U-boat commander. Ordained 1924, N. became pastor of the wealthy Berlin-Dahlem par. (1931-7). A strong supporter of nationalism and opponent of communism, he welcomed National Socialism (q.v.) and joined the Nazi party, but in 1933 he led a campaign against totalitarian control of the Lutheran Church and became an opponent of the Nazi regime. When the Nazis caused a schism in the Church, setting up the 'Ger. Christians' and virtually establishing the supremacy of the State and its teaching over the Church and its fundamental principles, including the adoption of the Aryan (q.v.) paragraph, N. became leader of the Confessional Church, *Bekennniskirche*, which remained true to Evangelical principles. He founded the Pastor's Emergency League (*Pfarrernotbund*) to defend the Lutheran faith, and helped to draw up the 'six principles' of the Confessional Church at the synod of Barmen (1934). At first the League had 7000 members, but Nazi persecution reduced its numbers, and in 1938 only 1000 parsons were left to reject the oath of allegiance to Hitler. N. preached courageously against Nazi domination of the Church and other policies, and his services were crowded. On 1 July 1937 he was put into Sachsenhausen concentration camp, but refused to recant or accept release on the condition that he would undertake not to preach any more. In a secret trial in 1938 before a 'people's court' he was sentenced to 7 months' 'fortress' imprisonment (an honourable prison for officers), and after 8 months was released, only to be rearrested by the Gestapo and kept in 'protective custody' throughout the Second World War. In 1946 he admitted Germany's war guilt at the

International Missionary Council in Geneva, and in 1947 was elected first bishop of the reformed Evangelical Church of Hesse-Nassau. His works include *Vom U-Boot zur Kanzel*, 1934 and *Dass wir an ihm bleiben*, 1935. See H. M. Stückelburger, *Der Kampf der Bekenntniskirche*, 1945.

Niemsch, von Strehlenau, Nikolaus, see LENAUE.

Niepece, Joseph Nicéphore (1765-1833, Fr. physicist and an inventor of photography, b. Châlon-sur-Saône. From 1791 to 1801 he was administrator of Nice when he returned to his native place and directed his energies to chemical research with his brother Claude (1763-1828). In 1811 he turned his attention to lithography, in 1827 produced a photograph on a metal plate; in 1829 he joined Daguerre in his work, and after years of experimenting together they discovered the process of chemically amplifying the photographic image.

Nierembergia (named after J. E. Nieremberg), genus of the family Solanaceae, allied to *Petunia*. There are 20 species native to tropical America, perennial herbs and shrubs, frequently cultivated. *N. caerulea*, *N. calycina*, and *N. frutescens* are grown as half-hardy annuals or greenhouse plants.

Nierstein, Ger. vil. in the Land of Rhine land-Palatinate (q.v.), in the Rhine (q.v.) valley, 8 m. S. of Mainz. Its white wine, *Niersteiner*, is greatly prized. Pop. 5000.

Nietzsche, Friedrich Wilhelm (1844-1900), Ger. philosopher of aristocratic Polish extraction, was b. Röcken, near Lützen, the son of a Lutheran pastor. After a brilliant univ. career at Bonn and Leipzig he was appointed, in 1869, prof. of Greek at Basel. This post he resigned in 1879 owing to ill-health, retiring on a small pension. In 1889 he went mad, and, after remaining so for 11 years, he d. at his sister's house in Weimar. To these few biographical details must be added (for it is the key to much in his philosophy) the fact that his life was one long struggle against sickness, neuralgia and insomnia being its principal manifestations.

N.'s philosophy can be expressed in a few words. He regarded humanity as being composed of 2 types fundamentally different from each other: the weak and the strong, the slavish and the masterful, the mob and the aristocratic few. In the struggle between these 2 types each would naturally seek to impose its morality on the other and to deprecate those qualities in its opponent that are dangerous to it. Thus the weak commend the qualities of meekness and compassion, extol poverty and renunciation. Because Christianity, which, according to N., extolled this 'slave morality', he was opposed to it and proclaimed himself Antichrist. He would revalue all values in the light of the morality of the strong. And for mankind he held up the ideal of surpassing itself, the need for creating a higher, stronger, and more dominant race, the Superman. These ideals are set forth in his many books, but chiefly in

the lyrical and epigrammatic *Thus Spake Zarathustra*.

A complete ed. of N.'s works in Eng. (18 vols.) has been ed. by Dr Oscar Levy (1909-12). See E. Förster-Nietzsche, *Das Leben Friedrich Nietzsches* (3 vols.), 1895-1904; F. C. Copleston, *Friedrich Nietzsche, Philosopher of Culture*, 1942; R. M. Thompson, *Nietzsche and Christian Ethics*, 1951; F. A. Lea, *The Tragic Philosopher: a Study of Friedrich Nietzsche*, 1957.

E.N.A.

F. W. NIETZSCHE

Nieuwland, Pieter (1764-94), Dutch poet and mathematician, b. near Amsterdam. He became prof. of mathematical and physical science at Leyden. His *oésies hollandaïses*, 1788, contain some fine pieces, among which may be mentioned the poem *Orion* and the elegy on the death of his wife. His scientific works include *Almanach nautique*, with Van Swinden; *Disertations sur la construction des océanis de Hadley*, 1788, *Discours sur les moyens d'accélérer l'art nautique*, 1789, and *L'Art de la navigation*, 1793.

Nieuwpoort (Fr. Nieuport), tn in the prov. of W. Flanders, Belgium, 21 m. WSW. of Bruges. It stands on the R. Yser (q.v.) about 2 m. S. of its mouth and is the junction of sev. canals. It is one of the less important Belgian seaports, but has a fishing fleet. By opening the sea-locks in Oct. 1914, thus inundating the lower polders as far as Dixmude, the Ger. advance could be stopped at the Yser. During the war the city was completely destroyed and its interesting

buildings, the cloth hall, the belfry, and the Gothic church, were lost. Rebuilt, the city suffered again very much in the Second World War. It is engaged in fishing, and there are oyster parks, salt works, and manufs. of ropes, sails, and nets. It has sev. war memorials. Pop. 6500. Nieuwpoort-Baden, 2 m. from the tn, is a fashionable seaside resort.

Nievis, see **NEVIS**.

Nièvre, dept of central France, formed of the old prov. of Nivernais with a part of Orléanais. It belongs to the basins of the Loire and Seine. The surface is rugged in the E., comprising part of the granitic mts of the Morvan, of which the highest point within the dept is Prénéley (2790 ft). Forests cover large areas, but much land is given over to pasture and the cultivation of forage, the fattening of cattle and the rearing of sheep and horses being important agric. industries. The chief cereals are oats and wheat, but potatoes are largely cultivated. Vines are grown in the valley of the Loire and in the neighbourhood of Clamecy, the white wines of Pouilly being famous. The prin. mineral is coal, which is found in the neighbourhood of Decize, and the chief manufs. are iron and steel at Guérisny, Fourchambault, and Imphy. The prin. tns are Nevers (the cap.), Château-Chinon, Clamecy, and Cosne (q.v.). Area 2658 sq. m.; pop. 240,100.

Niffer, or **Nuffar**, see **NIPPUR**.

Niger, **Gaius Pescennius**, governor of Syria, was a Roman of equestrian rank. He was chosen emperor by the troops in AD 193 on the death of Commodus; but, failing to march on Rome at once, was intercepted by Severus, a rival claimant. Three battles were fought, resulting in the defeat of Pescennius, who fled towards the Euphrates. He was captured and put to death, AD 194.

Niger (the name is not derived from the Lat. adjective for 'black' but from a Libyan and Sudanese root, meaning 'water' or 'river'). The word was used by Ptolemy in the Gk form of *nigrit* and is used at the present time by Lake Chad tribes in the form *nier*, important riv. system of W. Equatorial Africa, ranking next in size to the Congo and the Nile. It rises in the country of the Mandingos, about 150 m. from the coast, and flows N. and N.E. towards the Sahara, then S.E. and S., finally entering the Bight of Benin in the Gulf of Guinea by an enormous delta (14,000 sq. m. in area), which extends nearly 150 m. inland. Its chief stream, the Tembi, is joined by the Tamincono and the Falico, all rising in the mountainous region of N.E. Sierra Leone. Lower down, at its confluence with the Tankisso, it is called the Babaa or Joliba. At Bamaku in Bambarra it becomes navigable for steamers, and after passing Sansanding it divides into sev. arms, enclosing extensive is. The Niger's chief l. b. trib. is the Benué (q.v.) or Chadda, joins it opposite Lokoja, and being navigable from Adamawa affords communication with the interior. The Bussa rapids, in which the explorer Mungo Park was drowned (1805), are below the junction of

the Sokoto and the Niger. Total length about 2600 m.; area of basin 600,000 sq. m.

Mangrove forests form the chief vegetation of the remarkable delta region. The Upper Niger was explored by Mungo Park (1795-7 and 1805), the Middle by Barth (1851-4), and the Lower by Clapperton (1826-7) and Lander (1830). Among other explorers are Houst (1896), Lenfant (1903), and Talbot (1904). The riv. is British from its mouth to the end of navigation; above that part it is French. See J. Thompson, *Mungo Park and the Niger*, 1890; A. Mockler-Ferryman, *Up the Niger*, 1893; J. K. Trotter, *The Niger Sources*, 1898; A. G. Leonard, *The Lower Niger and its Tribes*, 1906; B. Alexander, *From the Niger to the Nile*, i 1907; P. Germann, *Mungo Park*, 1924; M. Abadie, *La Colonie du Niger*, 1927; E. P. Stebbing, *The Forests of West Africa and the Sahara*, 1937; C. Hanin, *Occident noir*, 1947; D. Forde, *Peoples of the Niger-Benué Confluence*, 1955.

Niger Territory (Fr.), see **NIGER** and **SUDAN**, **FRENCH**.

Nigeria, **Federation of** (from very early times the land of the Niger—Négritia of the ancients—on the derivation of which name see **NIGER**, a Brit. colony and protectorate of Brit. W. Africa extending between the Lower Niger and Lake Chad, rapidly approaching self-governing status. It is situated on the N.E. shore of the Gulf of Guinea, and enclosed roughly by parallels of lat. 4° and 14° N. and by the meridians of long. 3° and 14° E. It is bounded on the N. and N.W. by the Fr. Sudan, on the S. and S.W. by the Gulf of Guinea, and on the W. by Dahomey (Fr.). Greatest length from N. to S., 650 m. The area of Nigeria, including the trusteeship ter. of the Cameroons (q.v.), is approximately 373,250 sq. m. The country is divided into the N., E., and W. Regions and S. Cameroons. Lagos is an area of 27 sq. m. (pop. 324,000), containing the Federal cap. N. Region, pop. 17,714,000, cap. Kaduna, area 281,782 sq. m.; E. Region, pop. 7,782,000, cap. Enugu, area 29,484 sq. m.; W. Region, pop. 6,613,000, cap. Ibadan, area 45,376 sq. m.; S. Cameroons, pop. 953,000, area 16,581 sq. m.

The country is usually divided into the delta region (swampy, unhealthy, and abounding in mangroves), the forest region (very hilly in parts), and the plateau region in the centre, where the climate is hot but much drier and more pleasant. The harmattan (hot dry wind) blows from the Sahara at certain seasons. The fine particles of sand, individually invisible to the naked eye, collectively appear as a huge dark cloud blotting out the sun and making air navigation a serious hazard. These fine particles of sand reach ships many miles out to sea, more than 1000 m. from the Sahara.

Administration. The constitution of Nigeria is set out in an Order in Council which came into operation in Oct. 1954. This provides for a Council of Ministers comprising the governor-general as president and 10 ministers (3 from each

Region and 1 from the S. Cameroons). There are 3 *ex officio* members, viz. the chief secretary, the attorney-general, and the financial secretary of the Federation. There is a Federal House of Representatives presided over by the speaker, with 184 elected members composed of 92 from the N. Region, 42 from the W. Region, 42 from the E. Region, 6 from the S. Cameroons, and 2 from Lagos. In addition to 3 *ex officio* members (the chief secretary, the financial secretary, and the attorney general), the governor-general may appoint 6 special members to represent special interests. Each of the 3 Regions has its own executive council presided over by the regional governor. In the N. Region there are 3 *ex officio* members in the council as well as the ministers. In the W. and N. Regions there are 2 chambers (Chiefs and a House of Assembly), but in the E. Region a House of Assembly only. In the N. Region there are 4 *ex officio* members in the House of Assembly, and 5 special members appointed by the regional governor; the other members are elected. In the E. and W. Regions all members are elected.

After Jan. 1959 the S. Cameroons ceased to have an Executive Council with the commissioner as president, but a House of Assembly was instituted, with a speaker and 26 elected members.

Membership of the Federal House of Representatives is decided by special elections: in the N. Region and S. Cameroons through electoral colleges; in the W. Region by ballot, all taxpayers being qualified to vote irrespective of age; and in the E. Region by adult suffrage. Owing to the high illiteracy rate in Lagos and in the W. and E. Regions, voting is done by the use of symbols; and the ballot is secret. Elections in the N. Region are carried out along the same lines; but the regional governor may, within limits, vary the procedure. Under the constitution the Federal Legislature has exclusive authority in matters concerning external affairs, aviation, customs, banking, defence, police, mining, mercantile marine, posts and telegraphs, railways, and arterial roads. Other matters may be dealt with either by the Federal or by the Regional Legislature.

The emirs of N. Nigeria mostly stem from the cattle-owning, nomadic Fulani invaders. The degree of personal autocracy exercised by each varies according to custom and temperament. Some are progressive, a few openly reactionary. As a class they possess political instinct, and the development of a big international air junction round Kano put them in touch during the Second World War with world affairs. They are fully conscious of the need for the N. to overcome S. opposition to their rule if their traditional way of life is to survive at all. In domestic life they are frugal. Inhabiting rambling, castellated mud palaces, they maintain large retinues but do not go in for luxuries in the W. sense. The H.Q. secretariat of an emirate is the prin. repository of power.

The secretariat is run entirely by Africans with Brit. advisers holding a watching brief. It deals with almost every branch of administration, including revenue and police.

Production and exports. There are great agric. resources in the N. Region. Crops for home consumption include maize, yams, cassava, sweet potatoes, sugar-cane, Guinea corn (or sorghum), ground-nuts, rice, millet, tobacco, plantains, bananas, and beans of various kinds. The prin. agric. exports (with amounts and/or values as at 1954) are: cocoa (98,000 tons, £39,261,000); palm oil (208,000 tons, £13,431,000); palm kernels (464,000 tons, £22,791,000); ground-nuts (428,000 tons, £29,900,000); bananas (£2,863,000); rubber (£2,907,000); cotton (£7,530,000). Other products for export are cotton lint (but cotton is grown mainly for the local industry of hand spinning and weaving), hides and skins, and a variety of timber. Wheat is grown to a small extent; large herds of cattle, sheep, and goats are raised in the N. Region; and in the extreme N. camels are bred. Horses and donkeys are bred, and in common use in the N. part of the protectorate. Tin is the chief mineral produced. In 1954 the total export value of hides and skins, tin ore (10,933 tons, plus 2914 tons of columbite), and timber was £5,172,000. Also in 1954, 45 per cent of total imports came from the U.K., and 9 per cent from Commonwealth countries, while 72 per cent of total exports were destined for the U.K.

Tin ore has been worked and smelted by natives during the last hundred years, and tin is mined by sev. Brit. companies. Beds that could only have been made by man may be seen that have been found in the deep detrital deposits, and they bear no resemblance to any modern ornaments made by tin workers, and, further, the depth at which they have been found precludes a modern origin. The prin. tin-fields are situated on the W. boundary in the Bauchi Prov. and in the provs. of Nassarawa, Zaria, and Kano adjoining the boundary. Tin is also known to exist in the provs. of Ilorin, Calabar, and Yola, but as yet has not been found in payable quantities. The second important mineral of Nigeria is gold, but development is still confined to the alluvial stage. Deposits of lignite and coal have been discovered near Asaba and Udi in the S. Region. A colliery was opened by the gov. in 1915 at Enugu, the coal won being used by gov. depts or sold to the public. This colliery produced 636,000 tons in 1954. There are salt and soda deposits in Bornu Prov. There are no large secondary industries, with the exception of a saw-mill at Sapele, where there is also a modern plywood and veneer factory. Other products are colanuts, capsicum, gums, balsams, and indigo. Citrons, limes, oranges, date-palms, pomegranates, mangoes, and other fruits flourish. Subsidiary companies of Unilever Ltd., especially the United Africa Co., carry on much of the trading and mining operations throughout Nigeria.

Mining rights are vested in the gov.; but under an agreement with the Royal Niger Co. at the date of the revocation of its charter, the company receives half the gross profits from royalties on minerals for a period of 99 years as from 1900. Much of the organised retail trade is in the hands of Syrians and Lebanese; but in the markets African women have a monopoly and wield considerable political influence. There are 4 independent regional marketing boards, for cocoa, palm kernels and palm oil, ground-nuts, and cotton. The ports served by ocean steamers are Lagos, Forcados, Burutu, Warri, Sapele, Bonny, Port Harcourt, Degema, Opobo, Calabar, Victoria, and Tiko.

E.N.A.

KANO: HOUSES OF PROSPEROUS HAUSAS IN THE NATIVE QUARTER

Fauna and flora. The fauna and flora of Nigeria are interesting. Lions, leopards, elephants, giraffes, a kind of buffalo, hyenas, antelopes and gazelles, camels, monkeys, and snakes are found. The rivs. contain numerous varieties of fish, while the crocodile, the rhinoceros, and the hippopotamus are also common. The tsetse-fly and mosquitoes infest the coast dists. and all the delta region. The birds include ostriches, bustards, birds of prey (such as vultures, kites, and hawks), snipes, quails, partridges, ducks, widgeon, and teal, and many varieties of parakeets, pigeons, geese, etc. Among the chief trees are different kinds of palm (notably the oil-palm, *Elaeis guineensis*; the date-palm, *Phoenix dactylifera*; and the doum-palm, *Hyphaene thebaica*), the gambier, the baobab, shea-butter, and locust trees, and the tamarind. In the drier regions mimosa and acacia bloom freely. Mangroves are confined to the swampy coast dist. and form its peculiar vegetation.

Tribes. The vast number of tribes in Nigeria precludes any detailed account, but a few of them may be mentioned. Among the coast tribes are the Jekri, Ijor, Ibo, and Aros; to the S.E. round Calabar dwell the Efiks, Ibibios, and Kwass. The Hausas and Fulani of the N. are much higher races than these coast dwellers. Other tribes are the Munsili, Okpotos, Berberi or Kanuri, and Yorubas.

Communications. The W. div. of the Nigerian Railway (3 ft 6 in. gauge) runs from Lagos through Abeokuta, Ibadan, Kaduna, and Zaria to Kano (705 m.). The main line from Kano has been extended to N'Guru (Borku). There are also 4 branch lines, one from Minna to Baro on the Niger (111 m.), Ife junction to Idogo (27 m.), Zaria to Kaura Namoda (137 m.), and Zaria to Jos (133 m., of 2 ft 6 in. gauge track). Port Harcourt is linked with Enugu by a 3 ft 6 in. gauge line, this line being generally known as the E. Railway. It runs through a wide oil-palm belt, and taps the coal-field at Enugu. The line is 593 m. in length and is an alternative outlet for the tin ore and agric. produce of the N. Total rail mileage 1903, and track mileage 2218. There are 31,184 m. of good roads, of which 2022 are tarred. The R.s Niger and Benue are in themselves great natural highways and in the S. there are numerous other navigable waterways which provide means of communication and transport. There is a wireless station at Lagos under the control of Cable and Wireless Ltd., and a number of Post Office wireless stations for internal communications. Direction finders have been installed at Lagos and Kano. There are sixteen aerodromes, Kano and Lagos being international airports.

Religion. The Muslim religion is widely diffused in the N. Region, notably among the Fulani and Hausa tribes who are of very long-standing historical antecedents. Paganism prevails in some parts. Protestant and Catholic missions have industrial schools at many stations, and in 1954 the number of Christians was estimated at 1,000,000. The small number is surprising in view of the fact that the W. coast of Africa has been in close contact with Europe for 3 cents. But Christian missionary effort did not make any great headway until the beginning of the present cent. It has met with conspicuous success in S. Nigeria where, unopposed by Mohammedanism, it has gone hand in hand with European education. Elsewhere Christianity suffers from a number of disabilities, compared with Islam. It is spread by Europeans, whose culture is poles apart from that of the African; Islam is spread among blacks by blacks. Christianity is presented in multitudinous forms; Islam is practically free from sectarianism and indeed constitutes one huge brotherhood.

Education. The federal gov. is responsible for education in Lagos. Elsewhere it is a regional responsibility. Since Jan. 1955 education has been free for all primary schoolchildren within the 6-12-year age group. At the end of 1955

there were about 1,277,000 children receiving primary education. There are 156 teacher training institutions having a capacity for 10,400 trainees. There are 162 secondary schools capable of holding 30,000 pupils; 1 technical institute; and 8 trade centres for 1630 apprentices. At the Univ. College, Ibadan, there are 511 undergraduates; 393 students were attending colleges of art, science, and technology at the end of 1955. Scholarships are awarded for studying overseas; more than 2000 Nigerians were said to be studying in the U.K. in 1954, and 300 in the U.S.A. The Nigerian Union of Teachers has a membership of 31,000, the largest of Nigeria's 177 trade unions.

Health. This is the responsibility of regional govts., the federal gov. being responsible for Lagos. Malaria, yellow fever, trypanosomiasis, cerebro-spinal meningitis, pneumonia, smallpox, leprosy, yaws, tuberculosis, dysentery, venereal diseases, intestinal parasites, filariasis, onchocerciasis, elephantiasis, and tropical ulcers are all prevalent. Leprosy is being tackled with outstanding success, and malaria is being progressively combated. There are 142 hospitals, 419 maternity centres, 9 rural health centres, and 1000 dispensaries. There are about 12,313 hospital beds, and expenditure on the health services in 1954-5 amounted to £4,135,000.

History. The N. part of Nigeria, although vaguely known to Arab geographers of the 14th cent. who were acquainted with the Negro kingdoms of the W. Sudan, remained unknown to Europe until, towards the end of the 18th cent. and in the first half of the 19th cent., explorations by Mungo Park, Clapperton, the Landers, Barth, and others revealed the true course of the Niger and the existence of organised states of the interior. These discoveries led to attempts to open the country to overseas commerce, and, despite very heavy mortality in the early years, trading posts were estab. on the banks of the Niger and the Benue. When the interior of Nigeria first became known to Europeans, the open country had been for some time the home of the Negroid and Berber peoples, who had adopted the Muslim religion and formed powerful and comparatively civilised states. In the forest and mt country, on the other hand, there dwelt many Negro tribes, the people of which were rude savages, addicted to cannibalism and human sacrifice. Of the origin of the Yorubas, numerically the most important tribe, who now occupy the country between Lagos on the S. and the Niger on the N. and are the predominant race throughout the provs. of Abeokuta, Ijebu, Ondo, and Oyo, there is no definite knowledge. A tradition that they came from Egypt is suggested by certain bronze heads found at Ife and the manner in which the dead are bound for burial. However, their estab. in the W. of Africa was, it is generally stated, in consequence of their being driven by Yaa-rooba, son of Kahtan, out of Arabia to the W. coast between Ethio-

pia and Egypt, whence they advanced into the interior of Africa until they reached Yarba. The Alafin, ruler of Oyo, was left with little but the cap., and the Fulani from Ilorin came and sacked the tn. Soon afterwards the emir of Ilorin summoned the Alafin to Ilorin and compelled him to accept the doctrines of Islam, whereupon the Yoruba people resolved to drive out the Fulani and thereby avenge the insult to their titular head. The Fulani, however, inflicted on their forces a crushing defeat; Oyo was deserted, and the people fled before the victorious Fulani, who overran the country as far S. as Abeokuta.

The estab. of the early Hausa states must have taken place at a very remote era, but we have little documentary evidence of the early hist. of the Hausas, who to-day are spread over a large area of N. Nigeria, especially in the provs. of Sokoto, Kano, Zaria, and Bauchi. Before the spread of the Muslim creed the Hausas were pagans, but the new religion penetrated the country in the course of the 13th cent. and profoundly affected both the religious and social life of the Hausas. A form of government grew up based on Islamism, with a well-organised fiscal system and judiciary, and each state was ruled by a chief in a walled cap. to which people could flee from invaders. Though each Hausa state was independent, they seem to have been joined together at times in a loose confederation for purposes of defence. From the early years of the 16th cent. until the beginning of the 19th cent. there was a series of civil wars in Hausaland, and then there was a resurgence of the Fulani people under Othman dan Fodio. Othman was not only a warrior but also a devout Muslim and a scholar. When he succeeded in firmly establishing a Fulani empire, he retired to continue his studies. He handed over the administration to his brother Abdullahi and his son Bello. Othman d. in 1817. He was followed by Bello, whose reign was a troubled one, there being continual wars against tribes which refused to submit to Fulani hegemony; but, despite these wars, Bello found time to study and, like his father, wrote sev. works on hist., theology, and geography. He was visited by Clapperton at Wurno (1824) and sent a cordial message by Clapperton to William IV. The Fulani rulers certainly administered the Hausaland with ability and justice, and the fact that they were able to maintain their rule for a hundred years, a comparatively small number of aliens governing a numerous subject people, is evidence of their marked superiority among the W. African tribes. But as Othman's original famous 'flag-bearers' in the jihad passed away, corruption crept in, the emirs slackened in their administration and lapsed into the habits of the pagans. Thus it was a diminished kingdom, from which the glory had departed, when the Brit. arrived at the end of the 19th cent.

Lagos was bought in 1861 from a native chief, in 1866 placed by letters patent

under the gov. of Sierra Leone and, later, administered as part of the Gold Coast colony until 1886, when a separate colony and protectorate of Lagos was founded. It is true that other European nationals had set up trading posts on the Niger as early as the 17th cent., but they were not interested in political development and were concerned exclusively with the slave trade, and indeed it was only after the abolition of this trade in the early years of last cent. that there was any appreciable advance in the commerce in commodities. Even so, Lagos had been bought chiefly to prevent its continued use as a slave market. Prior to the period commonly known as the 'scramble for Africa,' Brit. merchants came together in mutual defence against Fr. competition, under the leadership of Sir George Goldie (the 'founder of Nigeria'), as the United African Co., being granted a royal charter (1873). In 1885 the Brit. claim to a protectorate over Nigeria was recognised by the Berlin Conference, and that part of the country which was not included within the Lagos ters. or the sphere of the chartered company was placed under Foreign Office administration as the 'Oil Rivs. Protectorate,' later named the 'Niger Coast Protectorate.' By 1900 the chartered company had passed its period of usefulness and its charter was revoked. The N. part of its ters. became the N. Nigeria Protectorate and the S. was combined with the Niger Coast Protectorate as the protectorate of S. Nigeria, and both were placed under the Colonial Office. In 1906 the colony of Lagos and its protected ters. were combined with the protectorate of S. Nigeria and designated the colony and protectorate of S. Nigeria, with Lagos as the seat of gov. In 1914, the N. and S. protectorates were amalgamated to form the colony and protectorate of Nigeria. Until 1900 the chartered company had been responsible for both the civil administration and commercial development, but it never succeeded in extending its administration over the whole of Nigeria, though its influence was felt along the main trade routes on the rvs. Even after the transfer of gov. to the Crown much remained to be done in the pacification of the country, a work which owed much to Lord Lugard and the late Sir Hugh Clifford; and it was not until after 1900 that the phase of internal economic development could begin. Yet, as Lord Hailey justly observes, 'the fact remains that for a capital outlay of about £1,000,000 the largest Brit. colony in Africa was added to the Crown.' See also BENIN; BENUE; BORNU; FULAHs; HAUSA; KANO; LAGOS; NIGER; NUFE; SOKOTO.

Night, see DAY.

Night-blindness, see NYCTALOPIA.

Night-blooming, or Noctiflorous, Plants, plants which have adapted themselves so as to gain the fertilising services of moths and a few other nocturnal insects. All are strongly scented, and on that account are valued in the garden. Most of these plants bear showy white flowers, and those that are tinted yellow, pink, or blue are of such a texture that they are conspicuous in the lighter hours of the summer night. A common instance amongst native plants is the bladder campion, *Silene cucubalus*. The tobacco plants (*Nicotiana*) partially close their flowers in the daytime, opening at about 6 p.m., and emitting a penetrating, very sweet odour. In some plants the flowers last for a number of nights, but others open and fall in one night. Other familiar garden noctiflors are the jasmines, the tree of sadness, the marvel of Peru, the night-blooming cactus, the night-scented stock, dame's violet, and the evening primrose, none of which are natives of Britain.

Night Heron or *Nycticorax*, genus of birds of the family Ardeidae of very wide distribution. They are most active at night. Of about 9 species, *N. griseus* alone visits Britain. The bird is 23 in. long, and its plumage is beautifully coloured, the back being greenish-olive and the breast wine colour; long white plumes are borne on the head.

Nighthawk, another name for the Brit. nightjar. Also the best-known species (*Chordeiles virginianus* or *C. popetue*) of Chordiles, a genus *Caprimulgus* (goatsucker). It is the nighthawk of N. America and has a wide range from Canada to Brazil. See GOATSUCKER.

Nightingale, Florence (1820-1910), reformer of hospital nursing, b. Florence. While quite young she did much philanthropic and social work in England, and in 1844 visited many hospitals and reformatories in Europe. In 1851 she trained as a nurse at an institution of the Protestant Deaconesses at Kaiserswerth, on the Rhine, and on her return to England devoted herself to the Governesses' Sanatorium in connection with the London Institute. At the beginning of the Crimean War the wounded soldiers suffered so terribly from the inefficiency of the nursing dept that Florence N. volunteered her services and sailed in 1854 with a party of 38 nurses, including Sisters of Mercy from England and Ireland. An interesting sidelight on her work in the Crimea is afforded by her letter from Balaclava Hospital to Mother Clare Moore of Bermondsey: 'Your going home is the greatest blow I have had yet. But God's blessing and my love and gratitude go with you as you will know.... You were far above me in fitness for the general Superintendency both in worldly talent of administration and far more in the spiritual qualification which God values in a Superior. My being placed over you

in our unenviable reign of the East was my misfortune and not my fault.' Her self-sacrificing services to the wounded made her name famous throughout Europe. She wrote sev. pamphlets on nursing and hospitals, and a fund, the interest on which amounts to about £1600 per annum, was raised in 1857 for the purpose of training nurses, now carried out at St Thomas's and King's College Hospitals. She received the Order of Merit in 1907. The Verney-N. papers afford interesting details of her relationships with Benjamin Jowett (who wanted to marry her), Richard Monckton Milnes (also a great admirer), Sidney Herbert, and the poet Arthur Hugh Clough, both also intimate friends. See lives by Miss Tooley, 1904; Sir E. T. Cook, 1913; R. Nash and A. Short, 1925; G. C. Willis, 1931; C. Woodham-Smith, 1950; also L. Strachey, *Eminent Victorians*, 1918.

DEADLY NIGHTSHADE

Nightingale (*Luscinia megarhynchos*), most famous of the warblers, or indeed of any song-birds. The male bird arrives from N. Africa, in the middle of April, a few days before the female, going almost invariably to the woods and copses which have always been the haunts of its species; but the distribution is very local, being confined to the S. and Midland cos., though sometimes found in the W. The Nightingale's song on a calm night in May or June has a perfect setting; but it is impossible to exaggerate the beauty of its song, which is unique in its variety and sustained melody. Contrary to the popular idea, the song can be heard by day as well as at night-time. The nest is made often on the ground, of dry grass and leaves, and in it are laid 4 to 6 olive-green eggs. The male's song continues until the young are hatched. The female is slightly smaller than the male, but exhibits no definite distinction of plumage. The upper parts are chestnut-brown; the long rounded tail is reddish-brown, and the breast is dull greyish-white, tinting to brown. The food is mainly composed of caterpillars, other insects, and small

worms; but fruit is sometimes eaten. The winter migration is begun as early as July, and is completed before the end of Aug. Nightingales are sometimes kept in captivity, but need much careful management. *L. philomela*, the thrush nightingale of E. Europe, is a louder but not such a sweet songster. The Persian nightingale (*L. hafsi*) is said to be the bulb of the poets.

Nightjar, see GOATSUCKER.

Nightmare, see DREAM and FREUD.

Nightshade, name given especially to a number of plants of the family Solanaceae. The deadly N. (*Atropa belladonna*, q.v.) is the most dangerous of Brit. poisonous plants. Every part of the plant has the poisonous principle, atropin (q.v.). The woody N. is *Solanum dulcamara* and the Black N. is *S. nigrum*, both poisonous. See SOLANUM and BITTERSWEET. Enchanter's N. is *Circaea* (q.v.).

Nigri Sembilan, see NEGRI SEMBILAN.

Nigritia, see NIGERIA and SUDAN.

Nihilism (Lat. *nihil*, nothing) as a philosophic term dates from the 12th cent., and may be said to signify that sceptical attitude of mind which denies everything, even existence. In more modern times, however, N. came to stand for an amorphous body of social and political discontent which manifested itself among the Russian educ. classes. Its currency in Russian intellectual circles owed much to Turgenev's famous novel, *Fathers and Sons*, where the chief protagonist of the creed recognises no authority, doubts every general principle and value, and asserts the freedom of the sovereign individual. N. was essentially a philosophical and literary school without any political action of its own. However, from the fact that in so far as it was given a political direction it aimed at a reconstruction of society on a communistic basis; and as, in order to attain that end, Nihilists did not scruple to use the most violent means (their most prominent victim was the Tsar Alexander II, who was assassinated on 13 Mar. 1881), N., in the popular mind, became a synonym for anarchism (q.v.). But the great bulk of Nihilists in Russia took no part whatever in the political struggle, and were content to devote their energies to such matters as education, the raising of the status of women, etc., and to making known their ideals through the channels of literature and art. During the last decade or two prior to the First World War, the term N. became more and more obsolescent, for the politically minded reformers had become identified with definite political creeds and parties. See also RUSSIA, *History*. See J. B. Hopkins, *Nihilism*, 1881; K. Oldenburg, *Der russische Nihilismus von seinen Anfängen bis zur Gegenwart*, 1888; Prince P. Kropotkin, *Memoirs of a Revolutionist*, 1899, and *The Terror in Russia*, 1911; H. E. Read, *The Philosophy of Anarchism*, 1940; E. von Schenck, *Europa vor der deutschen Frage*, 1946; A. Weber (trans. R. F. C. Hull), *Farewell to European History: or, the Conquest of Nihilism*, 1947.

Nihon, see NIPPON.

Niigata, seaport city of Niigataken, Japan, 160 m. NW. of Tokyo. It is an important centre of rice production and general commerce. Seat of the prefectural gov., it also has steel, machine-tool, locomotive, and paper industries, and there is trade with Siberian ports. The production of petroleum has been developed, and there is a large manuf. of chemicals. Pop. 262,000.

Nijar, Sp. tn in the prov. of Almería, in the Sierra Alhamilla. It has a trade in cereals, fruit, olives, and esparto. There are iron, lead, and manganese mines near by. Pop. 13,400.

Nijinsky, Vaslav (1890-1950), Russian ballet dancer and choreographer. His family, of Polish origin, had been dancers for many generations. He was b. at Kiev and at the age of 10 entered the Imperial School of Ballet as a student under Nicolai Legat. His extraordinary talent soon became evident, and in May 1908 he graduated as a member of the Imperial Ballet, making his début at the Mariinsky Theatre in the ballet of Mozart's *Don Giovanni*. Two years later he resigned because, it is believed, the propriety of his costume in *Giselle* was questioned. By this time, however, he had won a European reputation with his creation of the parts, among others, of the Egyptian slave in Bakst's *Schéherazade* and of Harlequin in Fokine's *Carnaval* during the seasons of Russian ballet organised in Paris by Diaghilev in 1909 and 1910. Early in 1911 he left Russia with the independent company which Diaghilev formed with H.Q. in Monte Carlo. During the seasons held there and at Paris, Rome, Berlin, and London over the next 2 years N. added to his triumphs—particularly in Fokine's ballets, *Le Spectre de la Rose* and *Petrouchka*, in which there was scope not only for N.'s genius as a dancer but also his great dramatic ability. In 1913 N. succeeded Fokine as *maitre de ballet*, and in *L'Après-midi d'un faune*, *Jeux*, and *Le Sacre du printemps* he created a new non-classical style of dancing, violently controversial at the time. In Aug. of that year he went to S. America with the Ballets-Russes and on arrival at Buenos Aires he married Romola de Pulszky, a member of the company, the daughter of an aristocratic Hungarian family. The marriage caused a break with Diaghilev, and N. endeavoured to maintain a London season with his own company. He was entirely unsuited to the administrative work involved and his health broke down. On the outbreak of the First World War he, his wife, and daughter Kyra were interned in Hungary, but in 1915 he was allowed to go to the U.S.A., where he again joined the Ballets-Russes. His new ballet *Till Eulenspiegel* to music by Strauss was produced in New York in 1916 but was ineffectual. The Amer. tour was followed by a short season in Madrid and Barcelona at the invitation of Diaghilev. A S. Amer. tour undertaken by N. in the summer of 1917 proved a failure and was the end of his association with the Ballets-Russes. He retired to St Moritz. His mental instability, noticeable even in the earlier

years when he was devoted to his art almost to the exclusion of normal adult responsibility, now became more evident, and from 1918 until his death in London he was able to take no further active part in ballet. He was the greatest of male dancers, the role of whom he revolutionised. His technique, interpretation, and characterisation amounted to genius, and were combined with wonderful lightness of movement. It is said that he defied the law of gravity, appearing to descend through the air more slowly than he rose. See also **BALLET**. See Romola Nijinsky, *Nijinsky*, 1933, and C. W. Beaumont, *Vaslav Nijinsky* (2nd ed.), 1943.

Nijmegen, Nimeguen, or Nimwegen, tn in the prov. of Gelderland, Netherlands, on the R. Waal. It was formerly the residence of the Carolingian emperors, and the beautiful park called the Valkhof occupies the site of the old palace. Another interesting feature of the tn is the church of St Stephen, which was originally built in 1272, and contains a monument of Catherine of Bourbon (d. 1469). There is a Rom. Catholic univ. at Nijmegen, estab. in 1923. There are extensive manufs. of beer, Prussian blue, and leather, as well as of pottery, cigars, and gold and silver work.

Nijmegen figured prominently in the Anglo-Amer. operations on the W. front in Sept. 1944, being involved in the plan to acquire flanking bridgeheads across the lower Rhine beyond the main fortifications of the Siegfried line (q.v.) in the hope of quickly turning the Ger. N. flank and so ending the war earlier than might have been expected. This operation to seize the lower Rhine bridges comprised an airborne operation to capture the vital bridges over the Maas, Waal, and lower Rhine at Grave, Nijmegen, and Arnhem and a land operation, on a very narrow front with a one-road communication most of the way, to advance through Eindhoven and Nijmegen. The Brit. 1st Airborne Div. was dropped furthest N. in the Arnhem area, the U.S. 101st Airborne Div. N. of Eindhoven, and the U.S. 82nd Airborne Div. in the Nijmegen area (17 Sept.). In the next few days there was much confused and heavy fighting between Nijmegen and Arnhem. Repeated Ger. attacks against the thin allied line of communications necessitated the temporary withdrawal of armour from Nijmegen to keep the single road open; but gradually, as the line was strengthened, a firm front was estab. along the Waal and Maas (for further details see **under** **WESTERN FRONT in SECOND WORLD WAR**). Nearly the whole shopping area of Nijmegen was destroyed by bombing and shelling; but extensive rebuilding has since been carried out. A new double-track road has been constructed between Nijmegen and Arnhem. Pop. (1957) 121,470.

Nijni-Tagil, see **NIZHNIY TAGIL**.

Nika Riot, insurrection at Constantinople during the reign of Justinian I, AD 532. It started in the hippodrome (q.v.) as a clash between the sporting factions, which had for long formed the basis of political cabals. Discontent had been

fanned into flame by burdensome taxation, and the outburst was of unparalleled violence. The imperial palace was attacked; Justinian would undoubtedly have lost his throne, and probably his life, but for the courage of the empress, Theodora, who refused to leave the city. It is said that 30,000 people were killed before the rebellion was finally crushed by Belisarius (q.v.).

Nike, Gk goddess of victory, daughter of the giant Pallas and Styx, by whom she was sent to fight for Zeus against the Titans. She is generally represented as winged, and with a wreath and a palm branch. As herald of victory she also has the caduceus (see DIVINING ROD). In the 5th cent. bc a temple was built in honour of N.-Apteros (unwinged) at Athens. Her Rom. equivalent was Victoria.

THE TEMPLE OF NIKE-APTEROS,
ATHENS

Nikko, city of Tochigiken, Japan, noted for its Toshogu shrine and the scenic beauty of the neighbourhood. The shrine is the mausoleum of Ieyasu, founder of the Tokugawa Shogunate gov., and was built by the third Shogun Iemitsu in 1654. N. has a large copper and aluminium industry, although tourism is the biggest source of the city's income. Pop. 33,000.

Nikolas of Cusa, see CUSA.

Nikolayev (Ukrainian Mykolayiv): 1. Oblast in S. Ukraine in the Black Sea lowland steppe, traversed by the S. Bug. Wheat, sunflowers, and cotton are grown, and there are market gardening and dairy farming. It has large engineering and food industries. N. was practically unpopulated until annexed by Russia from Turkey, 1774-91. Pop. 1,000,000, Ukrainians and Russians (before the war also Jews and Germans).

2. Cap., economic and cultural centre of the above, at the S. Bug estuary. It is a major industrial centre with large shipyards, agric. engineering, and food and light industries. It is also one of the chief Black Sea ports. N. was founded in 1788

as a centre of shipbuilding and naval base on the Black Sea; it has been prov. cap. since 1802, a commercial port since 1862, and has had large scale industry since 1895. Pop. (1956) 206,000 (c. 1914, 120,000; 1923, 81,000; 1939, 167,000), Russians and Ukrainians.

Nikolayevsk-na-Amure, seaport in the Khabarovsk Krai of the Russian Far E., on the Amur near its mouth. It is the centre of an important fishing and gold-mining area, with a school of navigation (since the 1850's) and a teachers' training school for the peoples of the Russian Far E. It was founded in 1850 as a naval base and was cap. (until 1880) of the Russian Pacific ters. It was occupied by the Japanese, 1918-22. N. was cap. of the Lower Amur oblast within Khabarovsk Krai, 1934-56 (abolished). Pop. (1926) 7400 (c. 1914, 16,500).

Nikolsburg, see MIKULOV.

Nikol'sk-Ussuriyskiy, see VOROSHILOV.

Nikon (1605-81), Patriarch of Moscow, 1652-8, a Mordvin (see MORDVA) by origin. He introduced sev. reforms (correction of books used in church services, unification of the ritual, etc.) which were rejected by a part of the clergy and of the laymen (the Old Ritualists or Old Believers), thus causing the schism in the Russian Church. N.'s attempt to put the authority of the Church above that of the State led to a conflict with the tsar Alexis Mikhaylovich (q.v.). Defeated in this struggle N. was condemned by the Church council, 1666-7, attended by E. patriarchs, and confined to a monastery.

Nikopol', tn in the Dnepropetrovsk oblast of the Ukraine, on the Dnieper, 70 m. SW. of Dnepropetrovsk. It is a major centre of metallurgy and engineering, the centre of a rich manganese mining area, and a riv. port. It was founded in the 18th cent. on the site of the destroyed Zaporozh'ye Sich (see SICH); it became a tn in 1782. Pop. (1956) 84,000.

Nikopol (anct Nicopolis), tn of Bulgaria, in Pleven (q.v.) prov., on the r. b. of the Danube (q.v.), opposite Turnu-Măgurele in Rumania, 23 m. NE. of Pleven. Sigismund (q.v.) of Hungary was defeated here in 1396 by the Turks under Bajazet I (q.v.). The tn was burnt by the Russians in 1877. There is a riv. port and an agric. market. Pop. 6000.

Nile (from the Semitic *nihal*, a riv.), longest and most important river of Africa; its source is in the vast lake of Victoria Nyanza, which stands at an altitude of 3900 ft above sea level. None of the rivs. which flow into this lake is sufficiently large, in relation to the size of the lake, to be a source riv. The chief trib. is the Kagera, the length of which, from the source to Victoria Nyanza, is 530 m. The Nile leaves the Victoria Nyanza at its N. extremity, and flows in a NW. direction, passing through the Ibrahim and Kioga Lakes. The riv. leaves the central African highlands at Fauvera and turns westward, being known now as the Somerset Nile. Between Fauvera and the Albert Nyanza the riv. falls at least 1000 ft, with many cataracts, such as the

Murchison Falls (118 ft). After leaving this lake, and receiving as a trib. the Sem-like Nile from Albert Edward Nyanza, the riv. begins its northerly course and soon flows through the plains of the E. Sudan. It is now navigable, and is in character like a riv. of the lowlands, having a sinuous course. The main riv. is split up into sev. channels; at $7^{\circ} 30'$ N. the 2 main arms are the Bahr-el-Jebel and the Bahr-el-Seraf, which join again about $9^{\circ} 30'$. The Bahr-el-Ghazal here flows into the main stream, and deflects it for a short distance to the E., but when the Sobat joins it the course once more turns northwards. From Fashoda to Khartoum the riv. is known as the White Nile (Bahr-el-Abiad), and the name 'Nile' simply is given to it only after the junction with the Blue Nile (Bahr-el-Azrek), which joins it at Khartoum, flowing from the Abyssinian tablelands. The Atbara is the last trib., which joins the Nile at a point 200 m. below Khartoum, and is a large riv. in the rainy season, though greatly reduced in the dry. The Libyan and the Red Sea plateaus, which approach the riv. in succession, are the cause of its sinuous course in Nubia. Between 16° and 24° N. lat. there are 6 groups of cataracts, the largest being at Wadi Halfa. From the junction of the Atbara to the sea the Nile does not receive a single trib., the lower basin being hence very small in area, varying in width from 1 to 12 m., that is to say, the region over which the ann. inundations of the riv. extend. This region increases from less than 1 m. in Upper Egypt, and it is the extent of the inundation which determines the prosperity of the country during the ensuing season. N. of Cairo the delta of the Nile, which has a width of 120 m. and an area of 8500 sq. m., commences, with many canals, lakes, etc. The most important branches are the Dumietta and the Rosetta, each having a length of 146 m.

Irrigation was begun by Mohammed Ali; in 1842 he called in Mougel Bey, a Frenchman, who built the Cairo barrage. Water was conducted to the land by irrigation canals, but the control of the water robbed the land of silt, and its productivity decreased. Bey's barrage was used until 1883, when Brit. engineers rebuilt it, increasing the depth of water so that it travelled down the irrigation canals with increased velocity and carried the silt with it. The Aswân (Assuan) dam, which was begun in 1895 and finished in 1902, was heightened in 1912. From Dec. to Mar. the sluices are closed and the waters held until the maximum capacity of $2\frac{1}{2}$ milliards of cubic metres is reached. Before Mar. and July the

water is drawn off into the irrigation canals. S. of Aswân for 200 m. the riv. is one large reservoir. Above the Aswân dam is a barrage at Esna, made by placing suitable booms at an angle of 45° to the stream, and there is another barrage at

THE RIVER NILE

Assiut. Assiut dam gave new life to an irrigation system which was 3000 years old. A dam at Sennar, 170 m. S. of Khartoum, has been constructed to hold up the waters of the Blue Nile. It was finished in 1925, and is nearly 2 m. long. The Aswân reservoir holds 5,500,000,000 cubic metres of water, and the Gebel Aulia reservoir (completed in 1937)

2,000,000,000 cubic metres. New barrages have been constructed at the bifurcation of the Nile below Cairo to replace the existing structures which, having been built in 1861, were unable to meet the conditions following the increase in summer supplies, the reclamation of considerable waste lands, and the earlier watering of food crops. The Mahmudik Canal, which connects the Rosetta with the Alexandria Nile, is of great commercial importance. At high water there is continuous communication between Fort Berkeley and the sea, a distance of 2900 m., but in periods of low water the cataraacts impede the navigation. All the year round navigation is possible between Khartoum and Fort Berkeley (1090 m.), and also from the sea as far as Mansura (60 m.) on the Damietta, and as far as Kafr-el-Zayuh (70 m.) on the Rosetta branch. The ann. rise of the middle and lower Nile is due to the periodical rains of Ethiopia (q.v.) and equatorial Africa. The White Nile constitutes a more uniform source of supply, whilst the Blue Nile and the Atbara, when swollen by 3 months' rain, cause the inundating floods. A series of new projects has been formulated to bring the Nile under control so that every possible cubic foot of its water will be utilisable. The principle of the projects is 'century' or continuous storage, enabling the maximum supply in abundant years to be conserved for lean years. The first of the new projects is the Owen Falls (q.v.) dam on Lake Victoria, the object being not only to utilise to the greatest possible degree the waters of the White and Blue Niles and their tribs., but also to safeguard against flooding and its concomitant famine. At present much water goes to waste, for excess supply from years of plenty cannot be stored. Yet in low years all the water that can be stored from the flood still falls short of normal crop requirements. Even if its size permitted, excess water could not be stored in a reservoir like Aswân because of evaporation losses. Adequate storage is possible only in the great lakes of central Africa—Victoria, Albert, Kioga, and Tana. On these lakes evaporation and rainfall are nearly equal and, in fact, rainfall may exceed evaporation. In the great lakes a far greater vol. of water could be stored without much increase in surface area, and therefore in evaporation, an important consideration when a reservoir may be held at high levels for many years. The White Nile's capacity is, however, limited by the swamps of the Sudd, N. of Mongalla. In these swamps a high proportion of the flow is lost through evaporation and plant transpiration, so that out of 100 cub. ft. leaving Mongalla, only 62 reaches Aswân. It is therefore planned to cut a by-pass canal, the Jonglei diversion, round the swamps. Its size will depend on the discharge, and the velocity of the water must be sufficient to prevent the growth of weeds and papyrus. Lakes Victoria and Tana are to be the main reservoirs, Lakes Albert and Kioga being used as regulators. At present about 6,000,000 feddans (or ac.) are

irrigated in Egypt, and less than 500,000 in the Sudan. The new projects would supply enough water for 7,000,000 feddans in Egypt and 2,000,000 in the Sudan. The whole scheme may take 20 to 25 years, and it may be as long as 20 years more if there are a succession of bad years before the Victoria reservoir fills. The Nile has the longest basin of any riv., although the area of that basin (1,107,227 sq. m.) is surpassed by those of the Amazon and Mississippi; the length from the outlet at the Victoria Nyanza is 3473 m. Considering the great importance of the Nile to Egypt, it is not surprising that in ancient times it was deified, and it has always been regarded with the utmost reverence. Each year the Nile floods its banks and the height of the flood has been recorded annually since at least 3600 bc. It was not until the latter half of the 19th cent. that the question of the source of the Nile was finally settled, Sir J. H. Speke discovering the Victoria Nyanza in 1858; Bruce had in 1770 discovered the source of the Blue Nile.

See Sir S. W. Baker, *Nile Tributaries of Abyssinia*, 1880; Sir H. Johnston, *The Nile Quest*, 1903; W. E. Garstin, *Report upon the Basin of the Upper Nile*, 1904; H. G. Lyons, *Physiography of the Nile and its Basin*, 1906; J. H. Speke, *Discovery of the Source of the Nile*, 1908; Sir W. Willcocks and J. I. Craig, *Egyptian Irrigation*, 1913; A. Moret, *Le Nil et la civilisation égyptienne*, 1926; E. Ludwig, *The Nile* (Eng. trans., 1940); H. E. Hurst and R. P. Black, *The Nile Basin*, 1945; H. E. Hurst, *The Nile*, 1952.

Nile, Battle of the (1798), see ABOUKIR.

Nile, Blue, see BAHR-EL-AZREK.

Nile, White, see BAHR-EL-ABIAD.

Nile Province (now Northern Province), prov. of Uganda, comprising the dists. of Karamoja, Langro, Acholi, and W. Nile. The soil is fertile, and coffee, cotton, and indigo are grown; there are rubber and ebony trees.

Niles, city in NE. Ohio, U.S.A., on the Mahoning R., 8 m. NW. of Youngstown. The chief industries are the manuf. of iron and steel, railway cars, and chemicals. Pop. 16,800.

Nilgai, see NYLGHAU.

Nilgiri Hills (Blue Mts), plateau in India in Madras state, with a general elevation of 6500 ft. the highest peak being Doddabetta (8760 ft). The climate is healthy and invigorating and the whole area is popular as a hot weather resort. The prin. hill stations are Ootacamund, formerly the summer H.Q. of the Madras Gov., Coonoor, Kotagiri, and Wellington. The hills are inhabited by a curious, primitive race, the Todas, who live in bee-hive-shaped huts and devote themselves mostly to grazing buffaloes.

Nilo-Hamites, group of Negro peoples living in Kenya, Uganda, Tanganyika, and S. Sudan and speaking languages which show Hamitic influence on an original Negro base. Although dark in colour their features show a marked non-Negro element. They are divided into 3 divs.: the Northern N.-H. (Bari, Kakwa, Lokoya, Lotuko, etc., of Sudan), Central

N.-H. (Karamojong, Jie, Toposa, Didinga, Turkana, etc., of Uganda and Kenya), and S. N.-H. (Nandi, Suk, Kipsigis, Masai, etc., of Kenya and Tanganyika). Most of these tribes are cattle keepers, and none has kings or powerful chiefs, tribal organisation being based on clan and age-set systems, in which initiation by circumcision plays an important part. *See also* NEGROES; HAMITES; MASAI. *See* C. G. Seligman, *The Races of Africa*, 1939; G. W. B. Huntingford, *The Northern Nilo-Hamites and The Southern Nilo-Hamites*, 1953; P. and P. H. Gulliver, *The Central Nilo-Hamites*, 1953.

Nilometer is, as its name indicates, an arrangement for measuring the height of the Nile in Egypt. There were sev. such arrangements in antc times, as the height of the riv. was then, as now, the factor which determined the country's measure of prosperity for the year.

Nilotes, group of African Negro peoples speaking Nilotic languages and inhabiting the S. Sudan, parts of Uganda, and W. Kenya and the Nuer-Dinka (Nuer and divs.: the Shilluk-Luo (Shilluk, Luo, Burun, and Anuak of Sudan; Lango, Acholi, Alur of Uganda; and Luo of Kenya) and the Nuer-Dinka (Nuer and Dinka of Sudan). Physically they are tall and very dark skinned, and linguistically show signs of early Hamitic influence on a basic Negro stock. The Shilluk and Anuak have a Divine Kingship, most of the other tribes having a clan-based organisation without kings or powerful chiefs. The best known are Nuer and Shilluk. *See also* NEGROES; SHILLUK; NUER; DINKA; HAMITES. *See* A. Butt, *The Nilotes of the Anglo-Egyptian Sudan and Uganda*, 1952, and C. G. Seligman, *Pagan Tribes of the Nilotic Sudan*, 1932.

Nilotic Languages, *see* NEGRO-AFRICAN LANGUAGES.

Nilsson, Nils Martin Persson (1874-), Swedish archaeologist, educ. at Lund, Basel, and Berlin Univs. Lecturer in Greek (1900) and prof. of classical archaeology and antc hist. from 1910 to 1939 at Lund Univ.; he is now emeritus prof. there. N. has written many works on archaeology and antc Greece, including *A History of Greek Religion*, 1925, *The Minoan-Mycenaean Religion and its Survival in Greek Religion*, 1927, *Mycenaean Origin of Greek Mythology*, 1932, *Homer and Mycenae*, 1933, *Greek Popular Religion*, 1940, and *Greek Piety*, 1948.

Nimbura, *see* NYMBURK.

Nimbus, *see* CLOUD. For the meaning of the word in art *see* AUREOLE.

Nimeguen, *see* NIJMEGEN.

Nimes (formerly Nismes, antc Nemausus), Fr. tn, cap. of the dept of Gard. Founded by Augustus (q.v.), it became one of the finest cities of the Rom. Empire, but was ruined in the barbarian invasions. It was the scene of much strife during the religious wars of the 16th and 17th cents., and its growing industrial prosperity suffered from the revocation of the Edict of Nantes (q.v.). It is celebrated for its Rom. remains, chief among which are the amphitheatre (converted into a fortress in the Middle Ages); the Maison C rée, a

temple in the style of the Parthenon; the temple of Diana; the Tour Magne, still 92 ft high; 2 Rom. gates and the aqueduct of the Pont du Gard (q.v.). It is the seat of a bishopric. Nicot, Guizot, and A. Daudet (qq.v.) were b. here. Silks, carpets, footwear, brandy, and machinery are manuf., and there is a trade in wines, grain, groceries, and colonial produce. Pop. 89,150. *See* E. Espérandieu, *Le Pont du Gard et l'aqueduc de Nîmes*, 1926, and *La Maison Carrée à Nîmes*, 1929.

Nimitz, Chester William (1885-), Amer. admiral, b. Fredericksburg, Texas, U.S.A., son of Chester Bernhard N. Graduating from the U.S. Naval Academy, 1905, he became ensign in the U.S. Navy in 1907. Having sev. years' experience as a submarine officer before the First World War, N. was lieutenant-commander of the Atlantic submarine flotilla, 1916, and, in 1918, chief of staff to the commander of the Atlantic fleet's submarine force. From 1933 to 1935 he was commanding officer of the U.S.S. *Augusta*. Promoted to rear-admiral in June 1938, he was chief of the bureau of navigation in the Navy Dept, 1939-41. On 17 Dec. 1941, following the Jap. attack on Pearl Harbour, the naval high command was overhauled and N. became commander-in-chief of the Pacific fleet, with the rank of admiral. N. then reorganised his fighting groups and strategy, selecting as leaders Halsey, Mitscher, Kincaid, Spruance, and Turner. He was responsible for the reconquest of the Solomon Is. in 1942-3, of the Gilbert Is. in 1943, and of the Marianas and Marshalls in 1944. With the withdrawal of the Jap. fleet to the inner seas there was a regrouping of the Amer. naval forces in the Pacific. Gen. MacArthur was given the Seventh Fleet as part of his command; Adm. Halsey was assigned to the Central Pacific as commander of the Third Fleet, which, with the Fifth Fleet under Adm. Spruance, was put under the supreme direction of Adm. N. MacArthur invaded Leyte, aided by immense naval forces sent to his support by N. N. directed the initial stages of the invasion of Okinawa (1945). (*See* PACIFIC CAMPAIGNS, or FAR EASTERN FRONT, in SECOND WORLD WAR.) In Dec. 1945 he was promoted to the 5-star rank of fleet admiral of the U.S. Navy. N. was chief of naval operations from 1945 to 1947; special assistant to the secretary of navy from 1947; named chairman of the Presidential Committee on Internal Security and Individual Rights. In common with most distinguished naval officers N. is opposed to the merger of the armed services. In Mar. 1949 he was appointed by the U.N. as administrator for the plebiscite in Jammu and Kashmir (q.v.) in conformity with the terms of the last interim report of the U.N. Commission for India and Pakistan.

Nimonic, *see* NICKEL.

Nimonic Alloys, nickel base alloys containing 20 per cent chromium and hardened with small additions of aluminium, titanium, and iron. Sometimes part of the nickel is replaced by 18 per cent cobalt. As these alloys are strong at high temps. and resist oxidation they are used

extensively in the manuf. of jet and gas turbine engines. See ALLOY.

Nimrod (Gen. x. 8-11; 1 Chron. i. 10; Micah v. 10), son of Cush, i.e. perhaps the Kassites, who conquered Babylonia (the land of Shinar) in the second millennium BC. Nothing is known of this legendary figure, though his name survives (probably under scriptural influence) attached to one of the 4 cities he is said to have founded in Assyria, viz. Calah on the Tigris (24 m. S. of Nineveh) which is now called Nimrud, and in Birs Nimrud, near Babylon. He is

an earlier vil. site by Shalmaneser I c. 1200 BC; rebuilt by Ashurnasirpal II in 879 BC; fl. until c. 640 BC, and was destroyed by the Medes in 612 BC. Xenophon called Nimrud Larissa. Fine collections of bronzes of the period of Sargon II, and Phoenician ivories found by Loftus, have been supplemented by the recent excavations of the Brit. School of Archaeology in Iraq (under Mallowan) which in 1949-58 found additional palaces, inscriptions, and large ivories. See also ASSYRIA. See A. H. Layard, *Nineveh and its Remains*,

British Museum

LION HUNT: RELIEF FROM ASHURBANIPAL'S PALACE AT NINEVEH

said to have been a 'mighty hunter before the Lord.' The meaning of the latter phrase is disputed. It may mean 'in heaven,' which would make N. a deified figure, like Orion with a constellation named after him. He has been identified with Ninurta, the god of war (who in turn has been identified (1) with Gilgamesh (q.v.), solar hero of a great epic, who was a deified king of the first dynasty of Erech, or (2) with Lugabanda). Modern scholars equate N. with Marduk (q.v.).

Nimrod, see APPERLEY, CHARLES JAMES. **Nimrud**, the biblical Calah, anct Assyrian military cap. Kalkhu. The citadel by the R. Tigris 24 m. S. of Mosul, Iraq, was excavated after 1847 by Layard, Rassam, and Rawlinson. Prin. discoveries were the sculptured reliefs of human-headed winged bulls now in the Brit. Museum. The city was founded on

1849, and M. E. L. Mallowan, *Twenty-five Years of Mesopotamian Discovery*, 1956.

Nimwegen, see NIMEGEN.

Nine-power Agreement, treaty made in 1923 between Great Britain, the U.S.A., France, Belgium, Italy, Holland, Portugal, China, and Japan, to guarantee the sovereign independence and territorial and administrative integrity of China. Japan violated the treaty in 1931 by occupying Manchuria and by starting a large-scale war in China in 1937. In that year the treaty was invoked and a conference of the signatories was held at Brussels (Nov.), but to no purpose.

Nineteen Thirty-nine-Forty-five Star, see STAR (decoration).

Nineveh, a cap. of anct Assyria. According to all accounts it was a city of size, strength, and magnificence. The anct city is represented by 2 large mounds

known as Kuyunjik and Nebi Yunus ('Prophet Jonah': the site of the reputed tomb of the prophet Jonah), situated on the E. bank of the Tigris, opposite the modern city of Mosul. In the Neolithic period a small vil. existed there. During the first 3 cents. of the Assyrian Empire, N. was a poor place. Sharrukin (or Sargon) II (721-705 BC) had made his cap. successively at Ashur, Calah, and N., and then finally at Dur-Sharrukin or Khorsabad. The real founder of the great N. was Sargon II's son and successor, Sennacherib (705-681 BC). He planned the fortifications of this city, restored its temples, built its most magnificent palaces, and gave it a system of water works: he conducted water from the hills by 18 canals, and distributed it round the moats into the ponds and tanks within the city. It is computed that his great palace contained not less than 10,000 ft of walls lined with sculptured slabs. Ashurbanipal's reign (669-c. 633 BC) was the 'golden age' of Assyria and of N. His important work was the estab. of the great royal library at N. In the temple of Nabu at N. one library had already been in existence at least since Sargon II, but Ashurbanipal's library was to surpass all others in size and importance. He sent to all the old temples of Babylonia and had copies made of their mythological epics, hymns, and incantations. About 25,000 clay tablets were collected, containing chronicles, medical and other scientific literature, dictionaries, religious literature, official dispatches, and archives, business documents, and letters. They form the basis of our knowledge of the Assyrian and Babylonian language, literature, and hist. With the death of Ashurbanipal, the Assyrian period and that of N. had really closed. The kingdom and N. continued for 20 years more, but they were the years of a lingering death.

The story of N.'s fall is told by a Babylonian clay tablet preserved in the Brit. Museum: N. fell in 612 BC, the fourteenth year of the Babylonian king Nabopolassar (625-605 BC), who was joined in the destruction of this city by Cyaxares the Mede and the Scythians. The destruction of N. was predicted by the prophet Zephaniah (ii. 13-15), and in the book of Nahum (iii. 1-3) we have an ecstatic expression of delight at the prospect of ruin overtaking the hated city ('bloody throughout'). N. in its prime was, no doubt, a city of great magnificence. It was constructed of brick and enamelled tile, or of stone brought from nearby quarries. It was surrounded by brick walls 9 m. in length. Winged bulls and lions with human heads, and sculptured sphinxes with wings, guarded the gates of the royal palace, while its numerous rooms were decorated with bas-reliefs, mouldings, and carvings, giving evidence of no little artistic skill. Many reliefs and inscriptions are preserved in the Brit. Museum.

Research. Early in the 19th cent., Claude James Rich, resident of the E. India Co. at Bagdad, visited the mound Kuyunjik (and others), where he made slight excavations. In Dec. 1842 Paul

Émile Botta (of It. parentage), a Fr. vice-consul at Mosul, began digging on the site of N., but he worked there only for 3 months. He was followed by Victor Place. The excavations begun by a young Englishman of Huguenot descent, Austen Henry Layard, in 1845 at Nimrud (the biblical Calah) and Kuyunjik constitute the next great landmark in the hist. of modern archaeology. In 1847 Layard discovered at N. the palace of Sennacherib, which was largely unearthed from 1849 to 1851. In 1852 Hormuzd Rassam (who had been one of Layard's helpers) continued the excavation of N. under the direction of Sir Henry C. Rawlinson, the Brit. consul-general at Bagdad. Rassam, who worked until 1854, had the good fortune to find Ashurbanipal's palace and his great library. In Dec. 1872 George Smith, of the Brit. Museum, announced that among the tablets from N. he had found an account of the flood which closely resembled that in the Bible. This aroused so much interest that the *Daily Telegraph* commissioned Smith to undertake further explorations. George Smith worked at N. in 1873 and 1874. Between 1876 and 1933 there were 7 further expeditions to N. on behalf of the Brit. Museum. Finally, also on behalf of the Brit. Museum, in 1931-2 M. E. L. Mallowan (now prof. at the Institute of Archaeology, Univ. of London) excavated the first prehistoric settlement at N., underlying the Assyrian levels. See A. H. Layard, *Discoveries in the Ruins of Nineveh and Babylon*, 1853; S. Smith, *Early History of Assyria*, 1927; R. C. Thompson and R. W. Hutchinson, *A Century of Exploration at Nineveh*, 1929; *Nineveh and the Old Testament* (trans.), 1956; D. J. Wiseman, *Chronicles of Chaldean Kings*, 1956.

Ninghsia, formerly a prov. of Inner Mongolia, China, now merged with the prov. of Kansu.

Ningpo (or **Yin hsien**, city of the calm waves), a former treaty port and an important trading city of Chekiang prov., China, on N. Riv., 16 m. from its mouth opposite Chusan, and 95 m. from Hangchow. Manufs. include silks and other fabrics, gold, silver, and lacquered wares, carved wood, furniture, carpets, and confections. Tea, raw cotton, drugs, and straw goods are among the exports. Bamboos and rice are grown. There are salt works and fisheries near by. The ruined Pagoda (T'ien-feng-t'a) and the old Drum Tower are interesting buildings. N. contains numerous temples (e.g. that of 'the Queen of Heaven'), monasteries, schools, and clubs, and a fine library founded in the 16th cent. There was a Portuguese settlement from 1522 to 1545. A Brit. occupation took place in 1841-2, and in the latter year the port was opened to foreign trade by the treaty of Nanking. It serves as a distributing station for Shanghai. Pop. estimated (1949) 218,800.

Ningyuan, see KULJA.

Ninian, St (d. 432?), missionary preacher, probably from Strathclyde. He went to Rome and was ordained bishop of the S. Picts by Pope Siricius in 394. He founded the church of Candida Casa, or

Whithorn, in Wigtownshire, and dedicated it to St Martin of Tours. According to Bede, he preached Christianity to the Picts of all S. Scotland as far N. as the Grampians. His feast is on 16 Sept. See Bede, *Historia Ecclesiastica* and Ailred of Rievaulx, *Life of St Ninian*.

Ninon de l'Enclos, see L'ENCLOS.

Ninove, tn in the prov. of E. Flanders, Belgium, 14 m. W. of Brussels, on the R. Dender. There is a fortified city gate of the 18th cent. It has manufs. of safety matches, cotton goods, linen, lace, silk, gloves, and shoes. Pop. 11,700.

Ninus, see SEMIRAMIS.

Niobium (or Columbium, Cb), symbol Nb; atomic number 41; atomic weight 82.91. Discovered by Hatchett, 1801. A metallic chemical element, it is usually associated with tantalum, and occurs in the minerals tantalite, columbite, and fergusonite. The metal is obtained by reducing the chloride with hydrogen in a red-hot iron tube, or by reducing the oxide with carbon in the electric furnace. It is a steel-grey metal of sp. gr. 8.56, burns on heating in air, and is soluble in warm concentrated sulphuric acid. Its resistance to corrosion makes it suitable for the manuf. of chemical apparatus and it improves stainless steel. N. carbide is very hard and thus used for cutting-tools.

Niort, Fr. tn, cap. of the dept of Deux-Sèvres, on the Sèvre Niortaise. It has sev. fine churches and a massive keep. Mme de Maintenon and Fontanes (q.v.) were b. here. Footwear, gloves, and brushes are manuf. N. is known for its angelica. Pop. 32,800.

Nipigon, Lake, sixth largest of Ontario's immense number of lakes, has an area of 1750 sq. m. and 800 m. of shore line, and lies 35 m. N. of Lake Superior, in a forest reserve of over 7000 sq. m. It is 70 m. long and 50 m. wide, is exceedingly deep, and contains over 1000 is. The R. Nipigon drains the lake, and is the largest which flows into Lake Superior. The lake is notable for the grandeur of its scenery and its wild primitive surroundings.

Nipissing, Lake, lake of Ontario, Canada, about half way between Huron Lake and the Ottawa R. It is 50 m. long, 20 m. broad, and contains numerous is. The Sturgeon R. enters it on the N., and the outflow to Georgian Bay, Lake Huron, is by the French R.

Nippon, Nihon, Nippon, or Dai Nippon, native name for the whole of the Jap. Empire. It is used particularly of Honshu, the prin. is. of Japan.

Nippur, modern Niffer or Nuffar, ant. city of Sumer and Babylonia, c. 100 m. SE. of Bagdad. It was the seat of the god Enlil (q.v.), continuously occupied from Neolithic to Parthian times. The Amer. excavations (1889-1900; 1951-) are particularly notable for the many Sumerian literary texts discovered. See Seton Lloyd, *Foundations in the Dust*, 1956.

Niquiran. Some scholars still use this term (while others prefer the term *Nicarao*, an abbreviation from 'Nicaragua') for the important language, now extinct, which was spoken, at the time of

the Sp. conquest in the 16th cent., by the native pop. of the ter. lying between the Pacific Ocean and the Lake Nicaragua, and on the is. of this lake.

Unlike Mangue or Chorotega (which is an Ottomi-Mangue dialect), the prin. native language of Nicaragua still in existence, N., or Nahuatl, belongs to the Nahuatl linguistic family, being thus closely related to Aztec of Mexico, Pipil of Salvador, Guatemala, and Honduras, Tlascaltec of Salvador, and the extinct Sigua of Costa Rica and Cazan, which was spoken on the Rio Grande di Santiago. The Nahuatl group is a subdiv. of the Uto-Aztecan group of languages. The other two subdivs. are Piman or Sonoran, and Shoshonean. According to Sp. sources, the N. possessed codices written in pictographic script, but none has been preserved.

Nirvana, highest state of spiritual enlightenment attained by Buddha. It is the transitive moment when a Buddhist passes from his earthly life to the state of budhissattvaship. Existence is a continual passage from one state into the next, man's earthly life being but one episode. This 'round' of existence is but a veil over reality. If ignorance, desires, and all other 'poisons' can be removed, the individual is delivered from his fictitious individuality, and from the 'round.' This is the state of N., and is completely discontinuous from the 'round.' N. cannot be defined, since the terms used by man bear no relation to it. See BUDDHA AND BUDDHISM.

Niš (anc. Nalissus), tn in Serbia, Yugoslavia, on the Nisava. It was the bp. and the summer residence of Constantine the Great (see CONSTANTINUS I.). The tn was destroyed by the Huns in the 5th cent., and was rebuilt by Justinian the Great (see JUSTINIANUS, FLAVIUS ANICIUS). In 1914-15 it was the seat of the Serbian Gov. During the Second World War it was severely damaged, but has been reconstructed. An important road and rail junction, N. has railway workshops, chemical manufs., and a large trade in agric. produce. Pop. 60,700.

Nisan, see ABB.

Nishapur, dist. and tn of Khorasan, Persia, 44 m. E. of Mashhad. Omar Khayyám (q.v.) was b. and buried here. There is trade in almonds and fruits. Pop. of tn 25,800; of tn and dist. 181,700.

Nisi, Decree, see DIVORCE.

Nisi Prius (literally 'unless before'). When the judges sit at the assizes to try civil actions they are still said to be 'sitting at N. P.' though the words N. P. have lost their original significance. N. P. denotes no more at the present day than the commission by virtue of which judges are empowered to try civil causes at assizes. The words N. P. originated in the writ of *venire facias* (a writ addressed to the sheriff of a co. where a particular action was to be tried calling upon him to secure a jury) as altered in form by the Statute of Westminster II to square with a prevalent practice by which inconvenience to jurors was avoided. Prior to this alteration, if jurors were summoned

from any part of England whatsoever, they were bound at least in theory to come up to Westminster (where the king's courts then were) and wait about until the case in which they were summoned came on. The result was that the inconvenience was partially mitigated by the practice of attorneys allowing the action to be pending in Westminster from term to term until such time as the justices were about to go on circuit to the particular co. whence the jurors had been drawn, and then transferring the case to those justices as soon as it was certain they were coming. The Statute of Westminster II provided that the writ of *venire* should contain words to the effect that the sheriff should command the jurors to come to Westminster on such a day in such or such a term, *N. P.* (unless before) that day the justices appointed to take assizes should come into the co. in which the cause of action lay. See also ASSIZE.

Nisibis, anc. city, about 130 m. NW. of Mosul (N. Iraq). The cap. of an Assyrian dist. (Nisibina), caravan centre and fortress, it was of considerable importance in the wars between Rome and the Parthians. Nisibis was the Macedonian *Antiochia Mydonia* and finally fell to the Persians in AD 363. With the decline of the Aleppo-Mosul trade route, modern Nusaybin is but a small, mainly Armenian, tn.

Nismes, see NÎMES.

Nissa, see CAITANISSETTA.

Niterói, cap. of Rio de Janeiro state, SE. Brazil, standing on the opposite shore of the harbour to Rio, with which it is connected by ferries. It is associated with the Indian chief, known as Martin Afonso, who assisted the early Portuguese colonisers. It has fine prov. gov. buildings and handsome private houses. Many Brit. and Amer. families live here. When the port installations are completed N. will become a port of call for transatlantic shipping. Pop. 174,500.

Nith, Scottish riv., rising about 8 m. S. of Cunnock, Ayrshire, which flows SE. for some 70 m. through Nithsdale to enter the Solway Firth 8 m. S. of Dumfries.

Nithsdale, William Maxwell, 5th Earl of (1676-1744), Scottish Jacobite. He joined the rising of 1715. He was captured after the battle of Preston, imprisoned in the Tower, and condemned to death. His wife devised a plot and secured his escape, disguised as a woman. He fled to Rome and joined the Elder Pretender. His lands were later restored to his son, though the title remained forfeit. The story of his flight was written by the Countess of N., and pub. in the *Transactions of the Society of Antiquaries of Scotland*.

Niton, see RADON.

Nitra: 1. Region (*kraj*) in Southern Czechoslovakia, bordering on Hungary, part of the former prov. of Slovakia (q.v.). It is generally low-lying, and is watered by the Dunaj (see DANUBE) and its tribs., the Váh (q.v.) and the N. Area 3077 sq. m. Pop. 690,000.

2. (Ger. *Neutra*) Czechoslovak tn, cap. of the region of N., on the N. Riv. It is

the seat of a bishop, has a trade in agric. produce, and has some manufs. Pop. 18,000.

3. Riv. of Czechoslovakia, which rises in the Carpathians (q.v.) and flows S. through the region of N. to join the Dunaj at Komárno (q.v.). Length 120 m.

Nitrates, see NITROGEN.

Nitre, or **Saltpetre**, potassium nitrate (KNO_3); Chile saltpetre is sodium nitrate (NaNO_3). It is found on the ground and impregnating the upper soil in India and Persia; sodium nitrate is found in Chile and Peru. The soil is lixiviated and the pure salt obtained by crystallisation. Potassium nitrate is used in the manuf. of gunpowder, sulphuric acid, and nitric acid, and in medicine as a diuretic and diaphoretic. Sodium nitrate is used for the manuf. of potassium nitrate, and is an important fertiliser. N. when heated evolves oxygen and is converted into potassium nitrite.

Nitrian Desert, see NATRON.

Nitric Acid and Oxide, see NITROGEN.

Nitriding (Nitrogen Case Hardening), method of producing a very hard surface skin on steels by heating in ammonia at 500° C. for periods up to 96 hrs. A surface skin of nitride is formed on all steels by this treatment, but in most cases the skin is brittle. But with special 'nitralloy' steels, containing 1.4-1.7 per cent of chromium and 0.9-1.2 per cent of aluminium, the skin becomes intensely hard and firmly adherent. It resists wear and corrosion, and is used for surface hardening of gauges, spanners, gears, etc.; but it is not suitable for resisting severe localised pressure. The nitralloy steels possess mechanical properties comparable with those of a high tensile steel.

Nitrification, see NITROGEN CYCLE.

Nitriles, esters of hydrogen cyanide or prussic acid. They form a series which may be prepared by heating the alkyl halogen compounds with potassium cyanide. The lower members, as methyl cyanide, or acetonitrile (CH_3CN), and ethyl cyanide, or propionitrile ($\text{C}_2\text{H}_5\text{CN}$), are colourless liquids with a somewhat pleasant odour, and are miscible with water. The higher members are insoluble. The N. have corresponding isomers known as isonitriles, carbylamines, or isocyanides. They are poisonous colourless liquids of disagreeable odour. The aromatic N., e.g. $\text{C}_6\text{H}_5\text{CN}$, are also of importance. All N. on hydrolysis with caustic potash yield the potassium salt of the corresponding acid, e.g. $\text{CH}_3\text{CN} + \text{KOH} + \text{H}_2\text{O} = \text{CH}_3\text{COOK} + \text{NH}_3$.

Nitrites, see NITROGEN, Compounds.

Nitrobenzene ($\text{C}_6\text{H}_5\text{NO}_2$), nitrated derivative of benzene. It is usually prepared by slowly adding to 10 parts of benzene a mixture of 12 parts of nitric acid of sp. gr. 1.45 and 16 parts of concentrated sulphuric acid at a temp. under 40° C. The vessel should be kept moving so as to keep the various constituents in contact, and when all the acid has been added, the mixture is heated to about 80° for half an hour, and then cooled. The N. collects at the top of the vessel, and after separation and washing with water, when it forms the

lower layer, it is dried over calcium chloride and distilled. N. is a pale yellow oil with a strong smell of bitter almonds. It has a sp. gr. of 1.2 at 20°, and boils at 205°; it is very slightly soluble in water. It is used for the manuf. of aniline and benzidine, and for flavouring and perfuming purposes under the name of 'oil of mirbane,' in spite of its poisonous nature. (1 : 3) metadinitrobenzene is a solid, obtained by using a higher temp. for the nitration. Other N.s are ortho-dinitro (1 : 2), para-dinitro (1 : 4), and trinitro (1 : 3 : 5), which is an explosive.

Nitro-cellulose, see CELLULOID; GUN-COTTON; PYROXYLIN.

Nitro-compounds, or **Nitro-derivatives**, those compounds which contain the

compound radicle $\begin{array}{c} \text{O} \\ \diagup \text{N} \diagdown \\ \text{O} \end{array}$ (as opposed

to the grouping $-\text{O}-\text{N}=\text{O}$ in the nitrites) directly attached to a carbon atom. When an aromatic compound such as benzene is treated with nitric acid of sp. gr. 1.3 to 1.5 at ordinary temps., a mononitro-compound is usually produced; and, generally speaking, the more concentrated the acid and the higher the temp. employed, the larger will be the number of NO_2 groups introduced into the molecule. The product is in such cases a mixture of dinitro and trinitro derivatives. The concentration of the acid is usually effected by mixing the nitric with a larger proportion of concentrated sulphuric acid, which effectively absorbs the water produced in the reaction, and maintains the nitric acid in a concentrated condition. The N. are for the most part yellow, stable, crystalline substances, only slightly soluble in water, but readily soluble in alcohol, ether, etc. The higher N. such as picric acid and T.N.T. can be detonated and form widely used high explosives. With various reducing agents, as tin, with hydrochloric acid, N. are converted to amino-compounds, thus nitrobenzene ($\text{C}_6\text{H}_5\text{NO}_2$) is converted into aminobenzene or aniline ($\text{C}_6\text{H}_5\text{NH}_2$). The N. of the aliphatic bodies are obtained by the action of silver nitrite on an alkyl halide, and by the action of nitric acid on the hydrocarbon, both reagents being in the vapour phase.

Nitrogen, non-metallic chemical element, symbol N, atomic number 7, atomic weight 14.008 (Fr. *azote*, without life). At ordinary temps. it is a gas, and occurs in an uncombined state in the atmosphere, forming approximately 78.1 per cent of air by volume. It also occurs combined with other elements in animal and vegetable substances; in various minerals as ammonium salts; in the form of nitrates in Chile saltpetre and other deposits found in the soil. The gas is colourless, tasteless, and odourless; it is slightly soluble in water, to a less degree than oxygen; it is slightly lighter than air. Liquid N. boils at -194°C . and solidifies to a white body at -214°C . N. was discovered as a constituent of the atmosphere by Daniel Rutherford in 1772. It was recognised as an extremely inert gas, and

all attempts to bring about direct combination with other substances for a time failed. In 1785 Cavendish showed that N. combined with oxygen in the neighbourhood of an electric spark discharge. This method was used by later investigators, and in 1894 Lord Rayleigh demonstrated the presence of argon in the atmosphere by causing all the N. in a sample to be combined in this way. In 1892 Sir Wm Crookes showed that the electric arc caused the formation of a N. and oxygen compound. This has been put to commercial use.

The artificial production of N. compounds derives its importance from the part played by N. in vegetable life. N. does not constitute a large proportion of the elements contained in vegetable matter; but it is a very essential constituent, and, as far as is known, most plants are unable to utilise the N. of the atmosphere directly. The N. used in building up the tissues of plants is contained in the soil in the form of nitrates, ammonium compounds, etc. These nitrates may owe their existence, in part, to the activities of certain micro-organisms which have the power of causing the combination of atmospheric N. Under ordinary circumstances cultivated land uses up the nitrates thus formed more rapidly than they can be replaced, so that the N. supply has been a problem to the agric. world. Experiments have been successfully made in the direction of cultivating bacteria of peculiar effectiveness as regards production of nitrogenous compounds, but the usual method is to dress the soil with manures consisting largely of nitrogenous material. The main source of nitrogenous manure was for long the natural deposits found in vast quantity in parts of N. and S. America, particularly Chile and Peru. The continued exportation of these nitrates gave rise to the apprehension that they would quickly become exhausted, and Sir Wm Crookes predicted that this would happen in about 100 years. It therefore became of supreme importance that some technical method should be worked out for the solution of the problem. In war-time it is of obvious significance that a country must be capable of producing sufficient supplies of N. compounds such as nitric acid, if it is to be independent of outside help. Indeed it is often said that the Germans did not declare war in 1914 until they had perfected their method of making N. compounds from the air (see NITROGEN, FIXATION OF). Whatever the truth of the matter, Germany was in a position to be independent of outside supplies of nitrates when that war commenced.

N. is usually obtained from the atmosphere by removing the oxygen. This may be done by passing a current of air over copper heated to redness, by burning phosphorus in a confined volume of air, or by the action of an alkaline solution of pyrogallol on air. It may also be prepared by passing a current of chlorine through excess of ammonium hydroxide, or by heating ammonium nitrite or a mixture of ammonium chloride and

sodium nitrite. But perhaps one of the soundest methods is by the fractional distillation of liquid air. The gas obtained by removing the oxygen from atmospheric air contains argon and small quantities of other gases besides N. All of these gases are so inert chemically that they can only be separated with difficulty. Chemically N. is inert, on the whole, but it will combine with many metals on heating to form nitrides. In 1911 Strutt demonstrated that an electric discharge from Leyden jars acted upon a low pressure current of N. in such a way as to produce a continuance of the glow after the gas had passed the region of the discharge. The 'active N.' produced in the change is capable of bringing about various changes which ordinary N. cannot do. It combines with nitric oxide to form N. peroxide, with mercury to give a nitride, and it possibly consists of single atoms. All attempts to liquefy it have failed. This luminous gas also converts ordinary phosphorus into red phosphorus, while sodium and mercury combine with the gas when heated within it.

Compounds. N. forms with oxygen 5 oxides: nitrous oxide (N_2O), nitric oxide (NO), N. trioxide (N_2O_3), N. dioxide (NO_2), and N. pentoxide (N_2O_5). Nitrous oxide (N_2O), or 'laughing gas,' is prepared by heating ammonium nitrate. The oxide is a colourless gas with a pleasant odour and taste. It condenses at $15^\circ C$. under a pressure of 50 atmospheres. It is soluble in water, is easily decomposed by heat, and resembles oxygen in supporting combustion, but it can be distinguished from the latter gas by mixing it with nitric oxide, when no brown N. dioxide is formed. It has marked anaesthetic properties, and is used in dental practice to a great extent. There is a corresponding oxyacid, Hyponitrous acid ($H_2N_2O_2$), forming salts called hyponitrites, of which the silver salt is most usually prepared. Nitric oxide (NO) is prepared by the action of dilute nitric acid on copper, or by the action of sulphuric acid on a mixture of potassium nitrate and ferrous sulphate. It is a colourless gas which readily combines on admixture with oxygen, forming reddish-brown fumes of N. dioxide. It is only sparingly soluble in water. It can be converted into a liquid boiling at $-153.6^\circ C$. and into a solid which melts at $-164^\circ C$. The gas combines with ferrous sulphate to form an addition product which is easily decomposed by heat. This is the basis of a common test for a nitrate. Thus if a nitrate is dissolved in water and a crystal of ferrous sulphate is added and shaken up until dissolution takes place, then on tilting the tube and gradually pouring in strong sulphuric acid, a brown ring appears at the junction of the 2 liquids. N. trioxide (N_2O_3) is prepared by decomposing a nitrite with sulphuric acid in the cold. It is a very unstable compound, and the gaseous form is probably a mixture of nitric oxide and N. tetroxide. At low temps. it condenses to a blue liquid. It is the anhydride of nitrous acid, which is also an unstable

body, readily decomposing into nitric acid and nitric oxide. Nitrous acid forms salts called nitrites, which are all soluble in water, and give off reddish fumes when heated with a warm mineral acid. N. dioxide, or tetroxide (N_2O_4), is formed by the direct combination of nitric oxide with oxygen, and the condensation of the reddish-brown fumes. The liquid is colourless at low temps., but darkens in colour as the temp. rises. The behaviour of this body furnishes a good example of dissociation, a reversible thermal change, $N_2O_4 \rightleftharpoons 2NO_2$, mixtures of the two being known as N. peroxide. Bodies which burn with sufficiently high temps. to decompose the gas will continue to burn in it. Water dissolves N. peroxide with the production of nitrous and nitric acids at low temps., and of nitric acid and nitric oxide at high temps. N. pentoxide (N_2O_5) is a white crystalline solid obtained by the action of phosphorus pentoxide on nitric acid at a low temp. At $30^\circ C$. the crystals melt to form a yellowish liquid which tends to decompose at higher temps. N. pentoxide is very readily soluble in water, forming nitric acid, which forms salts called nitrates. Nitric acid is a colourless, fuming liquid with a powerful oxidising action. It readily chars dry organic matter and attacks metals, forming the nitrates or the oxides. The nitrates are all soluble in water and decompose at high temps. N. forms with hydrogen the compound ammonia (NH_3) (q.v.), which was at one time supposed to be the oxide of a metal ammonium. No such metal exists, however, and the ammonium salts are derived from a radicle (NH_4), which behaves chemically in much the same way as the alkaline metals: sodium potassium, etc. Hydrazine N_2H_4 is another compound, as is N_2H hydrazoic acid. N. trichloride (NCl_3) is obtained by the action of chlorine on ammonium chloride. It is a volatile yellow oil, irritating to the mucous membrane, and is very explosive. Nitrosyl chloride (NOCl) is obtained by the combination of nitric acid and chlorine. It is an orange-coloured gas which is readily liquefied. N. sulphide (N_2S_4) is obtained by the action of ammonia on sulphur chloride. It is an orange-coloured crystalline solid, melting at $178^\circ C$. See also CYANAMIDE.

Nitrogen, Fixation of. Any process whereby elementary N. is converted into useful N.-containing compounds, particularly those connected with artificial manures, explosives, nitric acid, and ammonia.

(1) Under the action of an electrical discharge, N. and oxygen in air combine to a small extent.

$N_2 + O_2 \rightleftharpoons 2NO - 43,000 \text{ gm.-calories.}$
Technical methods utilise this reaction.

In the Birkeland-Eyde process (formerly used in countries where electricity is cheap, e.g. Norway), an electric arc passing between water-cooled copper electrodes (alternating current at 5000 volts pressure) is spread out into a circular sheet of flame by the action of a strong magnetic field. Air is forced into the furnace containing

the electrodes and leaves at a temp. of about 1000° C., after which it is cooled quickly, passes into chambers where the oxidation $2\text{NO} + \text{O}_2 = 2\text{NO}_2$ (about 1-1.5 per cent of air converted) goes on, and thence to granite towers packed with quartz, down which water trickles.

The nitric acid produced is either kept as such, or converted into calcium nitrate. The remaining nitric oxide is largely absorbed in towers containing alkali, but some is lost. In the Pauling process

I.C.I.

FIXATION OF NITROGEN: COMPRESSION PLANT OF THE BILLINGHAM AMMONIA SYNTHESIS PROCESS

The compressors shown are of the reciprocating type: those at the right raise the pressure of the gases used for ammonia production to 50 atmospheres, and those on the left complete the compression stage by further raising the gas to 250 atmospheres.

(Italy and Austria) the hollow, water-cooled electrodes are inclined at right angles, and the sheet of flame spreads up between them, whilst the Schönherr process utilises a long arc along which the air streams with a whirling motion. All these methods are now obsolete, having been replaced by (2).

(2) *Ammonia production.* In the Badische process steam and air are passed over hot coke, and the resulting gases subjected to a catalytic process, whereby carbon monoxide is converted into carbon dioxide. The mixture is compressed in stages to 200 atmospheres (the Claude process uses 1000 atmospheres), and

carbon dioxide removed by water, traces of carbon monoxide and poisons being removed later. The pure gas (a mixture of N. and hydrogen 1 : 3 by volume) is led into steel converters containing catalysts (e.g. iron) and promoters (e.g. molybdenum) at a temp. of nearly 600° C., when the change goes on

about 8 per cent. The ammonia in the issuing gas is washed and removed, or converted into ammonium sulphate by the action of carbon dioxide and anhydrite suspension. Many details are kept secret. Sometimes electrolytic hydrogen is used.

(3) *Formation of nitrides, etc.* Serpek's process, now obsolete, utilised the action between alumina and coal heated in a current of N. 1800-1900° C.

with catalysts like copper. Rotating cylinders are employed for the mixing. With water the nitride forms ammonia. *Calcium cyanamide* (CaCN_2). Calcium carbide (q.v.) made on the spot is finely pulverised, mixed with lime and heated in steel cylinders electrically to 1000° C., when pure N., made by the distillation of liquid air is introduced. One ton of N. is fixed by the expenditure of 115 kilowatt-hours. The product is cooled, sprayed with a little water to remove carbide, and is known variously as lime N., calcium cyanamide, nitrolim, kalkstickstoff. It yields ammonia, especially when heated with water in an autoclave. Some plants (leguminous) can fix N. directly.

See J. Knox, *Fixation of Atmospheric Nitrogen*, 1921; J. R. Partington and P. H. Parker, *Nitrogen Industry*, 1922; F. Ernst, *Fixation of Atmospheric Nitrogen*, 1928; T. P. Hilditch, *Catalytic Processes in Industry*, 1929; and T. P. Hilditch and C. C. Hall, *Catalytic Processes in Applied Chemistry*, 1937; W. D. McElroy and B. Glass (eds.), *Symposium of Inorganic Nitrogen Metabolism*, 1956.

Nitrogen Case Hardening, see NITRIDING.

Nitrogen Cycle, The. Although the atmosphere contains 80 per cent of nitrogen it is unavailable as a food source. But all plants and animals need nitrogen to build up their proteins. The N. C. is a process by which plants obtain their nitrogen from nitrates in the soil, animals obtain their nitrogen from plant proteins, and complex dead residues are changed by micro-organisms to available forms of plant food. The whole cycle takes place in stages: *Protein breakdown* by which the proteins of dead plants and animals are broken down by putrefactive bacteria; *ammonification* where the products of protein breakdown are converted by fungi and bacteria to ammonia; and *nitrification* of the ammonia to nitrate which takes place in 2 stages. First, one type of bacteria oxidises the ammonia to nitrate and then the oxidation is completed by a second type. The nitrates are then utilised by plants. There is

some loss of nitrogen due to the activity of denitrifying bacteria which convert nitrogen compounds back to gaseous nitrogen. However, this loss is more than offset by *nitrogen fixation*, a process by which some bacteria can turn atmospheric nitrogen directly into protein. One species (*Rhizobium radicicola*) lives in small nodules on the roots of leguminous plants. Hence the value of clover crops, etc., in agriculture. See also CROPS.

Nitrogen Peroxide, see NITROGEN, Compounds.

Nitro-glycerine, $C_3H_5(ONO_2)_3$, or more correctly glyceryl trinitrate, was produced first by Sobrero in 1846 by the action of nitric acid on glycerol. Nobel introduced it into the manuf. of explosives. It is prepared by adding one part glycerine to about 6 parts of a mixed acid of sulphuric and nitric acids containing little water, around or less than 0.5 percent; the mixture is kept cool by cooling coils or a water-cooled colandria. The N. separates from the nitrating acid and is separated off and washed sev. times with water and weak soda solution to free it from acid. It has a sweetish burning taste and is poisonous. N. is very sensitive to shock and friction, to avoid which special precautions are taken throughout manuf. Ignited or heated in a confined space it explodes violently. N. has found a wide range of uses as an ingredient in blasting explosives (ammonium nitrate mixtures), blasting gelatine, dynamite, propellants (cordites), and to a limited extent in medicine. See EXPLOSIVES.

Nitroline, see KALKSTICKSTOFF.

Nitro-sulphuric Acid $SO_2(OH)ONO_2$ is possibly obtained as an intermediate product in the commercial manuf. of sulphuric acid. It is produced by the interaction of sulphur dioxide, nitrogen peroxide, and water. It is a white crystalline compound which is decomposed by excess of water, forming sulphuric acid and a mixture of nitric oxide and nitrogen peroxide.

Nitrosyl Chloride, see CHLORO-NITROUS GAS.

Nitrotoluenes. The nitration of toluene (q.v.) leads to the formation of a mixture of ortho (1:2) and para (1:4) Ns., $CH_3 \cdot C_6H_4 \cdot NO_2$, which can be separated by fractional distillation. The ortho-compound is a liquid which solidifies at $-10.5^\circ C.$ and boils at $218^\circ C.$, whilst the para-compound is a solid melting at $54^\circ C.$ and boiling at $234^\circ C.$ They are both employed in the colour industry. Meta-N. is obtained from paratoluidine by converting it first into its acetyl derivative and then nitrating the latter. The resulting meta-nitro-par-aceto-toluide on hydrolysis and diazotisation in alcohol yields meta-N., a solid which melts at $16^\circ C.$ and boils at $230^\circ C.$ There are a number of dinitrotoluenes, $CH_3 \cdot C_6H_3 \cdot (NO_2)_2$, the most important being the (1:2:4.) compound obtained by the further nitration of toluene. Trinitrotoluene, or T.N.T., is used as a powerful explosive (q.v.), and is obtained by the nitration of toluene. The formulae of the bodies mentioned are

Nitrous Acid, see NITROGEN.

Nitrous Ether, or **Ethyl Nitrite** ($C_2H_5NO_2$), is a colourless liquid (sp. gr. 0.947 at 15.5° ; boiling-point $17^\circ C.$) with a pleasant fruity odour like apples. It is usually prepared by distilling a mixture of alcohol and sulphuric acid with copper and nitric acid. It is insoluble in water, is hydrolysed by boiling water and dilute alkalis, and is a component of the 'sweet spirit of nitre' used in medicine.

Nitrous Oxide, see LAUGHING GAS and NITROGEN, Compounds.

Nits, see LICE.

Nitti, Francesco Saverio (1868-1953), It. politician and economist, b. Meli, Potenza. Formerly prof. of science of finance at Naples Univ., he was Liberal deputy from 1904 to 1922, and minister of commerce and agriculture in the Cabinet of Giovanni Giolitti, the Piedmontese bureaucrat, from 1911 to 1914. N. was minister of finance in Orlando's gov., 1917-19. Following the victories of Diaz in the First World War, N. became Prime Minister and minister of the interior, 1919-20. He attempted to deal firmly with the internal chaos in post-war Italy, and his domestic views were radical and progressive, but he lacked the drive to make his basic principles sufficiently felt, and in a sense his indecisive gov. paved the way for Mussolini, whom N. strongly opposed. N. lived in France throughout the dictatorship of Mussolini, being held prisoner by the Germans, 1943-5; but after the Second World War he returned as a leader of the National Democratic Union. Though his views were listened to with respect, he had by now ceased to exercise much political influence. In 1947 he tried and failed to form a gov., and subsequently retired from active political life. Pubs. by N. include *Europa senza pace*, 1921, *The Decadence of Europe*, 1922, and *L'Inquietude du monde*, 1934.

Niuafoou, or **Tin Can Island**, volcanic is. on the outskirts of the Tongan Group. After a violent eruption in 1946, the 1300 inhab. were removed and eventually resettled on Eua, S. of Tongatabu. Formerly it was of peculiar interest to tourists and philatelists because of its unique method of mail delivery which earned it the nickname of 'Tin Can Island', inward mail being sealed up in tins and thrown from steamers into the sea, when it was picked up by 'postmen' who swam out to receive it.

Niue, coral is. in the S. Pacific Ocean, in lat. 19° 10' S. and long. 169° 47' W. It is 14 m. long and 10 m. wide. It was annexed, together with the Cook and other S. Pacific Is., to New Zealand in 1901. There is a resident commissioner, and laws, etc., are the same as for Cook Is. Straw-plaiting is one of the chief occupations, and hats, bananas, copra, baskets, and kumaras are exported. At Alofi, the seat of the administration and the port of the is., is a wireless station. Area 100 sq. m.: pop. 4763.

Nivelle, Robert George (1856-1924), Fr. general, studied at the École Polytechnique. He commanded the 11th Army, later becoming commander-in-chief of the armies of the N. and N.E. A former member of the Conseil Supérieur de la Guerre, in the First World War he first came to the fore at Verdun in 1916. In May 1916 he resisted the efforts of the Germans to overwhelm Fort Vaux, but ultimately both that fort and Douaumont (q.v.) fell. In Oct.-Nov., however, he launched a successful counter-attack on the E. bank of the Meuse, recovering both places, together with Dambloup, though it is commonly stated that the actual operations were conducted by Gen. Mangin (q.v.). Later in the same year Joffre was made a marshal of France, and N. was made commander-in-chief in his stead. During the general Ger. withdrawal in Mar. 1917 to the Hindenburg line (q.v.) N. conceived the bold plan of a 'decisive blow' and, abjuring the method of attrition, made preparations for a combined assault of all his armies from the Aisne heights from W., S., and SE., the most ambitious effort since the battle of the Marne of 1914. But he failed utterly, and a strong reaction set in against him, his methods being unfavourably contrasted with the more cautious Fabian strategy of Pétain and Foch (q.v.). The result was that the post of chief of the general staff in Paris was revived, and Pétain was appointed to fill it, the step being a mere formality to Pétain's eventual appointment to succeed N. as commander-in-chief of the Fr. armies, while Foch took Pétain's place at the Ministry of War. See F. E. A. Hellot, *Le Commandement des généraux Nivelle et Pétain*, 1917.

Nivelles (Flem. *Nijvel*), tn. in the prov. of Brabant, Belgium, 18 m. S. of Brussels. It has important railway works, and manufs. of paper and iron furniture. There are also steel works, copper foundries, and mills. The fine Romanesque church of St Gertrude, dating from the 11th cent., was heavily damaged in May 1940 when the centre of the city, with about 470 houses, was totally destroyed. Pop. 12,900.

Niven, Frederick John (1878-1944), Brit. novelist and poet, b. Valparaiso. Educ. at Hutcheson's Grammar School, Glasgow, and the Glasgow School of Art, he served in the Ministry of Information during the First World War. Later he settled in Brit. Columbia. Most of his works have Scottish or Canadian settings. His novels include *A Wilderness of Monkeys*, 1911, *Hands Up!*, 1915, *Sage-Brush*

Stories, 1917, *Justice of the Peace*, 1923, *Canada West*, 1930, *The Paisley Shawl*, 1931, *Mrs Barry*, 1933, *Triumph*, 1934, *The Flying Years*, 1935, *The Maillards*, 1939, *Mine Inheritance*, 1940, and *Prelude to Victory*, 1941. *Maple Leaf Songs*, 1917, and *A Lover of the Land*, 1925, are vols. of verse.

Nivernais, anct. prov. of central France, nearly corresponding to the present dept of Nièvre. It was a duchy, its cap. was Nevers, and it once belonged to the Mazarins. Louis XIV joined it to the Crown in 1669. The canal of N., constructed 1784-1842, connects the Loire and and Yonne Rs.

Nivkhi, see GILYAKS.

Nivôse (snowy month), fourth month of the year in Fr. revolutionary calendar. See CALENDAR.

Nix and **Nixie**, in Teutonic mythology, male and female water sprites, for the most part malignant. They were represented as of human form, and frequently mixing with mortals, particularly in music and dancing. See also DEMONOLOGY. See K. Heckscher, *Die Volkskunde des germanischen Kulturkreises*, 1925.

Nixon, Richard Milhous (1913-), Amer. politician, vice-president of the U.S.A., b. Yorba Linda, California. He graduated from Whittier College, 1934, Duke Univ. Law School, 1937, and practised law in Whittier, California, 1937-42. He served in the navy, 1942-6. N. was elected as a Republican to the House of Representatives in 1946, and to the Senate in 1950. He was, while in the House of Representatives, a member of the committee on Un-American Activities, played a prominent part in the case of Alger Hiss (q.v.), and was strongly in favour of continued investigation of Communist activity in the U.S.A. Nominated as Republican vice-presidential candidate in 1953, he was attacked for having accepted funds raised by Californian supporters for his political expenses. Elected, along with Eisenhower, he played a more extensive part in the gov. than is customary for the vice-president, partly owing to the illness of the President. He again ran for the vice-presidency in 1956, his candidature causing even more controversy, in view of Eisenhower's recent hist. of severe illness, and was re-elected with Eisenhower. See R. de Tolcedano, *Nixon*, 1957.

Nizam, title borne by the rulers of Hyderabad state (q.v.) in India till the reorganisation of states in 1956. The 7th and last N. was b. in 1886, succeeded to the title in 1911, became constitutional governor of his state under the constitution of 1950, and a private citizen in 1956.

Nizami of Ganja (1140/41-1202/3), Persian poet, b. Ganja. He enjoyed great popularity in Turkey as well as Persia. His main works are 5 *mathnavi* poems. The first, the *Treasury of Mysteries*, is mystical, and the other 4, *Khusrav and Shirin*, *Layla and Majnun*, the *Romance of Alexander the Great*, and the *Seven Effigies*, are romantic. N. is acknowledged by the Persians to be the greatest master of the romantic *mathnavi*. See W.

Bacher, *Nizmits Leben und Werke*, Leipzig, 1871.

Nizhnyi-Novgorod, see GOR'KIV.

Nizhnyi Tagil, city in the Sverdlovsk oblast of the Urals (Russia), 75 m. N. of Sverdlovsk. It is one of the chief metallurgical and engineering centres of the Urals, with 2 large iron and steel works (on local ore), a railway-car plant (biggest in Russia), and coking and chemical plants; it is also an important railway junction. N. T. is surrounded by a number of smaller iron and copper producing tns. It was founded in 1725 as an iron works; the first experimental railway in Russia was built here in 1834. It has seen particularly rapid industrial development since the 1930's. Pop. (1958) 297,000 (fifth in the Urals; c. 1914, 45,000; 1926, 39,000; 1939, 160,000).

Nizza, see NICE.

Njáls Saga, the longest and greatest of the Icelandic family sagas, relating events that took place in Iceland from 940 to 1015 approximately, the central event being the burning of Njál and his family in their house in 1010. Recent excavations seem to have located with certainty the site of the building. The standard Eng. trans. of the saga is Dasent's and is available in Everyman's Library (new ed., 1957).

N.K.G.B. (Russian abbreviation for **People's Commissariat of State Security**), the Soviet security service, 1943-6. It had essentially the same functions as its predecessor the N.K.V.D. (q.v.) and was largely occupied in dealing with 'unreliable' elements in tcrs. formerly occupied by the Germans, as well as with prisoners of war and civilian deportees returning from Germany. Many of these were sent to corrective labour camps (q.v.) or deported to Asiatic Russia. The latter treatment was meted out to certain native peoples of S. Russia as a whole (see BALKARS; CHECHEN-INGUSH; CRIMEA; KALMYKS; KARACHAY). Renamed M.G.B. (q.v.) in 1946.

N.K.V.D. (Russian abbreviation for **People's Commissariat of Internal Affairs**), name of the Soviet security service, 1934-1943. It had essentially the same functions as its predecessors the Cheka and the G.P.U. (q.v.), with the added responsibility for all places of detention (including corrective labour camps, q.v.), the ordinary police, and all civil registry offices. It was successively headed by Yagoda, Yezhov (1936-8), and Beria. The N.K.V.D. carried out the Great Purge (q.v.) and as a result became the most powerful apparatus in the state and the main pillar of Stalin's rule. After the Great Purge one of its main activities was the deportation of 'unreliable' elements from the border and the newly annexed tcrs. In 1943 it was divided into 2 commissariats, the N.K.V.D. and the N.K.G.B. (q.v.), the latter being responsible for state security. See M. Fainsod, *How Russia is Ruled*, 1953.

No, or **No-Amon** (Egyptian *nu-aa*, the large city, or *nu-Amen*, Amen's city), city in Egypt known to the Greeks as Thebes, and surviving to modern times in the ruins

at Karnak and Luxor. N. became prominent when from it sprang the 11th Dynasty; it was less prominent again till the time of the 18th Dynasty, then prominent to the 20th. It was the prin. centre of the worship of Amen, regarded as the equivalent of the Gk Zeus; hence its name No-Amon, of which the later Gk 'Diospolis' was a trans. The more ant Gk 'Thebes' was an adaptation of the Egyptian name *Ta-Opet*. See THEBES.

No Man's Land, name applied to outlying dists. in various countries. It has been used especially to designate the following: (1) region N. of Texas (Public Land Strip), ceded to U.S.A. in 1850, constituting Beaver co., Oklahoma, since 1890; (2) narrow dist. between Delaware and Pennsylvania; (3) small is. 3 m. SW. of Martha's Vineyard, Massachusetts, to which it belongs; (4) region corresponding to what is now Griguland E., Cape of Good Hope; (5) tract of S. Australia, 80,000 sq. m. in area; (6) battle zone between opposing front-line trenches in the First World War. It was also used as the name of a storage place on 18th-cent. ships.

Noah, son of Lamech, the biblical flood hero (Gen. vi-ix), builder of the ark in which he and his family survived the deluge, and as the patriarch of mankind; our benefactor also by the invention of wine and viticulture (Gen. ix. 20: 'And Noah the husbandman was the first to plant a vineyard').

Noah, the **Book of**, lost Heb. work which has, however, been largely incorporated into the Ethiopic Book of Enoch and the Book of Jubilees. It dealt with the birth and life of N. It must not be confused with the late Heb. work of the same name and partly based on it, given in Jellinek's *Bet ha-Midrash*.

Noah's Dove, see COLUMBA NOACHII.

Noailles, name of a noble Fr. family which dates from the 11th cent., the chief members of which are *Antoine de* (1504-1562), appointed admiral of France in 1547, and ambas. to England from 1553 to 1556. *François de* (1519-85), a diplomat, brother of Antoine, was ambas. to Venice and Constantinople. *Anne Jules* (1650-1708), 1st duke, took part in the siege of Maestricht in 1673, persecuted the Protestants in Languedoc, and became marshal of France in 1693. *Louis Antoine* (1651-1729) became Archbishop of Paris in 1695, and cardinal in 1700. *Adrien Maurice* (1678-1766), 3rd duke, was a distinguished soldier; he was defeated at Dettingen in 1743, but distinguished himself at Fontenoy in 1745. *Philippe* (1715-94), Duke of Mouchy, became marshal of France, and served in Germany and Flanders; he and his wife were guillotined. *Paul* (1802-85), 6th duke, politician and author, became a member of the Fr. Academy in 1849, and pub. *Histoire de la maison royale de Saint-Louis établie à Saint-Cyr*, 1843, and *Histoire de Madame Maintenon et des principaux événements de règne de Louis XIV*, 1848.

Noailles, **Anna**, **Comtesse de** (1876-1933), Fr. poetess, b. Paris, on her father's side a Rumanian, on her mother's side

descended from Gkaristocrats; by her marriage a member of Fr. aristocracy. Her poems are musical, personal, and often exotic and mystical. In 1901, after her marriage to Henri Mathieu, Comte de Noailles, in 1897, she pub. her first vol. of verses, many of which had been written when she was only 16. It was called *Le Cœur innombrable*, had an immediate success, and was crowned by the Fr. Academy. Other well-known books of poems are *L'Ombre des jours*, 1903, and *Les Vivants et les morts*, 1913. *L'Honneur de souffrir* was pub. in 1927, 4 years after the death of Maurice Barrès, one of her greatest friends. Her autobiography appeared in 1932. See lives by G. A. Masson, 1924; J. Larnac, 1931; M. Borély, 1939.

Nobel, Alfred Bernhard (1833-96), Swedish engineer and chemist, b. Stockholm. In 1842 he went to St Petersburg with his family, and studied the construction of torpedoes and marine mines with his father. In 1859 he returned to Sweden and devoted himself to the study of explosives, especially the utilisation of nitro-glycerine. In 1867 he discovered and patented the explosive mixture known as dynamite. A few years later he produced ballistite or smokeless powder. From his various other inventions and discoveries and the exploitation of the Baku oilfields, he amassed a large fortune. At his death he left the bulk of it in trust for 5 ann. prizes, to be awarded without distinction of nationality or sex, for eminence in physics, chem., physiology or medicine, literature, and to one who rendered the greatest service to promote international peace. See lives by H. Schlück and R. Sohlman, 1933, and Herta E. Pauli, 1948.

Nobel Prizes, prizes awarded, by the Swedish Academy of Science, for physics and chem.; by the Stockholm Faculty of Medicine, for medicine or physiology; by the Swedish Academy of Literature, for literature; and by a committee elected by the Norwegian Legislative Assembly, for peace. The prizes, which amount to about £8000 each, are awarded from the income of a capital sum of £1,750,000 left on trust by the Swedish scientist, Alfred Nobel (q.v.). This fund is administered by a board of directors chosen by the prize-awarding bodies above noticed, the president of the board being appointed by the Swedish Gov. Undistributed prize money reverts to the main fund or is reserved for each section. Mme Curie is the only case of an award of two prizes to one individual. The following lists show the winners of the various prizes from 1901 to 1957.

Physics

- 1901 W. K. Röntgen (German)
1902 H. A. Lorentz and P. Zeeman (Dutch)
1903 H. A. Becquerel (French) and P. and Marie Curie (French, b. Poland)
1904 Lord Rayleigh (British)
1905 P. Lenard (German)
1906 J. J. Thomson (British)

- 1907 A. A. Michelson (American)
1908 G. Lippmann (French)
1909 G. Marconi (Italian) and F. Braun (German)
1910 J. D. van der Waals (Dutch)
1911 W. Wlen (German)
1912 G. Dalon (Swedish)
1913 H. Kamerlingh-Onnes (Dutch)
1914 M. von Lane (German)
1915 W. H. Bragg and W. L. Bragg (British)
No award
1916 C. G. Barkla (British)
1917 M. Planck (German)
1918 J. Stark (German)
1919 C. E. Guillaume (Swiss)
1920 A. Einstein (German)
1921 N. Bohr (Danish)
1922 R. A. Millikan (American)
1923 K. M. G. Siegbahn (Swedish)
1924 J. Franck and G. Hertz (German)
1925 J. B. Perrin (French)
1926 A. Compton (American) and C. T. H. Wilson (British)
1927 O. W. Richardson (British)
1928 Due L. V. de Broglie (French)
1929 C. V. Raman (Indian)
1930 No award
1931 W. Heisenberg (German)
1932 P. A. M. Dirac (British) and E. Schrödinger (Austrian)
1933 No award
1934 J. Chadwick (British)
1935 C. D. Anderson (American) and V. F. Hess (Austrian)
1936 C. J. Davison (American) and G. P. Thomson (British)
1937 E. Fermi (Italian)
1938 E. O. Lawrence (American)
1939 No awards
1940 O. Stern (American)
1941 I. I. Rabi (American)
1942 W. Pauli (Austrian)
1943 P. W. Bridgman (American)
1944 Sir E. Appleton (British)
1945 P. M. S. Blackett (British)
1946 H. Yukawa (Japanese)
1947 C. F. Powell (British)
1948 Sir John Cockcroft (British) and E. T. S. Walton (Irish)
1949 F. Bloch and E. M. Purcell (American)
1950 F. Zernike (Dutch)
1951 M. Born and W. Bothe (German)
1952 W. E. Lamb and P. Kusch (American)
1953 W. Shockley, J. Bardeen, and W. H. Brattain (American)
1954 Chen Ning Yang and Sung Dao Lee (Chinese)

Chemistry

- 1901 J. H. van't Hoff (Dutch)
1902 E. Fischer (German)
1903 S. A. Arrhenius (Swedish)
1904 Sir W. Ramsay (British)
1905 A. von Baeyer (German)
1906 H. Moissan (French)

Nobelium, heavy metallic element, atomic number 102. It was discovered in 1958 by Dr Albert Ghiorso of Gatlinburg, Tennessee, as a result of the bombardment of curium. *See also* ELIUM; TRANSURANIC ELEMENTS.

Nobile, Umberto (1885-), It. aviator and aeronautical engineer, b. Avellino. He became director of the dept for aeronautical design and designed the dirigible *Norge* which made the successful Rome-Alaska trans-Polar flight in the Amundsen-Ellsworth-N. expedition of 1926. N. led the *Italia* airship expedition which flew to the North Pole but was wrecked off North East Land, and rescued by a Russian ice-breaker (1928).

Nobile Officium, in Scots law, the equitable jurisdiction of the Court of Session, somewhat akin to Eng. equity. In nearly all cases the power is exercised by the Inner House. The main purposes for which it may be employed are to supply omissions or remedy defects in statutes or deeds and to afford remedies by petition to the Inner House where no remedy is otherwise competent.

Nobility. It is difficult to define N.,

because the term connotes different qualities and privileges in different nations, and even in the same nation at different periods. N. does not necessarily imply titles, though at the present day it would be a violation of conventional ideas to speak of anyone as a noble who had no title, e.g. Article I of the U.S.A. Constitution contains a provision against the grant of any title of N. The Eng. baronial N. differed in important essentials from the N. of the Continent, whether of France, Germany, or the medieval rep. of Venice. Stubbs points out (*Constitutional History*) that 'the great peculiarity of the baronial estate in England, as compared with the Continent, is the absence of caste,' because in the Eng. system 'the theory of nobility of blood as conveying political privilege has no legal recognition.' This dictum, however, must be understood with the important reservation that Eng. peerages may become extinct or fall into abeyance, but so long as there is an heir to the title that heir is *ipso facto* an hereditary counsellor of the Crown or member of the House of Lords. The only difference, therefore, between the Eng. and the continental theory is that, whereas in the former one member only (the eldest son or next heir) of a family is noble in the sense of being a member of the peerage and an hereditary counsellor, in the latter the whole kin of certain families enjoyed political privileges from the fact of descent from an oligarchic aristocracy, and were therefore accounted noble.

History. Though political privilege is the mainspring of N., a brief survey of the 3 types of N., classic or ant., medieval, and modern, will reveal striking differences of origin and development. The types to be discussed are the patriciate of ant. Rome, the aristocracy of Greece, the N. of the Venetian rep., and the feudal aristocracy of England and their modern representatives.

The early Rom. patriciate, which was synonymous with the *populus* or original people of Rome, was based upon an eponymous ancestry (Romulus, founder of Rome) and upon the fact that the privileged members of the *gentes* were descendants of those who first occupied the hills of ant. Rome. Later, when it was shorn of its political privileges, the patriciate retained its spiritual or religious significance, because none but the members of a clan or *gens* could participate in the *sacra* proper to the *gens*, and because from very early in the hist. of Rome certain offices like those of the *flamines* (q.v.) always went to a patrician.

If any sort of generalisation be possible in the social distinction of a state so full of contradictions and seeming anomalies as ant. Athens, it is that the Athenian N. of the period prior to the Dorian invasion furnished a close parallel to the Rom. *populus*, being tribal in its genesis, and claiming precedence from an original occupancy of the soil; but that thereafter, in the heyday of the *demoi*, when the Eupatridae had lost all their political privileges, there was no N. in the true sense at all. But when the Dorians conquered the

Peloponnesus, there was an influx of wealthy families; and noble immigrant families like the Pisistratidae and Alomaeonidae outshone the old Athenian tribal N. in the eyes of the common people, and from that time the old military N. of Athens gave place to an aristocracy of wealth.

The hereditary N. of the rep. or signory of Venice traced its origin to no original occupancy, nor boasted a descent from a common founder of the race as distinct from past holders of office. The N. of Venice sprang conclusively from a commercial plutocracy and gradually usurped and retained all the political power in the rep. until the Church vindicated the rights of the lesser orders (see also MUNICIPALITY).

The Eng. N. of the Conquest and the Middle Ages was essentially feudal and military, and based upon the solid foundations of landed property. Like that of the feudal N. of the Normans and Germans, its origin is to be sought in the personal relationship of lord and vassal, and in the system of commendation by which the lord, in return for the allegiance and personal services (generally military or incidental thereto) of his vassal, gave or 'loaned' him land and guaranteed a reciprocal protection. The modern N. of England resembles the old feudal N. in no other respect than in the fact that it may possess landed estates; but for the rest the Brit. N. consists of a heterogeneous body of peers, some with patents entitling them to sit in the Upper House and some without, and baronets and knights, the great majority of whom possess titles of recent creation, awarded for political or other public services. Only a few of the existing Eng. peerages go back before the time of Wm Pitt the younger, who himself created over 100.

Theory of nobility. The theory of N. is biological, and based on the principle that selected stocks should be given opportunity and encouragement to develop and reproduce those qualities which are (a) most desirable in the higher administrative spheres; (b) difficult to acquire without leisure and economic independence; (c) lost again in a few generations of unfavourable environment.

In England emphasis is laid on lineal descent joined to wealth, and intensified environmental training in the public schools.

In Scotland and on the Continent less importance has been attached to the environment factor and more to matrimonial discrimination, or 'proof of nobility' (*preuves de noblesse*), i.e. '16 quarterings' (16 great-great-grandparents, or 8 great-grandparents) of the individual. The continental N. has always tried to maintain itself as a privileged caste, which has brought it into conflict with the bourgeoisie and proletariat. The Eng. system has been to maintain the peers and their immediate children as a high N. and to sink their junior descendants into a 'middle class.' The Scottish system also has been to sink the junior members of its N. into the mass of the people; but to

encourage even the poorest to retain their pride of race and sense of kinship to the chief or chieftain, whilst titles, etc., are regarded as reflecting credit, not merely on the holder, but on the whole clan.

British nobility. The term is used in 2 senses: (1) The 'gentle' classes, true equivalent of the continental *noblesse*, in which knights and baronets, and indeed younger children of peers, are included. In Britain, as on the Continent, the 'proof' of N. (*anglice* 'gentility') is lawful possession of armorial bearings, or paternal descent from an ancestor whom the Crown has either 'ennobled' by such a grant or recognised as already noble. In England Henry V definitely laid down that arms are 'tokens of nobility.' In Scotland non-nobles are prohibited by statute from bearing arms, but may be ennobled by grants of same; (2) N. in a restricted sense is applied to peers and their wives (sometimes children), who are equivalent to the *hoch adel* of the Continent. This peerage, or 'high nobility,' consists of the peerages of England and Scotland (created before 1707), of Ireland (created before 1800), and of Great Britain (1707-1800) and of the U.K. (since 1800). Each series consists of 5 degrees, (1) Duke, (2) Marquess, (3) Earl, (4) Viscount, (5) Baron, who differ in rank, but not as to privileges, except that peers of Scotland elect 16 (and until recently those of Ireland 28) representatives of their order, who, with all peers of England, Great Britain, and the U.K., form the 'Lords Temporal' of Parliament. The 2 archbishops and older bishops of the Church of England form the 'Lords Spiritual.' Unelected Scots and Irish peers, and peeresses in their own right, are members of the peerage, but not 'Lords of Parliament.' All peerages are hereditary (usually descending to the heir male of the body of the grantee) except the 'Law Life Peers' or Lords of Appeal in Ordinary, distinguished lawyers raised to the peerage for life to act as judges in the House of Lords.

A dukedom is the first grade of N., but archbishops, the moderator of the Church of Scotland, the Prime Minister, as such, and certain officers of state (including the lord chancellor) have precedence. 'Duke' is derived from *dux*, which among Saxons and Romans meant leader of an army. Being the highest dignity at the Crown's disposal, dukedoms have always been sparingly granted. Apparently the whole order became extinct in the reign of Elizabeth, but was revived by James I, who ennobled his favourite, George Villiers, as the Duke of Buckingham. Three of the present dukes are princes of the blood royal. Marquises, too, exhibit a like conservatism in numbers. Now (and in Britain always) a mere title of honour, it originally denoted those great barons of the empire who held fiefs on the *marches* or borders. *Earls* are created comparatively often; the term 'earl' (or 'jarl,' a Dan. title which about the time of Ethelred began to supersede that of 'ealdorman,' the chief magistrate of the shire in A.-S. times) denoted the head of a

shire. The expression 'belted earl' arises from the ant. mode of investiture of an earl, a belt with sword being buckled round the waist. The next degree, 'viscount,' is derived from *vicecomes*, i.e. the sheriff who presided in the co. court. Barons form the lowest grade of peers; anciently, they were those churchmen or laymen who held land of the king *per baroniam*, i.e. held by honourable service as feudatories of a prince (this still constitutes 'barony' and confers certain privileges in Scotland, without constituting a peerage). Baron or lord-baron is the most general title of N. in England. It was early decided that the fact of holding *per baroniam* did not necessarily give the right to be summoned by writ to the House of Lords. In Scotland the 'minor barons' were exempted from attendance in 1887, whilst the 'greater barons' remained as peers. Peers are created: (1) By writ of summons. Such peerages are not complete until the person honoured takes his seat in the House of Lords, when the title becomes hereditary. (2) By letters patent, which specify the line of descent of the dignity, and the heir specified in the patent succeeds even though the grantee die before taking his seat. Peeresses in their own right who marry commoners retain their titles, but peeresses by marriage lose their titles by remarriage. See G. E. Cokeayne, *The Complete Peerage*, 1910 ff., vols. 1-13; also the latest editions of Burke's (see BURKE, SIR JOHN BERNARD) and Debrett's *Peerages*.

Noble, Sir Andrew (1831-1915), Brit. armament-maker, b. Greenock, son of George N., naval officer. He was educ. at Edinburgh Academy and the Royal Military Academy, Woolwich. Assistant-Inspector of Artillery, 1859. In 1860 he assumed the direction of the ordnance dept. of Sir Wm Armstrong's works at Elswick, becoming chairman of the company in 1900. He was awarded the Royal Society's gold medal in 1880.

Noble, Sir Percy Lockhart Harnam (1880-1955), Brit. admiral. He was commander-in-chief W. approaches in Britain, 1941, and head of the Brit. Admiralty delegation to Washington, 1942-3.

Noble, ant. Eng. gold coin, first minted by Edward III in 1344. Its original value was 6s. 8d., but, it having increased to 10s. (the Rose Noble) owing to the depreciation of silver, a new coin, called an angel (q.v.), of the former value of a N., was issued by Edward IV. On one side of the N. was stamped a ship to commemorate the victory of Sluys.

Noble Gases, see INERT GASES.

Nocera Inferiore, or **Nocera dei Pagani** (ant. Nuceria), It. tn in Campania (q.v.), in the valley of the Sarno, 8 m. NW. of Salerno (q.v.). It has a cathedral, a ruined fortress, and a Rom. necropolis. There are textile manufs., and a trade in fruit and cheese. Pop. 37,100.

Noctiluca, genus of minute flagellate protozoa, found in all seas. They are phosphorescent, a bluish or greenish light being intermittently produced from

numerous minute points in the living matter, probably due to a rapid fermentation.

Noctilucent Clouds (luminous night clouds), very rare clouds which are only recognised after dusk because the sun is still shining at their exceptionally great height (about 80 km.). Usually observed about midnight in N. European lats. just after the summer solstice, they resemble cirrus and have a bluish-white to yellowish colour. A satisfactory explanation of their origin is lacking, but it is generally believed that they are composed of meteoric or volcanic dust. Other very high clouds seen after dark are known as *mother-of-pearl clouds*. Lower in average height (about 25 km.), they are roughly lenticular in shape with beautiful irisation, whence their name. Prof. H. Mohn first recorded observations of these clouds, mainly from Oslo, but most observations have been made by Prof. Carl Störmer, who pub. coloured photographs of them in *Weather* (vol. iii, Jan. 1948). Mr G. A. Clarke saw them from Aberdeen on 6 Feb. 1934; but in many years they have not been seen at all. Since 1926, by comparing photographs of the clouds as seen from different places against the stars the heights have been found to vary between 20 and 30 km.—well into the stratosphere. From the size of a large lunar corona seen in 1932, and from the position and colours of the irisation, the cloud droplets are estimated to be spherical with diameters from 1/1000 to 1/400 mm., the large drops being towards the centre of the cloud, and the probable temp. about -70°C .

Nocturn, div. of matins in the Rom. and other breviaries. Each N. in the present Rom. breviary consists of 3 psalms and 3 lessons with their antiphons. See BREVIARY.

Nocturne, 'night piece' or instrumental serenade, generally of a quiet, lyrical character, but sometimes (as in Chopin) with a more agitated middle section. As a pianoforte piece it originated, not with Chopin, but with John Field (1782-1837), but it existed already as the *lt. notturno* in the 18th cent., when, however, it was similar to the Serenade or Divertimento in sev. movements. The N. in the modern sense is not necessarily slow, soft, and sentimental. Even Field's are not all so, and one is in the curious form of a vocal operatic scene; Debussy's *Fêtes* is a very animated piece; and in Vaughan Williams's *London Symphony* the scherzo is a N., i.e. a piece suggesting London's gaiety by night.

Nodes. The N. of a planet or any other celestial body are those 2 points where its orbit is cut by a fixed plane; in the case of the solar system, by the ecliptic. The straight line which joins these points is called the line of N. The point at which the orbit of a planet or any other body passes from south of the ecliptic to north of it is known as the ascending node, the other and opposite point necessarily being the descending node. The long. of the ascending node is one of the 6 'elements' by which the movements of a celestial body are determined. Owing to the mutual

attractions of the planets, the line of N. is continually shifting; alternately advancing and receding. The retrogression of planetary N. never exceeds 1 degree per cent., but owing to the great attraction of the sun the lunar N. complete a retrograde revolution in 6793.391 days, which implies a retrograde motion of $19^{\circ} 21'$ in 365 days. The cycle, known as the *Saros*, (q.v.) was discovered by the Babylonian astronomers who observed that the eclipses of the sun and moon recurred in the same order in each cycle, which is 18 years 11 days.

Nodier, Charles (1780-1844), Fr. author, b. Besançon. In 1824 he became librarian at the Bibliothèque de l' Arsenal; in 1833 he was elected to the Academy; and in 1843 made a member of the Légion d' Honneur. He was the centre of the early members of the Romantic school; Hugo, de Musset, and Sainte-Beuve all acknowledged his influence. His best work consists of his fantastic short stories, among which are *Sinatra*, 1821, *Trilby*, 1822, *Histoire du roi de Bohême et de ses sept châteaux*, 1830, *La Fée aux miettes*, 1832, *Inès de las Sierras*, 1838. See Prosper Mérimée, *Portraits historiques et littéraires*, 1874, and P. G. Castex, *Le Conte fantastique en France de Nodier à Maupassant*, 1951.

Nodules, see ROOT TUBERCLES.

Noel, Conrad le Despenser (1869-1942), Eng. clergyman and Socialist, son of Roden N., poet, educ. at Corpus Christi College, Cambridge, and at the Chichester Theological College. He worked for some years among the poor of Portsmouth. As vicar of Thaxted from 1910 to 1942 N. was nicknamed the 'red priest' on account of his Socialist views and the red flag he flew from his church; he was a prominent member of the Christian Socialist movement. He lectured to Socialist groups and wrote a number of religious and political works, including *The Labour Party*, 1906, *Socialism and Church History*, 1910, *Byways of Belief*, 1912, *Uplifting the Son of Man*, 1919, *Life of Jesus*, 1937, and *Jesus the Heretic*, 1939. His unfinished autobiography was pub. in 1946.

Noetus (c. AD 130-c. 200), priest of Asia Minor, b. Smyrna, became a leader of the Patristians (q.v.), and was excommunicated. His contemporary Hippolytus's *Sermon against the heresy of a certain Noetus* is the authority for his doctrines, which his disciple Epigenus (followed by Cleomenes and Sabellius) preached at Rome.

Nœux-les-Mines, Fr. tn in the dept of Pas-de-Calais, S. of Béthune, in a coal-mining dist. Pop. 12,600.

Nogales, twin city of Sonora, NW. Mexico, situated on the frontier line, one half in Mexico and the other in Arizona. It stands at an altitude of 4000 ft above sea level, and it is here that the S. Pacific Railroad of America connects with the S. Pacific Railroad of Mexico. The new Pacific Coast Highway is opening up important tourism and trade prospects. The main industries in the dist. are mining and cattle ranching. Winter

vegetables are exported to the U.S.A. Pop. 14,000.

Nogay, Turkic-speaking people of N. Caucasus, who live in the Groznyy oblast and Circassian Autonomous Oblast, with a pop. of 36,000 in 1926. They are Sunni Muslims, and mostly peasants, engaged especially in sheep-rearing, but are now collectivised. They formed part of the Golden Horde (q.v.); in the 14th cent. they formed a separate N. Horde which later broke up. They voluntarily submitted to Russia between the 16th and 18th cents.

Nogent-le-Rotrou, Fr. tn, cap. of an arron., in the dept of Eure-et-Loir. It has a ruined 11th-15th-cent. château. Pop. 7800.

Nogent-sur-Marne, Fr. tn in the dept of Seine, an E. suburb of Paris. It has a 12th-13th-cent. church, and a fort. Watteau (q.v.) d. here. There are chemical and pottery manufs. Pop. 21,000.

Nogi, **Marasuke**, Count (1849-1912), Jap. soldier, b. Yamaguchi of a Samurai family, saw his first military service in the civil war of 1877, in which the Samurai were finally defeated (see JAPAN, *History*). He commanded a brigade in the war against China in 1894, and in the Russo-Jap. war (1904-5) he commanded the Third Army. It was N. who forced Port Arthur to surrender and it was his army's flank march which resulted in the signal and decisive Jap. victory in the battle of Mukden (20 Feb.-10 Mar. 1905). Together with his wife he committed 'honourable suicide' (hara-kiri, q.v.), according to the old-estab. custom, on the death of the mikado, Mutsuhito.

Noginak (formerly **Bogorodsk**), tn in the Moscow oblast of central Russia, 35 m. E. of Moscow. Varied textile industries (cotton, wool, and silk) have been carried on since the 19th cent. Known since the 16th cent. as a vil., it became a tn in 1781. Pop. (1939) 81,000 (38,000 in 1926).

Nograd County, see **SALGÓTARIAN**.

Noguchi, Hideoyo (1876-1928), Jap. bacteriologist and pathologist, b. Inawashiro. He studied at Tokyo, graduated in 1897, and worked at the Institute for Infectious Diseases there, 1898-1900, when he entered the laboratory of pathology at Pennsylvania Univ. He made researches into immunity against snake poisons and in 1904 pub. *The Action of Snake Venom upon Cold-blooded Animals*. At the Rockefeller Institute, which he joined in 1904, he did valuable work on the aetiology of syphilis and the cultivation of spirochaetes; he also studied the aetiology of trachoma and yellow fever, of which latter disease he d. when conducting investigations in Brit. W. Africa.

See life by G. Eckstein, 1931.

Nogués, Auguste (1876-), Fr. soldier, b. in the Hautes-Pyrénées, was educ. at the Ecole Polytechnique and was an artillery captain in the First World War. After the war he served against the Rifa (see **ABD-EL-KRIM**), 1924-6. Appointed resident-general of Morocco in 1936, and

commander-in-chief in N. Africa in 1939, he retained these posts during the Vichy regime. In 1940 he informed the Axis countries and Franco that he would not surrender N. Africa to any invader, even if he were ordered by Pétain to do so. After the landing of the Anglo-Amér. armies in N. Africa and the assassination of Darlan (q.v.) he became a member of Giraud's (q.v.) Fr. Imperial Council and deputy high commissioner for N. Africa, 1942-3. Early in 1943 he declared that he could not understand his unpopularity with the Americans, averring that he was justified in opposing the allied invasion. On 4 June 1943 Nogués, condemned by Gen. de Gaulle as a collaborator with Vichy, submitted his resignation.

Noh-play, traditional opera of Japan. It was estab. in the early 15th cent. by Kan-ami Kiyotsugu, and perfected by his son, Zeami Motokiyo. N. is performed on a square. The number of characters is generally less than 10 but sometimes as many as 20. They are accompanied by a chorus, seated to the right of the stage. The orchestra, seated to the rear, consists normally of 4 instruments: Jap. flute, *kotsuzumi* (small drum), *okawa* (medium drum), and *taiko* (large drum struck with 2 sticks). The outstanding characteristic of N. is its extreme simplicity; action and scenery are reduced to a minimum. Dances, on the other hand, are elaborate, and costumes magnificent. N. remains popular, and is taught by no fewer than 5 special schools to more than 2 million trainees. See also **DRAMA**, *Japanese Drama*.

Noisy-le-Sec, Fr. tn in the dept of Seine, a NE. suburb of Paris. It has chemical manufs. Pop. 16,100.

Nokrashy Pasha, Mahmud Fahmy El (1888-1948), Egyptian statesman, b. Alexandria, educ. at the Higher Training College, Cairo, and at Nottingham Univ. College, and entered the teaching profession. Later he entered the Ministry of Education in an administrative capacity. He was an active member of the Wafdist party; in 1930 he entered the first Wafdist gov. as minister of communications, a post which he held again from 1936 to 1937. In 1937, following the Montreux conference which ended capitulations, he was unexpectedly excluded from the Wafdist gov. through disagreement with the Wafdist leader over the Blue Shirt organisation. Soon after this N., with Ahmed Maher Pasha and their respective followers, resigned from the Wafd to form the Saadist party, pledged to uphold the true principles of Saad Zaghlul Pasha. From 1938, when the Saadists joined the coalition gov., N. held successive portfolios. In 1945 he succeeded to the premiership and leadership of the Saadist party, following the assassination of Ahmed Maher. Apart from a short period in 1946, when Sidky Pasha (q.v.) was premier, N. was head of the gov. until his assassination on 28 Dec. 1948. N. was responsible for breaking off the treaty negotiations with Britain and headed the Egyptian delegation to the Security Council of the U.N., 1947. He

enjoyed the reputation of being a first-class administrator, and was respected by all parties for his integrity.

Nola, It. tn in Campania (q.v.), 14 m. ENE. of Naples (q.v.). It has a 14th-15th-cent. cathedral, the remains of a 4th-cent. church, and a palace. Augustus (q.v.) d. here, and Giordano Bruno (q.v.) was b. here. Pop. 21,900.

Nöldeke, Theodor (1836-1930), Ger. orientalist, b. Harburg. His first work was a hist. of the Koran (1859), which won the prize of the Fr. Académie des Inscriptions, and which he rewrote in German as *Geschichte des Korans*, 1860 (ed. F. Schwally, 3 vols., 1909-38). In 1861 he lectured at Göttingen; in 1868 was prof. at Kiel, and from 1872 to 1906 prof. of oriental languages at Strasburg. N. was the author of many works on E. languages, literature, and hist., including *Sketches from Eastern History* (Eng. trans., 1892) and a *Syriac Grammar* (Eng. trans., 1904). See E. Kuhn *Übersicht der Schriften Theodor Nöldekes*, 1907, and *Festgabe für Theodor Nöldeke* 1916.

Nolle Prosequi, in legal practice an entry in the record of a court which indicates that the crown, in a criminal prosecution desires to proceed no further with the case. Formerly the practice in entering a N. P. applied both to civil and criminal suits, but it is now restricted to the stay of proceedings by indictment or information which can be entered only on the fiat (q.v.) of the attorney-general or solicitor-general.

In criminal cases when an indictment (q.v.) has been found (see JURY), proceedings on it can be stopped only by the Crown entering a N. P. against one or all of the defendants.

Nollekens, Joseph (1737-1823), sculptor, b. Soho. In 1760 he went to study in Rome, where Garrick met him and commissioned him to execute a bust. This was so successful that Sterne sat to him. He increased his income by buying and selling antiques, and by stock exchange speculation, and was so successful that at his death he was worth £200,000. He returned to England in 1770, and was soon the fashionable sculptor of the day, eccentric in character but very able in portraiture. See G. W. Stonier (ed.), *Nollekens and his Times* (by J. T. Smith, 1828), 1948, and P. Colson, *Private Portraits*, 1949.

No-load Characteristic, curve showing the terminal voltage as function of exciting current of a separately or shunt-excited d.c. generator at constant speed. See ELECTRIC MACHINES.

Nom-de-plume, see PSEUDONYM.

Nomad (Gk *nomas*, roaming, particularly in search of pasture, from *nemein*, to pasture), member of a race, tribe, or community who have no fixed abode, but whose chief occupation is the tending of flocks and herds and who wander about, shifting their location according to the state of pasturage, and living in tents on grassland or steppe. The Bedouins or desert-dwellers offer the most characteristic example of N.s, and they even claim to be descended from Ishmael. The

Bedouins are found mostly in Arabia or other Middle E. countries such as Iraq and Egypt, have a tribal organisation under sheikhs, tend herds of camels or goats and flocks of sheep, and are good horsemen (see BEDOUINS). Other examples are the Australian blackfellows and S. African bushmen (q.v.) who derive their subsistence from hunting. Gypsy van-dwellers may also be said to lead a nomadic life (see GYPSY). Among the Hamitic tribes of E. Africa the Galla (q.v.) and Borana, the Masai (q.v.) and Turkana, all cattle-owning people, are still nomadic; but the Nandi (q.v.) and Suk of Kenya, with the Teso (q.v.) of N. Uganda, live in vils, and practise agriculture. See Sir H. Johnston, *The Uganda Protectorate*, 1902; W. E. Elardt, *Die Kulturform des Nomadismus*, 1923; P. G. Merneer, *Das Nomadenium in Nordwestafrika*, 1937.

Nome, term used for a territorial div. of auct Egypt, and for a prov. of modern Greece.

Nome, tn S. of the Seward Peninsula, NW. Alaska, on N. shore of Norton Sound, 13 m. W. of Cape Nome. It is the centre of a great gold-mining dist., discovered in 1899, and the commercial and supply centre for NW. Alaska. It has a federal building, schools, and a hospital. Nome is a seaport (open May-Nov.) with connection to Seattle, and an air base and commercial airport. Fur farming, trapping, and fishing are important activities. Pop. 1852.

Nomenclature, see NAMES.

Nominalism, as opposed to *Realism* (q.v.), was one of the two doctrines of the Middle Ages, which arose from a consideration of the nature of species and genera. N. implies a belief in the theory that 'universals,' i.e. genera and species, are mere names. The Nominalists, as opposed to the Realists, who, with Plato, declare that class terms are real, more real than the individual things which come under them, deny that the concept, or class, has an existence of its own beyond the individuals which make up the class. A narrower form of N. hold that even concepts or ideas are not really general.

Roscelin in the 11th cent was a celebrated nominalist, but his teaching was condemned by the Church as involving a tritheistic doctrine of the Trinity. Abelard (q.v.) was a conceptualist (see CONCEPT and CONCEPTUALISM), but he tended towards N. and was also condemned by the Church. Later, in the 14th cent., Wm of Occam upheld N., and among more modern philosophers Hobbes and Berkeley may be mentioned as holding modified forms of the doctrine. See also REALISM and SCHOLASTICISM. See A. Rogers, *History of Philosophy*, 1921.

Nomuka, one of the is. of the Haapai Group of Tonga.

Non-commissioned Officers, see RANK.

Nonconformity, or Dissent, refusal to conform to an estab. order (usually religious). In the 17th cent. N. signified remaining within the bounds of the Anglican Church, yet refusing to conform to certain ceremonial practices, such as the use of the surplice, of the sign of the cross

in baptism, and of the ring in marriage. Eng. N. in the present meaning of the term dates from immediately after the Reformation. The violence of the Puritans turned the state against them, and during the reign of Elizabeth I they were persecuted. Under James I, brought up amongst Presbyterians in Scotland, they expected more favourable treatment, but the Hampton Court Conference speedily disabused them. Owing to the identification of king and bishop, the supremacy of Parliament was marked by a vigorous attack on Episcopacy, at first in the interests of Presbyterianism, but later in those of Independency. But the reaction against the Commonwealth which followed was directed also against Puritanism. The Restoration of 1660 was followed by legislation against Nonconformists. The Act of Uniformity, 1662, drove from eccles. benefices a large number of Puritan ministers, intruded under the Commonwealth, who would not receive episcopal ordination. The Conventicle Act, 1664, penalised all attending dissenting conventicles, and the Five Mile Act, 1665, forbade Puritan ministers to travel within 5 m. of a corporate tn. The Test Act, 1673, directed principally against Rom. Catholics, also pressed hard upon Protestant dissenters, and no satisfaction was felt by them at James II's Declaration of Indulgence, 1687-8, obviously intended to relieve Rom. Catholics. With the accession of William and Mary, and the Toleration Act of 1689, most of the disabilities imposed by the Clarendon Code went, though the Corporation Act and the Test Act remained in force until 1828.

In 1730 a non-corporate union of Baptists, Independents, and Presbyterians was formed. Outside this union the chief dissenting bodies were at this time the Quakers and the Unitarians. But by 1760 another important body joined them with the secession of the Methodists from the estab. church. The Corporation and Test Acts were repealed in 1828; in 1836 marriage in a dissenting chapel was made legal; in 1871 the univs. were opened to non-members of the Church of England; in 1880 Nonconformist ministers were allowed to conduct funerals in the par. burying grounds. In 1892 the National Council of the Evangelical Free Churches was set up (this became the Free Church Federal Council (q.v.) in 1940). In 1932 the United Methodists combined with the Wesleyan Methodists and Primitive Methodists to form the Methodist Church.

N. as a name for non-Anglican Protestants can only apply in England itself, where the Anglican Church is estab. The term is better replaced by one of wider reference, the Free Churches, free as dissenting from the historic creeds, episcopate, and systems of the Roman, E. Orthodox, or Anglican Churches. *See* BAPTISTS; CONGREGATIONALISM; FRIENDS, SOCIETY OF; METHODISM; PLYMOUTH BRETHREN; SALVATION ARMY; ADVENTISTS; UNITARIANISM. *See also* D. Coomer, *English Dissent, 1714-60*, 1946, and H. Davies, *English Free Churches*, 1952.

Non-contributory Pensions, *see* NATIONAL INSURANCE ACT (1946).

Non-co-operation, *see* PASSIVE RESISTANCE.

Nones, *see* BREVIARY.

Nones, in the Rom. calendar the ninth day before the Ides, i.e. the 5th of all months except Mar., May, July, and Oct.

'March, July, October, May
Make Nones the 7th, Ides the 15th, day.'

See CALENDAR.

Nonesuch Press, *see* MEYNELL, SIR FRANCIS.

Non-Intervention Committee, committee of various European states set up at the beginning of 1937 to supervise measures agreed on between them to stop the flow of volunteers to both sides in the Sp. Civil War, 1936-9. It formulated a plan for watching the Sp. coasts and frontiers which by the autumn had proved unworkable, gaps and loopholes in it having permitted enormous quantities of war material and even whole armies to come to Spain, while Germany sent bombers to attack the tns of the republicans. In the last stage of the conflict the committee ceased its activities, the policy of non-intervention having in fact much favoured the insurgents, for the republicans had derived little effective countervailing help even from the Soviet Union. *See further under* SPAIN, *History*.

Nonius, Fernan, *see* NUNEZ.

Nonius Marcellus, Lat. grammarian, probably of the 4th cent. AD. He is noted as the author of *De compendiosa doctrina*, valuable for the fragments preserved from old dramatists, satirists, and annalists such as Ennius, Cato, and Varro. Priscian and Fulgentius borrowed from this work. *See the ed. of* W. M. Lindsay (3 vols.), 1903.

Non-jurors, those clergy of the Church of England who after the revolution of 1688 refused to take the oath of allegiance to William and Mary. They were headed by Wm Sancroft, Archbishop of Canterbury, and included 7 other bishops: Ken of Bath and Wells, White of Peterborough, Lake of Chichester, Turner of Ely, Frampton of Gloucester, Thomas of Worcester, and Lloyd of Norwich. About 400 of the lower clergy refused to take the oath, among them being many distinguished ecclesiastics. Some soon returned to the Estab. Church, but the body continued to exist with gradually diminishing numbers well on into the 19th cent. *See* T. Lathbury, *History of the Non-Jurors*, 1845, and J. H. Overton, *The Non-Jurors*, 1902.

Non-metals, one of the 2 classes into which chemical elements are divided. Their characteristic physical properties are as follows: they may be gases, liquids, or solids at ordinary temps., and most of the liquid and solid N. are easily converted into the gaseous state at comparatively low temps. They are brittle, if solid, generally have a low sp. gr., and are bad conductors of heat and electricity. The chemical properties give a more definite test. The N. form acidic oxides, they are not acted upon by dilute mineral

acids, and generally form stable compounds with hydrogen. The distinction between N. and metals is, however, by no means always well defined, and several elements, such as arsenic and antimony, possess characteristics of both classes. Examples of N.: hydrogen, oxygen, nitrogen, chlorine, helium, carbon, sulphur, boron, phosphorus, silicon.

Non Nobis Domine, canon possibly but by no means certainly by Wm Byrd (q.v.) which is often sung in England in place of grace at dinners.

Nonnus, Gk epic poet of the mid 5th cent. AD, a native of Panopolis, Egypt. His most noted work is the *Dionysiaca* (Hist. of Bacchus). A *Paraphrase of St John's Gospel* is also extant (written in Gk hexameters). N. was probably a Christian. His *Dionysiaca* was ed. by A. Ludwich (2 vols.), 1910-11, and trans. by W. H. D. Rouse (3 vols.), 1940. There is an ed. of the *Paraphrase* by A. Scheindler, 1881. See P. Collart, *Nonnos de Panopolis*, Cairo, 1930.

Nonpareil, printing type (6 point) in which the text of this encyclopaedia is set. The French name signifying 'none similar' refers to the exceptional skill displayed in the final cutting of so small a character. See TYPE and TYPEFOUNDING.

Non Possumus (Lat., 'we cannot'), papal formula used to express refusal, final and absolute, taken from the words of St Peter and St John (Acts iv. 19-20). It is said to have been used by Clement VII in reply to Henry VIII's demand for a divorce from Catherine of Aragon.

Non-Suit. Technically a N.-S. no longer exists. Under the former practice N.-S. meant the voluntary abandonment by the plaintiff of his action, either because the judge or jury appeared to be against him or because in argument it appeared that in law he had no case. It differed from an adverse judgment in that it did not bar him from commencing the action again. In the days when forms of action, e.g. detinue (q.v.), trespass (q.v.), were so highly technical that the slightest verbal slip in the pleadings endangered the whole action, N.-S.s were frequent, but since the legal reforms of the last cent. such unsubstantial formalities, and together with them N.-S.s, have been abolished. The modern equivalent is a ruling by the Court either of its own volition or on the submission of counsel that the defendant has no case to answer. There is no formality to be observed, and the submission that there is no case can be argued at any stage of the proceedings.

Nontron, Fr. tn. cap. of an arron., in the dept of Dordogne, on the Bandiat. It has a busy market. Pop. 3200.

Noon, Malik Firoz Khan (1893-), Pakistan statesman and lawyer, b. Lahore, son of Nawab Sir Malik Mohammed Hayat Khan N., educ. at Chiefs' College, Lahore, and Wadham College, Oxford. He was successively advocate at Lahore high court, 1917-26; member of the Punjab legislative council, 1920-36; minister for local self-gov., Punjab gov., 1927-30; minister for education in the Punjab, 1931-1936; commissioner for India in the U.K.,

1936-41; member of the viceroy's executive council, 1941-5; labour member of the governor-general's executive council, India, 1941-2; and defence member of the governor-general's executive council, 1942-5. Knighted in 1933, N. was a delegate from India to the San Francisco Conference, 1945. In 1946 he renounced his title, in common with the other leading figures in the Muslim League. Later he became a member of the legislative assembly of the W. Punjab till 1950, and has been governor of E. Bengal since then.

Noordholland, see NORTH HOLLAND.

Noordzeekanaal, see NORTH SEA CANAL.

Noort (or Oort), Adam van (1557-1641), Flem. painter, b. Antwerp. Among his many pupils were Rubens and Jordaens. He had considerable ability, especially as a colourist, and was an admirer of the Venetians. He became a member of the guild of St Luke in 1587.

Nootka, tribe of the Wakashan stock of N. Amer. Indians. They dwell on the W. coast of Vancouver Is., near Nootka Sound. They number about 2000, and were famed as whale catchers. See E. Colson, *The Makah Indians*, 1953.

Nootka Affair (1788-90), an incident in the hist. of Anglo-Sp. colonial rivalry. In 1788 Capt. John Meares, an aggressive Eng. maritime trader, erected a store building on Nootka Is. and built a 30-ton schooner, the *North-west America*, the first ship launched on the Brit. Columbia coast. His obvious intention to trade there permanently moved the Spaniards to interference and, in the spring of 1789, a 20-gun Sp. warship appeared off the is. Its commander, Don Joseph Martinez, seized the *North-west America* and other Brit. vessels there and constructed fortifications. Meares appealed to the Brit. Gov., which at once decided to force Spain to a settlement. The Spaniards eventually restored Meares's property and, furthermore, agreed that Brit. subjects should have trading and colonising rights N. of the 38th parallel of lat. This amounted to an admission that Spain had modified her age-long exclusive claims to the Amer. Pacific coast.

Nootka Language, see NORTH AMERICAN NATIVE LANGUAGES, *Pacific Areas*.

Nootka Sound, harbour of the Pacific coast of Canada, lying behind Nootka Is. on the W. coast of Vancouver Is. N. S., Barclay Sound on the SW. coast of Vancouver, and Quatseanough Sound on the NW. coast all send branches into the heart of Vancouver Is.

Noranda, city of Quebec, Canada, adjoining Rouyn, 420 m. NW. of Montreal. The prin. industry is the smelting and refining of gold and copper ore. Pop. 10,000.

Norba Caesania, see CACERES.

Norbert, St (c. 1080-1134), was b. of a princely family at Xanten. He led a worldly life at the Ger. court and received holy orders for the sake of material advancement. In 1115, however, a narrow escape from death brought about his conversion. After trying to reform the chapter of canons at Xanten he became an itinerant preacher. Given the ter. of

Prémontré near Laon in 1120, he estab. a community of canons regular under the Augustinian rule, since known as Premonstratensians or Norbertines. His new order quickly spread over W. Europe. N. himself, compelled to accept the see of Magdeburg, began the reformation of his clergy, by force when necessary. He defended the doctrine of the Real Presence and fostered the cult of the Blessed Sacrament. N. was canonised in 1582; his feast is on 6 June.

Nord, most northerly dept of Franco, adjoining Belgium, and with a short coastline on the N. Sea. It is formed of the anct prov. of Fr Flanders (see FLANDERS). The greater part of the surface is flat, fertile, and well cultivated, watered by the Scheldt and the Sambre. Wheat, oats, potatoes, sugar-beet, flax, chicory, and some tobacco are the chief agric. products. The Fr.-Belgian coal-field is the centre of the prin. industrial area in Franco. Apart from coal-mining, N. has textile, metallurgical, chemical, and food-stuff industries. Fishing is important in the coastal areas. The prin. tns are Lille (the cap.), Avesnes, Cambrai, Douai, Dunkirk, Valenciennes, Roubaix, Tourcoing (q.v.). Area 2228 sq. m.; pop. 2,090,000.

Nord Fjord, inlet on the W. coast of Norway, extending for about 50 m. inland. The scenery is beautiful.

Nord-Trøndelag, co. of Norway, with a short Atlantic coastline near the Vikten ls. Long fjords include Trondheim, the latter traversing almost half the co. Agriculture, forestry, and fishing are the chief occupations. Area 8659 sq. m.; pop. 109,900.

Nordal, Sigurdur (1886-), Icelandic scholar of international repute. He was for 30 years prof. of Icelandic literature in the univ. of Iceland.

Nordalbingia, see DITHMARSHEN.

Nordau, Max Simon (1849-1923), Ger.-Hungarian physician and author, b. Budapest, of Jewish descent. He practised medicine in Budapest and later settled in Paris as a physician. Turning to literature, he wrote novels and plays in a satirical vein to illustrate his social theories, but he is more widely remembered for his analytical studies of contemporary society, notably *Die konventionellen Lügen der Kulturmenschheit*, 1883, *Paradox*, 1885, *Die Krankheit des Jahrhunderts*, 1887, and *Degeneration* (an attempt to relate genius to degeneracy), 1892-5. In these and other critical studies of modern society N. applies the theories of Lombroso (q.v. and also CRIMINOLOGY) to which he was strongly attracted. His other works include the plays *Der Krieg der Millionen*, 1881, *Das Recht zu Lieben*, 1892, and *Doktor Kohn*, 1898, and essays *Von Kunst und Künstlern*, 1905, and *Zionistische Schriften*, 1909, 1923.

Norddeutscher Lloyd (N. Ger. Lloyd), Ger. steamship line, inaugurated by H. H. Meier, of Bremen, who in 1857 induced the various shipping industries of the tn to amalgamate under the name of the N. L. In 1881 the first of the company's Atlantic service express steamers was

built. From the H.Q. at Bremen many steamers ran to New York, Baltimore, Brazil, Galveston, the R. Plate, etc. Mail steamers ran between Bremen and America, Asia, Australia, etc., and there was also a Chinese coasting trade. In 1914 the company had 135 sea steamers and auxiliary craft totalling nearly 1,000,000 tons gross. After 1919 all that remained of the great mercantile fleet were the seaside steamers, lighters, and tugs; but a surprising recovery was effected, and such large ships as the *Bremen* (burnt at Bremerhaven), the *Europa* (now the Fr. *Liberté*), and the *Columbus* (sunk in 1939) were built. Before the Second World War the total tonnage was nearly 615,000. After the Second World War the company's fleet was reconstructed, and in the N. Atlantic service the S.S. *Berlin*, and in the Far E. service the new combined passenger/freight motor vessels *Schwaabenstein*, *Hessenstein*, and *Bayerstein* were put into service. At its centenary, 20 Feb. 1957, the company was operating 40 sea-going vessels (gross tonnage approximately 280,000).

Norden, John (1546-?1625), topographer and surveyor. According to Anthony Wood, N. was b. 'of a genteel family,' but there is not sufficient evidence to confirm that he belonged to Wilts, and more probably his father was a native of Middx. A privy council order of Jan. 1593, addressed to lieutenants and other co. officers, declared that 'John Norden, gent., was authorised and appointed by the Queen to travel through England and Wales and make descriptions, charts and maps,' and the outcome of this order was his first work *Speculum Britanniae, first parte: Middlesex*, 1593. N. was the first to project a complete series of co. hist., but he was prevented by monetary difficulties from completing this design. He pub. *Hertfordshire* in 1598, and completed in MS. *Essex, Northampton, Cornwall, Surrey, and Kent*. He was surveyor of crown woods, 1600; surveyor to the Duchy of Cornwall, 1605; and, in 1607, surveyed Windsor and its neighbourhood. He pub. *Observations concerning Crown Lands and Woods* in 1618. He engraved a number of maps, in which roads were indicated for the first time. His maps of London and Westminster were dated 1593, but are somewhat later than those of Aggas and van den Wyngaerde. By the aid of these maps we can obtain a very fair notion of the extent and major features of Tudor London. His *Surveyor's Dialogue* (printed 1607 and reprinted 1618) is among the more meritorious of the earlier works on agriculture. The first 3 books deal with the now more or less obsolete rights of the lord of the manor and the various old forms of land tenure, together with the obligations they involved. The later parts are characterised by shrewd observations on the 'different natures of grounds, how they may be bettered, employed, and amended.' He was also the author of several religious works.

Nordenskiöld, Adolf Erik, Baron (1832-

1901), Swedish geographer and explorer, b. Helsingfors, Finland. After sev. successive voyages and explorations with Tonelli in the Arctic Sea, with frequent visits to Spitsbergen, where he measured an arc of the meridian, in 1878-9 he navigated the N.E. Passage by traversing, along the N. shores of Europe and Asia, the whole Arctic from the Atlantic to the Pacific. He contributed to the science of geographical research, particularly in his work *Perillus*, 1897. His pubs. in English include *The Voyage of the 'Vega' around Asia*, 1881, and *The Second Swedish Expedition to Greenland*, 1885. A series of scientific results of the *Vega* expedition were pub., 1882-7. See life by S. Hedin, 1928.

His nephew, *Nils Otto Gustaf Nordenskjöld* (1869-1928), explored the Magellan Straits and Patagonia in 1895-7, and Alaska in 1898; he also led the Swedish expedition which discovered King Oscar Coast, and Nordenskjöld Coast, Graham Land, and Antarctica, 1901-3. A series of scientific results have been pub. since 1911. See life by G. Bodman, 1928, and his *Antarctica*, 1905.

Norderney, is. in the N. Sea, in the E. Frisian group, belonging to the *Land* of Lower Saxony (q.v.), Germany. It is a very popular holiday resort. The is. is 8 m. long and about 1 m. wide. Area 9 sq. m.; pop. 6000.

Nordhausen, Ger. tn in the dist. of Erfurt, at the foot of the Harz Mts (q.v.), 40 m. NNW. of Erfurt (q.v.). It was a free city of the empire, 1253-1803. The area has potash mines, and there are engineering, textile, and oil industries. Pop. 30,000.

Nordic, *Nordism*, denote the tall, blond, dolicocephalic race found mainly in Scandinavia, and, to a lesser extent, in Germany, Denmark, and other countries. The theory that the N.s are a superior race from which all European culture has sprung seems to have originated with Joseph de Gobineau (q.v.), author of *The Inequality of Human Races*, whose pseudo-scientific doctrine found a temporary popularity in the early 20th cent. in the U.S.A. This theory also finds an echo in Carlyle's works, and in Nietzsche's cult of the 'superman.' It was carried further by the Englishman, Houston Stewart Chamberlain, from whose time it had a great vogue in Germany. Nordism then developed as a political weapon of Ger. Imperialism, the Germans being proclaimed by their propagandists as N.s (though only some 20 per cent of Germans can be described as N.), whose mission was to rule all other peoples as being of lower racial value. The extremist advocates of Nordism contend that all great men in hist., science, and art have been N.s, while some even assert that ant. Gk culture was the work of blond N.s who conquered Greece 4000 years ago. One school of N. theorists holds that the N.s are the best of the 'Aryan' races, while others go much further, claiming that Aryan and N. are synonymous (see on this ARYAN OR ARIAN). In fact, the N. race, as distinct

from the N. type in Scandinavia and other countries, is mythical. The existence of a common N. primitive people has never been estab., and long cents. of interbreeding have produced innumerable blends of N. with other types. The contention that to N.s alone are due the achievements of the European peoples is manifestly fantastic. The Nazis, for their own ends, erected Nordism into a veritable state creed. Slavs were contemptuously regarded as 'subhuman,' while the Jews became the special objects of Ger. animadversion and persecution (see also 'MEIN KAMPF').

Nordic Council, also known as the **Northern Council**, an assembly of elected representatives from the Scandinavian parliaments estab. in 1952 to foster closer co-operation between Scandinavian countries. Denmark, Norway, Sweden, and Finland each send 16 delegates, and Iceland 5. The aim of the N. C. is not so much the attainment of full uniformity, but a state of affairs whereby the Scandinavian countries can constitute an integrated area within which the citizens may move, live, and work while enjoying equal treatment regardless of nationality. The members of the N. C. have no authority to make decisions on behalf of their respective govts. The procedure is to discuss questions of common interest, and then to forward recommendations to the govts. concerned. The govts. then report to each ordinary session of the N. C. on the measures taken in pursuance of recommendations. Good results have been achieved, especially in social welfare, including a convention allowing any Scandinavian citizen, if resident outside his own country, to enjoy the same social security benefits as those enjoyed by the citizens of that country. A joint labour market has been estab., which allows a Scandinavian to apply, without formalities, for work in any country. In 1952, as a result of the N. C.'s recommendations, passport regulations were abolished between the Scandinavian countries. In the legal field each country now recognises the criminal and civil verdicts pronounced in other countries. Up to and including 1957 the N. C. has met each year since its inception.

Nordic Runes, see RUNES.

Nordland, coastal co. of N. Norway, having a length of 300 m. The Lofoten Is. (q.v.) and other is. fringe the coastline which is particularly beautiful. Narvik and Bodø (on Salt Fjord) are the chief tns. Fishing and mining are among the prin. occupations. At Mo i Rana Norway's first large steel plant came into operation in 1955. Area 14,727 sq. m.: pop. 221,600.

Nördlingen, Ger. tn in the *Land* of Bavaria (q.v.), 72 m. NW. of Munich (q.v.). It was once a free city of the empire, and an important tn of N. Swabia (q.v.); and it has remarkable walls, 2 fine Gothic churches, and a 13th-cent. tin ball. The Swedes suffered a reverse near by in 1634, during the Thirty Years War (q.v.). There are beer and leather manufs. Pop. 14,000.

Nordrhein-Westfalen, see NORTH RHINE-WESTPHALIA.

Nore, The, sand-bank at the mouth of the R. Thames (q.v.), marked by numerous buoys and, formerly, also by lightships. In the Second World War a series of 7 Maunsell towers were erected in the vicinity of the Nore as part of the Thames defences, and the lightship stationed at the E. end of the sand-bank, N.E. of Sheerness, was removed. These defences were demolished between 1956 and 1958. Hamblin placed the first lightship here in 1732. The Nore mutiny took place in the vicinity in 1797.

Norfolk, Dukes of, see HOWARD.

Norfolk, Hugh Bigod, 1st Earl of (d. 1176 or 1177), noble, received his earldom as a reward for his assistance to Stephen in obtaining the Eng. crown. He was noted for his treachery and double dealing, even in the faithless age in which he lived. In 1169 he was one of the nobles excommunicated by Becket, and in 1175 forfeited his castles for his part in the 1174 rebellion. He probably d. in Palestine.

Norfolk, Roger Bigod, 2nd Earl of (d. 1221), noble, son of the 1st Earl of N. He was in favour throughout Richard's reign, being ambas. to France on one occasion. He retained his power during John's reign, save for a short interval in 1213, but was excommunicated by Innocent III as one of the 25 executors of Magna Carta. On the accession of Henry III he regained his honours, and his hereditary right to the stewardship of the royal household was recognised.

Norfolk, Roger Bigod, 4th Earl of (d. 1270), marshal of England. He was prominent in the promulgation of the Provisions of Oxford, but later the dissensions of the barons caused him to transfer his allegiance to the side of the king. In 1265 he was one of the 5 earls summoned to Parliament.

Norfolk, Roger Bigod, 5th Earl of (1245-1306), marshal of England, one of the leaders of the nobles in their struggle against Edward I. He and Bohun, Earl of Hereford, were foremost in refusing to go on foreign service unaccompanied by their sovereign. In 1297 they secured the confirmation of the charter, which was ratified by Edward at Ghent, and in 1301 signed by him in person.

Norfolk: 1. Maritime co. of E. England, on the N. Sea, bounded N. and N.E. by the N. Sea, S.E. and S. by Suffolk, W. by the Isle of Ely (Cambridge) and Lincs, and NW. by the Wash. Norfolk is rich in prehistoric remains. The co. originally formed part of E. Anglia and suffered many incursions from the Danes. There are many fine churches, among them the beautiful Norman cathedral at Norwich, originally part of a Benedictine monastery. The vil. churches of the Norfolk marshland are notable for both their beauty and their length; among these may be mentioned Walsoken, Emmeth, and W. Walton, all near Wisbech; Terrington St Clement and Tilney All Saints nearer King's Lynn; and Walpole St Peter, especially noted for its embattled parapets and its gargoyles. At Castle Rising there is a fine Norman

church and the ruins of a Norman castle; Norwich Castle is still well preserved. Other interesting feudal and monastic ruins are Castle Acre, Bacton Abbey, and others. At Walsingham (q.v.) there are ruins of an Augustinian priory, and the shrine of Our Lady of Walsingham is visited by great numbers of pilgrims.

Blickling Hall, a magnificent Jacobean house built 1619-24 (see under ARCHITECTURE, *The Renaissance* and BLICKLING), is 9 m. S. of Cromer. The coastline is mainly flat and low, and has suffered much from erosion, though previously thousands of acres of land were reclaimed from the Wash around King's Lynn. There are few inlets, and owing to numerous sand-banks the coast is dangerous. Inland the surface is mostly level, and includes in the W. part of the Fen (q.v.) country known as the Bedford Level. The prin. rivs. are the Yare and the Great Ouse, with their tribs. A feature of the co. are the 'brouds' (q.v.), a series of beautiful lakes famous for fishing and for water fowl, and for boating, ann. regattas being held. The many windmills which once stood in this area are now largely derelict and have been replaced by power-driven plant. The soil is varied, chalk, sand, and loam being prevalent in different dists. Agriculture flourishes, oats, wheat, and barley being grown in great quantities. Cattle are extensively reared, and green crops include turnips and swedes; beans are grown, and some fruit. Large numbers of turkeys are reared. Building-stone, locally known as 'gingerbread stone,' is quarried at and near Snettisham, clay is dug for bricks and tiles at Hunstanton and Snettisham, limestone is quarried at Marham, and flints are worked for facing walls. The prin. manufs. are boots and shoes, and there are a number of flour-mills and mustard works; agric. implements are made; tanning, malting, and brewing are carried on; and there are fisheries at Yarmouth. Norwich is the co. tn; Yarmouth and Lynn are the prin. ports. The mild climate and long stretches of sand have made Yarmouth, Cromer, Hunstanton, and other coast tns favourite resorts. Sandringham is a royal country seat. Norfolk is divided into 6 co. parl. constituencies and 2 bor. constituencies. Area 2053 sq. m.; pop. 376,800 (administrative co. only). See F. Blomefield, *History of Norfolk*, 1739-75; W. Rye, *History of Norfolk*, 1885; W. A. Dutt, *Norfolk*, 1900; *Victoria County History of Norfolk*, 1901-6; A. Mee, *Norfolk*, 1942; R. H. Mottram, *Norfolk*, 1946; E. T. Long, *Norfolk* (revised ed.), 1949.

2. City and port in, but independent of, Norfolk co., Virginia, U.S.A., situated in Hampton Roads (q.v.), one of the finest natural harbours in the world, off Chesapeake Bay. It contains the largest naval base in the U.S.A., with a supply centre and naval air station. The harbour is served by a belt-line railroad connecting 8 trunk lines, and is the N. terminus of the Intracoastal Waterway. The industries include shipbuilding, aircraft components, automobile assembly, farm tools, clothing, soya bean processing, and food products;

and the prin. exports are coal, oil, tobacco, grain, cotton, and vegetables.

Norfolk Island, in the Pacific, about 400 m. NNW. of New Zealand, is under Australian Commonwealth Gov. administration. It was first discovered by Capt. Cook in 1774, and was shortly afterwards made a penal settlement. Then it was occupied by the Pitcairn islanders, who, however, soon deteriorated, owing to intermarriage. Some Pitcairn islanders still live in N. I. It is the H.Q. of the Melanesian Mission, which was inaugurated in 1867. The is. is 5 m. long and 2½ m. broad, and comprises an area of nearly 13½ sq. m. The soil is fertile,

1st Batt. fought in all the prin. battles of the opening months; the 2nd Batt. joined the Gallipoli expedition, one of its companies marching across country and losing practically every man. This battalion then joined Townshend's ill-starred force in Mesopotamia and, after strenuous exertions, surrendered in 1916 with the rest of the Brit. force besieged in Kut. Other battles in which one or other of the battalions, regular or territorial, fought were the Somme (Delville Wood), Ypres (Poelcapelle), and Bapaume. It became a royal regiment in 1935. In the Second World War one battalion was in Singapore when the is. was taken by the Japanese.

THE NORFOLK COAST: CROMER FROM THE EAST

yielding fruits of all kinds, such as oranges, lemons, figs, grapes, bananas, pineapples, etc. Coffee is also grown. The Norfolk pine (*Araucaria excelsa*) (q.v.) is a splendid tree of giant size. The coast of the is. is steep and rugged, and the highest peak is Mt Pitt (1050 ft). N. I. is a cable station and has a pop. of 942.

Norfolk Regiment, The Royal, old 9th Foot regiment, raised in 1685 in the W. of England, but, soon afterwards, designated the 9th (E. Norfolk) Regiment. Of its earlier battles, that of Almanza, though not among its battle honours, is remembered in its annals for the part played in covering the retreat of the Brit. Army under Gen. Stanhope. This exploit is traditionally commemorated by the figure of Britannia in its badge. The regiment fought in most of the great Peninsular battles, and thereafter had a distinguished record in India, Cabool, Moodkee, Ferozeshah, and Sobraon, all being among its honours. In the First World War the

Other units participated in the Burma campaign. The Royal Norfolk and the Suffolk Regiments are to form the new 1st East Anglian Regiment. See F. L. Petre, *History of the Norfolk Regiment, 1665-1918*, 1925.

Norfolk Spaniel, see SPANIEL.

Norge, see NORWAY.

Norham, par. and vil. of Northumberland, England, 7½ m. from Berwick-on-Tweed, on the R. Tweed, with ruins of a Norman castle (1112) which formerly belonged to the bishops of Durham. 'Norham's castled steep' figures as the opening scene of Scott's *Marmion*. The church is also Norman. Pop. 630.

Noric Alps, named after Noricum (q.v.). Rising between the Drave and Mur valleys, they are a part of the E. Alps, extending NE. from the Rhaetian Alps. Eisenhut (8000 ft) is the highest peak.

Noricum, Rom. prov. S. of the Danube between Rhaetia and Pannonia (q.v.). It was incorporated in the empire c. 16 BC,

and was an important bastion for the defence of Italy.

Noril'sk, tn in N. Siberia, in the Taymyr (q.v.) National Dist., directly subordinated to the Krasnoyarsk Kray authorities; an important industrial centre and one of the main centres of forced labour in the U.S.S.R. There was a large-scale strike of camp inmates here in 1953. In addition to the coal-mining industry, there are uranium, nickel, copper, and platinum works. Founded in the 1930's. Noril'sk became a tn in 1953. Pop. (1956) 92,000.

Norma (the 'Rule' or 'Square'), small and unimportant S. constellation between Ara and Lupus.

Normal, in geometry, is a straight line drawn from any point on a curve, in its plane, at right angles to the tangent at that point, or a line drawn from any point on a curved surface at right angles to the tangent plane at that point, or a line drawn from any point on a plane at right angles to the plane.

Normal Schools, see TRAINING COLLEGE.

Normal Solution, in chem., a solution 1 litre of which contains the equivalent in grammes of the dissolved substance. Thus the equivalent of sulphuric acid is 49, so that 1 litre of normal sulphuric acid solution contains 49 grammes of sulphuric acid. Decil-, semi-, etc., N. S.s contain one-tenth, one-half, etc., of the equivalent weight of the dissolved substance per litre of solution. N. S.s are much used in chemical analysis.

Normal Temperature and Pressure. For convenience the properties of gases are always given on a standard basis of temp. and pressure which is known as *normal temperature and pressure* (N.T.P.). The temp. is taken as 0° C. and the pressure as the equivalent of 760 mm. of mercury (about 14.7 lb. per sq. in.).

Norman, Sir Henry Wylie (1826-1904), Eng. field marshal. He took an active part in the Indian mutiny, being present at Delhi and at the relief of Lucknow. He was made governor of Jamaica in 1883, governor of Queensland in 1888, and governor of the Royal Hospital, Chelsea, in 1901. He was made a field marshal in 1902. See memoirs, 1908.

Norman, Montagu Collet, 1st Baron (1871-1950), financier and banker, son of F. H. Norman, banker. Educ. at Eton and King's College, Cambridge, he served in the S. African war, and afterwards became a partner in the family banking business and, in 1907, a director of the Bank of England. In 1920 he was made governor of the Bank of England, a post from which he retired in 1944, and a privy councillor in 1923. It was during his governorship that Britain, in common with other countries, after the First World War went off the gold standard, but in 1925 returned to the gold standard so far as foreign payments were concerned, despite the strong condemnation of the policy by Lord Keynes (q.v.). In 1931, however, when the financial and economic position had further deteriorated, gold payments were once more suspended and the gold standard has never since been restored (see

FREE EXCHANGE and GOLD STANDARD). During the period of his governorship N. was responsible for sev. important financial negotiations, notably those with the U.S.A. in 1923 which resulted in the agreement for the funding of the debt of £978,000,000 to the U.S.A. (see BALDWIN OF BEWLEY, STANLEY, 1st EARL and BANK OF ENGLAND). See Sir H. Clay, *Lord Norman*, 1957.

Norman, name given to the people of Normandy and their descendants in the European countries conquered by them. The word is identical with Northman or Norseman, but is mostly restricted to the mixed race which came into existence after the conversion of the heathen Norse settlers and their adoption of Fr. culture. Besides invading and conquering England in the 11th cent., the N.s. conquered and settled in S. Italy and Sicily, where they developed a notable civilisation. See also NORSEMEN.

Norman Architecture, see ARCHITECTURE (5) and ENGLISH ARCHITECTURE.

Norman Conquest, name given to the conquest of England by William of Normandy, made possible by his victory at the Battle of Hastings (q.v.), 14 Oct. 1066, and to the gov. subsequently imposed upon the country by him and his successors. For events leading up to the Conquest see EDWARD THE CONFESSOR; HAROLD II; WILLIAM I. The opening years of William's Eng. rule were insecure and he was dependent to a fair extent on the co-operation of men who had previously served Harold. But by about 1072 his hold on the kingdom was finally estab. Domesday Book (q.v.) shows to what considerable extent the Normans had become owners of the land within only 20 years of Hastings. The affairs of Church and State were completely in Norman hands; yet the break with the past was very far from complete, for William continued, or adopted, many estab. A.-S. institutions for the greater stability of his own system. One basic difference was the introduction of feudal land tenure, for, in spite of superficial similarities, the Saxon system was not built on the feudal essential, namely the granting of a definite piece of land in return for definite services.

The Conquest brought England more closely into the European stream of political affairs and religious thought: but a heavy price was paid in the obliteration of a society, which, for all its many weaknesses, possessed a cultural inheritance without parallel in Normandy. See E. A. Freeman, *The Norman Conquest*, 1867-79; F. M. Stenton, *English Feudalism, 1066-1166*, 1932, and *Anglo-Saxon England*, 1943.

Norman-French, Fr. dialect which originated after the settlement of the Norman invaders, under Rollo, in Normandy, c. 911. N.-F. was prominent in the growth of O.F. literature, and can be read in the 12th-cent. chronicles of Wace. It was introduced into England at the Conquest, but its development in England was largely independent of foreign influence, and the Eng. version is also known as

Anglo-French, differing from N.-F. as spoken in Normandy by the use of Saxon words for ideas for which there was no Fr. equivalent. In England, N.-F. ceased to be a spoken language after 1400, but it was the language of the court for sev. cents., and was used for law reports until the middle of the 16th cent.; indeed, certain law phrases and legal words have been incorporated into English. On the whole, N.-F. exercised a considerable influence on the development of the Eng. language. In 1362 a statute ordained that pleadings should be in English, but should be enrolled in Latin; but the language of the statute book was still French in 1483. The earliest important treatise in N.-F. is *Britton*, 1291, and the latest *Littleton*, 1481. N.-F. is still spoken among the native pop. of the Channel Is. (q.v.). A considerable amount of literature, poetry, and prose, in N.-F. has been preserved. See W. W. Skeat, *Principles of English Etymology* (2nd series), 1891.

Norman Island, see LEWARD ISLANDS.
Norman-Neruda, Wilma, see HALLÉ, LADY.

Normanby, Marquess of, see BUCKINGHAM AND NORMANBY, DUKE OF.

Normand, Henri René Le, see LENORMAND.

'**Normandie**,' until 1943 largest Fr. merchant steamship (less in tonnage than the *Queen Mary* and *Queen Elizabeth*, but longer than both), belonging, until the Second World War, to the Compagnie Générale Transatlantique, was completed in 1933 at a cost of \$10,000,000. She had a tonnage (gross) of 79,280, with a displacement of 53,000 tons; quadruple screw; length, 1029 ft; beam, 119½ ft; depth, 91·8 ft; speed, 28½ knots. The *N.* crossed the Atlantic (Bishop Rock to Ambrose Light) in 1935 in 4 days 3 hrs 2 min. and in 1937 in 3 days 23 hrs 2 min., which time, however, was beaten by the *Queen Mary* in 1938 (3 days 21 hrs 45 min. and 3 days 20 hrs 42 min.). She was taken over during the Second World War by the Amer. Gov. for conversion into a troopship and renamed *Lafayette*. But, while lying at her Hudson R. pier, she caught fire on 9 Feb. 1942, through the carelessness of a workman with his torch, and capsized from the hundreds of tons of water that had been poured into her to put out the flames. The charred hull was not finally raised until Aug. 1943 and the estimated total cost of the complicated and protracted salvage operations, including the pumping out of the ship, was \$3,759,000.

Normandy (Fr. *Normandie*), formerly a prov. in the N. of France bordering on the Eng. Channel, now divided into the depts of Seine-Inférieure, Eure, Orne, Calvados, and Manche. It is in general a very fertile, richly cultivated land, resembling a garden in many dists. Its chief agric. products are corn, flax, hemp, colza, and fruits (from which cider is largely made); its fisheries and manufs. are of great importance and its horses the best in the country; sheep and dairy-farming are important industries. There are iron mines near Caen. The prin.

tns are Rouen, Dieppe, Le Havre, Harfleur, Honfleur, Caen, Falaise, St Lô, Bayeux, Coutances, Avranches, Alençon, Evreux, Cherbourg, and Mont-St-Michel.

In the time of the Romans the country bore the name of Gallia Lugdunensis II. Under the Frankish monarchs it formed a part of Neustria, and was first called N. after Charles the Simple, in 912, had given it to Rolf or Rollo, the leader of a band of Norse rovers (see NORSEMAN), to be held by him and his posterity as a fief of the Fr. crown. His descendant, William II, son of Robert II, became Duke of N. in 1036, and in 1066 estab. a Norman dynasty on the throne of England (see NORMAN CONQUEST; WILLIAM I, THE CONQUEROR). In 1077 his eldest son, Robert, wrested N. from him, but it was again united to England under Henry I in 1105. Henry II, the son of Henry I's daughter, Matilda, after the death of Stephen of Blois, obtained in 1154 the gov. of England and N.; but in the reign of his son, John Lackland, it was conquered by Philippe Auguste (1203-4). It remained a portion of the Fr. monarchy for more than 200 years, but after the battle of Agincourt (1415) it was reconquered by the English, who held it till 1449, when it was finally wrested from them by Charles VII. In 1870 N. was partly occupied by the Germans, and in the First World War was the prin. base of the British.

N. suffered severely during the Second World War, particularly in the campaign of 1944, and many famous tns, such as Le Havre, Caen, and Lisieux, were almost destroyed. In most of the devastated areas, however, attempts were made to palliate the ravages of war as soon as peace was restored, and since then reconstruction has proceeded steadily. For a full account of the battle of N., 1944, see under WESTERN FRONT IN SECOND WORLD WAR. See P. de Felice, *La Basse-Normandie*, 1907; H. Prentout, *La Normandie*, 1910, and *Essai sur les origines et la formation du duché de Normandie*, 1911; P. Dearmer, *Highways and Byways in Normandy*, 1924; R. Elston, *Travels in Normandy*, 1930; A. H. Brodrick (ed.), *Normandy*, 1947; Ralph Dutton, *Normandy and Brittany*, 1953; the Earl of Onslow, *The Dukes of Normandy*, 1948.

Normans, see NORMAN; NORMANDY; NORSEMAN.

Normanton, tn in the W. Riding of Yorks, England, situated on the Calder, 24 m. from York. Besides an old Norman church there are traces of a Rom. encampment in the vicinity. There is a grammar school of the 16th cent. N. is an important railway junction, and has railway workshops and coal-mines. Pop. 18,900.

Norns, Scandinavian name for 3 maidens who in Norse mythology symbolise the past, present, and future; they are called Urd, Verdandi, and Skuld. They weave man's destiny and water the root of Yggdrasil, the tree of life, from the Holy Urdar Fount (cf. the Gk Moirae).

Norodom Sihanouk, Prince (1922-), ex-King and ex-Prime Minister of Cambodia (q.v.), noted for his unconventional political behaviour. As King of Cambodia

he proclaimed his country independent in 1945, but remained on the throne when the French returned. While on a visit to the U.S.A. in 1953 he made a forthright public speech demanding independence for Cambodia. On his return he left his cap. to live in Thailand until Cambodia was independent. Asked by the Thai Gov. to leave, he returned, not to Phnom Penh (q.v.), but to Siem Reap (q.v.). Prince N. S. abdicated in favour of his father, Norodom Surnarit, who became king in Mar. 1955, and then founded a political party which was elected with an overwhelming majority. Prince N. S. became Prime Minister of Cambodia, but has since resigned. He remains the most powerful and popular political leader in Cambodia.

Noronha, Fernando de, see FERNANDO DE NORONHA.

Norrbotnen, northernmost and largest co. of Sweden, bordered by Norway, Finland, and the Gulf of Bothnia, and including a part of Lapland. There are iron mines at Gellivare, as well as many forests, the lumber being carried on the numerous lakes and rivers. Area 40,754 sq. m.; pop. 250,400.

Norris, Charles Gilman (1881-1945), Amer. novelist, b. Chicago, brother of Frank N. (q.v.). From 1908 to 1913 he was art editor of the *American Magazine*. His novels deal with such themes as hereditary influences, eugenics, modern education, business morality, and the place of women in business. They include *Amateur*, 1915, *Sall*, 1917, *Brass*, 1921, *Bread*, 1923, *Pig Iron*, 1925, *Seed*, 1930, *Zest*, 1933, *Hands*, 1935, *Bricks Without Straw*, 1938, and *Flint*, 1944.

Norris, Frank (1870-1902), Amer. novelist, b. Chicago. He attended courses at the univs. of California and Harvard, and while a student began his first ambitious realistic novel, *McTeague*, which appeared in 1899. When he left Harvard in 1895 he became a newspaper correspondent in S. Africa, where he contracted fever, and the results of this so weakened his constitution that he d. 7 years later. N. was something of a mystic, contemplating the 'elemental' passions which he transmitted to his characters, and he had an epic mind able to grasp the spirit of America. He planned to write a trilogy on the battle of Gettysburg. This work was never written, nor was the last part, *The Wolf*, of his 'Epic of the Wheat,' of which the first 2 parts, *The Octopus* and *The Pit* appeared in 1901 and 1902 respectively. The second vol. of this trilogy, *The Pit*, had an enormous vogue in its day. It dealt largely with the speculation in grain in the Chicago wheat pit. His Californian novels are *Moran of the Lady Letty*, 1898, *Blix*, 1899, *McTeague*, 1899, and *A Man's Woman*, 1900. He also wrote a critical work, *The Responsibilities of the Novelist*, 1903.

Norris, John (1657-1711), philosopher and poet, b. Collingborne-Kingston, in Wilts. He was rector of Bemerton, near Salisbury, for 20 years. He was an idealist and a student of Plato and Malebranche. His pub. works include *Poems*

and *Discourses occasionally written*, 1684, *A Collection of Miscellanies*, 1687, *An Account of Reason and Faith in relation to the Mysteries of Christianity*, 1697, *An Essay towards the Theory of the Ideal or Intelligible World*, 1701-4, and *A Philosophical Discourse concerning the Natural Immortality of the Soul*, 1708. He also trans., in collaboration with Francis Digby, Xenophon's *Cyropædia*, 1685. See F. J. Powicke, *A Dissertation on John Norris*, of Bemerton, 1894, and F. I. MacKinnon, *The Philosophy of John Norris of Bemerton*, 1910.

Norris, Sir John (c. 1547-97), Eng. soldier, a son of Henry N., baron N. of Ryecote. He served as a volunteer under Adm. Coligny in the Fr. civil wars and in the disastrous undertaking of the Earl of Essex to colonise Ulster. N., in a vain effort to improve the fortunes of Essex, advanced against the Scottish allies of the Irish in the is. of Rathlin and massacred the islanders who had all taken refuge in the castle there. He served in the Low Countries from 1577 to 1585 at the head of another party of Eng. volunteers fighting on behalf of the states-general in their revolt against their Sp. rulers. N. showed exceptional prowess in the relief of Steenwyk, which was besieged by the Spaniards under Count von Rennenberg. He was sent again to Ireland in 1585, but this did not offer a wide enough field for his ambition. The news that the Spaniards were besieging Antwerp aroused all his ardour on behalf of his former allies and he returned to the Netherlands in 1588 as ambas. In the following year he commanded, with Drake, the fleet that ravaged the coasts of Spain and Portugal, and in 1591 he served Henry IV of France in his conflict with the League in Brittany. N. returned to Ireland (1597) to aid in reducing Tyrone. After fighting and negotiating with the O'Neills in Ulster and warring in Connaught, which he failed to pacify, he asked to be recalled. This was refused, but he was superseded in his military command.

Norris, Sir John (1660?-1749), Brit. admiral. He distinguished himself under Shovell in the battle off Malaga (1704) and in the taking of Barcelona in 1705, for which services he was knighted, as well as receiving a sum of 1000 guineas. In 1739 he was appointed admiral and commander-in-chief of the Eng. fleet. He retired from active service in 1744.

Norris, Kathleen, née Thompson (1880-), Amer. novelist, b. San Francisco. Educ. at the univ. of California, she married Charles Gilman N. (q.v.) in 1909. Her pleasantly sentimental novels include *Mother*, 1911, *Saturday's Child*, 1914, *Sisters*, 1919, *The Sea-Gull*, 1927, *Second Hand Wife*, 1932, *Secret Marriage*, 1936, *High Holiday*, 1949, and *Miss Harriet Townshend*, 1955. *Noon*, 1925, is an autobiography, and *Mary-Jo*, 1952, is a convent school story.

Norristown, bor. of Montgomery co., Pennsylvania, U.S.A., on the Schuylkill R., 18 m. NNW. of Philadelphia. There is a good trade in textiles, important iron works, and manufs. of furniture,

clothing, plastics, drugs, food and dairy products, and bricks. Pop. 38,126.

Norrköping, tn and port of Sweden in Östergötland, 113 m. from Stockholm, on both banks of the R. Motala. The tn is modern in appearance. There are paper, textile, and cotton mills as well as ship-building yards. Pop. 88,871.

Norrland, see SWEDEN.

Norse Languages. This group of languages, also known as Scandinavian or N. Germanic, is a sub-branch of the Germanic main branch of the Indo-European (q.v.) family of languages. Norse may be subdivided into 3 periods:

(1) Primitive or Early Norse, termed in Scandinavian languages *urnordisk*, spoken till c. AD 700 in central and S. Scandinavia, in Denmark and N. Slesvig, and partly also in Finland and Estonia. This language is preserved in about 100 runic inscriptions in the early 24-letter alphabet (see *RUNES*); and sev. hundred loan words penetrated into the Finnish and Lappish languages; instances are: Finnish *kuningas*, 'king' (Ger. *König*); Finnish *kulta*, 'gold' (Ger. *Gold*); Finnish *kauunis*, 'beautiful' (Gothic *skavuns*, Ger. *schön*). It appears to have been fairly homogeneous throughout the whole ter. Its nearest relation was Gothic (q.v.), and both groups are still considered by some scholars as forming a linguistic main group, termed *E. Germanic*, whereas the other Germanic groups of languages (including English and German) were called by these scholars *W. Germanic*. This subdiv., however, is nowadays rejected by the experts. In the 1st cent. AD Primitive Norse began to differentiate from the other early Germanic languages, but it still preserved the early Germanic vowels and endings.

(2) The second main period, known as Viking Norse (AD 800–1100), is the period of vital phonetic changes and of the development of the various dialects. Already in the 8th cent. Norse had undergone a considerable transformation, and at the end of this cent. Primitive Norse must be considered as non-existent, although the Scandinavians themselves still considered their language (then called *Dansk tunga*, 'Danish tongue') as one and the same. At that period, however, the Norse stock of phonetic sounds reached between 30 and 40, and consequently the common Teutonic runes became inadequate to represent all the sounds. Therefore it became the habit to represent different but allied sounds (such as *k* and *g* or *t* and *d*) with the same rune, and owing to this confusion of spelling some of the runes began to fall into disuse; from c. AD 800 a system of 16 runes (reduced from the original 24) came into use; these are known as the Nordic or Scandinavian runes (see *RUNES*). It was the period when Norse seamen, the Norsemen or Northmen, known as Vikings, or 'sons of the fiord,' descended from the coasts of Denmark, Norway, and Sweden, to ravage and plunder on the N. seas and off the coast of Great Britain. By the middle of the 9th cent. they were gaining their spoils as far S. as the waters of the Mediterranean (there and in France they were

called Normans); in the far NW., and perhaps in America (named by them Vinland); and in the SE. they successfully fought against the Slavs of Novgorod and founded a new Russian monarchy c. AD 862. Owing to this extraordinary territorial expansion, the Norsemen brought their dialects to the Orkney Is. and the Shetland Is. (where they were spoken from AD 800 to 1800), the Hebrides and the Isle of Man (800–1450), N. Scotland and parts of Ireland (800–1250), the Faeroes, Iceland, and Greenland, K. England (Northumbria, E. Anglia, and 'the five Danish boroughs': 875–1175), Normandy (900–1100), parts of Russia (862–1300?), and so forth. This territorial expansion certainly contributed to the further differentiation of the language, which we can study in the numerous runic inscriptions and the Scandinavian literature which was then arising. About AD 1000, with the definitive introduction of Christianity, the difference between *W. Norse* (Norway and its dependencies, including Iceland) and *E. Norse* (Sweden, Denmark, and their colonies) was already marked. Generally speaking, *W. Norse* preserved more primitive forms. The 11th cent. witnessed the development of the sub-dialects of *W. Norse* into Norwegian (q.v.) and Icelandic (q.v.) and of *E. Norse* into Swedish (q.v.) and Dan. (q.v.).

(3) While the N. L. of the first 2 periods are mainly preserved in runic inscriptions, the third period, called *Literary Norse*, c. AD 1100–1500, is the period of the great Early Scandinavian literature. Mention may be made of the Icelandic sagas, the great prose epics, celebrating the *sgðu-öld*, the epoch of the original colonisation of Iceland, c. 890–1030, and composed in the 12th and the 13th cents. During the third period the N. L. fully developed into the modern Scandinavian languages, each of them having various dialects. These can be classified in the following groups: (i) the dialects of Iceland and Greenland; (ii) the dialects of the Faeroe Is.; (iii) the N. Scandinavian group (N. Norway and N. Sweden); (iv) the W. Norwegian group; (v) Middle Swedish; (vi) the dialects of the is. of Gotland; (vii) S. Scandinavian, including S. Sweden and Bornholm, the Dan. is., and Jutland and N. Slesvig.

Norsemen, Northmen, or Vikings, in the strictest sense of the word, denotes the early dwellers in Norway; but the application of the term is sometimes extended to all Scandinavia. Between about 780 and 850 the hunting economy of Norway was strained, and emigration on a large scale took place. This factor was responsible for the Norse invasions of Europe which began on the E. coast of England in the year 787. Known to the English as 'Danes,' they were almost subdued by Alfred the Great; but they controlled England for a time in the 11th cent., under Canute (q.v.). It was at the end of the 8th cent. that they reached the Shetlands, Orkneys, and Hebrides. In Ireland they were also very powerful, and about 840 were masters of most of the northerly part,

founding their kingdom of Dublin. They reached the Faeroe Isles and Iceland about the end of the 9th cent., and from Iceland visited Greenland and thence travelled in the 11th cent. to N. America. They also pillaged the land of the Frisians and Flanders. In 843 they estab. themselves on the R. Loire, and a few years later had planted camps on most of the Fr. riva. They obtained possession of Paris in 845 (sacking the city), and again on 3 later dates. In 859 and 860 they sailed into the Mediterranean Sea, attacking Spain and the is. near and settling on the R. Rhone. Shortly afterwards they arrived in Italy, and continued to plunder tns. In 912 Rollo (q.v.) was made by the Fr. king the owner of the duchy of Normandy (q.v.). But in the S. regions the true Norsemen became absorbed into the alien race. See G. B. Depping, *Histoire des expéditions maritimes des Normands et de leur établissement en France au dixième siècle*, 1826; O. Delarc, *Les Normands en Italie*, 1883; P. B. du Chaillu, *The Viking Age*, 1889; C. F. Keary, *The Vikings in Western Christendom*, AD 789 to AD 888, 1891; I. Fischer, *Die Entdeckungen der Normannen in Amerika*, 1902; Katharine F. Boulton, *Asgard and the Norse Heroes* (Everyman's Library), 1903, 1914; T. D. Kendrick, *A History of the Vikings*, 1930 (with good selective bibliography); T. C. Lethbridge, *Merlin's Island*, 1948.

Norstad, Lauris (1907-), Amer. Air Force officer. Educ. at the U.S. Military Academy, West Point, N. was commissioned in the cavalry, but within a year transferred to the Air Corps. In the Second World War he was chief of staff 12th Air Force in Britain and N. Africa until 1943, then director of operations, Mediterranean Allied Air Force, until 1944, returning to the U.S.A. as chief of staff 20th Air Force at the end of the war. He was promoted lieutenant-general in 1947 and appointed deputy chief of staff. From 1951 until 1956 he was Commander-in-Chief U.S. Air Force in Europe. In 1956 N. succeeded Gen. Gruenther as supreme allied commander in Europe (S.H.A.P.E.).

Norte de Santander, dept. of Colombia, lying in the NE., with Venezuela to the E., the dept. of Magdalena to the N. and W., Santander to the SW., and Boyaca to the S. The cap. is Cúcuta. The industries include subropical products and petroleum. Area 8297 sq. m.; pop. (1955 estimate) 400,370.

North, Eng. family, among whose prominent members are: **Edward N.**, 1st Baron N. (1496-1564), chancellor of the Court of Augmentations, who was raised to the peerage in 1554. **Sir Thomas N.** (c. 1535-c. 1601), man of letters, chiefly distinguished for his trans. of Marcus Aurelius and Plutarch's *Lives*, which latter work was much drawn upon by Shakespeare. **Francis N.**, 1st Baron Guilford (1637-85), a lawyer, solicitor-general, 1671; attorney-general, 1673; chief justice of common pleas, 1675-82; lord chancellor, 1682; raised to the peerage, 1683. **Sir Dudley N.** (1641-91), one of the few important exponents of free trade before Adam Smith. **Roger N.** (1653-1734), a

lawyer, the author of *Lives of the Norths* (Francis N., Sir Dudley N., and Dr John N.), an Eng. classic (issued 1742-4), collected and ed. by Henry Roscoe in 1826 and by A. Jessopp (including Roger N.'s autobiography) in 1890. **Frederick N.** (q.v.), 2nd Earl of Guilford.

North, Christopher, see WILSON, JOHN. **North, Sir Dudley** (1641-91), economist, son of Dudley, 4th Lord N. He made a fortune in trading with the Levant and subsequently became a commissioner of customs and entered Parliament when, according to his brother, Roger N., he assumed the place of 'manager for the Crown in all matters of revenue.' As an economist he is remembered by his *Discourses upon Trade, principally directed to the cases of the interest, coinage, clipping and increase of money* (pub. anonymously in 1691). This work did not attract notice on its pub. nor does it seem to have been used by subsequent political economists. But it was ed. by J. R. McCulloch for the *Select Collection of Early English Tracts on Commerce*, printed by the Political Economy Club, London, in 1856. N. is highly praised by Wilhelm Roscher (q.v.) who includes his name among those who in the 17th cent. gave England the lead in Europe. Roscher points to the similarity of N.'s work to Adam Smith's classic and the tract does in fact anticipate Adam Smith's doctrines and those of the earlier free trade school to a marked degree, while being free from the prejudices and fallacies of the mercantile system (q.v.).

LORD NORTH

North, Frederick, 2nd Earl of Guilford, better known as Lord North (1732-92), statesman, educ. at Eton and Trinity College, Oxford. He entered Parliament in 1754, and was a junior lord of the Treasury from 1759 to 1766, in which year he became joint-paymaster of the forces. In 1767 he became chancellor of the exchequer and leader of the House of Commons in the Grafton administration, and 3 years later he became Prime

Minister. He acted as the mouthpiece of the king, who ruled the House of Commons by a group of 'King's Friends,' and, by appeals to his loyalty, induced N. to carry out his will. N. was personally opposed to the Amer. war, but allowed the king to influence him against his better judgment. He resigned in Mar. 1782, but with Fox formed a gov. which lasted from April to Dec. 1783, after which he did not again hold office. He succeeded to the earldom in 1790. See R. Lucas, *Lord North, Second Earl of Guilford, 1732-92*, 1923, and life by W. B. Pemberton, 1938.

North, Sir Thomas (c. 1535-c. 1601), translator, second son of the 1st Lord N., is said to have studied at Cambridge. He entered Lincoln's Inn in 1557, but devoted himself to literature rather than to law. He is best known by his classic trans., pub. in 1579, of Plutarch's *Lives of the Noble Grecians and Romans*, from the French of Amyot, who himself had added charm to Plutarch's pedestrian style. N.'s trans. is in a vivid, dramatic, idiomatic English and is a masterpiece beyond either Amyot or Plutarch. It was the repository from which Shakespeare drew his knowledge of anc. hist.: in *Antony and Cleopatra* and *Coriolanus* N.'s language is often followed. Another trans. by N. was from an It. version of an Arabic book of fables, and bore the title *The Morale Philosophie of Dont*, 1570.

North Adams, city of Berkshire co., Massachusetts, U.S.A., on the R. Hoosic, 19 m. NNE. of Pittsfield. It carries on cotton and woollen manufs. and also produces electrical goods, shoes, and paper; it has a printing industry. There is a state teachers' college. Pop. 21,567.

North Africa, see AFRICA; CYRENAICA; LIBYA; MOROCCO; TRIPOLITANIA; TUNIS.

North Africa, Second World War, Campaigns in, see AFRICA, NORTH.

North America (Geology; Archaeology; Ethnology)

Geology. The oldest part of N. A. lies to the E., the dists. of New England, N. New York, and the Blue Ridge being the earliest parts of the continent to rise above the sea. The dist. is chiefly floored with Archaean formation where it is associated with Cambrian and Silurian beds. The Adirondack Mts and the Appalachian Mts are surrounded by Cambrian and Silurian formations. Scattered here and there are patches of Jura-Trias, some of which contain large deposits of coal. These areas widen further northwards, similar phenomena being found in the Hudson valley. There is also a carboniferous formation, loaded here and there with anthracite coal deposits. Bordering Lake Superior are areas of Algonkian formation in which vast iron-ore deposits are found. Towards the Atlantic are soft Tertiary beds which trend southwards to Florida. In the Appalachian valley are alternate beds of Algonkian, Cambrian, Silurian, and Devonian deposits, bearing evidence of considerable erosion. The Mississippi valley is floored with carboniferous layers containing large quantities of coal, and in SW. Missouri are extensive Silurian areas holding iron and zinc. Of

more recent formation are the great plains of N. A., composed mainly of Cretaceous and Tertiary beds, the oldest formation being Oklahoma, where Jura-Trias predominate. That remarkable region the Cordilleras, reaching through the Rocky Mts group, presents all geological stages from Silurian to Tertiary. The Sierra Nevada is a monoclinical range descending westwards to California, most of it being granite. In anc. times the N. part of the continent was buried under ice during the movement of a great glacier from the N. Traces of this exist as erosion in Canada and deposition in the U.S.A. The great prairies of N. A. are composed of transported soil, mainly loess (q.v.), and form part of a great belt which reaches through Europe to Russia, thence from Turkestan to China, reappearing in N. A. Wind played an important part in the origin of this belt, attacking the finer elements of glacier débris and depositing them over a wide area, where they became modified by water.

The chief feature of Canadian geology is the great area known as the Canadian or Pre-Cambrian Shield or the Laurentian Plateau (see LAURENTIAN ROCKS). This shield is underlain by formations of the Pre-Cambrian age, which occupy nearly the whole of the country E. of a line joining Lake Winnipeg and Great Bear Lake, excepting the Maritime Provs., the S. of Ontario and Quebec, and a part of Ontario adjacent to the S. coast of Hudson Bay. The Pre-Cambrian rocks include the oldest known geological formations. Surrounding this Pre-Cambrian area is a wide extent of flat-lying sedimentary formations of Palaeozoic, Mesozoic, and Cenozoic age. As one approaches the Atlantic and Pacific coasts, the flat-lying sedimentary series yield to great assemblages of folded sedimentary and volcanic rocks pierced by granite bodies and forming the Appalachian system of mts on the E. and the Great Cordillera on the W. In the extreme N. an analogous mt range stretches from Greenland westward into Ellesmere Is. The Pre-Cambrian formations are prolific in mineral deposits of great number, variety, and extent. They occur generally at or near the contact of the intrusives and the intruded rocks, and among them are the gold deposits of Porcupine and Kirkland Lake, associated with intrusions of porphyry, the silver deposits of Cobalt, S. Lorrain, and Gowganda, associated with diabase sills, the vast nickel-copper deposits of Sudbury, associated with norite, the auriferous copper sulphides of W. Quebec, the copper-zinc sulphides of Flin Flon, and the iron ores and iron pyrites of Ontario; in the Grenville-Hastings area are found deposits of galena, mica, graphite, feldspar, magnesite, kaolin, molybdenite, talc, and apatite.

Archaeology. The first significant discovery of archaeological remains in N. A. was in 1902, when a skeleton was unearthed at Lansing, Kansas; and in Florida human remains have been found, accompanied by objects of human handiwork; but no definite age has been assigned

to these finds. Mineralised bones were discovered near Osprey, Manatee co., in 1880. The features of the facial bones bear close resemblance to those of Florida Indians. Some remains found near Omaha, identified as the Nebraska Loess man, were found in 1906, accompanied by flint implements. Considerable archaeological finds were discovered in the Los Angeles area, including a number of animal bones of the Quaternary period, and in 1914 a female human skeleton bearing similarity to the Californian Indian was found. Pleistocene remains were unearthed between 1913 and 1916 near Vero, Florida, including fossilised plant remains and vertebrate fossils. Perhaps the most complete Pleistocene skeleton yet found is that of the Lone Wolf Creek, near Colorado, Texas. A similar discovery was made near Folsom, New Mexico, in 1925. The Field Museum expedition in 1931 found traces of 3 distinct cultures at Lowry Ruin, Colorado. The walls show fragments of painting in black and white, and date back 3000 years, having been covered for at least 1000. Prehistoric designs representing sun, rain, lightning, and clouds are apparent, and masonry and pottery show work of a highly developed ancient Indian tribe. In 1954, near Midland, Texas, human bones believed to be of the Pleistocene period were found. An imperial archaeological survey of the Brit. Columbian coast was made in 1938, and much active research followed.

Ethnology. The Indians of N. A. are said to have come originally from the E. hemisphere. Hitherto N. A. has yielded no palaeolithic remains either of human beings or human implements. It is reasonable to assume that a migration took place from N. Asia via the Bering Strait. The theory claims some support by reason of the similarity in feature and speech in Eskimo types on both sides of the strait. Indeed Paleo-Asiatic tribes such as the Chukchee and Yukaghir are markedly similar to the Amer. types found among the Dene and Haida tribes, and a Paleo-Asiatic link is pointed out by some authorities with the Amer. Indians (see AMERICAN INDIANS). In E. Siberian races the point of resemblance is greatest.

For geography, climate, products, manufs., forms of gov., hist., etc., see ALASKA; CANADA; UNITED STATES OF AMERICA; and articles on the provs. and states of these countries.

Parkins, *Geography of North America*, 1934; R. Ruedemann and R. Balk, *Geology of North America*, 1939; S. Northey, *The American Indian*, 1939; F. C. Hibbs, *Treasure in the Dust*, 1953; and the pubs. of the U.S. Geological Survey. There are details of recent work in the *Digest of American Journal of Archaeology*, being vol. li pub. in 1947.

North American Indians, see AMERICAN INDIANS.

North American Native Languages.

Among the better known larger groups of languages spoken in N. America are Eskimo, now regarded by some scholars as a branch of the Ural-Altaic linguistic family (q.v.), Athabascan, Shoshonean, Algonkin, Caddoan, Iroquois, Muskogean, and Siouan, all of which are considered Amer. Indian or Amerind, or 'Red Indian languages.'

The Eskimo, or Innu, occupy more than 5000 m. of seaboard, from NE. Greenland to the mouth of the Copper R. in W. Alaska. The numerous Eskimo dialects (respectively spoken in Greenland, Kuskokivim, Labrador, Baffin Land, the Aleutian Is., and so forth) differ very widely, especially in their vocabularies, and employ different alphabets. The Athabascans, subdivided into 2 branches, the N. (Déné or Tinné, meaning 'men') and S. (Navaho, Apache, Hupa), once occupied a wide area in the NW. from the Rockies almost to Hudson Bay, small detachments spreading westwards to Washington, Oregon, and California, and in the SW. (Colorado, New Mexico, and Arizona). Navaho is one of the main languages; it is spoken by some 25,000 people, living in N. Arizona. Hupa is spoken in the ter. lying on the lower Trinity R. in N. California. The Shoshoneans were mainly centred in the region of the Rocky Mts. The Algonkins are much better known: their main linguistic branches are Blackfoot or Siksika, Micmac, Cheyenne, Arapahoe, Cree, which was reduced to writing about 300 years ago, Chippewa or Ojibway, Fox, and Lenni-Lenape and some other languages, which are less important.

The Caddoans live mainly on the Red R. in Louisiana, along the rivs. of NE. Texas, in Kansas, and Nebraska. This linguistic group consists of 4 major languages: Caddo, Pawnee, Wichita, and Kitsai or Kichai. The term Iroquois was originally applied to a group of 5, and later 6, tribes (Mohawk, Onondaga, Oneida, Cayuga, Seneca, Tuscarora), at the time united in a strong confederacy. Cherokee is now the main Iroquoian language; the Cherokees formerly lived in what is now N. Georgia and N. Carolina, but were moved to Indian ter. in 1838-9; they employed their own script, a syllabary which was the most developed writing ever created by an Amer. native. Huron and Attiwandaron are extinct; some other languages, such as Wyandot, are still spoken. Muskogean ter. extends along the rivs. flowing into the Gulf of Mexico parallel to the Mississippi. The following are the main languages belonging to this group: Muskogee or Muskokee, Creek, Seminole, Chickasaw, and Choctaw. Winnebago (Minnesota and Wisconsin) is one of the oldest Dakota languages. The Assiniboin or 'Stone Sioux' is another branch; it separated from the main stock about 300 years ago. An important dialect, originally spoken by a numerous tribe inhabiting Missouri and Arkansas, it is nowadays spoken by only 220 people living in Oklahoma.

Pacific areas. The ethnical hist. and linguistic situation of the native pop.

of the 'Pacific slope' are entirely different from those of the rest of N. America. The following are some of the main languages spoken in the extreme W.: Chinook, which embraces a number of closely related dialects originally spoken on both sides of the Columbia R. from the Cascades to the sea; Tillamook, spoken on the Oregon coast S. of the Columbia R.; Kutenai, spoken in the area from about 50° N. lat. to N. Idaho and Montana. Other languages spoken in Brit. Columbia belong to the Wakashan group; there are 3 main dialects, each divided into sub-dialects differing in phonetics and vocabulary, Kwakiutl being one of them. The Salish or Flathead tribes of the coast and the Kalispel constitute the Salishan linguistic group. Tsimshian and Nootka are spoken on the Skeena R. in N. Brit. Columbia and on the Is. further to the S. Takelma was spoken in the SW. of the state of Oregon. Maidu or Pujanen, comprising various dialects, is spoken in N.E. California; Dieguens is spoken in S. California; Pima is spoken in S. Arizona by a semi-civilised tribe; and Zuni is now spoken only by 2000 people on the Zuni reservations in New Mexico. *See* under LINGUISTIC FAMILIES. *See also* LANGUAGES, CLASSIFICATION OF; MEXICAN AND CENTRAL AMERICAN NATIVE LANGUAGES; SOUTH AMERICAN NATIVE LANGUAGES.

'North American Review,' critical review, reputed to be the oldest magazine in the world. The first number was pub. with Wm Tudor as its editor in 1815. In the 19th cent. practically every notable Amer. writer, together with some of the greatest contemporary thinkers in England, at one time or another contributed to its columns. One of its most celebrated editors was James Russell Lowell (1864-1872). It became a recognised channel in America for the most comprehensive discussions of important public questions. George B. M. Harvey (q.v.) was the owner and editor, 1899-1926. It ceased pub. in 1940.

North Atlantic Treaty, signed on 4 April 1949 at Washington by the U.S.A., Great Britain, Canada, France, Belgium, the Netherlands, Luxembourg, Norway, Denmark, Iceland, Italy, and Portugal, by which the U.S.A. associated herself with the W. European countries in security arrangements for their common or mutual defence against possible aggression. The pact had its origins in the hist. of the two years 1947-8, during which failure to come to terms with the Soviet Union and its satellites forced the W. countries to seek economic and security arrangements among themselves. Greece and Turkey were admitted to the treaty, 1951 (effective, 1952), and the Federal Ger. Rep. in 1954. The N. A. T. Organisation (N.A.T.O.) was organised in Feb. 1952, its first secretary-general, Lord Ismay (q.v.), being appointed in Mar. Its H.Q. are in Paris. Spaak (q.v.) was appointed Ismay's successor, taking up his office in 1957. The prin. body of the organisation is the council, on which members are generally represented by their foreign

minister or defence minister and which meets two or three times a year at ministerial level, a permanent representative acting on the minister's behalf at other meetings. In 1950 the council agreed on the estab. of a unified W. European defence force, under a supreme allied commander, with H.Q. near Paris. The first supreme allied commander was Eisenhower (q.v.): the present one (1958) is Gen. L. Norstad (q.v.). In Dec. 1957 the Amer. president (Eisenhower) and the Brit. premier (Macmillan) were among the leaders of gov. who attended the N.A.T.O. conference in Paris, at which agreement was reached in general on the principle of the Amer. offer to supply an atomic stockpile and nuclear weapons to European members of the organisation. *See* Lord Ismay, *Nato, the First Five Years, 1954.*

North Australia, *see* NORTHERN TERRITORY.

North Battleford, city of Saskatchewan, Canada, on the N. Saskatchewan R., 100 m. W. of Saskatoon. A distributing centre for a large area in N. central Saskatchewan, N. B. has elevators, stockyards, and mill works, and receives natural gas by pipeline from a neighbouring field. It is the site of a prov. mental hospital. Pop. 7480.

North Bay, tn and watering-place of Ontario, Canada, on Lake Nipissing, 190 m. N. of Toronto. N. B. has foundries and machine shops, manufs. railway cars and ships, pulp and paper. There are gold- and silver-mines in the neighbourhood. Pop. 20,160.

North Berwick, seaside resort and royal burgh of Scotland in E. Lothian co., 22½ m. (by rail) ENE. of Edinburgh. It was made a royal burgh by Robert III; the ruins of a Cistercian abbey founded by David I are in the neighbourhood. At the harbour are ruins of a pre-Reformation church. One mile to the S. is the hill called N. B. Law, rising to 612 ft; 3 m. E. of the tn are the ruins of the 14th-cent. Tantallon Castle, whilst 2 m. SW. is Dirleton Castle, built in the 12th cent. It has become popular as a watering-place, having a good beach and fishing, and 2 fine golf-courses. Pop. 4000.

North Berne, *see* BORNEO, NORTH.

North Brabant, largest prov. of the Netherlands, in the S. of the country. In the Middle Ages the duchy of Brabant included S. Brabant, which is now a prov. of Belgium (*see also* BRABANT). Cattle are raised, wheat grown, and sugar-beet produced in the NE., though the flat land is generally marshy and unproductive. Reclamation in the SE. has increased the cultivation. There are textile and tobacco industries and the manuf. of incandescent lamps (Eindhoven). The cap. is 's Hertogenbosch. Area 1920 sq. m.; pop. (1954) 1,354,363.

North Braddock, bor. of Pennsylvania, U.S.A., in Allegheny co., 9 m. SE. by E. of Pittsburgh. There are manufs. of steel products. Pop. 14,720.

North Bridgewater, *see* BROCKTON.

North Cape, headland on the is. of Magerøy (q.v.), Norway. It is the most northerly point of Europe, being in lat.

71° 10' 21" N. A road to the N. C. was opened in 1956. The midnight sun is seen from 14 May to 30 July.

North Carolina (Tar Heel State or Old N. State), S.E. Atlantic state of U.S.A., bordered by Virginia on the N., S. Carolina on the S., Georgia on the S.W., and Tennessee on the W. The coastal plain, forming about 40 per cent of the state, is fringed by a margin of swamps and shoals which are extremely treacherous to navigation. The largest of these swamps is known as Dismal Swamp. The Piedmont plateau region (45 per cent of the state) is bold and somewhat rugged in contour. The chief ranges of the Appalachian Mt region are the Blue Ridge and the Unaka Mt range. The highest peak of the Unakas is Mt Mitchell (6684 ft). The mts of this region are for the most part clothed with dense forests, which occupy two-thirds of N. C. The scenery is exceptionally beautiful, Asheville being the most famous resort, with a fine golf-course. N. C. is exceptionally rich in minerals, which include clay products, mica, feldspar, barytes, talc, kaolin, asbestos, granite, monazite, zircon, columbite, wolframite, etc. In 1953 mineral products were valued at \$26,343,000. The chief occupation is agriculture. Maize is the prin. crop (65,000,000 bushels in 1947). The chief cash crops are cotton, tobacco, and peanuts. Cultivation of cotton on 619,000 ac. in 1951 produced nearly 550,000 bales. N. C. leads in the production of tobacco (978,620,000 lb. in 1951) and of sweet potatoes. Also grown are peaches and *sorgo* syrup. The ann. lumber cut is about a billion ft, chiefly yellow pine. Tar and rosin are also flourishing trades. The state is first in cotton milling, and leads in cigarette manuf. (70 per cent of the country's production). Also important are the rayon, lumber, paper and pulp, fertiliser, and mining industries. Fisheries in the state are valuable.

The cap. of the state is Raleigh (pop. 65,679); the chief port is Wilmington, the largest city being Charlotte. Other cities are Winston-Salem, Durham, Greensboro, Asheville, and High Point. The state is represented in Congress by 2 senators and 12 representatives. Its General Assembly has a Senate of 50 and a House of Representatives of 120 members, elected for 2 years. N. C. was one of the original 13 states. The ter. was discovered by Amadas and Barlow in 1584, and a colony settled in Roanoke Is. in 1585-6, the famous 'vanished colony' which in 1587 was found to have disappeared without leaving a trace. The ter. was granted to various 'proprietors' by Charles I and Charles II, but in 1728 the Crown resumed control. The pop. consists of over 99 per cent native-born Americans, of whom 27.4 per cent are Negroes. The percentage of illiteracy is still somewhat high, but is being rapidly reduced by compulsory attendance at the schools. There are the state univ. at Chapel Hill and Duke Univ. at Durham, endowed with \$15,000,000 by J. B. Duke, the cigarette millionaire. There are also Davidson College (at

Davidson) and Wake Forest College (at Wake Forest). There are separate schools for white, coloured, and Indian children. There are 12 state-supported teachers' colleges, 6 white, 5 Negro, and 1 Indian. The area of the state is 52,712 sq. m., of which 3570 sq. m. are inland water. Pop. (1950) 4,061,929. See R. D. Connor, W. K. Boyd, and J. G. Hamilton, *History of North Carolina, 1584-1912*, 1919; A. R. Newsome, *North Carolina Manual*, 1929; S. H. Hobbs, *North Carolina: Economic and Social*, 1930; H. T. Lefler, *North Carolina's History told by Contemporaries*, 1934; Federal Writers' Project, *North Carolina: a Guide to the Old North State*, 1939; A. Henderson, *North Carolina, The Old State and the New*, 1941; P. W. Wager, *North Carolina: the State and its Government*, 1947.

North Dakota, N. central state of the U.S.A., bounded on the N. by Canada and known as the Northern State, on the S. by S. Dakota, W. by Montana, and E. by Minnesota. The physical features are bold and simple. Three vast tablelands rise successively from E. to W. The Red R. flows through the northernmost of these tablelands, which has a mean breadth of 50 m. and a mean elevation of 900 ft. The second tableland has a mean breadth of 180 m. and a mean elevation of 1400 ft. The third and most westerly tableland is called the Coteau du Missouri, and covers half the state. This plateau is watered by the Missouri. The rainfall is low, and the winters cold but sunny. Devils Lake, or Minniwaukon, in the N.E., has no outlet, and is salt. The valley of the Red R. is very fertile, and produces fine wheat crops. N. D. leads usually in the production of barley, spring wheat, rye, flax, alfalfa, and *durum* wheat. Other important products are potatoes, hay, oats, and maize. Horse and cattle raising flourishes. The mineral resources consist chiefly of coal, in the Coteau du Missouri, and great lignite deposits. The co. seat is Bismarck (18,640); other cities: Fargo (38,255); Grand Forks (26,836); and Minot (22,030). The state sends to Congress 2 senators and 2 representatives. It has a Senate of 49 members elected for 4 years, and a House of Representatives of 113 members elected for 2 years. There is a state univ. and a state agric. college. Area 70,665 sq. m., of which 611 sq. m. are water. It was first settled c. 1812-15. The state formed part of the Louisiana Purchase and remained for a long time unorganised. The part E. of the Missouri R. was attached to the ter. of Minnesota; the part on the W. to the ter. of Nebraska. Dakota was organised as a ter., 1861. N. D. was admitted as a state in 1889. Pop. (1950) 619,636. See C. Lounsbury, *Early History of North Dakota*, 1913; Z. I. Trinka, *North Dakota To-day*, 1919; L. F. Crawford, *History of North Dakota*, 1931, and *North Dakota*, 1938; Federal Writers' Project, *North Dakota: a Guide to the Northern State* 1938; B. Nelson, *Land of the Dakotas*, 1946.

North Downs, see Downs.

North-East Passage, route, finally found by A. E. Nordenskiöld (q.v.) in 1878-9,

from Europe and the Atlantic through the Arctic Ocean round the N. coast of Asia to the Pacific Ocean. *See also* ARCTIC EXPLORATION and NORTHERN SEA ROUTE.

North-East Polder, area of the Netherlands, consisting of part of the former Zuider Zee, now called IJsselmeer (q.v.). It is situated NW. of the prov. of Overijssel, and includes the two former ls. of Urk and Schokland. Its reclamation, completed in 1942, has provided an additional 120,000 ac. of agric. land. A number of vils. and modern roads have been built, and the new tn of Emmeloord is the social and commercial centre of the Polder (q.v.). Pop. 18,600.

North-East Provinces, China, *see* MANCHURIA.

North Foreland, *see* FORELAND, NORTH AND SOUTH.

North Foreland, Battles off the, were 3 battles of the Dutch wars. The first battle commenced on 2 June 1653, between fleets commanded by van Tromp and De Ruyter on the Dutch side, and Monck, Deane, Penn, and Lawson on the Eng. During the first day's fighting Deane was killed, but Blake came to the reinforcement of the English at night with 18 fresh ships, and on the next day the Dutch were obliged to retire. They had 11 ships captured and 7 or 8 sunk in the action. The second battle was one of the hardest fought and most disastrous battles of the second Dutch war. The Eng. fleet, under the command of Monck, engaged the Dutch fleet, commanded by De Ruyter, in the Downs, on 1 June 1666. The fighting went against the English, who eventually had to retire with a loss of 21 vessels against the Dutch loss of 7 ships only, although the victors were not in much better plight than the vanquished. An Eng. victory was gained in the third engagement, of 25 and 26 July 1666.

North German Confederation, league of Ger. states estab. in 1867, linking under Prussian leadership the 22 states N. of the R. Main. The King of Prussia was president and commander-in-chief of the army of the confederation. *See also* under GERMANY, *History*.

North German Lloyd, *see* NORDDEUTSCHER LLOYD.

North Holland, prov. of the Netherlands, comprising the peninsula between the IJsselmeer (Zuider Zee) and the N. Sea, including the is. of Texel on the N. side, and bounded on the S. by the prov. of S. Holland and Utrecht. Area 1150 sq. m. The inhab. are chiefly engaged in cattle-raising, agriculture, and gardening. There is considerable trade in dairy produce, and linen is manuf. in the tns. The fishing industry on the E. coast declined after the completion of the Afsluitdijk (q.v.) in 1932. Much of the land is below sea level and protected by dykes, and there are sev. canals, notably the N. Holland Canal and the N. Sea Canal. The chief tns are Haarlem (cap.), Amsterdam, and Hilversum. Alkmaar and Edam are famous cheese market centres. Pop. (1954) 1,950,244.

North Island, *see* NEW ZEALAND.

North Kazakhstan, oblast (prov.) of the

Kazakh S.S.R., lying on the N. border. The Ishim R. traverses the region, of which Petropavlovsk is the chief tn. It is in the black earth steppe region and produces grain, especially wheat, and beet. There are iron-ore deposits between the Ishim and upper Irtysh R.s. Pop. 360,000.

North Lancashire Regiment, *see* LOYAL REGIMENT.

North Land, *see* SEVERNAYA ZEMLYA.

North London Collegiate School, for girls, estab. in 1850 by Miss Frances Mary Buss (q.v.) in Camden Town, London, was among the first to recognise the importance of an intellectual education for girls. In 1940 the school moved to new buildings at Canons, Edgware.

North Ossetian Autonomous Republic lies on the N. slopes of the central part of the main Caucasus range and the adjacent lowland, traversed by the R. Terek. There are lead, zinc, and oil deposits. Maize and wheat growing, horticulture, sheep and cattle raising are carried on, and the industries include non-ferrous metallurgy, oil extraction, and food (including cheese). The cap. is Ordzhonikidze (q.v.). The area was included in the Mt People's Autonomous Rep. (q.v.) in 1920, was formed the N. O. A. Oblast in 1924, and the Rep. in 1936. It was largely occupied by Germans in 1942, and the scene of bitter fighting. Area 3500 sq. m.; pop. (1956) 417,000, mostly Ossetians (q.v.) and Russians. *See* W. Kolarz, *Russia and Her Colonies*, 1952.

North Park, one of the 'parks of Colorado', U.S.A., in Larimer co.; its area is 2000 sq. m., and it stands at a mean elevation of from 8000 to 9000 ft. It is noted for its big game.

North Plainfield, residential bor. of New Jersey, U.S.A., in Somerset co., 12 m. SW. of Jersey City. It manufs. metal products, electrical motors, and office equipment. Pop. 12,766.

North Pole, *see* ARCTIC EXPLORATION.

North Rhine-Westphalia (Ger. *Nordrhein-Westfalen*), *Land* of W. Germany, in the Federal Rep., bounded on the N. by Lower Saxony, on the E. by Hessen, on the S. by Rhineland-Palatinate, and on the W. by Belgium and the Netherlands. It comprises the former Prussian prov. of Westphalia, the governmental dists. of Cologne, Aachen, and Düsseldorf (once parts of the Rhine Prov., q.v.), and Lippe (qq.v.). In 1949 36 sq. m. of its ter. were given to Belgium and the Netherlands in frontier adjustments. It is divided into 6 areas, 38 urb., and 57 rural dists. There are 3 univs. (Cologne, Bonn, and Münster, qq.v.), and there are also a technical univ. at Aachen and a medical school at Düsseldorf. The pop. is (1954) 52.8 per cent Rom. Catholic and 42.2 per cent Protestant. The *Land* contains the Federal cap. Bonn. Area 13,107 sq. m. Cap. Düsseldorf. Pop. (1955) 14,693,200.

North Riding, *see* YORKSHIRE.

North Sea, or German Ocean, European sea, bounded on the E. by the continent of Europe, on the W. by Great Britain; on the S. it is connected by the Straits of

Dover with the Eng. Channel and the Atlantic; and on the N. it extends to the Shetland Isles, joining the Norwegian Sea in the NE. The maximum length is 600 m., the greatest breadth 400 m., and the total area 182,000 sq. m. The N. S. is very shallow, the Continent and Britain once being continuous. Its mean depth is about 50 fathoms. The Dogger Bank stretches across the N. S. from E. to W. The coasts of the N. S. are mainly flat; the Eng. coast consists of sandy cliffs and beaches, and the continental coast consists of marshes and protecting banks. The N. S. waters are composed of a mixture of Baltic water through the Skagerrak, Atlantic water through the Shetland-Faeroe channel, and Arctic water through the Norwegian Sea, and consequently there is a great variety of temp. and salinity in various parts of the sea. The union of the N. tidal wave and that from the straits of Dover sends high tides to London, a fact which is invaluable for shipping purposes. The Atlantic tides, which have a salinity of 35 *pro mille*, send out considerable heat. The fisheries of the N. S. are the most productive in the world. A Convention regulating the polling of the fisheries was concluded in 1882 by the European countries interested. Trawl fishing is extensively carried on in the shallow parts of the sea, and yields vast supplies of haddock, cod, whiting, halibut, sole, brill, turbot, plaice, etc. Line fishing is practised in the deep waters. The courses of the herring shoals round Britain are remarkable. In Shetland herring fishing commences in June, and later at various stages southward down the Brit. coast, till it ends in the late autumn and winter off Norfolk.

North Sea-Baltic Canal, see KIEL CANAL.
North Sea Canal (Dutch Noordzeekanaal), Netherlands, completed in 1876, links Amsterdam with the N. Sea. It is one of the largest artificial inland waterways in the world, being 15 m. long, 100 yds. wide, and 40 ft deep, lying at 33 ft above sea level. New big locks at IJmuiden, the N. end of the canal, were inaugurated in 1930; partly destroyed during the Second World War, they were rebuilt in 1946.

North Shields, see SHIELDS, NORTH.

North Somerset, see SOMERSET.

North Staffordshire, University College of, founded in 1949 at Stoke-on-Trent. The chief force behind its inception was the activity of the city council of Stoke-on-Trent, the bor. council of Burton-on-Trent, and the co. council of Staffs, a corporate work paralleled only by the estab. of the 'Town's College' by the Edinburgh co. council in 1563. The U. C. of N. S. was empowered to organise from the outset its own examinations for a B.A. degree, although the univs. of Oxford, Manchester, and Birmingham sponsored the college and appointed representatives to an academic council responsible for the maintenance of academic standards. The normal degree course comprises a foundation year of general studies and 3 further years of more specialised studies at honours level. As

a whole it is designed to avoid the danger of over-specialisation and yet combine breadth with depth. Keele Hall, some 5 m. from Stoke-on-Trent, was acquired as a central site; the capital expenditure for building was made the responsibility of the Univ. Grants Committee.

North Staffordshire Regiment, The (The Prince of Wales's). Formerly the 64th and 98th Regiments. The 64th, raised in 1756 as the 2nd Batt. 11th Foot, was made a separate regiment in 1758, and served in America, the W. Indies, and India. The 98th, raised in 1824, served in the Cape of Good Hope, China, and India. The 2 regiments were linked in 1881 to form the present regiment, which served in the S. African war, 1900-2. During the First World War it raised 17 battalions, which served in France, Flanders, Gallipoli, Egypt, Mesopotamia, Persia, and on NW. Frontier of India. In the Second World War the regiment fought in Libya and Italy. Amalgamation with the S. Staffordshire Regiment takes place in 1959.

North Sydney: 1. Residential suburb of Sydney, New S. Wales, Australia. It is situated on the N. shore of Port Jackson, and on account of overcrowding and transport difficulties in Sydney, some big commercial undertakings have transferred their offices to N. S. Pop. 55,970.

2. Nova Scotia, *see* SYDNEY.

North Tarrytown, vil. of Westchester co., New York, U.S.A., 26 m. N. of the city of New York, on the Hudson R. Near here is Sleepy Hollow of Washington Irving's *Legend of Sleepy Hollow*, and it is also the burial place of Irving. It possesses an old Dutch Reformed church, dating from 1699. It manufs. electrical products and automobiles. Pop. 8800.

North Tonawanda, city in Niagara co., New York, U.S.A., on the Niagara R., 10 m. N. of Buffalo. Its greatest amount of trade is carried on in lumber, but it also manufs. iron, nuts and bolts, boilers and engines, radios, toys, stone, metal, and paper products, and chemicals, drawing its electric power from Niagara Falls. Pop. 24,731.

North-West Frontier of the Indian sub-continent, one of the great frontiers of the Commonwealth, nearly 2000 m. in length, extending from the Karakoram Mts in the N. of Kashmir to the Arabian Sea. In the far N. it is bordered by Sinkiang; thence, for a short stretch, it borders Russian Turkestan along the Pamirs, then turns S. and for the rest of its length lies through the mt hinterland of the Afghan border tribes. From Chitral to Baluchistan, the boundary is the 'Durand line,' agreed with the Afghan Gov. in 1894. Throughout its length the frontier traverses Muslim ter., the greater part of which is occupied by warlike tribesmen. Sinkiang, too, is predominantly Muslim. On the Kashmir side, in this region, are the small Muslim states of Hunza and Gilgit now administered by the Pakistan Gov. Before the independence of India the Brit. Gov. of India was responsible for defending the N.-W. F., and most of the Brit. Indian Army was

concentrated on the frontier or in cantonments in the Punjab near by. Military action was not infrequent, but was with recalcitrant tribes, not an external enemy. Though in 1949 the Pakistan Gov. had fewer forces at its disposal, the position, in one respect, was more favourable for Pakistan than it was for the Brit. authorities, because as a great Muslim power it was likely to continue to attract a degree of loyalty from the tribesmen never given to Britain. Pakistan therefore withdrew most of its regular forces from the frontier, relying on the Frontier Irregular Corps and a few aeroplanes to keep the peace. Considerable progress has been made in development and pacification, but an uncertain factor is the attitude of the Afghan Gov. towards the Durand line settlement, which it had always regarded as one which deprived it of the allegiance of the tribes on the Indian (now Pakistan) side of the line. In 1947, after the decision to partition India, an effort was made to satisfy Afghan sentiment by holding a plebiscite in the N.-W. F. Prov. on the issue whether the Afghans there wished to join India or Pakistan. The plebiscite result was in Pakistan's favour, a result which was resented by the Afghan Gov., which had intimated to Britain that it did not regard the prov. as a part of Brit. India. Despite propaganda from Kabul that Afghanistan was no longer interested in the idea of the independence of the N.-W. F., it was obvious that official circles in Kabul still entertained hopes of Afghanistan *irredenta*, and there has been a prolonged propaganda campaign in favour of a visionary Pushtoonistan, proposed as an independent ter., including the tribes on both sides of the frontier. It has made little headway (see also *KHYBER PASS*). See Sir W. R. Barton, 'The North-West Frontier,' in the *Fortnightly*, Aug. 1949.

North-West Frontier Provinces, see **PAKISTAN**.

North-West Highway System, the Canadian section (1257 m.) of the Alaska Highway. See **ALASKA**, *The Alaska Highway*.

North West Mounted Police, famous force of paid and uniformed military police organised by the Canadian Gov. in 1873 under civil law and popularly known as the 'Mounties.' Though the Red R. Rebellion had ended in 1871, there was no security in the thinly pop. W. for life or property after Gen. Wolsley's soldiers had been withdrawn. The problem was met first by sending a garrison to replace Wolsley's soldiers and then by raising the N. W. M. P. In the summer of 1874 their scarlet coats (scarlet was chosen for the tunic because it was admired by the Indians on the Canadian side of the border) appeared on the prairies for the first time, when a detachment of 300 men marched from Dufferin, now the border tn. of Emerson, to posts on the plains. This land march, ending where Fort McLeod was built, is one of the most memorable episodes in the hist. of the N. W. M. P. The mounted police were never a large force and always depended

on their reputation for integrity, fairness, and courage rather than on numbers. They soon dealt with law-breakers, whisky runners vanished, and Fort McLeod became a centre for the maintenance of law and order on the border lands of the W. The police also had an important part in the difficult problem of the half-starving Indians of the prairies, and much of the work of persuading them to go on the Reserves was entrusted to the mounted police. Their forts had been centres for the distribution of food, and from those centres the tribes were shepherded northward to the wooded country where lands had been set apart for them, and the 'Mounties' were always regarded by the Indians as friends. In 1904 the force was granted the privilege of calling itself the Royal N. W. M. P., and in 1920, when it was given duties in various parts of the dominion, the name was changed to the Royal Canadian Mounted Police (q.v.).

North-West Passage, see **ARCTIC EXPLORATION**.

North-West Territories, see **NORTH-WEST**.

Northallerton, mrkt tn and cap. of N. Riding of Yorks, England, 40 m. N. of Leeds. It is the site of an old Rom. camp, and All Saints' church dates from the 12th cent. Remains of a Carthusian priory are near by. Leather goods and engineering products are made. Pop. 7000.

Northam: 1. Urb. dist. and seaside resort in N. Devon, England, incorporating Westward Hol (q.v.) and Appledore. The par. church dates from 1261; the Stella Maris convent school is at N. Shipbuilding flourishes at Appledore. Pop. 6500.

2. Tn in York co., W. Australia, in the Avon valley, 66 m. N.E. of Perth. It is a junction for the S. line to Albany, and centre of a farming dist. Pop. 5725.

Northampton, Spencer Joshua Alwyne Compton, 2nd Marquess of (1790-1851), politician, b. Wilts, England. He was associated with Wilberforce in the anti-slavery campaign, and helped Sir James Mackintosh in his efforts to reform the criminal law. From 1838 to 1849 he was president of the Royal Society.

Northampton, William Parr, Marquess of (1513-71), brother of Catherine Parr (q.v.), the sixth wife of Henry VIII. He was created Earl of Essex in 1543 and Marquess of N. in 1547. He played an important part during the reign of Edward VI, supporting the causes first of Somerset and then of Northumberland. On the death of Edward VI he supported the accession of Lady Jane Grey (q.v.) and as a result was condemned to death under Mary, but the sentence was commuted to the forfeiture of his titles and estates. On the accession of Elizabeth I he was again taken into favour and was created marquess for the second time in 1559.

Northampton: 1. Co. and mrkt tn, parl., co. and municipal bor. of Northants, England, on rising ground on the l. b. of the R. Nene, 67 m. W. of London. N. was held by the Danes at the beginning of the 10th cent. and was burned by them

in 1010. After the Conquest it was bestowed on Simon de St Liz (Senlis), and the castle he built (now destroyed) became a favourite resort of the Norman and Angevin kings. Prin. buildings of modern N. include the shire and tn halls, the modern police building and fire station, and the numerous churches, among which are St Peter's, a restored and beautiful specimen of enriched late Norman work, and the 12th-cent. church of the Holy Sepulchre, one of the very few round churches in the country. N. is the seat of a Rom. Catholic bishop (the Catholic cathedral was designed by

Ermine Street both cross the co. In 1215 the barons besieged Northampton Castle, held by King John, and in 1264 the castle was wrested from the younger Simon de Montfort by Henry III. Henry VI was defeated at Northampton during the Wars of the Roses, and later the famous battle of Naseby (1645) took place in the co. N. has few monastic remains, the most important being the abbey church of Peterborough (Medeshamstede), now the cathedral, begun by Penda in 665; there are some beautiful Norman churches. Famous market crosses are at Brigstock, Helpston, Higham Ferrers,

Photocrom Co. Ltd

SULGRAVE MANOR, NORTHAMPTONSHIRE: SOUTH FRONT

Pugin). Boot- and shoe-making is the staple industry, and other industries include leather trimming, and the manuf. of leather goods, shoe machinery, ladies' clothing, electric lifts, fire grates, motor-car accessories, lasts and models; also motor-body building, engineering, printing, and brewing. N. returns 1 member to Parliament. Pop. 103,700.

2. City in Hants co., Massachusetts, U.S.A., on the r. b. of the Connecticut R., 8 m. NW. of Holyoke. It has manufs. of silk, brushes, cutlery, etc. There are the Smith College for women and the Clarke School for the deaf in the city. Pop. 29,003.

3. Tn of W. Australia, 262 m. NNW. of Perth, a lead-mining centre. Pop. 630.

Northamptonshire, midland co. of England, originally included in the Mercian kingdom, and part of Tostig's earldom in the 11th cent. At Harrington there is evidence of occupation in the early Iron Age. Earthworks and Rom. remains have been found, and Watling Street and

Irthlingborough, and at Hardingstone and Geddington are two of the Queen Eleanor crosses built by Edward I in memory of his wife. The ruins of Potheringay Castle, where Mary Queen of Scots was executed, are also in the co. The family of George Washington, first president of the U.S.A., originated at Sulgrave Manor (q.v.). Notable N. mansions include Burghley House, Althorp Park, Rushton Hall, Rockingham Castle, Castle Ashby, Dingley Hall, Deene Park, and the ruined Kirby Hall.

The surface of the co. is mainly level or broken with low hills, and the scenery is beautiful and well wooded. It includes part of the fen country (q.v.), what is known as the 'soke' of Peterborough, being land reclaimed from the Fens (the soke constitutes a separate administrative co.). The prin. rvs. are the Avon, Nene, Welland, Cherwell, Leam, and Ouse. The Grand Union Canal crosses the co. Ironstone in large quantities, limestone, and

clay are worked, and a particular kind of building-stone known as Weldon or Stamford marble. The mild climate and level surface, in addition to a rich soil, are admirable for agriculture. Farming of all kinds flourishes, wheat and barley being the prin. crops, while cattle and sheep are reared extensively, the former especially in the rich pastures of the Nene and Welland valleys. Apart from agriculture the main industries are the iron-working carried on at Kettering, Wellingborough, etc., and the manuf. of boots and shoes, Northampton being the centre of the trade for England. Since 1933 iron ore has been quarried at Corby (q.v.) and iron and steel foundries estab. The co. is divided into 4 co. constituencies and 1 bor. constituency (the co. tn), each returning 1 member to Parliament. Areas, N. co. 905 sq. m.; Soke of Peterborough 84 sq. m.; pops. 265,200 and 65,000. See J. Taylor, *Bibliotheca Northamptoniensis*, 1869; Victoria Co. History, *Northamptonshire*, 1908; A. Mee, *Northamptonshire*, 1945; T. Ireson, *Northamptonshire*, 1954.

Northamptonshire Regiment, The. The 1st Batt. was originally the 48th (Northampton) Foot, and was raised in 1740; the 2nd Batt. was the 58th (Rutlandshire) regiment of foot, raised in 1755. The 2 regiments were linked in 1881. The 48th served first as marines and took part in the battle of Culloden (1746). The 58th had a fine record in the Peninsular War and also fought in the Crimean War, at Sevastopol, in S. Africa (1879), at Tirah (1897-8), and at the Modder R. in the S. African war. The 1st Batt. went out to the W. front as part of the 2nd Infantry Brigade, 1st Div. of the original B.E.F. In 1914, suffering very heavy losses in resisting the Ger. attack of 2 Nov. 1914, near Hoge Wood. The 4th Batt. (T.A.) took part in the Suvla landing in 1915 and later (1916) in the second battle of Gaza. Service of 'Kitchener' battalions of the regiment fought in the Somme battles of 1916, and were conspicuous in 1917 for their part in the defence of the Lombartzyde light-house. In the last year of the war they fought at Villers-Bretonneux, Bapaume, Epéhy, and in the Cambrai-St Quentin battle. In the Second World War they fought in many of the most critical battles of the Burma campaign. In Italy other units were part of the Eighth Army (q.v.). The Northamptonshire and Royal Lincoln Regiments are to be joined to form the 2nd East Anglian Regiment. See R. Gurney, *History of the Northamptonshire Regiment, 1724-1934*, 1935. See also REGIMENT.

Northbrook, Barony of, see BARING.

Northcliffe of St Peter in Thanet, Alfred Charles William Harnsworth, 1st Viscount (1865-1922), newspaper proprietor, b. Chapelizod, Dublin, eldest child of Alfred Harnsworth, a barrister of Eng. birth. He started in journalism as a reporter for the *Hampstead and Highgate Express*, and later he became assistant editor of *Youth*, a paper linked with the *Illustrated London News*. After an attack of pneumonia in 1884, he had to live out of London, and worked for Iliffe & Sons, Coventry.

With modest savings, he returned in 1887 to London, opening as a publisher at 26 Paternoster Square. On 2 June 1888 he pub. the first number of a snippet weekly, first called *Answers to Correspondents*, but soon merely *Answers*, modelled on the pattern of Newnes's *Tit-Bits*, begun 1881. He was assisted in this enterprise by his brother Harold Sidney, afterwards the first Lord Rothermere. In 1892 they were selling 1,000,000 copies weekly. In Aug. 1894 N. bought the *Evening News*, a Conservative paper. The same year he equipped the Jackson arctic expedition at his own expense. On 4 May 1896 he began pub. of the *Daily Mail*, a revolution in journalism from its inception, with ideas of make-up and presentation of news items which were widely copied by rivals. The Harnsworths also acquired newspapers at Glasgow and Leeds. Innumerable, as years went by, were the subsidiary Harnsworth journ. pub. by Amalgamated Press. In 1904 he was made a baronet, and in 1905 he became Baron N. In 1906 he and his brother acquired forests in Newfoundland, in order to make their own paper. In 1908, with the utmost precaution to ensure secrecy of the negotiations, he became proprietor of *The Times* (see H. Kitchin, *Moberley Bell and 'The Times'*); he retained the controlling interest until his death. Through the *Daily Mail* he had been popularly supposed to have made the S. African war; and in the First World War he performed notable service as head of the British War Mission in the U.S.A., but he declined the Ministry of Air when Lloyd George offered it to him in Nov. 1917. He was made a viscount that year, and became director of propaganda in enemy countries, in which work he was extremely successful. From the end of 1918 he suffered much in health, largely owing to overwork throughout his life. He went for a tour round the world in 1921, but received no benefit. He d. in London, 1922. He was married, but left no issue.

That N. was a great journalist is not open to doubt. His aim was not so much to 'amuse' as to humanise and extend the scope of the daily newspaper. He was the first to see that women, as well as men, could be interested in a newspaper. A notable quality of N. was his prescience. He foresaw the possibilities of aviation more clearly than most, except the experimental pioneers themselves and the military advisers. His part in the First World War in moulding and interpreting public opinion was of great importance. But in Fleet Street his name will probably be mainly associated with raising the status of the ordinary journalist. It was well said that nothing unclean or indecent was allowed in any of the journ. under his control. Through his numerous pubs. N. exercised tremendous influence and was one of the most dynamic personalities of his generation in Great Britain. See Sir M. Pemberton, *Lord Northcliffe, a Memoir*, 1922; M. Wilson, *Lord Northcliffe*, 1927; H. Hamilton Frye, *Northcliffe: an Intimate Biography*, 1930; T. Clarke, *My Northcliffe Diary*, 1931;

Sir J. A. Hammerton, *With Northcliffe in Fleet Street*, 1932; and H. J. Greenwall, *Northcliffe: Napoleon of Fleet Street*, 1957.

Northcote, Henry Stafford, 1st Baron Northcote of Exeter (1846-1911), statesman, b. London, was the second son of Sir Stafford Henry N., first Earl of Iddesleigh, and was educ. at Eton and Merton College, Oxford. In 1877 he became private secretary to his father, then chancellor of the exchequer, and in 1880 became a member of Parliament. He held minor appointments until 1900, when he was raised to the peerage and made governor of Bombay, in which position he greatly distinguished himself. The Commonwealth of Australia was formed in 1901, and 3 years later N. went out as governor-general (1904-8).

Northcote, James (1746-1831), painter, b. Plymouth. In 1773 he began his studies under Sir Joshua Reynolds (of whom he wrote a life, pub. 1813) and at the Royal Academy schools. He went to Italy in 1777, and on his return to England he became famous as a portrait painter. In 1786 he was elected associate of the Academy, and his historical picture, 'The Young Princes murdered in the Tower,' was completed in that year. This was followed by 'The Burial of the Princes' and 'The Death of Wat Tyler.' 'The Entombment' and 'The Agony in the Garden' are among his last works. Much information about N. as an individual is contained in articles pub. in 1826 by Wm Hazlitt in the *New Monthly Magazine*: these appeared in book form in 1830 as *Conversations with James Northcote Esq., R.A.* (new ed. by F. Swinnerton, 1949).

Northcote, Sir Stafford, see IDDESLEIGH. **Norther**, cold or N. or NW. wind, often with snow, occurring in winter in the Gulf of Mexico and Texas regions. The N.s are produced by a strong depression over the W. Caribbean Sea.

Northern Pacific Railway, with 6879 m. of track, operates mainly in the states of Minnesota, N. Dakota, Montana, Idaho, Washington, and Oregon, with Pacific coast terminals at Seattle and Portland, and middle W. terminals at Minneapolis, St Paul, and Duluth. The road was constructed under an Act of the U.S. Congress in 1865, and was completed in 1883. It handles a large freight business, especially cargoes of grain, timber, and mineral ore.

Northern Rhodesia, see RHODESIA AND NYASALAND, FEDERATION OF, and RHODESIA, NORTHERN.

Northern Sea Route, system of shipping lanes traversing the coastal waters N. of Siberia from the Bering Strait in the E. to the straits between the Barents Sea and

the Kara Sea in the W. It has been mainly developed by the chief administration of the N. Sea Route (Glavsevmorput'), beginning with the appointment by the Soviet gov. of O. Y. Schmidt (q.v.), 1932-9. The administration was given responsibility in the 1930's for the whole economic development of N. Siberia. The route is important both politically and from an economic viewpoint. See T. E. Armstrong, *The Northern Sea Route*, 1952.

Northern Territory, name given to that part of the Australian continent N. of 26° S. lat., and between 129° and 138° E. long., with a length of about 1000 m. and breadth of 580 m. Total area is 426,320 sq. m., and over four-fifths lies within the Torrid zone. The chief is. off the coast are Melville, Bathurst, Croker, Groote Eylandt, and Wessel.

Physiography. The low, flat coastline of 1040 m. seldom reaches a height of 100 ft. Sandy beaches and mud flats, thickly fringed with mangroves, prevail. The coastline is indented with bays and inlets and the estuaries of numerous rivers, of which the Roper R. is the chief. Many of the rivers are navigable by shallow-draught vessels for considerable distances, but apart from Port Darwin there is an almost complete lack of navigable harbours. Inland there is a general rise southwards to the 18th parallel, where the higher lands form the watershed between the rivers flowing northwards to the sea, and those forming the scanty supply of the interior systems. Towards the centre of the continent the land over a wide area is of considerable elevation and there are sev. mt ranges, generally with an E. and W. trend. The prin. is the Macdonnell Range (q.v.), which reaches 4000 ft.

Climate. The climate varies considerably over the whole ter., the proximity of the sea keeping the coastal regions more equable, while further S. the climate is of a continental type. Over four-fifths of the ter. lies within the tropics. In the N. section the year has 2 climatic divs.—the wet season, lasting from Oct. to April, and the dry, May to Oct. Darwin averages 56 in. in the wet season and 3 in. in the dry. The S. part of the ter. is generally sandy, and below the 16th parallel ann. rainfall is less than 25 in. and evaporation high. Alice Springs averages about 10½ in. per year. Sub-artesian water from bores is used in these areas.

Fauna and flora. The ordinary types of native Australian fauna inhabit the ter. Marsupials, crocodiles, fresh-water tortoises, snakes (mostly non-venomous), and frogs abound. The bird life is prolific and includes honey-eaters, butcher birds, Torres Strait pigeons, scrub turkeys, cockatoos, and many varieties of parakeets, as well as water birds in the coastal areas. There are many varieties of fresh-water fish. The white ant is a pest, and mosquitoes and sand flies are troublesome, particularly in the wet season. Buffalo formerly existed in large herds. The N. T. is poorly endowed with forested land, the greater part carrying either no timber or only scattered trees of a stunted

type. This is owing to climate and the low rainfall received over much of the interior. Forests occur only in the N. portion of the ter. and are mostly located within a 300-m. radius of Darwin. They are of 4 types—open eucalypt; cypress pine; dense pure forest of paperbark on swamplands and along streams; and small areas of rain forest. In the first 3 scarlet banksia and yellow bottle brush are found. In the low rainfall areas there is mulga, some desert oak, and riv. red gum along the water courses. In the Victoria R. and Barkly Tableland dists. there are large areas of open downs country with Mitchell and Flinders grass. Much of the centre area is arid spinifex country and sandy desert, but there are areas of sparse shrubs and grasses which make good cattle country.

Production. Much of the interior is desert, but peanuts, tobacco, cotton, grain, sorghum, bananas, pineapples, citrus, mangoes, pawpaws, vegetables, fodder plants, and rice can be grown in certain areas. Transport difficulties and the great distance from markets have hitherto prevented economic development, but peanuts have been exported for some years. On the subcoastal plains E. of the Stuart Highway, and extending to and beyond the Adelaide R., experiments in rice-growing have been carried out in recent years. At Humpty Doo, 30 m. from Darwin, rice has already been produced in small quantities. The pastoral industry has long been the mainstay of the ter.'s economy, the main element of pastoral production being beef cattle. Main beef cattle areas are the Alice Springs, the Barkly Tablelands, and the Victoria R. Dists. Beef cattle pop. at 31 Mar. 1956 was over 1,000,000. Value of cattle exported during 1954-5 was £1,871,653. Since 1951 there have been promising experiments in transporting beef carcasses by air to Wyndham for overseas export. The sheep industry, by contrast, is of minor importance and is confined to the Alice Springs Dist. Estimated number of sheep at 31 Mar. 1956 was 33,000. Horses are no longer bred for export, but stock horses are bred. There is little pig-raising and practically no dairying at present.

The N. T. is rich in mineral resources and mining is the second most important industry. Tennant Creek is the main gold-producing area. Other minerals worked in the ter. include copper, mica, tin, and wolfram. Uranium was first discovered at Rum Jungle in Sept. 1943 and many other deposits have been found subsequently. The first full-scale treatment plant was opened at Rum Jungle on 17 Sept. 1954. Total value of mineral production (excluding uranium) in 1954-5 was £1,753,168. The prin. exports from the ter. are cattle, minerals, and pearl shell.

Transport and communication. There is a railway from Port Augusta to Alice Springs, a distance of 771 m., of which 200 are in the N. T. The terminus of the N. Australian Railway is at Birdum, 316 m. from Darwin. For road transport

2 new highways were built during the Second World War: the Stuart Highway, from Darwin to Alice Springs (954 m.), and the Barkly Highway, from Tennant Creek to Mt Isa, Queensland (400 m.). At 30 June 1955 there were 111 licensed aerodromes in the ter., of which 70 are included in scheduled airline services. Darwin has a first-class international airport. In addition to internal airways the main routes regularly operated are Darwin-Brisbane and Sydney; Darwin-Adelaide via Alice Springs; Darwin-Perth via Wyndham. The N. T. has a comprehensive aerial medical service based on Darwin with an additional service operating from Alice Springs. Specially equipped Australian made de Havilland Drovers are used. Use of shipping is restricted by the fact that Darwin is the only port in the ter. capable of accommodating large vessels, but regular services are run from Perth as well as the E. states.

Population. The N.T. is sparsely populated. In 1947 the pop. was 10,868, and in 1954 16,469, excluding full-blood aborigines. The pop. of Darwin was then 8071, and Alice Springs 3000. The aboriginal pop. was estimated at 13,962.

Aborigines. The long-range policy of the Commonwealth Gov. is to encourage the assimilation of the aborigines as an integral part of the community. The aboriginal pop. is estimated to have remained fairly constant over the past few years, and a recent estimate puts the total at less than 14,000 full-bloods. Of these over 3000 are in full employment, over 4000 are under the influence of missions, and over 3000 reside on gov. settlements; only about 600 remain truly nomadic.

The administration has set aside 17 areas as reserves, the largest of which is Arnhem Land. Throughout the reserves there are 13 gov. settlements. Special schools to cater for the aborigines' particular needs have been estab.—10 conducted by the gov., 13 by missions, and some by pastoral companies. Seven mission authorities function in the ter., keeping in regular contact with over 4000 full-blood aborigines. There are 14 mission stations in the ter.

History and administration. The region formerly belonged to New S. Wales, but was annexed to S. Australia in 1863 and transferred to the Commonwealth on 1 Jan. 1911. In 1928 the ter. was divided, for administrative purposes, into N. Australia and Central Australia, the dividing line between these 2 ters. being 20° S. lat. The whole of the N. T. was reconstituted as an administrative entity in 1931. In 1947 the Northern Territory (Administration) Act estab. a legislative council consisting of the administrator and 6 elected and 7 official representatives. The council has power to make ordinances for the N.T. which are subject to the assent of the Administrator and in certain circumstances of the Governor-General. The N.T. elects a member to the House of Representatives who has the right to take part in debates but to vote only on

matters relating to N. T. ordinances. The seat of the Administration is Darwin.

The coast was surveyed by Philip Parker King in 1818 and by J. C. Wickham and John Lort Stokes in 1838 and 1839. Port Darwin was charted in the latter year. In 1845 Leichhardt reached Port Essington after a trying journey from S. Queensland during which he and his party were attacked by aborigines, and his naturalist, John Gilbert, was killed. His route is marked by the names which he gave to features that he discovered, amongst these being Calvert and Roper R.s, named after members of the party. Two years later Leichhardt embarked on his fateful journey from E. to W. whence none of his party returned. In 1855-6 A. C. Gregory explored the interior, crossing from W. to E. down the Victoria R. Stuart Creek, the Elsey, and then into Queensland. In 1861 J. McDouall Stuart began his transcontinental journey from Adelaide and reached the W. side of Van Diemen's Gulf in 1862. Early settlements at Port Essington, Fort Dumas, and Raffles Bay all came to nothing, but Darwin's future was assured when Charles Todd, superintendent of telegraphs for S. Australia, selected it as the terminal for the submarine cable from Java. The overland telegraph from Adelaide to Port Darwin was completed under Todd's direction by 22 Aug. 1872.

In the eighties some thousands of Chinese and other aliens were employed on the railway construction works for the Palmerston (now Darwin)-Pine Creek Railway. In the meantime legislation in Queensland, designed to restrict the employment of alien labour in that state, had a direct bearing on N. T. hist., for the S. Australian gov., yielding to general popular sentiment, abandoned the project of developing the ter. by any but white people. This restrictive policy foreshadowed the White Australia ideal.

Arnhem Land has in recent years been explored by D. F. Thomson. He found that the native inhab. had been strongly influenced by Malay or Macassar visitors. Indonesian characteristics are preserved in vocabulary, ceremonial life, and material goods, such as the dug-out canoe, smoking pipe, and calico. In 1948 the Amer.-Australian Scientific Expedition to Arnhem Land made important findings in the fields of aboriginal art and mythology, archaeology, ethnology, botany, and zoology.

Northern Union, Eng. rugby football union formed in 1893, to avoid the ban on professionalism within the Rugby Union, and renamed the Rugby League in 1922. See FOOTBALL, *Rugby League*.

Northfield: 1. Dist. of the city of Birmingham (q.v.), England; the church, mentioned in Domesday Book, has a Norman tower and door. The Great Stone Inn, the vil. pound, and sev. old cottages still preserve the character of the vil. as it was before the city encompassed it.

2. Tn of Washington co., Vermont, U.S.A., 10 m. SW. of Montpelier. Here is Norwich Univ., removed in 1866 from Norwich. Pop. 4314.

3. City in Minnesota, U.S.A., 35 m. S. of St Paul, in grain, livestock, and dairying area. It is the seat of Carleton College and St Olaf College. Pop. 7500.

4. Tn in Massachusetts, U.S.A., 42 m. NE. of Springfield. It is the bp. of Dwight L. Moody (q.v.), and the site of N. School for girls and Mt Hermon School for boys. It is also the H.Q. of American youth hostels. Pop. 2246.

Northfleet, tn of Kent, England, 1½ m. W. of Gravesend, engaged in the manuf. of paper, chemicals, cables, rubber tyres, and cement. Pop. 19,280.

Northmen, see NORMEN.

Northolt, par. in the bor. of Ealing (q.v.), Middx, England, 2½ m. SSW. of Harrow. The manor was given by William the Conqueror to Geoffrey de Mandeville, and granted in 1398 to the abbey of Westminster. During the Second World War the aerodrome here was the station of the Polish fighter wing and an important air transport terminal. Subsequently it was developed as one of the two main civil airports for London, but its use as such has been discontinued.

Northrop, John Howard (1891-), Amer. biochemist and biologist, b. Yonkers, New York, and educ. at Columbia Univ. (B.S., 1912; Ph.D., 1915; D.Sc., 1937). Since 1916 he has worked at the Rockefeller Institute for Medical Research, Princeton, New Jersey. N. is the author of a book on crystalline enzymes, and shared the Nobel prize in 1946 for his work in this sphere. He pub. *Crystalline Enzymes* in 1939.

Northstead, Manor of. Appointment to the crown stewardship of this Yorks

manor serves as an occasion for the resignation of a member of Parliament. See *CRILTERN HUNDREDS*.

Northumberland, Dukes and Earls of. Since the time of the Norman Conquest there was an Earl of N., but the title did not become hereditary until 1377, when Henry, Baron Percy, became earl. The title of Duke of N. was held by John Dudley from 1551 until his death in 1553 (see separate article). The ducal title was held by George Fitzroy, a natural son of Charles II, from 1683 until his death without issue in 1716.

Except for a period of forfeiture, from the death in 1408 of the first earl until its restoration to his grandson, the title of earl remained in the Percy family (q.v.) until the death of the eleventh earl in 1670; his daughter married Charles Seymour, Duke of Somerset, and their son Algernon, seventh Duke of Somerset, became Earl of N. in 1749. Dying without issue, his son-in-law, Sir Hugh Smithson, became earl and took the name of Percy: in 1766 he was created Duke of N. The fourth duke d. in 1875, the title passing to his grand-nephew George, Earl of Beverley: from him are descended the later dukes of N. The present duke (b. 1914) succeeded his brother, who was killed in action in 1940. See G. Brennan, *History of the House of Percy* (ed. W. A. Lindsay), 1902.

JOHN DUDLEY, FIRST DUKE OF
NORTHUMBERLAND

Northumberland, John Dudley, Duke of (c. 1502-53), politician and soldier. His father had been attainted, but this was reversed by Henry VIII. He had a successful military career and was already powerful when Henry VIII d. Further military success followed, and N. soon became the real power behind Edward VI (q.v.) and in 1551 was created Duke of N. Utterly unscrupulous in his lust for power and extremely capable, N. married one of his sons to Lady Jane Grey (q.v.), 1553, hoping thereby to retain his authority after Edward's death. He was primarily

responsible for the attempt to make Jane Queen of England, and after Mary's accession was executed for treason. Another of his sons became Elizabeth I's favourite, the Earl of Leicester.

Northumberland, most northerly co. of England. There are extensive Rom. remains in N., including Hadrian's Wall (q.v.). The co. originally formed part of the Saxon kingdom of Bernicia, which with Deira became merged into the kingdom of Northumbria (q.v.) about the end of the 6th cent. It suffered much from border raids, but there are some fine old buildings, notably Lindisfarne Priory (1093), Hexham Abbey Church, built over the crypt of Wilfrid's Abbey of St Andrew, and the castles of Alnwick, Dilton, etc. The co. also includes such famous battlefields as Otterburn and Flodden Field, and is the home of the great Percy family. The coastline is flat and sandy, the cliffs are low, and there are few inlets. There are sev. is., the most important being Holy Is., or Lindisfarne, and the Farne Is. The surface from the low plains in the E. rises to a moorland region in the centre, and so upward to the Cheviot Range, reaching its greatest elevation in the Cheviot (2876 ft.). The chief rvs. are the Tweed, Aln, Coquet, Wansbeck, Blyth, and Tyne; the Tweed being famous for its salmon fishing and the Coquet for its trout. In the SE. lies the big coal-field; lead and zinc are found, and building-stone is quarried. The soil varies very much, and a large proportion is permanent pasture. Oats and barley are the prin. crops. Sheep-rearing is carried on very extensively, there being a particular breed known as the Cheviots; cattle are also reared. Tyneside forms the great manufacturing centre, the industries including shipbuilding, iron works, blast furnaces, rope works, chemicals, potteries, brick-fields, and glass factories. Machinery and tools are also manuf. N. Shields is the centre of the sea-fisheries, and Hexham is the largest marketing centre for store cattle in the country. The Tyne has the largest coal-shipping trade in the world, Newcastle being the prin. port. Other ports besides those on the Tyne are Blyth, Amble, Alnmouth, and Berwick. The co. is divided into 10 parl. divs., each returning 1 member. Area 2018 sq. m.; pop. 798,175. See *Victoria County History, Northumberland*; Newcastle upon Tyne Public Library, *Local Catalogue of Material concerning Newcastle and Northumberland, 1932*; Ann Sitwell, *Northumberland, 1949*.

Northumberland Fusiliers, The Royal, raised as a regiment in Dutch service in 1674; it finally became part of the Brit. Army in 1688. It fought at the battle of the Boyne, served in the Seven Years War and in the Amer. War of Independence, and fought in most of the great battles of the Peninsular war, winning the nickname of the 'Fighting Fifth.' In 1836 it became a fusilier regiment, and served in the Afghan war, 1878-80, at Khartoum, and at the Modder R. and other battles in the S. African war, 1899-1902. In the First World War the 1st

Batt. was part of Shaw's 9th Infantry Brigade in the original B.E.F. In that war the N. F. comprised, besides 3 regular and special reserve battalions, 5 territorial force battalions, and a score of service (new army) battalions. The 1st Batt. was prominent at the capture of Givenchy (Oct. 1914) and in the storming of Aubers. Various units fought in the Somme battles of 1916, and, together with sev. Canadian units, the N. F. suffered very severe losses in the La Boisselle-Contalmaison region. The 9th Batt. greatly distinguished itself in the fighting near Mametz wood. In 1918 units of the regiment took part in the dour fighting on the Menin Road-Polygon Wood front of the Ypres salient. In the Second World War the N. F. served on the W. front and in NW. Europe. They fought in the battle of Normandy, 1944, and in the advance to the Rhine, while other units were part of the Eighth Army (q.v.) and fought in the battles for Sicily, in those on the advance to Rome, and in the bitter struggle for the Gothic line. The 1st Batt. served with the 29th Brigade in the Korean war. See H. M. Walker, *History of the Northumberland Fusiliers*, 1919. See also REGIMENT.

Northumberland Strait, Canada, separates Prince Edward Is. from Nova Scotia and New Brunswick. Length 130 m., breadth 8 to 30 m.

Northumbria, one of the greatest of the A.-S. kingdoms, situated between the Humber and the Forth, originally consisted of 2 independent kingdoms, Bernicia and Deira. Of the former kingdom Ida was the first ruler (547-49). The first ruler of Deira was Ella (560-188), and he was succeeded by Ethelfrid, who had united the 2 kingdoms by 603. Redwald of E. Anglia defeated and slew Ethelfrid, and Edwin, son of Ella, then succeeded to the throne of N. He extended the frontiers to the coast (including Anglesey and Man), and during his reign the kingdom was the most powerful in England. After Oswald's death (641) the kingdom disintegrated, and did not recover its former position till Oswy became King of Bernicia, defeated and killed Penda of Mercia in 654, and incorporated the N. part of Mercia in his kingdom. Mercia recovered her ter. in 658, and N. pushed her frontiers northward, annexing Strathclyde and Dalriada. In 685 the Picts recovered their independence. Aldfrith, the son and successor of Oswy, made no further attempts to extend his kingdom. Under his patronage learning flourished. His successors were incompetent rulers, and henceforth the political decline of the kingdom was rapid. The first Dan. raids occurred c. 793. In 827 Eanred, King of N., formally acknowledged the supremacy of Egbert of Wessex. From 876 to 954 N. was largely controlled by the Danes, and subject to increasing Scandinavian immigration. After the battle of Stainmore (954) the permanent separation of N. from the rest of the Eng. kingdom ended. N. was for a considerable period the chief seat in England of literary and missionary activity. In the Golden Age of the Con-

version Cuthbert flourished in his monastery at Lindisfarne, Bede at Wearmouth and Jarrow, and Wilfrid at Hexham and Ripon. In 731 Bede at Jarrow wrote his famous *Ecclesiastical History*. The stone crosses, Ruthwell and Bewcastle as early examples, and the schools of York and Ripon as later developments, are evidence of the beauty and power of Northumbrian sculpture. It was not till the reign of William the Conqueror that N. really became an integral part of England. See R. H. Hodgkin, *History of the Anglo-Saxons*, 1939 ed., and T. D. Kendrick, *Anglo-Saxon Art*, 1938.

Northumbrian Dialect, see ENGLISH LANGUAGE.

Northwest Territories. The mainland portion of Canada, N. of lat. 60°, between Yukon Ter. on the W. and Hudson Bay on the E., together with the is. between the Canadian mainland and the N. Pole, including those in James Bay, Hudson Bay, and Hudson Strait, comprises the N. Ter.; the region includes the former N. Ter. and Rupert's Land except such areas of these as form the Yukon Ter. and the provs. of Alberta, Manitoba, and Saskatchewan. There are 3 administrative dists.: Mackenzie (527,490 sq. m.), Keewatin (228,160 sq. m.), and Franklin (554,032 sq. m.).

Along the shores of the Arctic Ocean and stretching far inland lies a country covered with a sort of Arctic grass, which has considerable nutritive value. S. of this region are the forest lands, chiefly black spruce, white spruce, and larch. In the W. part of the ter. is the great water system of the Mackenzie, which includes the Athabaska and Slave R.s, with Great Bear and Great Slave Lakes. Great Bear Lake is fourth and Great Slave Lake fifth in size of the lakes of N. America. The Mackenzie R. and its lakes extend 1469 m. N. and S.; with the addition of its trib., the Athabaska, its length is 2525 m. The large alluvial plains of its basin grow vegetables and wheat, oats, and barley; while trees a foot in diameter grow in its delta, within the Arctic Circle.

The fur trade and mining are the chief industries. Furs to the value of \$732,789 were obtained in 1956-7; the most valuable is white fox, and others include beaver, mink, lynx, and red fox. Gold and silver and other minerals are mined on the N. shore of Great Slave Lake in the Yellowknife Region. Uranium concentrates and radium are produced from pitchblende ore at the Eldorado mine on Great Bear Lake. A large oil-field was found in 1943-4 in the Lower Mackenzie Basin, petroleum being produced at Norman Wells. Natural gas is found. Mineral production reached a record of \$9,033,714 in 1952. There is a fishery on Great Slave Lake, and reindeer herding as a native industry is being developed. To aid the development of the N. Ter., a highway of 315 m. is projected from Hay R. to Notikewan in Alberta, and a 8000 h.p. hydro-electric plant on the Snare R. 94 m. NW. of Yellowknife.

The area is 1,304,903 sq. m. The 1941 pop. was 12,000 (including approximately

2300 whites, 4300 Indians, and 5400 Eskimos); largely owing to increased mining activity the 1955 pop. had risen to an estimated 18,000. See R. Finnie, *Canada Moves North*, 1942, 1947; C. C. Lingard, *Territorial Government in Canada: the Autonomy Question in the Old Northwest Territories*, 1946; N. Polunin, *Arctic Unfolding*, 1948; and the pubs. of the Bureau of N. Terns and Yukon Affairs, Dept. of Mines and Resources, Ottawa.

Northwich, tn of Cheshire, England, on the R. Weaver, 13 m. ENE. of Chester.

in a separation. The unhappiness of her married life led her to interest herself in the amelioration of the laws regarding the social condition and the separate property of women and the wrongs of children. Her poems *A Voice from the Factories*, 1836, and *The Child of the Islands*, 1845, had as an object the furtherance of her views on these subjects. Her efforts were largely successful in bringing about the needed legislation. Her chief vols. of verse are *The Sorrows of Rosalie*, 1829, *The Undying One*, 1830, *The Dream*,

National Film Board, Canada

PORT RADIIUM, NORTHWEST TERRITORIES

Among the few anct relics in the tn is the picturesque church of St Helen, which belongs to the 16th cent. The chief industry is the manuf. of chemicals, the works being among the most extensive in the world. There are also shipyards, steel works, and iron foundries. The tn was once subject to numerous land subsidences caused by the pumping of the brine used for the manuf. of salt and alkali, but since the introduction of controlled pumping in recent years the subsidence has been negligible. Pop. 20,000.

Norton, Caroline Elizabeth Sarah (1808-1877), later Lady Stirling-Maxwell, poetess and novelist, b. London, the granddaughter of Richard Brinsley Sheridan, the dramatist. In 1827 she married the Hon. George N., a union which ended

1840, *The Child of the Islands*, 1845, and *The Lady of La Garaye*, 1861. Among her novels are *Stuart of Dunleath*, 1851, and *Lost and Saved*, 1863. In 1877 she married Sir W. Stirling-Maxwell after the death of her first husband in 1875. See J. G. Perkins, *The Life of Mrs Norton*, 1909, and Alice Acland, *Caroline Norton*, 1948.

Norton, Charles Eliot (1827-1908), Amer. man of letters, b. Cambridge, Massachusetts, U.S.A. He occupied the chair of hist. of fine art in Harvard Univ. from 1873 to 1898. He was joint editor of the *North American Review* with James Russell Lowell (1861-8), and a founder and co-editor of the *Nation* (1865). His chief works are *Considerations of Some Recent Social Theories*, 1853, an attack on experimental Socialism; *Notes of Travel and Study in Italy*, 1860; and

Historical Studies of Church Building in the Middle Ages, 1876. But he will be chiefly remembered for his trans. and studies of Dante's *Vita Nuova* and *Divina Commedia*, and his *History of Ancient Art*, 1891. He also ed. Carlyle's *Reminiscences*, 1887, making good the blunders made by Froude in 1881, and *The Poems of John Donne*, 1895. N.'s *Letters* were pub. in 2 vols. in 1913. See life by S. Norton and M. A. de Wolfe Howe, 1913.

Norton, Mary (1908-), writer of children's books and short stories, b. London. Trained as an actress, she turned to authorship after her marriage and is best known both in Great Britain and the U.S.A. for her 3 books about *The Borrowers* (1952, 1955, and 1959), the little people who live under the floor.

Norton, Thomas (1532-84), dramatist and lawyer, b. London. He entered Parliament in 1558, and was appointed to the office of Remembrancer of the City of London in 1571. He collaborated with Sackville in the composition of the first Eng. tragedy, *The Tragedie of Gorboduc*, 1561, written in blank verse.

Norton: 1. Tn and par. of Derbyshire, England, 4½ m. from the centre of Sheffield. The church was built (1180) to expiate the murder of Thomas Becket. N. was the bp. of Sir Francis Chantrey (q.v.). Pop. 15,000.

2. Par. and tn of E. Riding, Yorks, England, on the Derwent, 17½ m. NE. of York. It is noted for the training of racehorses. Pop. 4820.

Norton Sound, inlet, 130 m. long, 90 m. wide, at mouth of Hering Sea, Alaska, lying S. of Seward Peninsula. Norton Bay and Godolphin Bay are on the N. shore. None tn is on the N. side of the entrance of the sound.

Norumbega, name of unknown origin, found especially in 16th- and 17th-cent. maps to indicate a region or city on the E. coast of N. America. It is probably mythical, but has been identified with Vineland, the Norse settlement supposed to have been discovered by Ericsson or by Karlsefni, the name of which is derived from the legend that grapes were found there.

Norwalk, city of Fairfield co., SW. Connecticut, U.S.A., on Long Is. Sound at the mouth of the Norwalk R. and 13 m. SW. of Bridgeport. Manufs. include hats, clothing, shoes, cellophane products, tyres, name tapes, hardware, machinery, marine pumps, textiles, rubber, plastics, paper, glass products, and cosmetics. There are extensive oyster fisheries, and many shore resorts, including Bell Is., Harbor View Beach, Wilson Point, and many is. N. includes South N. (a railroad junction), Rowayton, Winnipauk, and Silvermine (an artists' colony). Settled in 1649, it was incorporated as a tn in 1651, and as a city in 1893. It was burned by the British in the revolution, and has been an industrial centre since the late 18th cent. N. suffered heavy damage in the flood of 1955, but is rebuilding its business section extensively. Pop. 49,600.

Norway (Norwegian *Norge*), Scandinavian kingdom occupying the W. and N. part of the Scandinavian peninsula. It is surrounded on 3 sides by the sea, on the S. by the Skagerrak, on the W. by the N. Sea and Atlantic Ocean, and on the N. by the Barents Sea. It is therefore cut off from Europe except for the land connection through Russia and Finland. It extends from the is. Kraaka in the SW. (lat. 57° 57' N.) to Knivskjerodden on Mageroy, W. of the N. Cape (lat. 71° 11' N.), in the NE.; and its most westerly point is Husøy in the Sognefjord (long. 4° 30' E.) and the most easterly Kiberg near Vardø (long. 31° 10' E.). The length of the coast, disregarding indentations, is 2100 m.; including the coastline of long inlets and of large is. it is at least 16,400 m., or more than half the circumference of the earth. Area 124,500 sq. m. (8900 being is. or skerries). By the treaty of 1920 Norway was given sovereignty over Svalbard (Spitsbergen) and Bjørnøya (Bear Is.) and, including these, the total area is 155,000 sq. m. In the Middle Ages the kingdom of Norway was twice as large as it is to-day, but much was ceded to Denmark; and at different periods Norway had various trib. lands, such as parts of Ireland, Scotland, the Hebrides, Lapp dists., Greenland, Iceland, and others. Norway has a frontier with Sweden of 1025 m., with Finland of 450 m., and with U.S.S.R. of 122 m., a total frontier of nearly 1600 m. The country is a high plateau, intersected in the SE. by great valleys and in the W. by deep fjords and bays. More than half its surface is over 2000 ft high. The interior is generally so mountainous that the pop. is settled almost entirely along the coast. Only in the great valleys of S. Norway and in the Trondheim Depression is there a high density of pop. inland. Pop. at the end of 1954 was estimated to be 3,408,000, giving a density of about 25 per sq. m. With the exception of some 20,000 Lapps, living in the most remote N. regions, the inhab. of Norway are generally a Scandinavian race, akin to the N. Germanic nations of Aryan descent.

Physical features. Certain fundamental physical features characterise the topography of Norway, and variations in their form and type heighten the variety of the landscape. The prin. features are the skjaergaard and the strand flat; the fjords; the gorges; the plateaus, with summits rising above their surfaces; ice-sheets; and valleys, often deeply incised. The skjaergaard is the is. zone of striated rock with but little vegetation. The outer is. are low-lying, but towards the mainland they are higher. The strand flat is a series of rock terraces along the borders of many of the is. and in the mouths of some of the fjords. The fjords have all the characteristics of glaciated valleys, being long, narrow, and straight, with uneven floors. The gorges extend inland above the level of the fjords and torrents flow down from the high uplands in great falls, roaring through the gorges. The plateaus are the upland surface above the gorges and rise steeply from the W. coast

towards the main watershed of Norway, and they are more extensive in S. than in N. Norway.

(a) *Southern Norway.* The great barren plateau known as the fjell occupies the W. part of much of S. Norway. It is diversified by fjords, gorges, and valleys, and its main subdivs. are the viddas Jostedalsbreen and Rørosvidda, collectively known as the Langfjell, and the Dovrefjell, Trollheim, and Rørosvidda, collectively

Royal Norwegian Embassy

MEROK IN GEIRANGER FJORD

the Dovrefjell. The viddas stretch for miles of barren, windswept rock varied with wild moorland and bog and numerous lakes and rivs., which enhance the general desolation. Jostedalsbreen region, lying N. of the Sognefjord, is an immense ice-cap extending over 580 sq. m. The Jotunheim is the wild, mountainous region lying below the Jostedalsbreen and the Bøverdalen on the W., and the Gudbrandsdal on the E. It is a region of towering snow-covered peaks, the highest being Galdhøipiggen (8097 ft), the highest mt in Norway, Glittertind (8041 ft), and Skagastølstind (7887 ft). The Dovrefjell is an area of barren rocky summits with patches of moorland and peaks rising above the general level of the plateau. The highest peaks are Snöhetta (7500 ft),

Rondeslottet (7162 ft), and Storrornden (7027 ft). There are sev. deep forested valleys cutting across the fjell and providing through routes from Oslo. The Trollheim, which extends northward to the Trondheim Depression, is barren and rocky in its highest part, but towards the coast the plateau decreases steeply in height and contains large forested areas. The SE. lowlands consist of the valleys of the great rivs., flowing S. to the Skagerrak and SE. to the Oslofjord, together with the plains lying round their mouths along the coast. It is a pleasant undulating countryside and the rivs., with their waterfalls, are conducive to agriculture and industrial development. The largest of the valleys of this region, the Setesdal, is followed by the R. Otra for 150 m. to its outlet in the Kristiansandsfjord. Other rivs. of this region are the Topdalselv and the Nidelv. Between the viddas and the lowland to the E. is the Telemark, a region of many lakes and riv. valleys, with bare outcrops and patches of conifers. It is broken by 3 main riv. systems. The rivs. feed the Totakvann, characterised by a remarkable series of locks, and the Tinnsjø, which flows in a deep forested valley to the great Rjukan falls. Below Lake Tinnsjø it descends by a series of great falls to the Hitterdalsvann. These rivs flow into the Norsjø and drain into the Lange-sundfjord by the Skiens R. E. of the Telemark many rivs. flow SE. towards the Oslofjord. The Laagen, flowing through Nummedal, reaches the sea in Larviksfjord. Another similarly named riv. rises in a lake in the heart of the Dovrefjell, flowing into Lake Mjøsa, below which it is called the Vorma as far as its confluence with the Glomma. Lake Mjøsa, largest lake in Norway, lies in an open wooded valley with gently sloping hills on each side. The Glomma, which follows the Østerdal, has a course of 400 m. from its source in the Rørosvidda to its mouth on the E. of Oslofjord. The current of the Glomma is swift and the riv. is used, especially in spring floods, for floating timber. The Dramselv, draining the Tyrifjord (a lake), descends in a broad valley to Høksund where it veers E. and flows through a wide cultivated valley to Drammen at the head of the Dramsfjord. Oslo itself lies in a small depression at the head of its fjord; low hills covered with spruce and pine extend westwards from the city, and northward the hills rise higher to the forest of Nordmarken. The Begna, rising in the S. of Jotunheim, flows through the Valdres valley in a number of lakes and a gorge below the Strandefjord, joining with the Randselv, and thence descending through a broad valley by a series of rapids.

(b) *Northern Norway.* The main topographical divs. of N. Norway are the Trondheim Depression, the Trøndelag, the Nordland, Troms, the coastal is. between Altafjord and Majerøy, and the plateau region of Finnmark. Towards the S. of the Trondheim Depression are the E. highlands (highest point, Storöla, 5600

ft). The dominant features of the lowlands of the Trondheim Depression are the Trondheimfjord, the Snaasavatn lake (30 m. long), and the Namdal. The country surrounding the fjord and lake is undulating and includes the rich region of good farms and large coniferous forests. The R. Namsen, flowing along the Namdal into the Namsenford, is the prin. riv. of the Trøndelag. The Nordland includes all Helgeland as far N. as Ofotfjord. Sev. snow-fields rise in isolated peaks above the level fied, the largest being Sulitjelma (6300 ft) and Blaamannsisen (4800 ft). In the Troms region the E. highlands occupy the coastal part of the mainland. The coast N. and S.E. of the Malangenfjord in this region is cut up into narrow peninsulas which have a wild and grand aspect with mts beeting above the steep slopes of the rugged coast. Finnmark plateau is a vast barren stretch extending from the W. watershed of the Altafjord across the N. part of Norway to the Finnish and Russian frontiers. The coast is formed by low cliffs unscroened by is. and exposed to the Arctic. The chief fjords are the Altafjord, Porsangerfjord, Laksefjord, Tanafjord, and Varangerfjord. All cut deeply southwards into the plateau, except the Varangerfjord, which runs W. The plateau is dissected by numerous rivs., of which the Alta, Tana, Neiden, Munkelv, and Pasvik are the chief. The Tana and the Anarjokka, its confluent, form the frontier with Finland for 150 m., the Pasvik for 60 m. The Munkelv, which rises in Finland, has only a few miles of its course in Norway.

(c) *The coasts.* The remarkable development of fjords results in a coastline of amazing complexity. The rugged shores often rise in sheer walls of rock from the water's edge, which restricts navigation to a few well-defined routes. A screen of reefs fringes the mainland between Cape Lindesnes (the most southerly point of the Norwegian mainland) and the Skjens R. Cape Lindesnes is a craggy headland at the end of a rocky forested peninsula. There are no large fjords extending far inland in this part of the coast such as are to be found on the W. coast, but there are many inlets, of which Kristiansandsfjord and Toppalsfjord together form the largest. The Oslofjord extends N. from the Skagerrak for 60 m. from 59° N. lat. Its shores are not very steep and the outer part is undulating forested land. It is a region of numerous scattered farming communities, with some large industrial tns (Drammen, Tönsberg, Oslo, Halden, etc.). From Cape Lindesnes north-westward are the Rosfjord and Grönsfjord with steep rugged shores, the Lyngdalsfjord and Listerfjord each side of the Lister Peninsula, characterised by a steep coast as far as Ana-Sira, craggy and treeless NW. of that place. The coast of Jaeren is unlike any other part of the Norwegian coast, there being no is. or fjords, though on the Stavanger Peninsula there are some is. and large inlets. The Haugesund Peninsula is divided into distinct regions by sev. narrow fjords which are generally frozen in winter.

The Hardangerfjord penetrates the mainland for 70 m. in a NE. direction, while the main branch, the Sörfjord, runs SW. for 24 m. There are extensive farmlands along both shores of the Sörfjord. Between the Hardangerfjord and the Sognefjord (about 80 m. N. of the Hardangerfjord) the coast is characterised by channels and lesser fjords, which form numerous is. and peninsulas and a most irregular coastline. Bergen is the nodal point of this region and lies sheltered at the foot of steep hills. The Sognefjord extends eastward into the mainland for about 100 m. and is for the most part narrow. The fjord on each side increases from 2000 ft to 5000 ft at the landward end and many streams flow into the fjord. Cultivable land here is rare. The coast of Salten from the Lofoten Is. is pierced by large fjords, which almost touch the Swedish frontier. The whole coast here is a labyrinth of complicated channels running between is. and promontories.

Climate. There are striking differences in the Norwegian climate, which changes markedly from the coast inland, or from W. to E. Apart from general influences such as the ocean, altitude, and lat. the weather of Norway is controlled by depressions along its shores. Most pass along its W. shore and bring S. and SW. winds on the coasts. Less often they pass along the S. coast and into the Baltic, while some cross the peninsula in the region of Trondheim. In winter the lowest temps. are experienced in Finnmark and around Röros, i.e. in the country furthest from the sea or from the influence of the Gulf Stream. At the latter place, for the first 3 months of the year, the temp. rarely rises above freezing point. Some of the coastal waters have quite mild winters. The highest temps. are to be found in the valleys immediately N. of Oslo, the July mean being 63° and the absolute maximum as much sometimes as 95°. Frost is frequent in all but the outer coastal areas. There are great contrasts of rainfall due to distances from the sea and altitude. The coastal mt region has a high rainfall. In the regions near the N. Cape storms are almost incessant, and rage with great violence. In the W. there are areas with falls up to 120 in., but at no great distance from the coast falls of 10-12 in. are common. Winter temps. decrease northwards, and N. of Trondheim the monthly mean is below freezing-point until spring, and on the mild W. coast snow falls on about 40 days in the year, but inland there is naturally a higher snowfall. Sev. of the mts rise above the limit of permanent snow. Fog is frequent on the S. coasts. In winter it is less widespread in the interior and is concentrated mainly in the E. valleys. The longest day, which in the S. is 18 hrs. may be said to be nearly 3 months in the high lats. of the N. dists, where the longest night lasts almost an equal length of time. The protracted winter of the N. regions follows quite suddenly on the disappearance of the sun, whence the absence of solar light is compensated for by the

frequent appearance of the aurora borealis, which shines with sufficient intensity to allow of the prosecution of ordinary occupations (see also MIDNIGHT SUN).

Flora and fauna. Norway has a luxuriant vegetation, despite its N. situation. It lies mainly within the area of coniferous forests, which are characteristic of cool temperate regions. Vegetation in the N. and on the fjell of W.-central Norway consists chiefly of shrubs, arctic plants, and mosses. The richest vegetation is round the Oslofjord and the great lakes

few plants of economic value in Norway, but seaweeds have some value for their salts of iodine. Peat bogs are extensive. The most characteristic of the arctic animals of Norway are the reindeer, arctic hare, arctic fox, lemming, and wolverine. These are found throughout most of N. Norway. The reindeer are largely tame and are herded by Lapps, but there are wild reindeer in Finnmark and in the mts of central and S. Norway. Lemmings migrate in great numbers towards lower land, pursued and destroyed in equally large numbers by wolves,

Norwegian Travel Bureau

TRYVANNSSIVA AND SKI-RUN

Mjøsa, Randsfjord, and Tyrifjord. Scotch pine and Norway spruce are the most important conifers. In the coniferous zone very little other vegetation can survive, but in the bogs and marshes are sphagnum, ling, bilberry, and cloudberry. Willow and lichen grow in the fjell region of the SW. There are no trees in the willow zone. Dwarf birch and willow shrub, however, form a dense growth of bushes. Reindeer moss predominates in the lichen belt. Herbaceous arctic plants also grow in the willow and lichen belts. The white *Ranunculus glacialis*, a food for reindeer, occurs on high mts. The fjords of W. Norway are barren and their sides afford little soil for vegetation. In the Trondheim Depression spruce is the predominant tree. N. of that region birch is the important forest tree. With the exception of the forest trees there are

foxes, and hawks. The wolverine or glutton is valuable for its fur. The elk, red deer, roe deer, and reindeer are the only wild ruminants. The elk (q.v.) is found in most of the forest regions of E. Norway. The bear, lynx, wolf, fox, otter, and various species of marten were until recently widespread and numerous, but the larger beasts of prey are now rare. The bear is almost exterminated and only found immediately N. of Trondheim. The badger occurs in SE. and S. Norway. The beaver has almost died out. The white whale appears off the N. shores. Bearded seal and walrus sometimes visit the far N. Reptiles include the lizard, slow-worm, and common viper. Most Norwegian birds are migratory. Those which breed in Norway are geese, wader, crane, curlew, snipe, sparrow, and falcons. The mild climate of the S. and W. causes

birds such as the starling, blackbird, woodcock, duck, and swan to winter there. Along the W. and N. coasts there are numerous colonies of sea-birds, including gulls, terns, guillemots, razor-bills, puffins, kittiwakes, cormorants, and eider ducks. Other coastal birds are sheldrake, heron, lapwing, oyster-catcher, and sea-eagle. Lowland birds are thrush, kestrel, skylark, jackdaw, wren, and corn-crake. The most important game-bird in the lowlands is the partridge. On the higher land are black grouse, willow grouse, blackcock, capercaillie, and ptarmigan.

Royal Norwegian Embassy

HARDANGERFJORD, WESTERN NORWAY

Black duck, golden plover, and ruff are found by marshes and lakes. Other common birds are the swallow, bullfinch, golden eagle, crow, blue-tit, and magpie. Fish occur in most of the rivers and lakes. The commonest in the W. and N. coast rivers are char, salmon, and trout. Grayling, perch, pike, turbot, and other fish of E. and central European origin occur in the waters of E. Norway. The sea-fish include haddock (rorqual), dolphin, porpoise, cod, pollack, haddock, whiting, ling, herring, and sprat. Mackerel and tunny are the only S. visitors which disappear in the winter. The Greenland shark comes into the fjords and coastal waters.

Production and industry. The occupations of the Norwegian people are to a very large extent determined by the natural conditions of the country. Agriculture plays so important a part that Norway was almost entirely an agricultural country until the beginning of the 20th cent., when hydro-electricity was first used for large-scale industry. Since then, with abundant cheap power, many manufacturing industries have grown up,

notably the electro-chemical and electro-metallurgical, although most raw materials have to be imported. At the end of 1957 the total production of electricity amounted to 23,500,000,000 kWh., nearly all produced by hydro-electric plants, about a fifth of the available water-power being developed for electricity production. About 95 per cent of the pop. have electricity in their homes. About 713,000 are occupied in agriculture and forestry; 182,000 in fishing and hunting; 1,125,000 in industry and building; and 600,000 in commerce and transport. Norway, being barren and mountainous for the most part, has not a great acreage under crops. In 1955 the harvest was 345,000 tons grain, 1,005,000 tons potatoes, 740,000 tons other root crops, 109,000 tons other vegetables, 2,420,000 tons hay, 90,000 tons fruit. Norway is self-sufficient in meat, dairy products, and eggs. The forests are one of the chief natural sources of wealth. There are 29,000 sq. m. of forest land, largely under pine, and state forests cover 5200 sq. m. The essential part of the growth is used in the paper industry.

Pyrites and iron ore are the chief minerals; but silver, copper, nickel, zinc, lead, and molybdenum are among the ores and minerals found, while among other metals and alloys are aluminium and ferro-alloys, etc. The distribution of deposits is fairly generally spread over the country, with perhaps a preponderance in the N. part. The output of the sea-fisheries is large, totalling about 1,900,000 tons a year, of which well over half is herring and much of the remaining cod. Norway is traditionally the biggest participant in Antarctic whaling. Output of whale oil in the 1954-5 season was 869,000 barrels.

Industry is chiefly based on the primary products of the country (wood and fish) and on water-power. The pulp and paper industry, the canning industry, and the electro-chemical and electro-metallurgical industries are the most important from the export standpoint. Trade in 1957 was valued at 9,100,000,000 kroner for imports and 5,868,000,000 kroner for exports. Exports from Norway to the U.K. in 1957 were 1,171,000,000 kroner, and imports from the U.K. 1,686,000,000 kroner. The registered Norwegian mercantile marine (as at 1 July 1958) was (ships over 100 gross tons only) 2716 vessels totalling 9,394,000 gross tons. Ships on order or under construction totalled app. 1,000,000 gross tons. The merchant fleet is the third largest in the world. More than half consists of tankers. The earnings help to bridge the gap between imports and exports. The railway network comprises 2700 m. of normal track and 140 m. of narrow-gauge track. About 700 m. are electrified. Aviation is largely by Scandinavian Airlines System, a consortium of the principal airlines of Norway, Denmark, and Sweden. There are also some independent companies operating certain domestic and shorter flights.

Total state revenue and expenditure

in the budget year ending 30 June 1958 were, respectively, 5,469,000,000 and 5,531,000,000 kroner.

The chief tns in order of size of pop. are Oslo (the cap., formerly Christiania), Bergen, Trondheim, Stavanger, Drammen, Kristiansand, Haugesund, Aalesund Moss, Skien, Kristiansund, Frederikstad (qq.v.).

Constitution and government. The constitution of Norway is dated 17 May 1814, and has been modified since that date. It vests the legislative power in the Storting (Parliament), the representative of the sovereign people. The

session and the final decision goes by a majority of two-thirds. The same majority is required for alterations in the constitution. The executive is represented by the king, who exercises his authority through a council of state (Statsraad). The ministries are entitled to be present in the Storting and to take part in the debates, but may not vote.

Religion and education. The evangelical Lutheran religion is the national Church and the only one endowed by the State. Its clergy are nominated by the king. All religions are tolerated, the ban

Royal Norwegian Embassy

ARLIFLOSS POWER STATION, TELEMARCK COUNTY

royal veto in regard to Acts may be exercised twice, but a Bill which passes 3 separate Stortings becomes law without royal assent. Every Norwegian subject of 21 years of age, subject to residential qualification, is entitled to vote. Since 1938 the electors have chosen their 150 representatives every fourth year. A system of proportional representation is used, with multi-member constituencies. By a law of 1938 all branches of the gov. services, including the State Church, are open to women. The Storting, when assembled, divides itself by election into 2 sections, the Lagting and Odelsting, one-quarter and three-quarters of the members respectively. Questions relating to the laws must be considered by each section separately. All new laws must first be laid before the Odelsting, from which they pass into the Lagting for acceptance or rejection. If the 2 sections do not agree, they assemble in common

on Jesuits being lifted in 1956. There are about 125,000 dissenters.

Education is compulsory from the age of 7 to 14 years. In 1955 there were 5069 primary schools in the country dists., with 291,000 pupils, and 182 in the tns, with 109,000 pupils. Most of the 280 secondary schools are mixed. Norway has 2 univs.: at Oslo (founded in 1811) and at Bergen (opened in 1948). There is a univ. college of science and technology in Trondheim, a univ. college of commerce in Bergen, and a univ. college of agriculture near Oslo. There are sev. high schools, special schools, technical, art, industrial, and craft schools, a veterinary college, and a teachers' training college.

Defence. The army of Norway is a national militia. Service is compulsory and universal, liability commencing at 18 and continuing till 55. The initial service period is 16 months in the army and 18 months in the navy and air

force. There is a Home Guard of about 100,000 men. The navy is composed of small vessels, none larger than a destroyer. The air force consists chiefly of fighter squadrons using U.S. aircraft. Since the Second World War, and especially since joining N.A.T.O., Norway has built up an effective, modern defence force, aided by U.S. military aid and N.A.T.O. intra-structure contributions.

History. There is good evidence of the presence of sub-Palaeolithic man in N. Norway, and modern research has been directed to the prov. of Finnmark, where traces of the earliest settlers in Scandinavia have been found on the banks of the fjords.

The Vikings play a part in the obscure and somewhat fabulous early hist. of Norway, which is comprised in that of other Scandinavian countries. The Viking period, however, ended early in the 10th cent. with more settled conditions in Norway, and its conversion to Christianity. The sea-rovers were, moreover, never more than a fraction of the people, most of whom were peaceable farmers and fishermen. Harald Haarfagre (Harald the 'fair-headed') was the first to bring all the settled parts of Norway under one rule. He was descended from the kings of Vestfold, a dist. W. of the Oslofjord, and was son of Halfdan the Black who ruled further N. He began to reign some time after 866, and from his time the hist. of Norway is comparatively full and authentic. When his own inherited kingdoms were secure, Harald, fired by Charlemagne's example, marched into and subdued the Trondheimers. But it was only after sev. more years that he routed the chiefs of the W. coast in a great battle at Hafsford near Stavanger. His defeated enemies had to take an oath of fealty to him, and the fylke-kings (the *fylker* were the old tribal divs.) were replaced by *jarte*s, removable at his pleasure. Harald d. c. 933 and left his kingdom to be divided among his many sons, making Erik, his favourite son, a sort of suzerain. Erik at once tried to secure all for himself, and to that end murdered 2 of his half-brothers. In 934 Haakon, a younger son of Harald, was summoned from England and, with the help of Sigurd, drove Erik into flight from Norway. Haakon restored to the Norwegians the rights and liberties of which they had been deprived; but although his attempts to convert his subjects to Christianity failed, his reign was for the most part peaceful despite a dangerous relaxation of central control. In 961 Haakon was killed in combat with Dan. invaders led by Erik, and in the ensuing years Norway was much disturbed until the arrival of Olaf Trygvason, grandson of one of the murdered half-brothers of Erik. Olaf, who had been a well-known viking leader and was a man of splendid physical endowment and great energy, was the founder of Nidaros (later called Trondheim), for many years the Norwegian cap. After a reign of only 5 years he perished in a sea-fight with Dan. and Swedish ships under

Earl Erik, son of Haakon, and the kingdom was then divided for the most part between the Swedish and Dan. kings and Earl Erik. Another seafaring king like Olaf Trygvason was Olaf Haraldson, a descendant of Haarfagre, who came to the throne as Olaf II c. 1015. Olaf II's policy was the double one of establishing both the royal power and the Christian Church on a national basis in opposition to the local chieftains who were claiming dists. by hereditary title. But though he strictly enforced the laws and gave Norway comparative stability, he too was doomed to perish at the hands of his foes, being killed at the battle of Stiklestad (1030). This victory, however, served to increase the influence of Denmark, whose king, Knut (Canute), sent Svend Knutson to rule as viceroy. On Knut's death in 1035 Knutson was expelled and Magnus, son of Olaf II, was brought from exile in Russia. Olaf II is commonly reputed to have been the first to awaken a national consciousness and came to be regarded as the national champion, while his zeal for the Church sanctified his memory, so that later he was extolled as the patron saint of Norway. On Hardeknut's death (1042) Magnus inherited the crown of Denmark. He made his nephew Svend Estridsen his viceroy, but the latter, with the aid of Harald Haardraade, tried to secure his own independence. Haardraade, who was a half-brother of Olaf and a great warrior, came to terms with Olaf and together they ruled Norway. Under Olaf III (Olaf Kyrre), son of Haardraade (killed at Stamford Bridge, 1066), Norway enjoyed peace and prosperity. Sigurd, a son of Magnus, was the last of the line of Harald Haarfagre to wield undisputed sway over Norway, and with his death ended what has been called the classic period of Norwegian history.

After the death of Sigurd there ensued a long period of intestine strife over rival claims to the throne, and in these conditions the power of the aristocracy and the political influence of the Church both tended to grow at the expense of the king. When Magnus V, son of Erling Skakke, who was not of royal blood, was chosen king in 1161 it was thought expedient that the Archbishop of Trondheim should crown him and thereby at least make the kingship nominally dependent on the goodwill of the Church. In 1184 Magnus was defeated and killed on the Sognefjord by the Birkebeinar, desperate armed followers of Sverre, who claimed to be of royal descent. Sverre, an able and strong ruler, set out to make the royal power supreme over both national Church and State, and his efforts to achieve his purpose were largely successful by the time of his death (1202). Pretenders to the throne were not finally crushed until 1240. Haakon Haakonson (Haakon IV), however, succeeded Sverre and ruled until 1263. It was during his long reign that Iceland became directly dependent on Norway, but an attempt to bring the Hebrides and other Scottish is. into the same relationship utterly failed, and they were ceded later to

Scotland by Magnus VI, in whose reign the relations of the Crown with the old aristocracy were to some extent improved. Erik, his son and successor, *d.* in 1299. His only child, the 'Maid of Norway,' was drowned on the way to Scotland and the crown then passed to Haakon Magnusson (Haakon V), his brother. Haakon V left no son and the crown then (1319) passed through his daughter to the reigning house of Sweden. The child Magnus VII, hereditary King of Norway and grandson of Haakon V, was elected King of Sweden in 1319, so that the 2 kingdoms became nominally united. From that time until the 20th cent. the hist. of Norway is inextricably interwoven with that of other parts of Scandinavia. The union, accidental in its origin, was so unsuccessful that it was arranged that Haakon, younger son of Magnus, should reign over Norway. Haakon VI *d.* in 1380 and Margaret, his wife, daughter of Valdemar, King of Denmark, acted as regent in both countries, even after her son's (Olaf) death in 1387. In Sweden Albert of Mecklenburg, who had been chosen to replace the deposed Magnus, became so unpopular with his nobles that they asked Margaret to assume power, and in 1389 Albert was defeated by her army at Falköping and Margaret was now *de facto* mistress over all Scandinavia, while in 1397, by the union of Kalmar, the 3 countries were declared to be 'eternally' united under one sovereign.

After 1412 Sweden revolted against the union because the more important posts were held by Dan. nobles. Christian of Oldenburg (Christian I), who succeeded to the crown of the 3 countries in 1448, could not establish his power over Sweden, and in 1523 Sweden finally seceded from the union. In 1525 the Danes set up the Duke of Holstein as king with the title of Frederick I, but his zeal for Lutheranism made enemies of the Church in Norway. Frederick *d.* in 1533 and Christian III was chosen king by the Dan. council. He, too, was an extreme Lutheran, but an attempt by the opposition, under Archbishop Olaf Engelbriktsson (or Engelbrechtsson), to reject him having proved abortive, Norway became practically a prov. of Denmark, the people, who were scarcely more numerous than in the years preceding the Black Death, being too scattered in remote settlements to have any true understanding of political conditions. Thus Norway had to all intents ceased to exist as a sovereign state and for a long time appeared only in Dan. hist. It was concerned only indirectly with the wars in which Denmark, under Christian IV, became involved, but its actual disintegration seemed to be imminent when, in the disastrous war of the Danes under Frederick III, Trondheim was lost to the Swedes (1658). But the Norwegians asserted themselves and most of the lost ter. was soon recovered. Norway's fortunes began to revive with the growth of her maritime trade during the wars of the Dutch with the English and French. But in 1717-18 Norway was invaded by Charles XII of Sweden, whose purpose

was to obtain a portion of ter. with which to negotiate peace with his enemies; but in the result Sweden's power was so weakened that she no longer constituted a threat to her Scandinavian neighbours.

During the Napoleonic wars Norway was faced with economic chaos and famine owing to her dependence on blockaded Denmark. In 1810 the Fr. marshal, Jean-Baptiste Bernadotte, was made Crown Prince of Sweden as Karl Johan and, the old king (Charles XIII) being infirm, Bernadotte became the effective power. Bernadotte's rule was popular in Sweden owing to his kindness to Swedish prisoners during the war with Denmark. But as King of Sweden he was almost necessarily led into tortuous ways and now made the acquisition of Norway the keystone of his whole policy, his aim being to divert the popular ambition of Sweden from the conquest of Finland. This project received support from England and other powers in consideration of Sweden's aid against Napoleon. Norway was then again the victim of blockade, and national bankruptcy soon followed. After his success at Leipzig Bernadotte defeated the Danes, and under the ensuing peace treaty of Kiel (1814) the King of Denmark renounced all rights in Norway, though the Norwegian dependencies, Iceland, Greenland, and the Faeroes, were reserved to Denmark. The Norwegian people, however, who were not consulted on this arrangement, were intensely hostile to it. The result was that Prince Christian Frederick, next in succession to the Dan. king, was sent to Norway as regent. He soon abdicated, and Norway was at length declared 'a free, independent, indivisible, and inalienable kingdom united with Sweden under one king,' under the Act of Union of 6 Aug. 1815. This second union with Sweden, which was maintained from 1815 to 1905, was purely personal in the sense that the king was the sole connecting link.

The 2 states had their separate and very different systems of gov., defence, finance, and laws, and their economic and political interests were diverse and often antagonistic. The Norwegian view was that the 2 states were intended to be on a footing of absolute equality, but the Swedes claimed that Norway was no more than ceded ter. enjoying only a nominal autonomy. Only after the accession of Oscar II in 1872 did the situation become less strained. Under the Liberals, in 1883, the king yielded to the Norwegian desire that the ministers and state councillors should have the right of access to the Storting and of participation in its debates, thereby establishing ministerial responsibility in Norway. But Norway still had no foreign minister and claimed that her divergent economic interests entitled her to have separate consular services. In 1892 and 1898 these questions brought Norway and Sweden to the verge of war. In 1905 the Norwegian ministry of the day resigned following the king's (Oscar II) veto of a measure for a separate and independent Norwegian consular service and his

refusal to form another gov. The Storting then claimed that Oscar had abjured his constitutional functions and ceased to be King of Norway, and that the union with Sweden was at an end. This was confirmed by a Norwegian referendum by 259,563 votes to 69,264 against, and a treaty was signed at Karlstad, 6 Oct. 1905, defining the terms of separation, including the delimitation of a 'neutral' zone, and Norwegian fortifications were dismantled. There was a small popular demand for establishing a rep., but the peasantry were one strong factor against it, and the Storting chose Prince Charles, second son of the then Crown Prince Frederick of Denmark, to be king. He was elected by referendum (18 Nov. 1905) and was crowned King Haakon VII (q.v.) on 22 June 1906, in Trondheim Cathedral. Princess Maud Charlotte, the youngest daughter of Edward VII of England, his consort, became queen.

In the First World War Norway adopted an attitude of strict neutrality, but her timber and mining industries suffered heavy losses and the national debt increased enormously, speculation became widespread, wages rose with the cost of living, and this economic confusion was enhanced by the fall of the currency. Victories at the election of 1927 gave the Labour party 50 representatives in the Storting and a Labour gov. was formed in 1928, but it soon went out of office with the threat of complete disarmament and financial chaos. Unemployment reached its highest point during the time of the Liberal gov., under Mowinkel (1933), and when this gov. was defeated it was succeeded in 1935 by an all-Labour gov.; but the Labour party had learned its lesson and increased the vote for defence (1937). In 1920 Norwegian sovereignty over the Spitsbergen Archipelago (known as Svalbard) was affirmed by international treaty. A long-standing dispute over Greenland came before the International Court of Justice at The Hague, but the court upheld Denmark's claim (1933). In 1939 Norway annexed part of the Antarctic coast between 20° W. and 45° E., the land within, and its territorial waters.

On 9 April 1940 the Ger. minister at Oslo presented a series of demands to the Norwegian Gov., e.g. that the gov. should appeal to the people and army to refrain from resisting the Ger. troops. But already, sev. hours before these demands were delivered, Ger. forces had begun the attack on Norway. Norway refused to submit to the Ger. demands. Naval and military operations were carried on against overwhelming odds by the brave Norwegian Army, assisted by Brit. and Fr. forces until 10 June. After the Germans opened their offensive on the W. front the Allies gave notice that they must withdraw their forces from N. Norway. The Norwegian Gov. decided therefore on 7 June to end the defence of N. Norway 2 days later at midnight, and continue the fight outside Norway. The king and members of the Norwegian Gov. took over the administration, assisted by

an administrative council. On 25 Sept. the Ger. Reich's commissar for Norway by a decree excluded the king, the legal gov., and all political parties, and estab. a council of commissars of the Quisling (q.v.) party. On 1 Feb. 1942 the Ger. commissar appointed Vidkun Quisling, the notorious Norwegian traitor, as 'minister president' of a puppet gov., an appointment at once repudiated by the *de jure* Norwegian Gov. in London.

One of Quisling's first acts in the interests of his new masters was to attack the schools and teachers in the vain hope of 'nazifying' them; but, apart from alienating the teachers, he came into conflict with the State Lutheran Church. He also tried to establish a corporative assembly, called the *Rikssting*, on the model of the Ger. *Arbeitsfront*, but most of the workers resigned from the trade unions which were to form the new labour front and Quisling had to abandon his plan. The usual Ger. repressive measures, as put into operation in other occupied countries, followed in 1943 in the shape of concentration camps, labour conscription, and police purges. But from outside Norway the Norwegian Gov. continued to direct the growing participation of Norway in the allied war effort. The Norwegian Navy was strengthened by an increase in its personnel to over 5000 men. Corvettes carried out much convoy work; Norwegian fighter planes had shot down 137 Ger. planes by the end of 1942, and the Norwegian Army continued its intensive training. In the years of the Ger. occupation the financial burden on Norway was very heavy, and was higher in proportion to the pop. than in any other occupied country.

In Oct. 1944 the Red Army, pursuing the retreating Germans from Finland, crossed the Norwegian border and took Kirkenes, the vital base from which the Germans had directed their attacks against the convoys to Murmansk. They soon cleared the Varanger Peninsula, and by the close of the year nearly half of the co. of Finnmark was liberated. Inside this area some 25,000 Norwegian civilians, who had succeeded in evading compulsory evacuation, set about the task of repairing their damaged towns and villages. Norwegian forces all through 1944 helped not only in preparations for the liberation of Norway, but also in the general allied offensives against the Reich. On 7 May 1945 Gen. Böhme, Ger. commander-in-chief in Norway, broadcast Germany's surrender, and the Norwegian home forces took over strategic points all over the country. By Sept. some 225,000 Germans had been evacuated; the Russian forces in N. Norway returned home in the same month, while Amer. and Brit. forces left before the end of the year. King Haakon returned to Oslo on 7 June. After the liberation the collaborators were brought to justice. Quisling himself, and others, were executed. Knut Hamsun, the novelist and Nobel prize-winner, who had actively supported the Germans, was arrested, but the capital charge against him was dropped because of his mental deterioration; he was heavily fined. In

the parl. elections of Oct. the Labour party, already the largest in the Assembly, increased its representation to 76 out of 150, thus securing a majority over all other parties.

Reconstruction was soon set on foot. Hydro-electric and industrial development was undertaken on a scale never before attempted in Norway. The merchant, whaling, and fishing fleets were rebuilt after heavy war-time losses. Agriculture was mechanised. Clearly, however, Norway could not plan in isolation, and the main problems lay in the field of collaboration with Scandinavia and the W. nations. Norway had been a member of U.N.O. from its inception, and a Norwegian, Trygve Lie, became first secretary-general of the organisation in Feb. 1946. In Feb. 1948 Norway announced her agreement with the aims of Marshall Aid (q.v.), and undertook to participate in the economic co-operation of the 16 Marshall Aid countries. There was also set up a Joint Nordic Committee of N. Denmark, Sweden, and Iceland for economic affairs and to consider the estab. of a Northern Customs Union. In Oct. 1948 Norway received from the Economic Co-operation Administration a loan under the European Recovery Programme of \$35,000,000. The total of Amer. aid in 1948-9 amounted to \$84,000,000. Norway also entered into the intra-European payments scheme. A joint Anglo-Norwegian committee was estab. in Mar. 1949 for mutual co-operation on economic matters.

In matters of political alignment it was ultimately estab. that Norway would take her place amongst the W. nations. Although in 1947 a 3-year plan for the reorganisation of defence had been drawn up, the experiences of Ger. occupation decided that Norway must seek security, as well as economic stability, in concert with others. This did not, however, prevent the rejection of an Amer. proposal to place Antarctica under international administration; Norway expressed her readiness to participate in international scientific exploration of the area, but wished to retain the sovereignty of her sector. Negotiations were opened in Nov. 1948 to set up a military pact for the collective defence of Norway, Sweden, and Denmark, but a fundamental difference of view became apparent. Sweden, who had been able to preserve her neutrality in the Second World War, and who was, moreover, so closely situated to Russia, wished this union to remain strictly a neutral bloc; Norway, a Ger.-occupied land, and with a geographically Atlantic outlook, insisted that she was a part of W. Europe. Denmark's views were midway between the two, but nearer that of Norway. Ultimately, therefore, the plan was abandoned, and Norway joined the N. Atlantic Treaty (q.v.), which later she ratified in July 1949. Simultaneously with the decision Norway rejected, as being unnecessary, a Russian proposal for a non-aggression pact. In May Amer. defence assistance was requested in accordance with the principles

of the treaty. In May 1949 Norway signed the Statute of the Council of Europe. In the election of Oct. 1949 the Labour party was again returned to power, with a further accession of strength at the expense of the Communists, who did not win a single seat, and was returned to power again, though with a reduced majority, in 1953. Haakon VII d. in 1957, and his death occasioned widespread and deep mourning over all Scandinavia. He was succeeded by his son, Olav V (q.v.). In the general election held in 1957 the Socialists were again returned to power. See also article on NORDIC COUNCIL.

Literature. The literature of Norway cannot be taken as a whole; for the old sagas, the poetry, and historical legends were written in Old Norse, which was the language of the colonists of Iceland from Norway, and is so bound up with Icelandic literature that it cannot be separated therefrom (see ICELAND, *Literature and Language*). Similarly, till well on into the 19th cent. the sources of Norwegian literature must be found in Denmark and in Dano-Norwegian, though many of the greatest writers, such as Holberg, Tullin, and Wessel, were Norwegians by birth. The separation of Denmark from Norway constitutionally in 1814 must be the starting-point in a brief outline. The poets of 17 May 1814, the inaugural day of Norwegian independence, the 'Trefold', Conrad Schwach (1793-1860), Mauritz Hansen (1794-1842), and Henrik Bierregaard (q.v.) (1792-1842), did much for the new school; but the greatest early figures were Henrik Wergeland (q.v.) (1808-45), a poetic genius of national tradition who also preached universal values, and his great opponent Johann Welhaven, classicist and conservative (1807-73). Wergeland's sister, Camilla Collet (q.v.) (1813-95), was an early realistic novelist, and her great novel, *The Governor's Daughters*, is a landmark in the women's suffrage movement. The most important event in 19th-cent. literature, however, was the national revival. It was a period of large-scale rediscovery of the old medieval songs and tales. Perhaps the most significant work was done by the linguist and vernacular poet Ivar Aasen (q.v.) (1813-96), who traced the connection between the various dialects and Old Norse and whose grammar and dictionary form the basis of the *Landsmaal* movement which aims at eventual unification of the dialectal elements in Nynorsk and what is known as Samnorsk. Aasmund Vinje (1818-70) wrote fine lyrical poems in the vernacular medium, and, incidentally, wrote a report on Britain, *A Norseman's Views on Britain and the British*, 1863.

Of the next period the great names are those of Henrik Ibsen (1828-1906) and Bjørnstjerne Bjørnson (1832-1910) (qq.v.), whose reputation and influence were world wide. Ibsen's first plays, such as *Warriors at Helgeland*, 1857, borrowed their themes from national legends; but the early *Lady Inger*, 1855, with its strong characterisation, more clearly foreshadowed his later triumphs. Naturalness

of dialogue and situation, adherence to the unities of time and place, the disappearance of soliloquy, the avoidance of the conventional happy ending, are all so familiar to-day that we are apt to forget that these fundamental changes are due to Ibsen. One strong ground of criticism of Ibsen was that he seemed unable to keep away from the topic of disease in its hereditary aspect, as in *Ghosts* which appeared in 1881, and, again, that his philosophy of life was too uncompromising. But whether his beliefs were justified or not, he swept away the fashionable, complicated plots which had no relationship to everyday life. Björnson gave life to conventional characters, but never shook off Scribner's (q.v.) influence. Like Ibsen he took the problems and tragedies of everyday life as themes for his later plays, such as *Leonarda*, *The Editor*, and *A Bankruptcy*. But Björnson handled his themes differently from Ibsen and was essentially a humanitarian whose views were obvious, while he manifold evidence to prove a case. He lacked Ibsen's concentrated technique and creative imagination; but the passionate honesty of his own character was expressed in the appeal in his plays for less casuistry and more truth. His novels are generally on pastoral life and contain some of the most delicate pictures of peasant life in modern fiction.

Of this period was also Jonas Lie (q.v.) (1833-1908). He was not a great creative artist, but stories such as *The Commodore's Daughter*, 1892, and *Dyre Rein*, 1896, are skilfully narrated and show great power in identifying himself with the peculiarities of Norwegian sentiment. His style, almost too colloquial, lacks the charm of Björnson and the art of his successors. Alexander Kelland (1849-1906), a writer with a subtle ironic touch, wrote novels of great force and vitality, attacking social and moral prejudices. A few years younger is Arne Garborg (q.v.) (1851-1924), who was early the recognised leader of the *Landsmaal* movement.

Modern Norwegian literature has not surpassed the high level of that of the last decade of the 19th cent. Though there are many well-known names, they have not reached the international standard of Ibsen, Björnson, Garborg, or Lie. The form chiefly adopted has been the novel, especially the naturalistic, inspired by Fr. and Russian models, and poetry has occupied an important place. Out of this transition period rises the most dominating modern figure in Norwegian literature, that of Knut Hamsun (q.v.) (1859-1952). His work is characterised by its vitality and extreme subjectivity. *Pan*, 1920, has a great poetic beauty. *Markens Grøde* (*Growth of the Soil*), 1920, a study of man against nature, is his greatest novel. Almost equally popular is Johan Bojer (q.v.) (1873-), the sober pragmatist and the antithesis of prose-poets like Hamsun and Hans Kinck. He is typically national in thought and language. With a greater depth and veracity than Bojer, though lacking his narrative style, is Sigurd Christiansen (1891-).

Kinck (q.v.) (1865-1926) is regarded as the conscious linguistic artist who seeks his character studies in the peasantry of the fjord dists. His best-known novels are *Sneskavlen brast* (*The Avalanche*), 1918-19, and *Driftkaren* (*The Cattle Dealer*), 1908. A calmer mentality pervades the work of Trygve Andersen (1866-1920), whose prose style of classical purity matches the monotony of his themes. His *Cancelliradens Dage*, 1897, short stories, and *Mot Kveld*, 1900, which treat of aspects of social decay, are his most notable works. Peter Egge (q.v.) (1869-), who, like Strindberg, is for ever dwelling on the personal conflict between man and woman, also enjoys considerable popularity. Amongst his prolific writings are *Inde i fjordene* (*By the Deep Fjords*), 1920, *Joegtvig og hans Gud* (*Joegtvig and his God*), 1920, and *Hansine Solstad*, 1929. Of the still more recent novelists, the best known is Sigrid Undset (q.v.) (1882-1949), whose *Jenny*, 1911, achieved great success, but has been surpassed by her historical trilogy, *Kristine Lavransdatter*, 1920-2.

Other 20th-cent. novelists are Cora Sandel (1880-), Johan Falkberget (1879-) who has described the life of the miners and mt-farmers in the Røros dist. and Sigurd Hoel (1890-) who has also pub. many short stories. Of the 'New Norse' school a conspicuous figure was Jens Tvedt (1857-1935), who depicts the westland peasants' life in a wealth of dialect idiom. In contrast with the objective realism of Tvedt, as exemplified in *Madli un'Apalen* (*Madli under the Apple Tree*), 1900, is the subjective moodiness of Rasmus Løland (1861-1908), whose stories of child life have won high praise. Among *riksmaal* writers are Andros Haukland (1873-), a prose-poet of the Arctic shores, and Hans Aanrud (1863-1953), who painted the folk life of the eastland with a quiet humour rare in Norwegian literature. Among the regional prose writers is Olaf Benneche (1883-), an historical novelist. Perhaps the outstanding lyric poet of modern Norway is Arnulf Øverland (q.v.) (1889-), whose fastidious sense of words is complemented by a strong passion for social justice; he was one of the earliest opponents of Nazism. Other modern lyrical poets are Nils Vogt (1864-1937), whose reflective poetry is unequalled in Norway, and Olaf Bull (1883-1933), whose poetry recalls that of Keats and Herman Wildenvey (1886-), a *plein air* singer. Tore Orjasæter (1886-) is a lyric-epic poet of great sincerity. In the field of non-lyrical poetry must be mentioned Olaf Aukrust (1883-1929), a visionary *landsmaal* poet whose *Himmelvarden*, 1916, forms an impressive collection of religious-philosophical poems. With Olaf Duun (1876-1939) *landsmaal* came into its own; in his deep insight into the peasant character, Kristofer Uppdal (1878-) portrays the labouring classes in the same medium. Niels Kjaer (1870-1924), one of Norway's few notable essayists, exhibits considerable diversity, and has also produced successful comedies. The most

conspicuous of modern Norwegian dramatists was the aristocratic individualist, Gunnar Heiberg (1857-1929), whose *Balkonen* (*The Balcony*), 1894, and *Kjerlighedens Tragedie* (*The Tragedy of Love*), 1904, are considered to be Norwegian classics. Of more recent drama the most important work has been by Helge Krog (1889-), and by Nordhal Grieg (1902-43), who was shot down over Germany, Norway thereby losing a playwright and poet of great promise.

Music. No national music was written in Norway until the Romantic Movement began in 1840 with the 'national revival' in which Ludvig M. Lindeman (1812-87) collected many of the rural melodies which had survived through the Dan. period. Some of these tunes have connections with the *kjempeviser*, ballad material common to all Scandinavia; the *springdans* is the same as the Swedish *polska*. However, 2 Norwegian dances, the *gangar* and *halling*, have no parallel, and their rhythms have inspired many Norwegian composers. In vocal music, too, Lindeman found strange medieval survivals, reminiscent of old church chants, yet showing even older, simpler structure. The influence of this vocal music on the *kjempeviser* produced music of almost monumental character; in addition to these heavy melodies there are light, airy embellishments of the melody arising from the peasant love of the patterns of unison music. This, together with the surprising rhythm, created a unique Norwegian folk music. The most typical instruments were the *langeleik* (plucked strings) and the *hardingfele* (Hardanger fiddle), the 8-stringed violin.

Ole Bull (1810-80), the violinist, was the first great name in Norwegian music, though he only wrote down 2 tunes. Halfdan Kjerulf (1815-68) was the founder of romanticism in Norway, and the work of Rikard Nordraak (1842-66) included many songs and the air of the national anthem.

The composer who is inseparable from Norwegian folk music is, of course, Edvard Grieg (q.v.) (1843-1907). Among his contemporaries were Johan Svendsen (1849-1911), restrained classical composer, Christian Sinding (1856-1941), disciple of Wagner, and the pianist and composer of songs Agathe Backer Grøndahl (1847-1907).

The founding of the Philharmonic Society in 1919 gave new scope for major orchestral works. With main emphasis on national themes Harald Sæverud (1897) and Klaus Egge (1908) have written works which have won international repute. Composer of atonal music is Fartein Valen (1887-1952), the most remarkable recent Norwegian composer.

Architecture, see SCANDINAVIAN ARCHITECTURE.

Art. Prehistoric pictures still exist in Norway, similar to the cave paintings of the Pyrenees: bold, naturalistic scenes of elk and reindeer hunting, of whaling and fishing. With the dawn of civilised society came the formation of a definite

national style in art, evolving from the rhythmical Celtic carving known all over Scandinavia and in Celtic Britain. This style was influenced not directly by Greece and Rome, as with the rest of Europe, but by all manner of local arts discovered (and plundered) by the Vikings (see VIKING ART). Then, as to-day, it was rich dramatic contrast which characterised Norwegian art. Even after the decline of Norwegian power in the Middle Ages, the stately Gothic style imported from the S. was superimposed upon this dramatic Norwegian element—literally so in the carving in the 'Stave' churches of Sognefjord. However, at the collapse of the Norwegian state, art styles became scattered and localised, developing and continuing in different ways in small areas.

When independence returned, in the 19th cent., all these localised styles became the tribes of a renewed stream of Norwegian style in art. The lively landscape work of I. C. Dahl was the first recognisably Norwegian art of the modern age; natural romanticism predominated, as in the work of Fearnley, Gude, and Tidemand, the great portrayers of peasant life.

It was not long before the tide of Fr. Impressionism swept in, strengthening the dramatic quality of colour and style even more. The 'most dramatic and explosive force' in all Norwegian art, produced by this period, is Edvard Munch (q.v.) (1863-1944), 'the Viking with the whole high-tensioned soul of our age.' A similar national synthesis of style is sought for in the world of sculpture by Gustav Vigeland (q.v.), who created the vast fountain project in Oslo's largest park, comprising scores of individual and group sculptures. For some years Vigeland practically monopolised Norwegian sculpture, and only since about 1920 has a new school appeared, under the teaching of Rasmussen, and including Seland, Pettersen, Vaas, and Dagfin Werenskiöld. At the same time painting has produced many artists whose expressionistic use of colour is linked with the traditional dramatic style: Thorvald Erichsen's sunshine-filled works have peculiarly soft, rich, and tender colouring, while Ludvig Karsten fills his canvas with shattering colours and vibrating light, in contrast to the severe linear style and clear colouring of Harald Sohlberg; the emotional nature scenes of Nicolai Astrup contrast with the grim city paintings of A. C. Svarstad; some of the liveliest portraits have been produced by Henrik Lundh. Monumental artists, largely influenced by Matisse, include Sørensen, Krohg, and Revold (frescoes in Bergen Stock Exchange, 1918). In later decades the contrasting elements of national romanticism and international classicism seem to have succeeded in combining to form something typically Norwegian in painting style. Modern Norwegian painting strikes one as a daring and highly talented experiment in colour. The younger phalanx, among them Midelfart, Lie-Jørgensen, and Steen Johnsen, carry on the exploration of Norwegian landscape.

Especially the dist. of Telemark, with its richness of light effects, has attracted a wide range of artists. A very vigorous painter with a social consciousness is Reidar Aule, but perhaps the most outstanding of all are Kai Fjell and Arne Egeland, who both carry on the Munch tradition.

Norway and Denmark, German Invasion of (1940). In Mar. 1940 Koht, Norwegian Prime Minister, was protesting to Germany against the sinking of Norwegian ships, just as earlier he had protested to the Brit. Gov. against the brilliant Brit. naval feat of rescuing some 300 Brit. prisoners from the *Altmark* (see NAVAL OPERATIONS). Like other neutrals, Koht was living in an unreal world, which had no place in the totalitarian conception of international relations. Ger. U-boats were flagrantly ignoring Norwegian neutrality by sinking ships in their territorial

waters, among them, scores of Norwegian vessels. The Allies then also violated the neutrality by the laying of mines in Norwegian waters, which mine-laying also served the useful purpose of checking supplies of iron-ore coming down from Narvik through these waters to Ger. ports. The Norwegians protested against this violation of international law by Britain. Shortly afterwards, however, Germany invaded Norway in such circumstances of time and equipment as made it abundantly clear that the attack, far from being an unpremeditated retort to the Allies' minelaying, had been planned for months beforehand. Goebbels's broadcast on 9 April to the Ger. people that Norway and Denmark had been 'taken under the protection of the Reich to forestall allied occupation,' and identical proclamations to the armed forces and people of Denmark and Norway, were made by the respective Ger. commanders of the invading forces in those countries. At dawn on that day strong mechanised Ger. units crossed the Schleswig frontier near Flensburg and Tønder and proceeded to the rapid occupation of the whole country, which was accomplished within a few hours without encountering any organised resistance. Simultaneously Ger. troops were landed from warships and transports at Copenhagen, København, and other places. The Ger. invasion was accepted by the Dan. Gov. under protest and they and the king called upon the people 'to adopt a calm and controlled conduct,' declaring it to be their duty to refrain from resistance. The Norwegians, on the other hand, refused to accept the Ger. ultimatum and their gov. ordered a general mobilisation. But already the Germans had landed troops at Bergen, Stavanger, Trondheim, Egersund, Narvik, and other places and all these troops were soon in their hands. Troops were also landed in Oslo Fjord. The Norwegian Parliament and King Haakon and the royal family left Oslo for the N., aided by the failure of the naval invasion of the cap. In the later afternoon Oslo was occupied by the Germans as a result of surprise airborne landings. Meanwhile Narvik had been taken after resistance by 2 old Norwegian defence vessels had been overcome by 10 Ger. destroyers. Brit. naval and air forces promptly counter-attacked and a number of Ger. ships, including transports, were sunk (see NAVAL OPERATIONS). Brit. troops were landed at sev. points on the Norwegian coast and more Ger. transports were sunk, while the Ger. pocket battleship *Admiral Scheer* was hit by a torpedo. An allied force under Maj-Gen. Carton de Wiart, V.C., effected a landing at Namsos and advanced in the hope of capturing the Trondheim-Namsos railway line. Ger. landings were, however, made in Trondheim Fjord, and heavy Ger. counter-attacks were delivered by these troops in the Trondheim area (23 April), and later the Germans captured the important position of Stenjkjer, while the Allies were forced to withdraw from positions near Lillehammer, it being evident that the

Germans would make every effort to establish contact between their forces N. of Oslo and those in the Trondheim area by a thrust up the Osterdal valley. Early in May Chamberlain announced that the Brit. troops in S. Norway had been withdrawn from Aandalsnes, the Brit. Gov. having decided that they must abandon any idea of taking Trondheim from the S. Brit. losses, however, were slight on land, but on the sea, during the 3 weeks that had now elapsed, the R.N. had lost 4 destroyers, 3 submarines, 1 sloop, and 5 trawlers. The Ger. losses at sea were, however, so heavy that they permitted of an important redistribution of the main allied fleets. In the following month the Allies withdrew from N. Norway. The loss of Narvik was important both from a material and psychological standpoint, for it was from this port that the much-needed Swedish iron-ore was shipped for Germany, though before abandoning it the Brit. forces had prevented the use of the port for some time; and furthermore, the abandonment of the whole Norwegian adventure, superadded to the fact that the Allies had been forestalled by the Germans, involved much damage to allied prestige. This failure led to a most acrimonious debate in the House of Commons with the result that Chamberlain resigned and was succeeded by Churchill. It is curious that the Brit. Gov. did not foresee the Ger. attack on Norway. Even at the eleventh hour Britain did not realise that the dispatch of strong Ger. naval units to the N. waters of Norway was a decoy to draw the Brit. fleet away from the Skagerrak where it could have destroyed most of the Ger. transports and accompanying vessels and then sailed N. to destroy the rest of the Ger. naval units. The result of the Ger. success was of course to place the entire Norwegian coast in their hands as a base for future operations against the Brit. Isles. See H. K. Lehmkühl, *The Invasion of Norway* (pub. by authority of the Norwegian Gov.), 1940, and *Hüller attacks Norway*, 1943, and T. K. Derry, *The Campaign in Norway*, 1952.

Norwegian Architecture, see SCANDINAVIAN ARCHITECTURE.

Norwegian Sea, name given to the part of the N. Atlantic Ocean which stretches between Norway and Iceland, and between the Arctic Ocean and about lat. 64° N. It is connected with the Arctic in the far N. between Svalbard (Spitzbergen) and Greenland by a wide, deep opening. An extensive seal and whale fishery is carried on, especially off the N. and E. coasts of Jan Mayen Is. Area 100,000 sq. m. Mean depth 870 fathoms.

Nor'-wester, prevailing wind of S. Is., New Zealand. It causes a heavy rainfall on the W. slopes of the S. Alps, and becomes a warm and dry föhn wind over the plains to the E. of the mts. The term is also used for tornados (q.v.) in India.

Norwich, Alfred Duff Cooper, 1st Viscount (1890-1954), statesman, diplomat, and author; educ. at Eton and New College, Oxford. He served with the Grenadier Guards in the First World War.

From 1924 to 1929 he was Unionist M.P. for Oldham and was financial secretary at the War Office, 1928-9. In 1931 he was elected M.P. for St George's, Hanover Square, and returned to his former position at the War Office, 1931-4. He held the same position at the Treasury, 1934-1935; secretary of state for war, 1935-7; first lord of the admiralty, 1937-8, resigning after the Munich Pact; minister of information, 1940-1; Chancellor of the Duchy of Lancaster, 1941-3. N. was the representative of the Brit. Gov. with the Fr. Committee of National Liberation, 1943-4, and an outstandingly successful ambas. to France, 1944-7. Author of *Talleyrand*, 1932, *Haig*, 1935-6, *The Second World War*, 1939, *David*, 1943, *Operation Heartbreak*, 1950, and his autobiography, *Old Men Forget*, 1953. N. married (1919) Lady Diana Manners, youngest daughter of the 8th Duke of Rutland.

Norwich, city and co. bor. in the centre of the E. portion of the co. of Norfolk, England, 20 m. from the coast, and situated in the valley of the Wensum, about 115 m. NE. by N. of London. Fragments of the anct walls, which were 4 m. in circuit, remain. On a mound, which existed before 1100, with pleasure gardens occupying the moat, stands the famous Norman castle. Built soon after the Conquest to dominate E. Anglia, it was destroyed in the Earl of Norfolk's rebellion against William I, and the present building, an almost cubic block, is attributed to Wm Fitz-Osbern (c. 1120). It suffered capture by Flemings in 1174, and by Fr. troops in the reign of King John, but its military importance declined with the coming of artillery and the gradual settlement of the country. It was given to the co. by George III and was used as a jail until 1887, when the prison on Mousehold was built. Refaced in 1834-9, the keep was opened in 1894 as the Norwich Castle Museum, where are to be found important collections of antiquities, raptorial birds, and flint implements. The art galleries, enlarged in 1951, contain the finest collection in the country of the works of John Crome, John Sell Cotman, and other artists of the Norwich School of landscape painting. Norwich Cathedral dates from 1096.

There are over 30 city churches, mostly built of flint in Late Decorated or Perpendicular style. The largest, St Peter Mancroft, dating from 1430 to 1455, is one of the finest par. churches in England; its tower is 102 ft, and the church contains the tomb of Sir Thomas Browne, whose statue stands on the Haymarket near by. St Andrew's Church, rebuilt 1506, contains elaborate tombs of the Suckling family and a memorial tablet to 'Abraham Lincoln' of great interest to Americans. The 15th-cent. church of St Peter Hungate is now an eccles. museum. Air raids cost the city sev. churches, including that of St Julian, associated with Julian of Norwich (q.v.), which has since been rebuilt. The grammar school, originally a charnel-house chapel of c. 1316, was converted into a school in the reign of Edward

VI. Lord Nelson, George Borrow, and Rajah Brooke of Sarawak were scholars there. The guildhall, a quaint flint building, dates from 1407 to 1413. The city hall, opened in 1938 by King George VI and Queen Elizabeth, is a good example of modern civic architecture. Its clock tower is 185 ft high. The garden of remembrance was designed by Lutyens. The 15th-cent. St Andrew's Hall was at one time the nave of the church of the Dominicans or Blackfriars. There is a magnificent Georgian Assembly House, restored in 1950 as an arts centre. Other notable features are the 15th-cent. Maid's Head Hotel; the Stranger's Hall, a 16th-cent. merchant's house, now a folk museum; Suckling House, a 16th-cent. banqueting hall; Erpingham Gate, built by Sir Thomas Erpingham, 1420; Ethelbert Gate, commemorating a riot between monks and citizens, 1272; the Bridewell, built 1370, now a museum of local industries; Pull's Ferry, anct water-gate; and the 13th-cent. Bishop's Bridge, one of the oldest bridges in England. The chief parks are Eaton Park and Earlham Park. Other parks and open spaces include Mousehold Heath, Chapel-field Garden (the central public garden of Norwich), Waterloo Park, and the quaint cobbled and gabled 'Tombland,' deriving its name from the *loom* or open land which was the market place of the original A.-S. settlement of Norwich (c. AD 600-700). Theatres include the Maddermarket, home of the Norwich Players, and the Theatre Royal.

During the Second World War Norwich was heavily damaged: 340 persons were killed, 1100 injured, and nearly 5000 houses and historical monuments were damaged or destroyed. Norwich is administered by a lord mayor, 16 aldermen, and 48 councillors, and returns 2 members to Parliament.

The staple industry of Norwich, employing over 10,000 hands, is that of higher grade shoe manuf. Other large industries include those of mustard, starch, cereals, confectionery, electrical and structural engineering, printing, insurance, brewing, silk and silk dyeing. For cents. Norwich has been the leading market in E. Anglia. There are large cattle, provision, and fish markets, and the provision market is of very anct origin. Pop. 121,226. There is a long hist. of Norwich in the Norfolk Directory, c. 1862. See Hudson and Tingey, *The Records of the City of Norwich*, 1906; Ian C. Hannah, *The Heart of East Anglia*, 1910; W. Rye, *Norwich Castle*, 1921; Thomas Wake, *Norwich, City of a Thousand Years*, 1945; A. Kent, *Norwich Inheritance* (photographs), 1948; R. H. Mottram, *If Stones Could Speak*, 1953.

Norwich, city of Connecticut, U.S.A., on the R. Thames, 40 m. SE. of Hartford. It is a port of entry and a flourishing industrial centre, and manufs. thermos flasks, textiles, aircraft components, paper products, leather goods and shoes, chemicals, clothing, bedding, metal products, paint, and cutlery. It was settled by colonists in 1659, when 9 sq. m. were

bought from Uncas, a Mohegan Indian chief. Pop. 23,429.

Norwich Cathedral. The original church was planned and begun (1096) by Herbert de Losinga, first bishop of N., and completed by his successor. De Losinga also built a Benedictine monastery for 80 monks under their rulers; this was closed (1538) and most of the buildings have disappeared. The church, however, remained as N. C., and retains the appearance of a typical Norman building. Much damage has been caused to N. C. at various times by storms and fires, and later rebuilding has taken place in the Early Eng., Decorated, and Perpendicular styles. Stone vaulting with richly carved bosses, erected c. 1472-1536, now replaces the flat, wooden ceilings in the prin. parts of the building. The carved wooden stalls in the choir date from 1416 to 1425. At the E. end is a chapel built on the site of 2 earlier chapels as a memorial to men and women of the co. who fell in the war of 1914-18; it is also the chapel of the Royal Norfolk Regiment. The bishop's anct throne, standing E. of the high altar and facing W., is the only seat of its kind in N. Europe which is still in use. The 14th-cent. cloisters took 130 years to rebuild. The glorious spire (rebuilt 15th cent.) is 313 ft high. Edith Cavell is buried outside the church near the E. end, in the part known as Life's Green.

Norwood, Sir Cyril (1875-1956), Eng. educationist, son of a clergyman, was educ. at Merchant Taylors' and at St John's College, Oxford, of which college he was president from 1934 to 1946. He secured the first place in the civil service examination for first-class clerks and for 2 years served in the Admiralty. At 26 he left the service to become a master at Leeds Grammar School. In 1906 he was elected headmaster of Bristol Grammar School and 10 years later he went to Marlborough College, where he introduced some rather drastic reforms (1916-25). From 1926 to 1934 he was headmaster of Harrow. He was knighted in 1938. He was chairman of the Board of Education committee asked to report on the curriculum and examinations in secondary schools (1941). The findings of this committee, which gave support to the tri-partite system, were very influential and are contained in a report widely known as the *Norwood Report*.

Norwood, Gilbert (1880-1955), Eng. classical scholar. He was prof. of Greek at Cardiff from 1908 to 1926 and then went to Toronto Univ. as prof. of classics. His pubs. include *Greek Tragedy*, 1920, *Writers of Greece*, 1925, *Greek Comedy*, 1931, and *Pindar*, 1945.

Norwood, Richard (1590?-1675), Eng. mathematician. In 1616 he was sent to the Bermudas to survey the newly settled is., and was accused of having reserved for himself some of the best land there; he resided there during the civil war as a teacher of mathematics. He ascertained the lat. at a position near the Tower of London and also of a place in the centre of York. He pub. a map of Bermudas in

1622, *The Gunner, shewing the whole Practice of Artillerie*, 1628, *Trigonometrie, Or the Doctrine of Triangles*, 1631, *The Seamans Practice*, 1637, and *The Doctrine of Triangles*, 1667.

Norwood: 1. Suburban dist. of S. London, a mile SW. of Dulwich. It consists of Upper, Lower, and S. Norwood, and forms the S. portion of the bor. of Lambeth. Pop. 85,600.

2. Suburb of Adelaide (q.v.), S. Australia, lying 3 m. NE. of the city; pop. 16,000.

3. City of Ohio, U.S.A., forming a NE. suburb of Cincinnati. It manufs. playing cards, office equipment, aircraft parts, electrical goods, etc. Pop. 35,000.

4. Tn. of Massachusetts, U.S.A., in Norfolk co., 14 m. SSW. of Boston. Tanning is carried on and there are printing and publishing plants, foundries, and knitting factories. Pop. 16,636.

Nose, organ of smell. It consists of an external portion and an internal part divided into 2 nasal cavities. The outer N. has the shape of a triangular pyramid. The bony structure of the N. consists of the short nasal bone which is connected with the forehead by a bridge. Besides this bone, the N. is supported by cartilages, of which the 5 chief are the cartilage of the septum and the upper and lower lateral cartilages. The cartilage of the septum forms the supporting part of the vertical partition which separates the right and left nasal cavities. The lower part of the septum is not formed by the cartilage of the septum, but is freely movable, and is on this account called the *septum mobile nasi*. The upper lateral cartilage is triangular in shape, and serves as a continuation of the nasal bone. It is joined at its lower edge on each side by fibrous tissue to the lower lateral cartilage. This consists of 2 plates; the outer one is oval and communicates with the inner one by a rounded piece which forms the point of the N. The lowest part of the N., or 'wing,' is formed of skin externally and internally. The orifices or nostrils are guarded by small hairs, or vibrissae, which serve to protect the nasal cavities from dust, small insects, etc. Above the aperture in each nostril is a slightly expanded cavity, the *vestibule*, which is prolonged towards the tip as a pouch, or *ventricle*. Above the vestibule the nasal passage, or *fossa*, is divided into 2 parts, the upper or *olfactory*, and the lower or *respiratory*, portion. The fossae are divided into 3 passages or *meatuses* by 3 *turbinated*, or scroll-like, bones. The meatuses communicate with the ethmoidal, sphenoidal, and frontal cells.

The olfactory region is lined with mucous membrane, yellowish in colour, and containing olfactory glands, or glands of Bowman, embedded in it. In the respiratory region the mucous membrane is covered by columnar, ciliated epithelium, and contains many cells secreting a watery fluid. The N. is supplied by branches of the facial nerve, the ophthalmic, and others for the conveyance of motor impulses and of ordinary tactile sensations. The sense of smell is conveyed

by olfactory nerves arising from the olfactory bulb and distributed over the mucous membrane of the olfactory region. Here they are connected with rod-like cells; these cells pass between the columnar epithelium to the surface, where a delicate filament serves as a free end; at the other end of each cell the filament becomes continuous with an olfactory nerve filament. It is not definitely known whether the external stimulus which gives rise to the sensation of smell is physical or chemical in its nature. In 1948 Prof. W. R. Miles of Yale Univ., after experiments with insects, put forward the theory that the sensation is due to infra-red radiations which the nose is able to receive. The substance exciting the smell must be in a finely divided state,

SECTION OF THE NASAL REGION
SHOWING THE RIGHT NASAL
CAVITY

A, frontal bone; B, nasal bone; C, D, nasal cartilages; E, nasal palate; F, superior ethmoidal concha; G, inferior ethmoidal concha; H, inferior turbinal (maxillary concha); I, opening of Eustachian tube; J, opening to sphenoidal sinus.

and is usually a vapour or gas. The free ends of the olfactory filaments are usually covered with a thin layer of fluid. If the fluid is too thick, as in catarrh, or if it is replaced by a dry crust, the efficiency of the olfactory organ is diminished or temporarily destroyed. The exciting substance becomes dissolved in the watery fluid, and so affects the cell filaments. In order that solution may be effected readily, a certain amount of pressure is necessary; that is, the air containing the substance must be driven with some force against the membrane by sniffing. The organ of smell is probably not so delicately differentiated in man as in some of the lower animals. The sense is quickly fatigued, so that a delicate odour is sometimes not perceived after the initial experience; most persons also find it difficult to discriminate in a mixture of smells, and probably only the predominating odours in a host of smells are perceptible to man, although the lower animals might be able to discern many.

Diseases, etc. The N. may be fractured by direct violence, and if adequate treatment is not resorted to, a displacement of

the septum may result, leading to nasal obstruction and possible complications. *Acne rosacea* is a skin affection characterised by congestion of the capillaries of the outer N. and later by hypertrophy of the sebaceous follicles. The N. has then a swollen appearance, and the course of the dilated capillaries can be plainly seen. It occurs in dyspeptics, alcohol- and tea-drinkers, and is known as 'brandy nose' or 'whisky nose,' though the cause may not be the use of alcohol. Lupus (see TUBERCULOSIS) and erysipelas (q.v.) may affect the N. Rhinitis is a very common complaint. It involves inflammation of the mucous membrane of the N.; its acute form is coryza or cold in the head. Rhinitis is an allergic manifestation in some cases, the allergens being certain dusts or pollens, as in hay fever. Chronic rhinitis is due to repeated attacks of the acute form, and produces in the early stages hypertrophy of the mucous membrane, and in the later stages atrophy of the mucous membrane, together with the formation of dry crusts, or scabs. The nasal mucous membrane is sometimes the site of diphtheritic infection (see DIPHTHERIA). Epistaxis is bleeding from the N. The cause may be a high arterial pressure due to one of a variety of conditions, and in many cases is itself a remedial effort of the organism. Where the bleeding continues the patient should rest quietly on the back. If the haemorrhage continues the N. must be plugged. Polypi, or tumours, may be formed on the mucous membrane. A soft mucous polypus can easily be removed and does not usually recur, but fibrous polypi have a tendency towards malignancy. Sinusitis, or inflammation of the chambers of the skull which open from the N., is of common occurrence.

Nosean, or **Noselite**, aluminosilicate and sulphate of sodium ($3\text{Na}_2\text{Si}_2\text{Al}_2\text{O}_5 \cdot \text{Na}_2\text{SO}_4$) closely allied to hatynite (q.v.) and the artificial ultramarines. It occurs in cubic crystals, usually dodecahedrons, of various colours and sometimes opaque. Found in the Lancher See (Rhine-land), the Alban Hills (Rome), Kaiserstuhl (Baden) and in sev. of the hatynite localities.

Noske, Gustav (1868-1946), Ger. politician, b. Brandenburg, served an apprenticeship as a carpenter, but soon took up political journalism, and in 1906 entered the Reichstag. In the First World War, which split the Ger. Socialist party, N. sided with the majority Socialists under Scheidemann and Ebert. He was appointed minister of defence in the Coalition Gov. of the Weimar Rep., 1919, but his firm handling of revolutionary disorders caused criticism which led to his resignation. Later he became president of the prov. of Hanover. N. was arrested by the Nazis after the plot against Hitler in July 1944 and sent to a concentration camp, but later moved to the Moabit prison where he was found when the war ended.

Nosology (Gk *nosos*, disease; *logos*, science), that branch of medicine concerned with the distribution and arrangement of diseases into classes, orders, etc. The term is also applied to collection of evidence as to whether a particular

condition should be regarded as a special disease.

Nossairians, or **Alawis**, see ANSARS.

Nossi-Bé, is. 8 m. from the NW. coast of Madagascar, belonging to France. It is 14 m. long by 10 m. broad with an area of 130 sq. m. It is volcanic and mountainous. Rice, maize, manioc, bananas, coffee, and sugar are grown. Cap. Hellville. Pop. 12,000.

Nostalgia (Gk *nostos*, return home; *algos*, pain), home-sickness. It is sometimes an early phase of melancholia, but is usually only a transient emotional manifestation. It varies in intensity from a sentimental inclination to think fondly of the homeland to an uncontrollable desire to return and a settled dislike of one's present surroundings. In its more severe form it is more likely to occur in the insecure, over-dependent type of personality that finds it difficult to achieve a fully adult adjustment to environment.

Nostradamus, or **Michel de Notre-Dame** (1503-66), Fr. astrologer, of Jewish extraction, b. St Rémy, Provence. For many years he practised as a physician, and gained high reputation for his skill in stemming the tide of the great plagues of Lyons. Catherine de' Medici brought him to her court, and he was physician to Charles IX. His *Centuries*, prophecies in rhymed quatrains, was pub. in 1555, and was condemned by the Holy See. See lives by E. Jaubert, 1856, and E. Baresté, 1840; also C. Wöllner, *Das Mysterium des Nostradamus*, 1926.

Nota, **Alberto** (1775-1847). It. comedy writer in the tradition of Goldoni, b. Turin. He was greatly influenced by Molière, but he followed his model too closely to give his own individuality scope and freedom. His best work is perhaps *La Lusignhiera*. Collected eds. of his plays were pub. at Florence in 1827 and at Turin in 1837 and 1842.

Notables, **The**, advisory assemblies of notable personages summoned by the kings of France in times of stress. These assemblies had no constitutional authority and their transactions were of a purely private and confidential nature. Richelieu consulted this body in preference to the states-general. The best known was that convoked by Louis XVI in 1787 at the instigation of Colonne; it was called in order that the privileged classes might be consulted on, and give their consent to, a more equitable system of tax collecting. Louis XVI again summoned the N. in 1788 when its members' reactionary attitude helped to increase popular ill-feeling and so probably encouraged the outbreak of the revolution.

Notary Public. The office of N. P. is of great antiquity, and its origin is to be traced to the professional writers or scribes who made drafts of public and private instruments. According to Brooke (*Treatise on Notaries*, 1901) the name was applied amongst the Jews to the royal secretaries who wrote the letters and edicts of the king, kept the register of his troops, and attended to his revenue and expenditure; to scribes who copied and interpreted sacred writings; and to officials

who wrote and prepared legal documents. The same authority finds analogous officials in ancient Syracuse, Egypt, Greece, and Rome. The term *notary* itself is derived from Latin, *notae*, meaning the system of stenography in vogue among the early Roman scribes, though later it appears to have been applied to the clerks or registrars attached to the prov. and municipal magistrates and officials of the emperor's privy council, while those who prepared private deeds and documents were specifically known as *tabelliones* from *tabella*, the thin waxed tablets used in drafting. There is no European nation without its N.s P., though their duties differ considerably in different countries. In England the duties of a N. P. are very circumscribed, and in status he is far below, for example, the N. P. of France. The Eng. notary's chief duties are to note and protest bills of exchange, to authenticate copies of private documents and deeds, to draft and attest instruments like powers of attorney about to be sent abroad, and receive affidavits of mariners, and administer oaths. A great many of the functions of a notary are, however, in England performed by solicitors, e.g. the preparation of wills and contracts, and hence it is that this official's duties are so commonly associated with protesting bills of exchange on dishonour. The utility of 'a notarial act' (i.e. the act of authenticating or certifying a document or entry by a written instrument under the signature and seal of a N. P., or an instrument attestation, or certificate made or signed by a N. P.) is that it is by the custom of all merchants accepted as unimpeachable evidence of the legal validity of the transaction recorded by it, notwithstanding that such transaction may have no validity in the country where it actually took place. The powers of a N. P. in America are wider; he may take depositions and do other acts relating to the recording of testimony, and take proofs of debts in bankruptcy. In England N.s P., who have always been civil and canon law officials, are appointed by the Archbishop of Canterbury. In America they are appointed by the state-governor, and with the advice of either the council or the senate of the state.

Notation (from Lat. *notare*, to mark). In music, the art of writing music in notes, i.e. representing musical sounds and their various modifications, by notes, signs, etc. Between 990 and 1050 N. was much improved by Guido of Arezzo, who founded our present system. The ancient Greek system was phonetic; also the modern Arabian system, the old tablatures, and Tonic Sol-fa methods of to-day. Sound, key distance, and scale relationship are their bases. The diastematic system of 'N. by intervals' comprised the neumes (or neumes), representing groups of notes, and first came into use about the 7th cent. The pitch of sound is now expressed by the positions of notes and the presence of clofs on sets of 5 lines, called 'staves' (which began as a single line and afterwards had companion lines added to it; plainsong still uses 4 lines with the old

square notes). Their relative duration is defined by variously shaped notes. Key and rhythm are indicated by signatures. Present N. is somewhat inadequate to the demands of modern music, because atonal writing involves frequent accidentals. Various new systems have been suggested, but the obstacle to reform is the vast mass of printed music.

In mathematics N. is the elaborate system of signs, symbols, numbers, and letters which has been gradually evolved to meet the needs of discovery. There is no accepted world system of N., but there is enough uniformity to enable mathematicians in different countries to understand each other. N. is of fundamental importance to mathematics, as language is to philosophy, and the progress made would have been impossible by the use of words alone. For a full treatment see F. Cajori, *A History of Mathematical Notation*, 1928.

Scales of N. are the various systems of writing numbers, the common and only one in practical use to-day being the denary scale or scale of ten, ten being the radix. On this scale 12 means $1 \times 10 + 2$. There can be binary, tertiary, etc., scales with radices of 2, 3, etc. On the nonary scale, for example, where the radix is 9, 12 means $1 \times 9 + 2$, which would be written 11 in the ordinary scale, and 346 represents $3 \times 9^2 + 4 \times 9 + 6$, etc. To transform 356 from the denary to the duodenary scale we may proceed as follows:

$$\begin{aligned} 356 &= 300 + 50 + 6 \\ &= (2 \times 12^2 + 1 \times 12) + (4 \times 12 + 2) + 6 \\ &= 2 \times 12^2 + 5 \times 12 + 8 \\ &= 258, \text{ omitting the radix symbols.} \end{aligned}$$

Each branch of science has its own particular system of N., based on mathematical N. and adapted for special needs. See CHEMISTRY; PHYSICS; etc. See also DECIMAL SYSTEM; DUODECIMALS; SIGN; SYMBOLS.

Notched-bar Test, method of testing relatively ductile materials. A notched metal bar is struck by a heavy pendulum, the energy required to break the bar being expressed in foot-pounds.

Notes, Bank, see BANKS AND BANKING. '**Notes and Queries**,' monthly paper of quaint or unknown or little-known facts, phrases, archaisms, and bibliographies of interest to the literary world, estab. in 1849 by the antiquary, Wm John Thoms, with the object of providing a weekly paper in which literary men could answer one another's questions. Its motto was, until 1923, Capt. Cuttle's, 'When found make a note of.' In 1920 it was bought by *The Times*, and in 1939 by the Oxford Univ. Press.

Notestein, Wallace (1878-), Amer. historian, educ. at Wooster and Yale Univs. He was prof. of Eng. hist. at Cornell Univ., 1920-8, and from 1928-47 was prof. of Eng. hist. at Yale. He was George Eastman Visiting Prof. at Oxford, 1949-50. His studies on the hist. of the House of Commons have become indispensable standard works and include an ed. of *D'Ewes Journal of the Long Parliament*, 1923, and *The Winning of the*

Initiative by the House of Commons, 1924. Other pubs. include *The English People on the Eve of Colonisation, 1954.*

Nothofagus, genus of deciduous and evergreen trees of the Antipodes and S. America, family Fagaceae, about 15 species; *N. obliqua*, Roblé Beech, *N. procer*, *N. dombeyi*, and *N. fusca* are hardy for mild localities in Britain.

Notholaena, family Polypodiaceae, a genus of delicate ferns, with under-surfaces of fronds clothed with fine powder, scales or tomentum, known as Gold and Silver Ferns; grown in warm greenhouses; *N. trichomanoides* being unequalled.

Nothoscordum, genus of bulbous plants (family Liliaceae) bearing umbels of white, yellow, lilac, rose, or purple flowers. *N. inodorum* and *striatum* are hardy; others are grown in cool greenhouses.

Nothotherium, see SLOTH.

Notice, Equitable and Judicial: Equitable. It is a principle of equity (q.v.) that an equitable as distinct from a legal (i.e. common law) interest in property is in no way binding upon the person who obtains the legal interest, unless he ought in conscience to respect the equitable interest, and in general his conscience can only be affected by *notice*, actual or constructive, of the existence of the equitable interest; e.g. A, the owner of an estate, creates an equitable mortgage of it to B; then without disclosing such mortgage, A makes another equitable mortgage of it to C. C is ordinarily postponed to B in the matter of repayment of their loans because later in point of time; but if, *assuming that at the time he took his mortgage he had no notice of the existence of the mortgage to B*, he subsequently induces A to convey to him the legal estate, whether by way of mortgage or otherwise, he can ignore B's mortgage altogether. By constructive notice is meant either knowledge of a fact from which the existence of an equitable interest ought to have been inferred, or the possibility of discovering its existence by the usual method of investigating title.

Judicial. A court of law is said to take *judicial notice* of a fact when it accepts it in evidence without proof. All judges take judicial notice of, *inter alia*: (1) all Acts of Parliament, public or private, and all unwritten laws and legal principles acted upon by the courts of Great Britain; (2) all general customs decided by a superior court of law of equity to have the force of law; (3) the course of proceeding, and all rules of practice, of the Supreme Court; (4) the general course of proceeding and privileges of Parliament; (5) the ordinary course of nature, and natural and artificial divs. of time; (6) the ordinary meaning of Eng. words; (7) the existence of every state and sovereign recognised by Great Britain; (8) the signatures of high court judges; and (9) all matters which they are directed by statute to notice. See Taylor, *On Evidence*, and Stephen, *Digest of Evidence*.

Notification of Diseases. The following diseases are notifiable throughout England and Wales under the Public Health Act, 1936: smallpox, cholera, diphtheria, membranous croup, erysipelas, scarlatina

or scarlet fever, fevers known by the name typhus, typhoid, enteric or relapsing. In London the fever known as 'continued' is notifiable under the Public Health (London) Act, 1936. The following diseases are also compulsorily notifiable by reason of regulations made by the minister of health: plague, acute poliomyelitis (including polioencephalitis), acute encephalitis, meningococcal infection, malaria, dysentery (including amoebic and bacillary dysentery), acute primary pneumonia, acute influenzal pneumonia, ophthalmia neonatorum, puerperal pyrexia, measles and whooping cough, and leprosy. Tuberculosis is a notifiable disease under the Public Health (Tuberculosis) Regulations, 1930. Food poisoning is notifiable under the Food and Drugs Act, 1938. In certain dists. the following are notifiable under local regulations made by, or local orders approved by, the Local Gov. Board or minister of health: anthrax, chicken-pox, epidemic diarrhoea, summer diarrhoea, glanders, hydrophobia, pemphigus neonatorum, acute rheumatism, scabies, infective enteritis, and zymotic diarrhoea. In one particular area only catarrhal jaundice, acute inflammation of the liver, toxic jaundice, and infective jaundice are notifiable under the Jaundice Regulations, 1943.

In Scotland the following diseases are notifiable: acute poliomyelitis (including acute polioencephalitis), acute influenzal pneumonia, cerebrospinal fever, cholera, continuing fever or puerperal fever, diphtheria, dysentery, encephalitis lethargica, erysipelas, infective jaundice, leprosy, malaria, membranous croup, ophthalmia neonatorum, plague, puerperal pyrexia, relapsing fever, scarlet fever, smallpox, tuberculosis, typhoid or enteric fever, typhus fever, and whooping cough.

Under the Factories Acts of 1937 and 1948 and the Lead Paint (Protection against Poisoning) Act, 1926, every medical practitioner attending on or called in to visit a patient whom he believes to be suffering from any of the following diseases, contracted in any factory or other premises to which the provisions of the Factories Acts as to notification of industrial diseases apply, must notify the case forthwith to the chief inspector of factories, Ministry of Labour and National Service: lead poisoning, phosphorus poisoning, manganese poisoning, arsenical poisoning, mercurial poisoning, carbon bisulphide poisoning, aniline poisoning, chronic benzene poisoning, compressed air illness, anthrax, toxic jaundice, toxic anaemia, and epitheliomatous ulceration or chrome ulceration.

Noto, tn in Sicily (q.v.), 17 m. SW. of Syracuse (q.v.), and 2 m. from the coast. It dates from 1703. The previous tn, 5 m. to the N., occupied the site of the Rom. *Netum* and was destroyed in an earthquake. There is a baroque cathedral and other fine churches, and in the vicinity are Christian catacombs, Gk cemeteries, and prehistoric tombs. There is a trade in agric. produce, wine, and olive oil. Pop. 30,000.

Notochord, supporting rod of closely

packed cells characteristic of those animals which comprise the phylum *Chordata*. The N. runs lengthwise from anterior to posterior ends, and is situated immediately ventral to the spinal cord. The members of the sub-phylum *Acrania* lack a skull and backbone; they comprise (1) the Cephalo-chordata, such as *Amphioxus* (q.v.) which are named from the extension of the N. to the extreme tip of the 'head,' (2) the Tunicates or Sea Squirrels, which possess a N. in the larval stage, though it is lost in the adult, (3) the Hemichordata, e.g. *Balanoglossus*, worm-like animals with the N. restricted to the region of the proboscis. In the remaining sub-phylum, *Cranialia* or *Vertebrata* (fishes, amphibians, reptiles, birds, and mammals), a skull with a cranium enclosing the brain is formed, and the N. becomes surrounded by the vertebrae of the backbone. In some lower forms of vertebrates, such as the lamprey, the N. persists in the adult, but in most it can be recognised only in the embryo, and is soon obliterated by the backbone which develops around it.

Notornis, see TAKAHE.

Nôtre, André Le, see LE NÔTRE.

Notre Dame Bay lies between Fogo Is. and Cape St John, on the NE. coast of Newfoundland in the Bay of Exploits; at the E. end is a large archipelago.

Notre Dame Convent, Mt Pleasant, Liverpool, Catholic secondary school for girls and training college for teachers, staffed by the Sisters of Notre Dame.

Notre-Dame de Paris (Our Lady of Paris), the great cathedral of Paris, is situated at the SE. end of the Île-de-la-Cité. The first stone of the cathedral was laid by Pope Alexander III and Louis VII in 1163, on the site of an ancient Merovingian cathedral. The general structure was completed by 1245. After undergoing many depredations in the 18th cent., Notre-Dame was restored by Viollet-le-Duc (q.v.) in 1845-64. It is a magnificent example of the first two periods of Gothic, the great rose-window, the apse, the towers, and the doors being especially noteworthy. See M. Aubert, *Notre-Dame de Paris*, 1928.

Notting Hill, residential dist. of London, near the W. end of Hyde Park, 4 m. W. of St Paul's, part of the bor. of Kensington.

Nottingham, Earls of, see FINCH, HENAGE, and HOWARD OF EFFINGHAM.

Nottingham, city and co. bor. of England, cap. of Notts, on the Trent, 125 m. NNW. of London by rail, and an important rail centre. The R. Trent is navigable to the sea, and gives access to Newark, Gainsborough, and the Humber ports. At the Nottingham end of the navigation there are adequate basins, warehouses, and transport sheds.

The Rom. station of *Margidunum* at E. Bridgford was an important site on the Rom. Fosse Way between Leicester and Lincoln. A fort of Claudian age has been very thoroughly excavated in recent years. The A.-S. named the tn *Snotingham* and occupied it for a long period from about the 6th cent. AD. N. was one of the 'Five Burghs' occupied by the Danes.

William the Conqueror occupied the tn in 1066. In 1589 the Rev. Wm Lee invented the first stocking-frame here. Charles I raised his standard here in 1642 and the next year the tn and castle were taken by the Parliamentarians. At N. Richard Arkwright first erected his spinning-frames and Hargreaves his spinning-jenny. Serious riots, occasioned by the introduction of machinery, took place in 1811-12 and 1816-17. Sherwood Forest (the legendary home of Robin Hood) has long been shorn of its mighty grandeur, but remains of it still exist in the Dukeries (q.v.). Wm Booth, founder of the Salvation Army (q.v.), was b. in N.

The prin. public buildings are the Council House, opened in 1929 by the Prince of Wales, the Guildhall, and N. Castle, originally built on Castle Rock by William the Conqueror, dismantled during the Protectorate, restored in 1878, and now the Castle Museum and Art Gallery. The collections include examples of N. alabaster carving, a local industry of the 14th and 15th cents. Other important buildings are the churches of St Mary (15th cent.), St Peter (partly 12th and partly 15th cent.), St Nicholas (1678), and the Rom. Catholic cathedral of St Barnabas (designed by Pugin), and the Shire Hall, Albert Hall, etc. There is also an art gallery in Victoria Street.

Facilities for educational advancement in the city are on a wide and generous scale. The education authority is responsible for primary, secondary, and grammar school education, and development is taking place to provide all forms of educational activity. In the sphere of further education, a college of art and crafts, a technical college, and many evening institutes have been provided. There are 2 high schools, namely, the boys' and the girls'. Ancillary services provided by the Education Committee include the school health service, school clinics, a child guidance clinic, open-air schools, and a school meals service. The N. Playhouse Theatre, a non-profit-making venture, was begun in Nov. 1948 and is run by a trust representing the various interests of city and univ. N. Univ. (q.v.) is housed in a beautiful new building erected by Sir Jesse Boot, later the 1st Lord Trent, in a park on the outskirts of the city in a setting of exceptional beauty, and was opened by George V in 1928. The park adjoining the college is 260 ac. in extent. Within a few minutes from the centre of the city is Wollaton Park (744 ac. in extent) with its magnificent Elizabethan hall, now a natural hist. museum. There are many fine parks and recreation grounds catering for all types of sport and recreation. Newstead Abbey, the home of Lord Byron, the poet, and of great historical interest, came into the possession of the corporation in 1931, the ceremony of handing over the property being performed by M. Venizelos, then Prime Minister of Greece. The abbey contains many fine Byron relics.

The city, which sends 4 members to Parliament, is governed by the city council, consisting of 68 elected members. There

is a lord mayor, a sheriff, 17 aldermen, and 51 councillors. The prin. industries include the manuf. of lace, hosiery, chemicals, mechanical products, tobacco, cycles, and general engineering works. Other important industries are bleaching, dyeing, spinning, tanning, brewing, and furniture. The water supply, health services, public lighting, and transport undertakings are all owned and controlled by the municipality. The amenities of the city include numerous public baths, libraries, and parks, an art gallery, and 2 museums. Over 20,000 houses have been built by the N. Corporation and it is estimated that a further 20,000 will be required during the next 20 years. There is a central retail market, a wholesale market, a cattle market, and a public abattoir, all municipally owned. The famous N. Goose Fair is held in Oct. each year. Pop. 311,500. See D. Gray, *Nottingham through Five Hundred Years: a Short History of Town Government*, 1949.

Nottingham, University of, at Highfields, 2½ m. from the centre of N. (q.v.), is a development of the former Univ. College (opened 1881). In 1903 the college received its royal charter of incorporation, and in 1920 it estab. the first fully constituted dept of adult education in the country. The foundations for an independent univ. for N. were laid by Jesse Boot, 1st Lord Trent, the N. industrialist, who spent about £1,000,000 on the univ. park and buildings. In 1948 a royal charter granted full univ. status. The Midland Agric. College, at Sutton Bonington, was in 1947 transferred to the univ. as its school of agriculture. The central univ. buildings, the Trent building containing the library, administration, and (at present) many teaching depts, and the Portland Building containing refectories, common-rooms, and student amenities, are finely placed on the upper slopes of a broad-backed ridge overlooking an ornamental lake. To the E., the Biology Building is the first in what is planned to be the sciences area. On the perimeter of the Univ. Park of 260 ac. are 4 halls of residence: Hugh Stewart and Wortley Halls for men, and Florence Boot and Florence Nightingale Halls for women; a third men's hall will shortly be built. There are between 2000 and 2500 students in the 7 faculties of arts, law, social science, education, pure science, agriculture and horticulture, and applied science.

Nottinghamshire (Notts), midland co. of England, bounded on the W. by Derbyshire, S. by Leics, E. and NE. by Lincs, and NW. by Yorks. In ant. times it formed part of the kingdom of Mercia, and was subjected to many incursions from the Danes. At the time of the dissolution of the monasteries there were 40 religious houses in N., but the only important remains are those of Newstead Abbey. There are some fine churches, including Southwell Minster, of Norman date, and some splendid mansions in the Dukeries. The surface of the co. varies, part of it being a continuation of the Yorks plain, rising towards the W., where

the Robin Hood Hills reach an elevation of over 600 ft. Near to these hills lies Sherwood Forest, famous for its connection with Robin Hood, and now mostly included in the parks that form what is known as the Dukeries. The prin. rvs. are the Trent, Erewash, Soar, and Idle. On the W. there are extensive coal-mines, Nottingham, Mansfield, and Work-sop being the chief centres. Sandstone, limestone, and clay are worked. The prin. manufs. are lace and hosiery; there are also silk, worsted, woollen- and cotton-mills, iron foundries, and cycle works, and at Beeston machinery and motor works, while there are tobacco factories at Nottingham. The greater part of the co. is under cultivation, and there are numerous hop gardens. Agriculture and farming flourish in the E., and there are large apple and pear orchards. It is divided into 10 parl. divs., 4 of which are in the city of Nottingham, each returning 1 member. Area 827 sq. m.; pop. 841,211. See Victoria Co. Hist., *Nottinghamshire*; A. C. Wood, *A History of Nottinghamshire*, 1947; Christopher Marsden, *Nottinghamshire* (Co. Books Series), 1953.

Nova Scotia Bureau of Information
LOBSTER FISHERMEN IN NOVA SCOTIA

Nottinghamshire and Derbyshire Regiment, see SHERWOOD FORESTERS.

Notus (Gk name for the S. or SW. wind), see AUSTER.

Nouméa, or Numea, also called **Port-de-France**, cap. of the Fr. colony of New Caledonia, on the Bay of N. on the SW. coast of the is. It has an excellent harbour which exports nickel, chrome, and copra. N. was an aircraft-carrier base in the Second World War. Pop. 10,400.

Noumenon (from Gk *noein*, to know),

in philosophy, a term introduced by Kant (q.v.) and rarely used apart from the consideration of his own philosophy. According to him, noumena are the real objects in themselves lying behind the phenomena, a phenomenon being defined as the 'undetermined object of an empirical intuition.' The noumenal world he held at first to be completely unknowable, since we can only recognise phenomena; but later he teaches that introduction to it is given by the practical reason, the

terminates at Cape Chignecto. The highest point is the Ingonish Mt in Cape Breton. The N. and S. Mts, 200 to 600 ft high, shelter the fertile Annapolis valley. On the Atlantic side of the coast between Cape Canso and Cape Sable is situated the harbour of Halifax. The Pictou harbour is the most important on the N. coast. Minas Bay, an inlet on the E. arm of the Bay of Fundy, penetrates some 60 m. inland, and terminates in Cobequid Bay. The prin. rivs. are the Annapolis, Avon,

Nova Scotia Bureau of Information

LOGGING IN NOVA SCOTIA

capacity which we exercise as moral agents.

Nova Gôa, or **Pangim**, cap. of Portuguese India since 1843, and of Gôa (q.v.), port on an inlet of the Arabian Sea, 255 m. SSE. of Bombay, once a suburb of Old Gôa. Salt is worked locally, and there is a trade in rice, copra, fish, salt, and other products. Pop. 14,200.

Nova Scotia (Fr. *Acadia*), prov. of the dominion of Canada, lying between 43° and 47° N. and 59° 40' and 66° 25' W. It consists of 2 portions, N. S. proper, a large peninsula, and the is. of Cape Breton (q.v.), separated from it by the Gut of Canso, now joined by Canso Causeway. N. S. proper extends 280 m. NE. and SW.; but its combined length with Cape Breton is 350 m. The isthmus of Chignecto, 11½ m. wide, connects it with the prov. of New Brunswick. The Cobequid chain of hills stretches from E. to W. and

Shubenacadie, the E., Middle, and W. rivs. of Pictou, the Musquodoboit, and the Lahave. The fresh-water lakes are Lake Rossignol, situated in Queen's co., and 20 m. long; Ship Harbour Lake, 15 m. in length; and Grand Lake, both of which are in Halifax co. The climate of N. S. is more temperate than that of New Brunswick, and the air as a general rule is very wholesome. Area 21,068 sq. m.; pop. 642,584. The cap. is Halifax. Other large tns are Sydney, Glace Bay, Dartmouth, and Truro. Indians are scattered throughout the prov. The local legislature consists of a House of Assembly of 37 members, at the head of which is appointed a lieutenant-governor by the Federal Gov. for a term of 5 years. Education throughout the prov. is free and compulsory. Chief univs.: King's College, Halifax (Anglican), founded in 1789; Acadia Univ., Wolfville (Baptist), founded

in 1838; St Francis Xavier, Antigonish (Rom. Catholic), founded in 1866; and the Dalhousie Univ., Halifax (undenominational), founded in 1818. An agric. college was founded at Truro (1905).

Agriculture is important, especially poultry raising, dairy farming, and fruit growing, particularly apples. The fisheries are also an important industry in N. S., employing over 18,000 men, and being valued at over \$38,000,000. Much fresh and frozen fish is shipped to market. Lumbering, the manufacturing of wood-pulp for paper, fish-processing, and mixed farming occupy an important section of the pop. In N. S. the greater part of the forest land, amounting to 15,200 sq. m.,

(except limestone, gypsum, and building materials) are the property of the Crown, but are administered by the minister of public works and mines. The Canadian National Railway, owned and worked by the Federal Gov., is the chief means of communication with the other provs. The Canadian Pacific Railway has running powers within a certain part of the prov.

The hist. of N. S. dates from the visit of the Cabots in 1497-8, but not until 1605 was any attempt at colonisation made by Europeans. In that year a number of Fr. colonists estab. themselves at Port Royal. The old name of the colony, which was Acadia, was changed in 1621 to N. S. by Sir Wm Alexander,

The High Commissioner for Canada

NOVA SCOTIA

A valley at North River, Cape Breton County.

has passed into private ownership, but the system of disposal of timber by licences to cut is now being followed. What remains vested in the Crown is administered by the chief forester under the minister of lands and forests. The prin. trees are spruce, fir, pine, birch, hemlock, oak, and maple. Many men work in the construction trades. The leading manufacturing industries are steel products, pig and rolled iron, and ferro-alloys; fish-curing; saw-mills; biscuits and confectionery; dairy produce; railway rolling stock; hosiery; and castings and forgings. Manufacturing is, to a considerable extent, dominated by the steel industry. The gross value of manufactured products is about \$325,000,000. The chief mineral product is coal (which was produced as early as the 16th cent.), which is subjected to a royalty of 12½ cents per long ton. There are 1000 sq. m. of known coal-fields. Other minerals are salt, lead, zinc, copper, clay products, manganese, gypsum, and limestone. The ann. value of the mineral production of N. S. is from \$65,000,000 to \$70,000,000. All minerals in N. S.

who received a grant of what are now the Maritime Provs. from James I, intending to colonise the whole of it. His settlements were a failure, but from this grant N. S. obtained her name, her coat-of-arms, and her flag. The French were granted the possession of the colony by the treaty of St Germain-en-Laye (1632). The Fr. settlers, however, quarrelled among themselves, and Cromwell in 1654 sent a force to occupy the settlement. Charles II, by the treaty of Breda (1667), restored N. S. to the French; but not until Britain took possession of the colony in 1713, according to the treaty of Utrecht, was peace possible among the colonists. In the treaty of Paris (1763) France resigned all claim upon the country, and in 1820 Cape Breton united with N. S. Representative gov. was granted as early as 1758, and a fully responsible legislative assembly was estab. in 1848 through the instrumentality of Joseph Howe. In 1867 the prov. entered the dominion of Canada.

See D. Campbell, *Nova Scotia*, 1873; Sir J. Bourinot, *Builders of Nova Scotia*; T. C. Haliburton, *History of Nova Scotia*;

H. S. Philpot, *The Province of Nova Scotia: Resources and Development*, 1930; L. R. Ward, *Nova Scotia: the Land of Co-operation*, 1942; G. Campbell, *The History of Nova Scotia*, 1948; W. L. Bird, *This is Nova Scotia*, 1950.

Novae, or **New Stars**, are stars which are suddenly perceived, after having been previously invisible. The outburst of brilliance is usually temporary. Probably new stars of small brilliancy are of not infrequent occurrence, but of the larger magnitude, such, for instance, as are visible to the naked eye, the number has been few. One such was observed by Hipparchus, the father of astronomy. Tycho Brahe observed the brightest recorded nova on 6 Nov. 1572, in the constellation of Cassiopeia, and in Oct. 1604 Kepler and Galileo saw one in Ophiuchus. The latter, and one seen in Vulpecula by Anthehn in 1670, were the only N. seen in the 17th cent.; but 8 were found in the 19th cent. Since 1900 nearly 100 N. have been discovered, though generally they were invisible to the naked eye. The discovery of N. has been facilitated by the examination of photographic plates. Two of the most important N. in recent years have been Nova Aurigae (1892) and Nova Persei (1901), both of which were discovered with the naked eye by Dr Anderson at Edinburgh. When discovered on the morning of 22 Feb. the magnitude of the latter was 2.8, next day it was 10 times as bright, outshining all northern stars, after which it declined till in 1903 it was of the twelfth magnitude. In 1918 Nova Aquilae achieved a brightness second only to Sirius; in 1942 Nova Puppis reached the first magnitude. It is probable that the outer envelope of the star is blown off by some immense explosion, though other theories have been suggested. Occasionally super-N. are discovered. These increase in brightness much more than ordinary N., but are so far away that they are known only by photographic records.

Novaes, Bartholomeu, see DIAZ.

Novesium, see NEUSS.

Novák, Vítězslav (1870-1949), Czech composer, b. Kamenice. He was the son of a doctor, but lost his father early and had to support the family by teaching. While studying law at Prague Univ. he attended the Conservatory, studying the pianoforte with Jiránek and composition with Dvořák, who persuaded him to devote himself wholly to music. He soon made a career as a distinguished teacher of composition, and in 1909 was appointed prof. at the Conservatory. After the First World War, which regained his country's independence, he became prof. of the 'Master School' and was its director in 1919-22. Works include operas, *The Imp of Zvíkov*, *A Night at Karlstein*, *The Lantern*, and *The Grandfather's Heritage*; ballets, *Signorina Gioventù* and *Nikotina*; cantatas, *The Storm*, *The Spectre's Bride*, and choral ballads; symphonic poems, *In the Tatra*, *Eternal Longing*, *Toman* and *the Wood Nymph*; overtures, *The Corsair* (after Byron), *Maryša*, *Lady Godiva*, instrumental pieces, and songs.

Novalis, literary name assumed by **Friedrich von Hardenberg** (1772-1801), Ger. poet and philosopher, b. Oberwiesedert, Thuringia. He studied at Jena, Leipzig, and Wittenberg. He then went to Armstadt, where he became enamoured of the 15-year-old Sophie von Kühn. In 1795 N. was made auditor of the Saxon Salt Works, of which his father was director. The death of Sophie and of his brother Erasmus, both in 1797, was a severe shock to N. *Hymnen an die Nacht*, 1800, were written about this time. The tragedy aroused in N. a poetic and mystic strength. Feeling himself ecstatically united with the dead beloved, he tried to free the spirit from material things. Many of his poems contain a note of mysticism. He commenced the romance *Heinrich von Ofterdingen* in 1800, but never completed it; in 1802 were pub. his *Geistliche Lieder*. N. is now considered one of the most important of the early romantics. His works were collected and ed. by his friends L. Tieck and F. Schlegel in 1802. Later eds. are those of J. Minor, 1907; P. Kluckhohn (with diaries), 1928; C. Seelig, 1946. See studies by E. Hellborn, 1901; R. Samuel, 1925; J. von Minnegerode, 1941.

Novara: 1. Prov. of Italy, in NE. Piedmont (q.v.). It is mainly in the Alps (q.v.), and is bordered on the north by Switzerland. The prov. contains the W. shore of Lake Maggiore (q.v.). The princ. towns include N., Borgomanero, and Domodossola (q.v.). Area 1250 sq. m.; pop. 433,000.

2. (anc. **Novaria**) It. tn, cap. of the prov. of N., 52 m. NE. of Turin (q.v.). Charles Albert (q.v.) of Sardinia was defeated here by the Austrians in 1849 (see ITALY, History). There is a fine 19th-cent. cathedral, to which is attached a very anc. baptistry. Other buildings of note are the 13th-cent. tn hall, the 15th-cent. mayor's palace, and the ruined Sforza (q.v.) castle. N. is an important agric. centre, and has textile, engineering, and chemical industries. There is also a trade in Gorgonzola cheese and rice. Pop. (tn) 58,400; (com.) 72,400.

Novaria, see NOVARA.

Novatian, priest at Rome in the 3rd cent. He was converted to Christianity after reaching manhood, and was admitted to holy orders by Pope St Fabian. In the discussion about those who had lapsed during the Decian persecution (250-1) N. opposed the policy of leniency adopted by Pope Cornelius. N. was in consequence put forward by his followers as an anti-pope. A Rom. synod pronounced him schismatic, and he was excommunicated and d. in prison. His bones were brought to Rome, where he was honoured as a martyr. His influence spread, and Novatianism was estab. in Carthage, Alexandria, Constantinople, and in Asia until the 7th cent. His followers claimed to be especially pure, and adopted the name of Cathari (not to be confused with the medieval sect of that name). In their doctrine they denied the power of the Church to absolve from mortal sin, and excluded all convicted sinners from the

communion of the Church. See A. d'Alès, *Novation*, 1925, and N. Kriebel, *Studien zur Trinitätslehre bei Tertullian und Novation*, 1932.

Novation, merging of one legal obligation into another so as to extinguish the former and give a right of action only on the latter. For example, A owes B £100 for money lent, and later signs a cheque for the amount. B cannot sue A on his personal obligation to repay, but only on the cheque; and if the bank on which the cheque is drawn should fail in the meantime B would never get his money. A N. is invalid unless both parties consent to it. The term N. is rarely employed in Eng. law, the effect of merger of old obligations being determined either by the ordinary principles of contract (q.v.) or by statute.

Novaya Zemlya ('New Land'), Arctic archipelago consisting of 2 large and sev. small is. off the coast of European Russia, to which it belongs. Total area 35,000 sq. m. The N. Sea Route (q.v.) passes through the Strait of Matochkin Shar between the 2 main is. or through Yugorskiy Shar S. of the S. is. It is very sparsely inhabited by Samoyeds (q.v.), who engage in reindeer raising, trapping, and the collection of elder down, and Russians working on meteorological stations. Novgorodians are said to have visited the is. in the 11th cent.

Nové Zámky (Ger. Neuhäusel; Magyar Érsekújvár), Czechoslovak town in the region of Nitra (q.v.), on the Nitra. It was in Hungarian hands, 1938-45. There are textile and leather manufs. Pop. 17,000.

Novel. The term N. may be said to denote a prose story. In its original use it meant a fresh story, but very soon it came to denote any story or tale in prose as opposed to a story in verse, which latter retained its old appellation of romance. Medieval romance dealt with a legendary past. The N., which seems to have had its origin in Italy soon after the Renaissance through the stimulus of foreign travel, dealt with the realities of everyday life and therein lay its fundamental attraction. Italy was indeed the home of the N., for it was there that Boccaccio (q.v.) wrote his prose tales of amorous adventure, the *Decameron*, styled 'Novelle Storie' or 'Fresh Tales,' which had so profound an influence on the subsequent development of prose fiction. Nowadays the term romance is sometimes loosely used as a synonym for N. or fiction—an instance of deteriorated meaning of a word; while, in a narrower sense, the term romantic is used to differentiate N.s of adventure or fancy or historical N.s from realistic N.s, which are designed to represent life as it is rather than as idealised.

ANCIENT CLASSICAL PROSE FICTION. The earliest known Gk prose fiction were the lost *Milesiaca* of Aristides (2nd cent. BC), trans. in the next cent. by Cornelius Sisenna. The *Ass* and other romances included in the works of Lucian (q.v.) belong to the 2nd cent. AD. The following 'erotic' N.s date from the 3rd cent.: Xenophon of Ephesus, *Ephesiaca*; Longus, *Daphnis and Chloë*; Achilles Tatius, *Leucippe and Clitophon*; Heliodorus of

Trikka, *Aethiopica*. To this last work Tasso, Guarini, and others were largely indebted. The Gk version of *Barlaam and Josaphat* (q.v.) is a work of the late 7th or early 8th cent. AD, but appears to derive from a Sanskrit original.

Two famous Lat. works of fiction have survived: the *Satyricon* of Petronius (q.v.) and the *Metamorphoses* or *Golden Ass* of Apuleius (q.v.). These date respectively from the 1st and 2nd cent. AD.

CHINESE PROSE FICTION. For an account of the novel in the Mongol dynasty, see CHINESE LITERATURE.

ROMANTIC FICTION IN WESTERN EUROPE is the product of new historical circumstances, which were but slightly affected by Byzantine influences. The *Eroikoi* reflect a corrupt and decaying civilisation; but medieval romances suggest a youthful, vigorous, and growing social life. They appear to have had their root and foundation in chivalry, and although the exploits and the marvels may have often been derived from foreign sources, yet the spirit, scenery, sentiment, and life of the legends reflect the characteristics of the earlier ages of feudalism. Medieval romances are divisible into 3 great series: (1) those relating to Arthur (q.v.) and the Knights of the Round Table; (2) those relating to Charlemagne (q.v.) and his Paladins; (3) those relating to Amadis de Gaul (q.v.) and his descendants. Besides the 3 distinct series of romance above mentioned, a fourth perhaps deserves mention, in which the heroes of antiquity are grotesquely tricked out in the costume of medieval knights. The prin. are the romances of *Jason and Medea*, of *Hercules*, of *Oedipus*, and of *Alexander*. They are all written in French, and the first 2 profess to be the work of a Raoul le Febvre.

DEVELOPMENT AND INFLUENCE OF FICTION IN ITALY. The Italians originated no romances of the kind described above. The earliest It. work of this sort is the *Cento novelle antiche*, commonly called *Il Novellino*. It is a compilation by different hands, all unknown. It was followed in 1348-53 by the *Decameron* of Boccaccio, finer in point of humour, sentiment, and style, but not more original in the matter of story than *Il Novellino*. Its influence on early European literature was prodigious. Chaucer and Shakespeare in England were greatly indebted to it for incidents and plots; while in France Boccaccio had a number of distinguished imitators. In his own country his influence was so overwhelming that for some cents. It. novelists could do nothing more than attempt to copy him. The prin. of these imitators are Franco Sacchetti, Ser Giovanni, Masuccio di Salerno, Sabadino degli Arienti, Agnolo Firenzuolo, Luigi da Porta, Molza, Giovanni Brevio, Girolamo Parabosco, Marco Cademoste da Lodi, and Giovanni Giraldo Cinthio. Cinthio was the greatest favourite of all the It. novelists with the Elizabethan dramatists. Besides these we may mention Antonio Francesco Grazzini, Straparola, and Bandello. A very different class of fiction is the *spiritual romance*. It

originated in the bosom of the Church. The first of the series is *Burlaam and Josaphat*, but by far the greatest work of the kind produced in the Middle Ages is the *Legenda Aurea*, or Golden Legend (q.v.). Besides these may be mentioned a species of spiritual tale, the *Contes Dévots*, popular in France during the 12th and 13th cents., which was written by monks.

ROMANCE OF THE SIXTEENTH AND SEVENTEENTH CENTURIES. During the 16th and 17th cents. 4 different kinds of N. were cultivated: (1) the comic romance, (2) the political romance, (3) the pastoral romance, (4) the heroic romance.

Comic romance substantially begins in modern times with Rabelais (q.v.), styled by Sir Wm Temple the 'Father of Ridi-cule.' Rabelais, in his inimitable burlesque romance, scoffs (with the tone of a sceptic, however) at the vices of the clergy, the crooked ways of politicians, and the jargon of philosophers. The next remarkable romance of a comic nature is the *Vita di Bertoldo*, 1618, of Giulio Cesare Croce, a work recounting the humorous and successful exploits of a clever but ugly peasant, which for 2 cents. was as popular in Italy as *Robinson Crusoe* or the *Pilgrim's Progress* in England. A few years earlier appeared *Don Quixote*, 1605 (see CERVANTES), in which 'war to the knife' was proclaimed against the romances of chivalry. Almost contemporaneous with *Don Quixote* was another Sp. romance, Mateo Aleman's *Life of Guzman de Alfarache*, 1599 (trans., 1623), which gave birth to a host of Sp. romances with beggars and scamps for heroes, of which the best is the *Lazarillo de Tormes*, 1586, of Diego de Mendoza (see also PICARESQUE NOVEL). In the following cent. France produced, among others, Scarron's *Roman comique*, 1651-7, and Furetière's *Roman bourgeois*, 1666.

Political romance. The earliest of the series is the *Utopia*, 1516 (first trans. from original Latin into English, 1551) of Sir Thomas More (q.v.); next comes the *Argenis* of Barclay (q.v.), pub. in 1621; and to the same class belong a variety of Fr. romances, of which by far the most famous is the *Télémaque*, 1699, of Fénelon.

Pastoral romance. The first important work of the kind is the *Arcadia*, 1501, of Sannazzaro, written in Italian. It was followed by the *Diana*, 1559, of Montemayor, written in Spanish, rev. of the episodes of which are borrowed from the It. novelists, while Shakespeare has in turn directly taken from it the plot of the *Two Gentlemen of Verona*, 1623, as well as some of the most amusing incidents in his *Midsummer Night's Dream*, 1600. In this class may be included also Sir Philip Sidney's (q.v.) *Arcadia*, 1590.

Heroic romances. The first of this long series was the *Pinczarende*, 1632, of Marin le Roy de Gomberville. His successor, La Calprenède, wrote *Cassandra* (10 vols.), 1644-50, *Cléopâtre* (12 vols.), 1646-57, and *Pharamond*, 1662. But the most prolific of the school is Mlle de Scudéry, whose prin. romances are *Arlamène ou le grand Cyrus*, 1648-53, *Clélie*, 1654-61, *Ibrahim*, ou *l'illustre*

1661, *Histoire romaine*, and *Almahide*, 1661-3.

NOVELS AND ROMANCES OF THE EIGHTEENTH CENTURY. The 2 European nations that most brilliantly distinguished themselves in the dept of fiction during this cent. were England and France.

English prose fiction. During the age of Elizabeth and her immediate successors, the imaginative genius of England, from various causes, had taken an almost exclusively poetical direction, and, with the exception of Sidney's pastoral of *Arcadia*, 1590, and Bunyan's (q.v.) *Pilgrim's Progress*, 1678 there is little in the shape of a N. or a romance for 100 years. At the beginning of the 18th cent. England was entering on the most prosaic, unimaginative, and unheroical period of her hist. Its characteristics are faithfully reflected in most of its novels, which possess a great historical value apart altogether from their literary merits. The first name that occurs is of the notorious Aphra Behn (q.v.), the greater number of whose novels, of which *Oroonoko*, 1678, is the best known, appeared towards the close of the reign of Charles II. But the first novelist of genius belonging to the new era is Daniel Defoe (q.v.), the father of modern Eng. prose fiction, in whose writings—*The Adventures of Captain Singleton*, 1720, *The Fortunes of Moll Flanders*, 1722, *The History of Colonel Jack*, 1722, etc.—the coarse, homely, unpoetical, but vigorous realism of the time is strikingly apparent. *Robinson Crusoe*, 1719, is the finest and the most famous of all that class of fiction which was extensively cultivated in both France and England. After Defoe is Samuel Richardson (q.v.) with *Pamela*, 1740, *Clarissa*, 1748, and *Sir Charles Grandison*, 1754. Fielding thought Richardson untrue to nature and wrote his first N., *Joseph Andrews*, 1742, as a burlesque on the style of his predecessor. Like his subsequent performances, *Tom Jones*, 1749, and *Amelia*, 1752, it represents society as Fielding's sharper eyes saw it—on the whole gross, vulgar, and impure. T. G. Smollett (q.v.) writes in the same spirit as Fielding. His chief works are *Roderick Random*, 1748, *Peregrine Pickle*, 1751, *The Adventures of Ferdinand Count Fathom*, 1753, and *Humphrey Clinker*, 1770. Laurence Sterne exhibits a genius so whimsical, peculiar, and original that it is almost impossible to class him with any of his contemporaries; his *Tristram Shandy*, 1760-7, stands by itself.

In 1766 appeared Oliver Goldsmith's (q.v.) *Vicar of Wakefield*, in which a change for the better, from a moral point of view, is noticeable. With the exception of Richardson, all the novelists above mentioned are usually described as humorists. The pub. of Percy's *Rhiques* reawakened an interest in the age of chivalry and romance. The first of the modern romantic school was Horace Walpole (q.v.) whose *Castle of Otranto* was pub., 1769. He was followed by Clara Reeve, the authoress of *The Old English Baron*, 1777; but the greatest genius in this line was undoubtedly Mrs Radcliffe (q.v.), whose

Mysterien of Udolpho, 1794, and other works were abundantly imitated. Her ablest successors were Matthew Gregory Lewis, author of *The Monk*, 1795, and Charles Robert Maturin, author of *Fatal Vengeance, or the Family of Montorio*, 1807.

Romance in which the incidents, though natural, are purely imaginary. This class corresponds with the modern conception of the N., and probably had its prototype in *Zayde*, 1670, and *La Princesse de Clèves*, 1678, by Mme de La Fayette (q.v.); but the first great name that adorns it is that of Marivaux (q.v.), whose *Vie de Marianne*, 1731, and *Paysan Parvenu*, 1735, were long in favour. Next to Marivaux comes the Abbé Prévost, chiefly remembered by *Manon Lescaut*, 1731. Other writers belonging more or less strictly to the same div. are Mme Riccoboni and Rousseau.

Humorous and satirical romance. By far the most celebrated specimens of this kind of fiction are the *Diabli boileux*, 1707, *Gil Blas*, 1715-35, and *Le Bachelier de Salamanca*, 1736, of Lesage (q.v.). Voltaire (q.v.) may claim to rank among these in virtue of his *Zadig*, 1748, *L'Ingénu*, 1757, *Canide*, 1759, and *La Princesse de Babylone*, 1768.

Fairy tales. The immediate forerunner and prototype of the Fr. fairy tales was the *Perlamerone*, 1788, of Signor Basile. This attracted and stimulated the fancy of Charles Perrault, whose *Histoires ou contes du temps passé* appeared in 1697. His prin. successors were the Comtesse d'Aulnoy, Mme Murat, and Mlle de La Force.

PROSE FICTION OF GERMANY DURING THE EIGHTEENTH AND EARLIER NINETEENTH CENTURIES. Towards the close of the 18th cent. writers became more numerous, and as the literary activity of many of them continued on till the first or second quarter of the 19th cent., it will be most convenient and natural to treat both cents. together. The first eminent Ger. novelist of this period was Wieland (*Geschichte des Agathon*, 1766-7, and *Oberon*, 1780). The prin. names of novelists influenced by Richardson and Fielding are August la Fontaine, Wetzel, Maler, Müller, Schulz, and Illppel. Almost contemporary with these there flourished for a brief period (1780-1800) a school whose works had their poetic counterpart in Schiller's *Die Räuber*, 1781. Chief writers of this *Sturm und Drang* (q.v.) period are Cramer, Spiers, Schlenkert, and Velt Weber. Alone and far above all others in abundance and originality of fancy, humour, and pathos, towers Jean Paul Richter, *Quintus Fidelein*, 1796. Apart from all schools stands Johann Wolfgang von Goethe (q.v.), whose N.s *Die Leiden des jungen Werthers*, 1774, *Wilhelm Meisters Lehrjahre*, 1795-6, *Die Wahlverwandtschaften*, 1809, *Wilhelm Meisters Wanderjahre*, 1829, as well as his poems, are poetico-philosophic efforts to represent, perhaps to solve, the great facts and problems of human life and destiny. *Wilhelm Meister* became the prototype of the romantic N. and influenced in particular *Frans Sternbalds Wanderungen*, 1798, by

Ludwig Tieck, and Wackenroder, and Novalis's *Heinrich von Ofterdingen* (unfinished, pub. among his *Works*, 1802). Other distinguished names are those of De la Motte Fouqué, Adelbert von Chamisso, Achim von Arnim, Clemens Brentano, and E. T. A. Hoffmann.

SOME ENGLISH FICTION OF THE NINETEENTH CENTURY. The cent. began with the ironical, perceptive genius of Jane Austen, but her immediate influence was annulled by Scott's Waverley N.s, which set the fashion for historical romance throughout Europe. Though he had some antecedents, including Maria Edgeworth's pictures of Irish life in *Castle Rackrent*, 1800, Scott may be said to have been the real inventor of the historical N. Possessed at once of far greater antiquarian learning, imaginative genius, common sense, and instinctive taste than any of his 'romantic' predecessors, he knew precisely what to shun and what to choose. The political reaction that took place in Britain showed itself in literature too, and Sir Walter Scott was its grandest representative. He strove to delineate the past as it seemed in the eyes of men who were dubious of the present and afraid of the future. The overpowering genius of Scott necessarily led to endless imitations. Galt and Wilson portrayed aspects of Scottish life which the author of *Waverley*, 1814, had passed over. After Scott, Bulwer (Lord) Lytton developed romantic and historical fiction, but his domestic N.s reflected Jane Austen's belated influence on the popular taste. Her powers of observation were inherited by George Eliot, who in 1858 pub. in 2 vols. *Scenes of Clerical Life*. Her later N.s entitled her to rank as one of the 3 great Eng. novelists of the 19th cent. The other 2, Dickens and Thackeray, brought the Eng. social N. to its zenith and with their work may be linked the philanthropic N.s of Mrs Gaskell and the 'Barnesshire N.s' of Anthony Trollope. Among much talented and individual work may be noted the nautical N.s of Marryat; the political N.s of Benjamin Disraeli; the sporting and military N.s of Charles Lever; the brilliant 'muscular Christian' N.s of Charles Kingsley; the 'governess N.s', as they have been aptly denominated of Charlotte Brontë; the 'school' N.s of Thomas Hughes and Dean Farrar; and the 'sensational' N.s of Wilkie Collins, Miss Braddon, and others. Other authors not less eminent are Mrs Oliphant and Charles Reade. One novelist of this period stands apart from his contemporaries: Thomas Love Peacock, who invented a N. of shadowy characters, containing irony and conversation and a mockery of romantic excesses. See also the separate articles on the authors named in the above paragraphs.

TENDENCIES IN THE EUROPEAN NOVEL IN THE SECOND HALF OF THE NINETEENTH CENTURY. At the cent.'s beginning, in addition to the lyrical and personal romances of F. R. Chateaubriand and Mme de Staël, the Fr. N., in the hands of De Vigny, Victor Hugo, and, in its decline,

of Dumas père and Eugène Sue, was mainly historical. The influence of Goethe and the Ger. romance was manifested in France in the idealistic N.s of George Sand. Then, with a greater admixture and realism, come the N.s of Honoré de Balzac, who set out to give an exact picture of contemporary manners. Allied to him in the 'realist' school are Stendhal and Prosper Mérimée, while the second half of the cent. is dominated by Gustave Flaubert, who succeeded in fusing the romantic and the realistic. He, like Balzac, portrayed the physical environment of life as the determining factor in character, and from his work derives the modern N. as a conscious artistic form. Before Flaubert and his contemporaries the only comparable author is Jane Austen, who is their equal in form. From Flaubert are descended directly such later Eng. writers as George Moore, while others who reveal more or less directly the influence of the Fr. naturalistic movement from Flaubert to Zola are Hardy, Gissing, and Conrad. Leaving aside a romantic recrudescence by followers of George Sand—Feuillet, Cherbuliez, and Fromentin—the naturalist N. was further developed by the brothers Goncourt and Alphonse Daudet, but naturalism was not formulated into a theory of art until Émile Zola did so. He and De Maupassant were responsible for the spread of naturalism throughout Europe, evidenced in the Swedish August Strindberg, in the Ger. social N.s of Spielhagen, Theodor Fontane, Otto Ludwig (*Zwischen Himmel und Erde*, 1855), the Swiss Jeremias Gotthelf and Gottfried Keller (*Der grüne Heinrich*, 1851-3), and in the Sp. realist, José María de Pereda, followed by Armando Valdes. In the It. N. Fr. influence is recognisable. The chief of the It. realist school is Giovanni Verga, whose most prominent followers were Luigi Capuana, De Roberto Fogazzaro, and D'Annunzio, all of whom also achieved European reputations, though their talent is more romantic than that of their contemporaries. In England the influence of the Fr. naturalists is seen, especially in the works of Arnold Bennett, but the Eng. social N. is indigenous, and has tended towards sociological study—witness the work of H. G. Wells and John Galsworthy. The Eng. N. is loose in structure, a fact which Flaubert deplored, and in this respect is allied more with the Russian N. than with the French.

The first part of Tolstoy's *War and Peace* appeared in 1862 and the work was completed 7 years later. Realism, which in W. Europe was a moral revolt against untrue romanticism, was, in Russia, a natural growth free from theorising, being present before Tolstoy in Gogol and Turgenev, and after him in Goncharov and Dostoyevsky. The contribution of the Russian novelists, epitomised in Tolstoy, is in the shift of emphasis from the physiological to the psychological. Though Tolstoy was Russia's greatest novelist it was Turgenev who influenced European literature most, since he combined Russian concentration on the psychology of his characters with Fr.

artistry and compactness of form. By this fusion Turgenev may be said to have bridged effectively the gap between W. and E. European literary currents. See the articles on the individual European writers named.

THE MODERN NOVEL. Since other classes of imaginative literature, both the drama and some kinds of poetry, are so closely akin to the N. it is not easy to discuss fundamental questions regarding the N. without trenching upon matters relating to these other classes. Thus the *Aeneid*, *The Ring and the Book*, and *The Dynasts* are essentially N.s in verse and, apart from points of poetic technique, any discussion of the N. in general applies as validly to them as, for example, to *War and Peace* and *Martin Chuzzlewit*.

The 20th-cent European N. is distinguished by variety and licence of experiment. The novelist has become the purveyor of life's experience for the benefit of those whose experience is limited, and this has approximated fiction to journalism (not in a derogatory sense). It has been said that H. G. Wells (q.v.) was a pioneer in the attempt to transform the N. into an intellectual clearing-house. The result of this attempt has been to bring into vogue the unsymmetrical or shapeless N. Wells's later N.s, and those of Proust, Joyce, Virginia Woolf, and Dorothy Richardson (qq.v.), and, in America, Wm Faulkner, Hemingway, and many others (see next section) are amorphous in the sense that they all show a strong tendency to free the art of N.-writing from the accepted canons of plot and dialogue so as to give scope for altogether wider activities. The element of justification in this 'shapeless' construction was that the 'realism' or 'naturalism' of the older N.s, such as those of Zola, the Goncourt brothers, George Gissing, and Arnold Bennett, was not really true to life. Hence this reaction to ultra-realism and the N. which pretends to reveal the 'stream of consciousness,' i.e. the N. which aims at getting rid of everything that might stand between the reader and the reflections in the character's mirror of consciousness. But this experimentation went to extreme lengths, as in Joyce's *Ulysses*, 1922, in which the 'recurrent themes' and 'internal rhythms' seem to have no permanent value (see further under JOYCE, JAMES). *The Voyage Out*, 1915, and other N.s of Virginia Woolf reveal a world of radiance and a high degree of sensitiveness, emotional and intellectual, yet are often fragmentary in presentation and wanting in continuity of narrative. But in these 'shapeless' N.s the characters seem to have no existence outside the author's mind. At least the characters of Wells, Galsworthy, Bennett, and Conrad were substantial. Proust's method attracted many copyists after his death in 1922. His long continuous N. *À la recherche du temps perdu* (trans. as *Remembrance of Things Past*), 1913, is a highly subjective work, which explores consciousness regardless of time sequence and with a leisurely reflectiveness. His characters' sole aim seems to

be to 'fill an infinite void of leisure with the satisfaction of insignificant appetites and the stimulation of largely artificial emotions.' The reader is indifferent to their fate, for their whole world dissolves into complete passivity, aimlessness, and futility. How different from the state of positive anxiety with which one follows the fortunes of the characters in a N. by Fielding, Trollope, or Hardy. Twentieth-century naturalism may be said to have ended with Arnold Bennett's *Riceyman Steps*, 1923; but the N.s of the 'shapeless school' which displaced it and seek realism in form rather than in content can hardly be condemned because they so far evade life as to avoid the central issues of our age, such as the threatened disintegration of society in the Democrat-Communist struggle. The day of the experimentalist may be said to be always dawning, but that of the traditionalist can never be said to be definitely past. Joseph Conrad was an experimentalist in a traditionalist framework. By contrast with his introspective brilliance Hugh Walpole was a mechanical traditionalist, painstaking, solid, undistinguished. E. M. Forster, in method, is a mid-19th-cent. novelist, displaying an orderly unfolding of story and character. Imagination is the most powerful element in his universe. Life as he sees it is supremely strange and it is only through the imagination that man can hope to penetrate its mystery. Sentimentality, which is pervasive in Virginia Woolf, is idealistic and incidental to Forster; while half-heartedness about sexual love may be said to be another impression made by both these novelists. A. P. Herbert's *The Water Gypsies*, 1930, is, in form, traditional, but has much in it that is fundamentally true to life. Its method is in sharp contrast with that of D. H. Lawrence, whose *Lady Chatterley's Lover*, 1928, illustrates the author's constitutional inability to deal dispassionately with certain emotional relationships (see further under LAWRENCE, DAVID HERBERT). Very different from the N.s of the experimentalists is the work of such writers as J. B. Priestley (q.v.), whose *The Good Companions*, 1929, is a reversion to the hurly-burly of Dickens's world; G. B. Stern, whose *Tents of Israel*, 1924, a 'family chronicle' N., has few superiors in that category; and F. Tennyson Jesse, whose *The Lacquer Lady*, 1929, is remarkable for vivid portrayal of varied experiences. The N.s of Aldous Huxley (q.v.) stand alone—devastating satires with something of the unemotional precision of the analytical chemist. His *Point Counterpoint*, 1928, and *Anlie Hay*, 1923, are essentially the N.s of a moralist who is out to expose by the process of stripping off the masks of falsity and cant, the ugliness of bohemianism and other aspects of contemporary life. Wyndham Lewis suggests that all art to-day is in fact satire. Thus he assumes that the Amer., Faulkner, is a 'fierce moralist, who operates upon the satiric plane, armed with sardonic weapons of aggression against the victims of his ethical rage,' and it is obvious that

his own N.s are of this genre. In this period too there were occasional successful essays in the field of fantasy, such as David Garnett's *Lady into Fox*, 1922, and Sylvia Warner's *Lolly Willows*, 1926.

The aftermath of the First World War brought N.s of disillusionment such as C. E. Montague's *Disenchantment*, 1922, Erich Remarque's *Im Westen Nichts Neues* (trans. as *All Quiet on the Western Front*), 1929; Richard Aldington's *Death of a Hero*, 1929, and H. M. Tomlinson's *All Our Yesterdays*, 1930—books of very varying literary quality but all alike a protest against war, without any attempt to exploit the social background as a cause of war. Among other novelists who have taken the war as their theme are Robert Graves, E. H. Mottram, Arnold Zweig, Jaroslav Hasek, and Herbert Read, whose N.s, unlike Tolstoy's masterpiece of the Napoleonic wars, deal rather with particular experiences than with general truths. Few of them have rivalled Henri Barbusse's (q.v.) *Le Feu*, 1916, which, in descriptive narrative, shirks nothing in the task of reflecting the fatigue, tedium, and horror of war. Two other notable war N.s *Ier Privates We*, by Private 19022 (Frederick Manning), 1930, and *War is War*, by Private X, 1930, the former, perhaps, the best Eng. N. on the war, are the work of educ. and imaginative men and not the unvarnished tales of characteristic private soldiers. Mottram's *The Spanish Farm*, 1924, a dispassionate and detached war N., is more remarkable for its central character, who seems to typify the Fr. farming woman in a war-scarred region throughout the cents., than for its narrative of experiences. H. E. Read's *In Retreat*, 1925, on the Fifth Army, is pseudo-fictional. Robert Graves's *Goodbye to All That*, 1929, like Stephen Graham's *Private in the Guards*, 1919, is a protest against military discipline and snobbery. *The Case of Sergeant Grischka* by Arnold Zweig, 1929, is a fine literary performance, yet its merit lies more in the travels of its unemotional hero than in its war interest. Hasek's *The Good Soldier Schweik*, 1930, is an extravagantly comic satire on military tyranny and pomposity.

In Germany, before the Hitlerian regime, there was a literature of revolt, which included the N.s of Heinrich and Thomas Mann, Theodore Plivier, and Ludwig Renn, most of it unknown in England. The N.s of Heinrich Mann, the acknowledged master of Wassermann and Feuchtwanger, portray a Germany in all its recent vulgar prosperity in the decades preceding the First World War. Thomas Mann's chief N., *Buddenbrooks*, 1901, may be described as the Ger. counterpart of the *Forsyte Saga*. After the collapse of the Weimar Rep. and the dawn of Nazism in Germany, came writers like Balder Olden, whose N.s give true pictures of demagoguery in the Fatherland; but such writers were either forced to escape or run the risk of internment in a concentration camp. Ger. literature as a whole, following the Nazi condemnation of the N.s of Remarque and Hans Fallada,

merely extols the law of the jungle. Thomas Mann, who left Germany in 1933 and became an Amer. citizen, pub. in 1948 *Dr Faustus*, perhaps his greatest N. Major N.s stressing human loneliness were written by Franz Kafka (*The Trial*, 1925, and *The Castle*, 1926). The same subject, though in a less despairing manner, was treated by Hermann Hesse. More recent Ger. novelists of importance include Werner Bergengruen, Edzard Schaper, Ernst Jünger, Hans Werner Richter, Heinrich Boll, and Walter Jens.

Soviet novelists are also circumscribed in their activities by the political outlook of the regime. Among the best-known of N.s of the revolution and civil war are Sholokhov's *And Quiet Flows the Don*, 1934—familiar to Eng. readers—and Alexoy Tolstoy's *Darkness and Dawn*, 1935, a picture of the Russian intelligentsia during and after the First World War. Sholokhov's *Virgin Soil Upturned*, 1935, is a masterly presentation of peasant life. Kataev's *Forward, O Time*, 1934, is an example of the type of N. which purports to reflect the tempo of the Five-Year Plan. The N.s of Il'ya Ehrenburg picture the unhappy Russian intellectual of the old type who cannot adjust himself to the new standards of objectivity.

The Second World War, apart from providing new material, did not greatly affect N. writing. New writers came to the fore and estab. ones produced new work. Among those deserving special mention are Graham Greene, a powerful writer on themes of a spiritual nature and great psychological insight (*Brighton Rock*, 1938; *The Power and the Glory*, 1940; *The Heart of the Matter*, 1948); Evelyn Waugh, who is chiefly a satirist (*Brideshead Revisited*, 1947); Ivy Compton-Burnett, Rosamund Lehmann, H. E. Bates, F. L. Green, Henry Green, and Storm Jameson (*The Moment of Truth*, 1949). The tendency of the younger novelists was a concern with the deeper realities of life rather than with manners, and the school of James Joyce and Virginia Woolf has not found a great following. Of the older generation W. Somerset Maugham is the doyen, a member of the realist school and of great technical skill (*Of Human Bondage*, 1915; *The Moon and Sixpence*, 1919; *Cakes and Ale*, 1930). He also, in *The Razor's Edge*, 1943, left the ironical social scene for a deeper theme. Aldous Huxley has been drawn towards a sort of eclectic mysticism, exemplified in *Time Must Have a Stop*, 1944, and Charles Morgan, leaving the philosophic heights of *The Fountain*, 1933, wrote scorching N.s on moral problems (*The Judge's Story*, 1948, and *The River Line*, 1949). Notable work has also been done by Elizabeth Bowen, Christopher Isherwood, Nigel Balchin, and Gerald Bullett. Other novelists prominent in the fifties were Joyce Cary, L. P. Hartley, Anthony Powell, and C. P. Snow, whose work *The New Men* was awarded the Tait Black Memorial Prize for the best novel of the year 1954. In the years immediately following, this ann. award went to Ivy Compton-Burnett for *Mother and Son* and

to Rose Macaulay for *The Towers of Trebizond*. See the separate articles on the authors named in the above section.

Of Fr. novelists, the most outstanding are André Gide, Georges Duhamel, François Mauriac, Roger Martin du Gard, Jules Romains, André Maurois, André Malraux, André Chamson, and Albert Camus (qq.v.).

THE AMERICAN NOVEL. The first professional Amer. novelist was Charles Brockden Brown (1771-1810), whose books were in the manner of the Gothic horror tales then popular in England. With Fenimore Cooper (1789-1851), author of *The Last of the Mohicans*, 1826, Amer. fiction turned to romance and adventure, themes which were to reach a high level with Herman Melville (1819-91) in his *Moby Dick*, 1851, and novels of the S. Seas. In 1850 appeared *The Scarlet Letter* of Nathaniel Hawthorne (1804-64), whose imaginative tales and fantasies give him a high place in Amer. literature, and 2 years later Harriet Beecher Stowe's *Uncle Tom's Cabin* became world famous. Bret Harte (1836-1902) and Samuel Langhorne Clemens (1835-1910), better known as Mark Twain, were both masters of fiction of a humorous or satirical type, while in the novels of Wm Dean Howells (1837-1920) what may be termed the classical Amer. novel reached its culmination. Henry James (1843-1916), a cosmopolitan rather than an American in his literary relationships, was one of the greatest masters of the psychological novel. In the nineties the cult of the red-blooded novel of adventure was carried on by the short-lived Stephen Crane (1871-1900) and Frank Norris (1870-1902), followed by Jack London (1876-1916), who lived in and wrote of the primitive; while historical romance was represented by such authors as Mary Johnston (1870-1936) and the Amer. Winston Churchill (1871-1947). At the beginning of the new cent. leading places were held by Edith Wharton (1862-1937), a professed disciple of Henry James, who like him handled social themes with cultivated restraint, and another follower of the same tradition, Willa Cather (1873-1947), who wrote of pioneering days in the W. frontier.

In 1900 the pub. of *Sister Carrie* by Theodore Dreiser (1871-1945) was symptomatic of a new vogue which disregarded the conventions and restraints of the previous cent. The sordid realism of this vigorous and unpolished writer brought him into collision with the censorship but also had a great influence on younger authors such as John Steinbeck (1902-), whose *Grapes of Wrath*, 1939, deals with the problems of migrant labour; Erskine Caldwell (1903-), who wrote of the depressed agricultural classes in *Tobacco Road*, 1932, and *God's Little Acre*, 1933; and James Farrell (1904-), whose *Studs Lonigan*, 1937, is a sordid study of the Chicago slums. Less squalid pictures of Amer. life were drawn by Sinclair Lewis (1885-1951), whose *Babbitt*, 1922, was a brilliant satire on the Amer. business man, and who in 1930 was the first American to be awarded the Nobel Prize for Literature.

Upton Sinclair (1878-), in his 'Lanny Budd' series of some 10 novels, 1940-53, made a fictional record of world history from 1913 onwards, and John Dos Passos (1896-) has given a panorama of Amer. life in his trilogies *U.S.A.*, 1938, and *District of Columbia*, 1952. Scott Fitzgerald (1896-1940) wrote sev. witty and moving books on the post-war era, notably *The Great Gatsby*, 1925, and *Tender is the Night*, 1934. Often reckoned the greatest Amer. novelist of this cent. is Wm Faulkner (1897-), who portrays Southern decadence in his tales of Yoknapatawpha Co., Mississippi, whose co. in Jefferson can be identified with the Amer. Oxford; in 1950 Faulkner was awarded the Nobel Prize for Literature, a distinction won by only 3 other Amer. novelists—Sinclair Lewis, mentioned above, Pearl Buck (1892-), and Ernest Hemingway (1899-). Pearl Buck has written a number of novels about China, of which *The Good Earth*, 1931, is the best known. Hemingway's *A Farewell to Arms* is one of the best books about the First World War, while his famous novel, *For Whom the Bell Tolls*, 1940, is based on the Sp. Civil War. Two writers who defy orthodox classification are James Branch Cabell (1879-1958), a satirist who wrote medieval fantasies round an imaginary kingdom he called Poitresme, and Thornton Wilder (1897-), whose *Bridge of San Luis Rey*, 1927, set a new fashion in fiction. The cult of the mammoth novel in the thirties was well illustrated by Hervey Allen's *Anthony Adverse* and Margaret Mitchell's *Gone With the Wind*, which was the record best-seller of all time in America. A noteworthy development typical of America's literary self-consciousness has been the growth of the 'regionalist' N., which portrays characteristic aspects of life and culture in different regions of the U.S.A. The bleakness of the Middle W. as reflected in the N.s of Zona Gale (1874-1938) and the realist studies of Virginia in the work of Ellen Glasgow (1874-1945) illustrate this movement. Another byway of literary development is seen in the humorous fiction of Robert Benchley (1889-1945) and James Thurber (1894-), who supports his inspired absurdities with his own drawings. See the separate articles on the authors named in the above section.

Novellae, see JUSTINIANUS, FLAVIUS.

Novello, Clara (1818-1908), soprano singer, daughter of Vincent N., b. London and trained in Paris. She made her first public appearance in England in 1833, and from then until her retirement in 1860 she was regarded as one of the greatest vocalists in concert, opera, and oratorio, both in England and on the Continent. See her *Incarnations*, 1910, compiled by her daughter, Contessa V. Gigliucci.

Novello, Ivor (1893-1951), original name Ivor Novello Davies, b. Cardiff, son of Clara Novello Davies (1861-1943), Brit. singing instructor, choral conductor, and founder and conductor of the Royal Welsh Ladies Choir. N. first appeared on the stage in 1921, but had already won some success as a song writer, his *Keep the Home Fires Burning* being very popular during the First World War. His musical plays and revues include *Tabbs* and *The House that Jack Built*, and, as his own actor-manager, *The Rat* (written in collaboration with Constance Collier). His own plays include *The Truth Game*, 1928, and *Symphony in Two Flats*, 1929, while other plays which he acted in and managed were *Murder in Mayfair*, 1934, *Glamorous Night*, 1935, *Careless Rapture*, 1936, *Crest of the Wave*, 1937, *The Dancing Years*, 1939, *Perchance to Dream*, 1945, and *King's Rhapsody*, 1949. He also acted star parts in many films.

Novello, Vincent (1781-1861), Eng. musician of It. descent, b. London, where he held posts as organist from 1796 to 1822. He ed. the masses of Haydn and Mozart, the works of Palestrina, and other great music then unknown in England. He composed a vast quantity of sacred music, and with his pub. of the first vol. of his original work in 1811 laid the foundation of the publishing firm of N. & Co. He was the founder of *Musical Times*, and shared in the foundation of the London Philharmonic Society. See M. Cowden-Clark, *The Life and Labours of Vincent Novello*, 1863.

November, eleventh month of the year, derives its name from the Lat. *novem* (nine), as, until the Julian arrangement, it was the ninth month of the old Rom. year, which began in Mar. There are 30 days in the month; the 11th was considered by

the Romans as the beginning of winter, and the *epulum Jovis* (banquet of Jupiter) was held on the 13th.

Noventium, see CITTANOVA.

Novgorod: 1. Oblast in NW. Russia, with the lowland around Lake Il'men' in the W. and the Valday upland in the E., half covered with mixed forests. It has lignite and peat deposits. There are lumbering and woodworking industries, peat extraction, and linen milling; old crafts are practised, and flax and dairy farming pursued. The area was the core of the vast terr. in northern Russia dominated by N. city in the Middle Ages. Area 20,700 sq. m.; pop. (1956) 718,000 (Russian).

2. Cap. and cultural centre of the above, one of the oldest Russian tns and a cradle of Russian statehood. It is situated 119 m. SE. of Leningrad, and has varied industries. N. is a treasury of Russian architecture of the 11th-18th cents. Extensive excavations have been made since 1929. The tn has been known since the 9th cent. According to Russian chronicles, the Varangian (Scandinavian) prince Rurik, invited by Novgorodians, came to N. in 862, and this year is traditionally considered to mark the foundation of the Russian state. Oleg transferred the cap. to Kiev in 882. N., which remained the main centre of foreign trade, obtained self-gov. from Yaroslav the Wise in 997, and achieved independence in 1136. The N. Rep. (officially styled 'Sovereign Great N.'), embracing the whole of northern Russia to the Urals, was governed by the chief officials of the city elected by the assembly of the townspeople (see *VECH*), with princes invited from other Russian centres as military commanders. Captured and annexed by Ivan III of Muscovy in 1478, N. retained its commercial position until the construction of St Petersburg. It became prov. cap. in 1727. N. suffered greatly during the Second World War (occupied 1941-4). Pop. (1956) 49,000 (in the 14th cent. allegedly 400,000).

Novgorod-Severskiy, tn in the Chernigov oblast of the Ukraine, on the R. Desna, 110 m. NE. of Chernigov. It has notable 11th-18th-cent. buildings. It has been known since 1096, was cap. of a principality, became Lithuanian in 1355, Muscovite in 1503, and Polish in 1618-67. Pop. (1935) 9,000.

Novgorodtsev, Pavel Ivanovich (1866-1924), Russian jurist and philosopher, prof. at Moscow (1903-18) and Simferopol' (1920-1) Univs., dean of the Russian Juridical Faculty in Prague (1922-4). He advocated the revival of the doctrine of natural law, stressing the independent validity of the moral evaluation of social and political events. His chief works are *The Historical School of Jurists*, 1897, *Kant's and Hegel's Teachings on Law and State*, 1902, *The Crisis of Contemporary Legal Consciousness*, 1909, *The Political Ideals of the Ancient and Modern World*, 1910, and *On the Social Ideal*, 1917. He ed. the symposium *Problems of Idealism*, 1903, which was a landmark in the hist. of Russian thought (see *VEKHI*).

Novi, or Novi Ligure, It. tn in Piedmont (q.v.), 13 m. SE. of Alessandria (q.v.). It has a ruined 14th-cent. castle, is an important centre of communications, and manufs. confectionery and ironware. Pop. 21,100.

Novi Sad (Ger. *Neusatz*), tn in Serbia, Yugoslavia, the cap. of the autonomous prov. of Vojvodina (q.v.). On the l. b. of the Danube, N. S. is a fine, modern tn, the seat of a bishopric, and a centre for the Hungarian minorities in Yugoslavia. For long called 'the Serbian Athens' because of the part it played in the cultural development of Serbia, it is to-day a busy riv. port, a road and rail junction, and an industrial and commercial centre. Pop. 83,200.

Novice, person who, after a period of probation as a postulant, is admitted to a religious order to be trained in the religious life, with a view to becoming a professed member of the order. The period of training, called the novitiate, varies in length with different religious orders.

Novigrad, see CITTANOVA.

Novikov, Nikolay Ivanovich (1744-1818), Russian journalist and publisher. A freemason, he endeavoured to improve social conditions and spread education. He pub. sev. periodicals and *The Library of Old Russian Authors* in 30 vols. He was imprisoned during the last years of Catherine II's reign.

Noviodunum, see NEVERS.

Novocheerkassk, tn in the Rostov oblast of S. Russia, 33 m. NE. of Rostov-on-Don. It has an engineering industry (locomotives) and is a notable academic centre (Polytechnic Institute founded 1907; Zootechnic and Veterinary Institute founded in Warsaw 1840, evacuated, 1916; Don Cossacks Hist. Museum). N. was founded in 1805 as cap. of the Don Cossack Region. In 1917-20 it was one of the main centres of the anti-Bolshevik movement and the White armies, and cap. of the ephemeral Don state and SE. League. Pop. (1956) 90,000 (c. 1914, 67,000; 1926, 62,000).

Novo-Georgievsk, see MODLIN.

Novo-Marinsk, see ANADYR'.

Novonikolayevsk, see NOVOSIBIRSK.

Novosibirsk: 1. Oblast in W. Siberia stretching along the Trans-Siberian Railway, largely lowland with coniferous forests in the N., and steppe (see *BARABA* and *KULUNDA*) in the S., traversed by the R. Ob' in the E. It has heavy (mostly engineering) and food industries, and wheat and dairy farming. The area was gradually annexed to Russia in the 16th-early 18th cents. Area 69,000 sq. m.; pop. (without N. city, 1956) 1,477,000, mostly Russians, also Ukrainians and some Tatars.

2. (until 1925 **Novonikolayevsk**) Cap., economic and cultural centre of the above, on the Ob' and the Trans-Siberian Railway, the largest city in Siberia and one of the main industrial centres of Russia, directly subordinated to the gov. of the Russian Federal Rep. It has large engineering (mining and electrical equipment, tools, agric. machinery) and varied

light and food industries. It is also a major transportation centre. It has a branch of the U.S.S.R. Academy of Sciences (1933), and sev. higher educational establs. N. was founded in 1893 in connection with the building of a railway bridge over the Ob'. Until 1930 it was developing as a commercial centre of the surrounding agric. area. Industrial development has taken place since the first Five-Year Plan and particularly since the Second World War. N. was the administrative centre of Siberia in 1925-30, and of W. Siberia in 1930-7. Pop. (1956) 731,000, ninth in the U.S.S.R. (1917, 69,000; 1926, 120,000; 1939, 406,000).

Novosibirskiy Ostrova (New Siberian Islands), group of Russian is. in the Arctic Ocean, NE. of the Lena Delta. Area 9650 sq. m. They include Koteln'y, Fadeyevskiy, New Siberia, Lyakhov (Lyakhov), and several smaller is. They are mostly uninhabited, except temporarily by hunters. Fur-bearing animals abound. Bones of the mammoth and other extinct animals have been found. Liakhov discovered the is. in 1770. Seven Soviet weather stations have been set up since 1928.

Novo-Teherkassk, see NOVOCHERKASSK.

Nový Kolín, see KOLÍN.

Nowa Sól (Ger. Neussal), tn of Poland, in Zielona Góra prov., on the Oder (q.v.), 13 m. SE. of Zielona Góra (q.v.). It has textile and paper industries. Pop. 7000.

Nowra, tn on Shoalhaven R., in New S. Wales, Australia, 95 m. S. of Sydney. It is the site of a large naval air station. Dairy farming is the prin. rural activity. Pop. 6000.

Nowshera, or **Naushara**, tn of W. Pakistan, 25 m. E. of Peshawar. It is from N. that the road and railway branch north to Dargai and the Malakand Pass.

Nowy Port, see GDANSK.

Noyes, Alfred (1880-1958), poet, b. Wolverhampton. He was educ. at Exeter College, Oxford, where he was notable as an outdoorsman. Encouraged by George Meredith, he devoted himself to poetry and succeeded in making a livelihood by it. His first vol., *The Loom of Years*, 1902, was followed by his popular sea epic, *Drake*, 1906-8. In 1913 he delivered the Lowell lectures in the U.S.A., taking as his subject 'The Sea in English Poetry,' and from 1914 to 1923 he was prof. of Mod. Eng. literature at Princeton. In 1918 he received the C.B.E. Later he returned to England and settled in the Isle of Wight, and in 1930 he was received into the Rom. Catholic Church. In his command of rhythm and melody N. belongs to the school of Tennyson, the sea and fairyland being his special provs. His epics *The Flower of Old Japan*, 1903, and *The Forest of Wild Thyme*, 1905, are the finest fairy poetry since the Elizabethans. His most famous works are *Drake*, *Tales of the Mermaid Tavern*, 1913, and *The Torchbearers*, 1922-30, an epic of scientific discovery. A single vol. of collected poems was pub. in 1950. He also wrote sev. plays and a book of critical essays, *Aspects of Modern Poetry*, 1924. *Two Worlds for Memory*, 1953, is an

autobiography. See study by W. C. Jerrold, 1930.

Noyes, John Humphrey (1811-86), founder of the Perfectionists (q.v.), b. Brattleboro, Vermont, U.S.A. He founded a community at Putney, in Vermont, the tenets of the sect being communism in everything, including marriage. The sect afterwards went to Oneida, New York, but N. found himself in difficulties owing to his free ideas with regard to marriage. He wrote *The Doctrine of Salvation from Sin Explained and Defined*, 1843, *The Berean*, 1847, and *History of American Socialisms*, 1870.

Noyon, Fr. tn in the dept of Oise, on the Verre. It was a bishopric from the 6th cent., and was one of the caps. of the Frankish kings. Here Charlemagne (q.v.) was crowned in 768, and Hugh Capet (q.v.) in 987. It has a splendid cathedral, partly 12th cent. The tn was damaged in both world wars. N. was the bp. of Calvin (q.v.). It has iron works and an agric. trade. Pop. 6200. See R. L. Stevenson, *An Inland Voyage*, 1878, and M. Aubert, *Noyon et ses environs* (Paris), 1920.

N.S.D.A.P., abbreviation for *Nationalsozialistische Deutsche Arbeiter-Partei*, or Ger. Workers' party. See NATIONAL SOCIALISM.

N.T.S. (Russian abbreviation for *National Labour Alliance*, also known as *National Alliance of Russian Solidarists*), Russian political organisation aimed at the overthrow of the Communist regime by a popular revolution and the estab. of a free and democratic gov. Its programme advocates a semi-socialist welfare state with some corporatist features (a vestige of the early influence of It. Fascism). Founded by young émigrés in W. Europe in 1930, during the Second World War it worked underground in Ger.-occupied ters. of Russia and in the Vlasov (q.v.) movement. Since the war it has conducted revolutionary propaganda from abroad and by sending emissaries to Russia. Many N.T.S. members have been imprisoned in Nazi and Soviet concentration camps, and the Soviet security organs attempted to murder its present leaders, V. D. Poremskiy and G. S. Okolovich. In recent years the Soviet Gov. has repeatedly protested to foreign govts. for allowing N.T.S. activities on their ters.

Nuba, black aboriginal people dwelling in the SE. quarter of Kordofan (q.v.), Sudan, remarkably heterogeneous in physical type and language. They are pagans, living in autonomous groups under the control of their *meks* and rain-makers and observing the cult of the spirits of the dead. Their prov., the Nuba Mts, like certain other inland parts of the S. Sudan, is most difficult of access. The numerous rocky massifs, rising from the plain, are covered with thorny scrub and honeycombed with deep and intricate caves, and lie amid the swamps of the Upper Nile and Bahr-el-Ghazal riv. systems. There has been frequent trouble with the Nuba, and various punitive operations in the Nuba Mts have been due to one

or other of sev. causes or a combination of them, namely, inter-mt feuds and pillaging forays, attacks on Arabs or police or travellers in the plains, and refusal to pay taxes or hand over captives to the gov. In 1928, in order to facilitate administration, the Nuba Mts prov. was amalgamated with Kordofan. See C. G. and B. Z. Seligman, *Pagan Tribes of the Nilotic Sudan*, 1932; Sir H. MacMichael, *The Anglo-Egyptian Sudan*, 1934; S. F. Dadel, *The Nuba: an Anthropological Study of the Hill Tribes in Kordofan*, 1947.

Nubeculae Major and Minor, see MAGELLANIC CLOUDS.

those of Egypt, lacking Negro characteristics and resembling the Temehu, or Libyans, of the W. desert. Later the Libyans tended increasingly to settle in N. on the W. bank of the riv. By about 2000 BC the fusion of these races had produced a pop. resembling that of to-day in physical characteristics, while the rulers of Egypt had estab. garrisons and colonies in what is now Dongola prov. Under Sesostris, Pharaoh of the 12th dynasty, Kerma was rebuilt as one of the chief administrative centres of N., and it remained so till its destruction in 1600 BC. About 950 BC Libyans obtained

NUBIA: THE TEMPLE OF ISIS, PHIILAE

A photograph taken after the creation of the Aswân Dam, which caused the partial submersion of the island and its famous buildings.

Nubia, tract of country, with no precise limit, in NE. Africa, anciently known as Ethiopia to the Greeks and as Kush to the Pharaohs and, broadly, lying between Egypt and the Gezira area. The ancients gave the name of Ethiopia to the W. bank of the Nile, from Meroë to the bend of the riv. The name may have been derived from the Egyptian and Coptic *Noub*, or *Gold*, a name still retained in Wady Nouba, which extends from the frontier of Dongola N. of the Wady Soboua, above Derri. The tract between Soboua and Aswân is called the Wady Kenous. The modern inhab. of N. consist principally of Arabs, who invaded the country after the rise of Mohammed, and merged with older races, the prin. tribes being the Djowahere and El Gharbye, who inhabit from Aswân to the Wady Halfa.

An Egyptian Gov. expedition of 1931, which was led by W. B. Emery, excavated the 5th- and 6th-cent. tombs of the Blemmyes, at Qustul and Ballana. It seems that in the 4th millennium BC N. had been inhabited by a people identical with

control in N. and there founded an independent monarchy with its centre at Napata, near the holy hill of Barkal (in Dongola). Kashta, a Libyo-Sudanese, in the 8th cent. conquered Egypt as far as Thebes. In 600 BC a Nubian king re-occupied the Delta, but soon afterwards was driven out by Assurbanipal, and in 654 BC the Nubian dynasts had withdrawn beyond the cataracts. There they consolidated their power, and for 3½ cents. the Napatan kingdom prospered from the swamps of the White Nile to the Aswân cataract. About 300 BC the sovereignty passed to Meroë (q.v.). The appearance, shortly before the beginning of the Christian era, of the Rom. legions in Ethiopia ended in the destruction of Napata (23 BC) and henceforth the 2 kingdoms of Napata and Meroë were again united under the rule of Meroë after a period of internecine strife in Ethiopia during which the ruling house at Napata had regained some influence. But final disaster overwhelmed Meroë about AD 350 at the hands of the Ethiopian King of Axum.

From the 3rd to the 6th cents., when it was converted to Christianity, the S. part was a pagan and independent Nubian kingdom: it had been settled by the Blemmyes who inherited a great part of Merotic culture. Northern N. became converted to Christianity in the 6th cent. and a form of Christianity based on the foundations laid by Julianus and Longinus remained the official religion of N. until superseded by Islam 700 years later. It was probably in the 6th cent. that the tn of Dongola was founded and made his cap. by Silko, a convert who styled himself 'prince of the Nubians and all the Ethiopians.' In AD 641 the ruler of Egypt sent 'Abdulla ibn Sa'ad with 20,000 men to invade N., but they made no great advance and soon returned. A few years later 'Abdulla, as governor of Upper Egypt, again invaded N., destroyed Dongola, and concluded a treaty with the Nubians which subsisted for some 600 years of varied observance. About the middle of the 9th cent. the period of Arab domination in Egypt ended and the Mamelukes (q.v.) usurped power. The immediate result was that large numbers of Arabs migrated southwards and settled among the Nubians, and north of Halfa they won over a proportion of the Nubians to their faith, but further S. they made no impression. Little more is recorded of N. until, about AD 1200, it was visited by Abu Salih, the Armenian, who found that it contained 7 bishoprics, including one at Dongola. But under Beybars, the Mameluke imperialist, N. was laid waste. Henceforth it could offer but little resistance. The encroachments of the Arabs increased each year. Sultan after sultan sent armies to capture slaves and plunder. The Christian barrier set up in the 6th cent. now finally crumbled before the Arab hordes. In the 13th, 14th, and 15th cents. the northern and central regions of the Sudan fell to the Arabs, and those of the older inhab. who were not forced into the S. fastnesses became merged with the Arabs, thus evolving the characteristic type of the present day.

The part of N. between Aswân and Wady Halfa is called Lower N. and is under Egyptian jurisdiction; Upper N. belongs to the Rep. of the Sudan. The chief attractions of this country to travellers are the numerous temples and other anct remains of the Egyptians, extending from Philae to the Isle of Argo. These consist of the temple of Isis, in the Isle of Philae, founded by Nectanebo I, and continued by the Ptolemies; the temple of Deboud, built in honour of Amen Ra by Ataramen, and continued by the Romans; Tafa or Taphis, the modern Kalabshe, built by Rameses II; the rock temple of Beit e Welly, recording the conquests of the same monarch; Wady Halfa, built by Osertesen I; the rock temple of Isamboul, built by Rameses II; Gebel Addeh, built by Horus of the 18th dynasty; Ibrim, built by Amenophes II; Amada, founded by Thothmes III; Gherash, Sebous, and Derri, built by Rameses II; Dakkeh, the anct Pselcis, built by Ergamenes; the Colossus of the

Isle of Argo; and the Pyramids of Meroë and Tanquassi. See also ETHIOPIA. See J. L. Burokhardt, *Travels in Nubia*, 1819; E. A. Wallis Budge (ed.), *The Egyptian Sudan*, 1907, and *Nubian Texts*, 1909; Sir H. MacMichael, *The Anglo-Egyptian Sudan*, 1934; J. and A. Hamilton, *The Anglo-Egyptian Sudan from Wilket, 1937*; R. L. Nuble, inland prov. of central valley of Chile, immediately S. of lat. 36° S., and crossed by long. 72° W. Wheat, wine, timber, and cattle are produced. Its cap. is Chillán. Area 5487 sq. m.; pop. 251,607.

Nucellus, in botany, the part surrounding the embryo sac in the uniovular ovaries of a plant. The N. is a mass of tissue and the embryo sac embedded in it contains an abundance of protoplasm and a number of small cells. Surrounding the N. are an inner and outer integument or envelopes of ovule.

Nucoria, see NOCERA INFERIORE.

Nuclear Counters, see CERENKOV COUNTER; GEIGER-MUELLER COUNTER; SCINTILLATION COUNTER.

Nuclear Emulsions, special photographic emulsions sensitive to the passage of a charged atomic particle, e.g. a proton or alpha particle, or even an electron. Ordinary photographic plates can be blackened by alpha particles, but it was not until 1947 that the value of the method was made evident by the discovery of the pi-meson (q.v.) by Powell and Occhialini using improved emulsions. The track of the particle can be seen under a microscope after the emulsion has been processed and consists of a series of dark grains. The emulsions are often 0.4 or 0.6 mm. thick, much thicker than those of ordinary photographic films or plates, and are sometimes stripped from their glass backings and stacked together (with thin tissue interleaving) to form large blocks of emulsion (e.g. 14" × 10" × 5"). Complete high energy cosmic ray events can then be studied. The variation of the grain density and the small side to side deviations or scattering along the track enable the identity of the particle to be estab. See GEIGER-MUELLER COUNTER and WILSON CLOUD CHAMBER.

Nuclear Fallout, the precipitation under the action of gravity of the products of a large-scale nuclear reaction, such as the explosion of an atomic bomb (q.v.). These products are nearly all radioactive with half-lives ranging from fractions of a second to many years. The rate of precipitation and the area affected depend on the atmospheric conditions, but the major fallout is complete in sev. hours and the effects of single bombs have been detected over most of the surface of the earth. The hydrogen bomb (q.v.) with its more powerful explosion causes serious concern to many nations because of the increasing danger of N. F. with its effect on the health of people and animals.

The U.K. and the U.S.A. appear to have tested 'clean' bombs with only a few per cent of the fallout of the earlier types.

Once the short-lived radioactive products have decayed to a low level (after a few days), direct contamination of surfaces presents a small problem compared with that of inhalation and ingestion. Of the many elements involved only a few are considered to be highly dangerous at the levels of radioactivity usually encountered after a few days. Radiostrontium (Sr 90) has chemical properties similar to calcium and accumulates in bone. Its radiation may lead to various forms of cancer, including leukaemia. Because of radioactive decay and biological elimination the harmful radiation is reduced to one half of its original value in about 10 years. Radioactive iodine (I 131) with a half-life of about 8 days is normally a less serious danger. The abnormally large proportion of radioiodine released in the accident at Windscale (q.v.) was due to the exceptional circumstances. Most of the effects of radiation on the health of the individual are fairly well understood, but relatively little is known of the consequences to subsequent generations of the mutation of genes brought about by exposure to N. F. The genetic hazards are such as to demand a continued caution in the testing of nuclear weapons. See H. Heckstall-Smith, *Atomic Radiation Dangers*, 1958.

Nuclear Power. power produced from reactions involving the nuclei of atoms. At the present time the reactions used for power production are: (a) fission of the nuclei of some heavy elements, and (b) fusion of the nuclei of some light elements. The fission reaction has recently been employed for power production on a small scale in experimental N. P. stations in the U.S.A. and U.S.S.R., and on a commercial scale in the U.K. Calder Hall power station. So far as is known the fusion reaction has not yet been utilised for the controlled production of appreciable amounts of power. Its application has been limited to relatively uncontrolled releases of power, as in the hydrogen bomb.

Importance. The importance of N. P. may best be judged from a consideration of the predicted duration of the world's power resources. It is estimated that the existing economic fossil fuel reserves (coal, oil, etc.) will be exhausted in about 100-200 years. At this time the world would probably be dependent largely on hydroelectric power which with the greatest possible development would only account for a small percentage of the requirements. Assuming that no other power sources existed, civilisation in its present form would end. However, it is estimated that the resources of N. P. derivable from the fission process are about 100 times as large as the energy available from existing economic fossil fuel reserves. Moreover it is thought that the controlled fusion process utilising light elements will make available energy equivalent to 100 million times the present economic fossil fuel reserves. It is thus

seen that the application of nuclear fission to power production has ensured that the world's power resources will be adequate for many cents. after the exhaustion of fossil fuel reserves, while the advent of a controlled fusion reaction would provide power reserves lasting for many millennia.

In the U.K., where coal production is not keeping pace with consumption, the importance of N. P. was recognised by the pub. of a Gov. White Paper in 1955 laying down a programme for the development of N. P. The programme was based on the existing ann. increase in power consumption of about 7 per cent, and indicated that N. P. stations of a capacity of 2 million kW. (about 5 per cent of the total capacity) would be required by 1965 to meet the deficit between power requirements and coal production. In 1957 this programme was revised and now requires the production of 6 million kW. by 1965.

Power production from fission. So far as is known all existing N. P. producers rely mainly for their energy source on the fission of uranium 235. Natural uranium contains largely 2 types of uranium, chemically similar, but of different atomic weights. The respective atomic weights of the 2 isotopes, as they are called, are 235 units and 238 units and the 2 types of uranium are known symbolically as U235 and U238. Natural uranium contains 140 times as much U238 as U235. A nucleus of U235 on being struck by a neutron, a nuclear particle with no electrical charge, may undergo fission. When this occurs the nucleus of the U235 atom is split, emitting a quantity of energy which ultimately appears as heat and also emitting, on the average, about 2.5 new neutrons. If it can be arranged that one of these newly emitted neutrons can cause a further fission of a U235 nucleus, and so on, then it is possible to achieve a chain reaction whereby the fission reaction becomes self-propagating and does not require any external energy source to enable the reaction to continue. This neutron induced chain reaction is utilised in N. P. plants, the heat emitted being utilised to raise steam which is then passed through conventional steam turbines driving alternators which produce electricity. The energy available in a given weight of U235 is equivalent to that produced by about 2 million times the weight of coal.

The other products of the fission reaction are the remaining fragments of the U235 nucleus, known as fission products, which are intensely radioactive and can cause damage to health if they are not carefully shielded and stored.

The U238 which is usually present in reactors absorbs neutrons, and some is eventually converted to plutonium, which is a fissionable material somewhat similar to U235. Plutonium can probably be used for fuelling future reactors, and it is the value of the plutonium which helps to make the cost of N. P. production competitive with conventional methods. Normally the stock of fissionable material in a reactor is decreasing, as not enough

plutonium is produced to compensate for the U235 which has been fissioned. By the use of the so-called fast reactor it is possible with careful neutron economy to produce plutonium more rapidly than the U235 is fissioned, a process known as breeding. Breeding makes it possible to convert virtually all the fertile U238 to plutonium and thus to increase the reserves of fissionable material by a factor of 100.

Basically there are 2 types of reactors, termed thermal and fast reactors. The fast reactor utilises neutrons at or about the fast speeds with which they are emitted in the fission process. In the thermal reactor the fast neutrons emitted in fission are slowed down to thermal speeds, that is to speeds equivalent to the normal velocities of the molecules of the material through which they are passing. The molecular velocity is, of course, proportional to the temp. of the material, hence the use of the term thermal velocity. This slowing down

process is carried out by means of a moderator, often made of graphite of high purity. The slowing down of the neutrons increases their chances of causing fission and is an essential operation in a natural uranium reactor. The fast reactor on the other hand does not require a moderator but does require a higher percentage of U235 than is available in natural uranium. The fast reactor, because of the absence of a moderator and the high concentration of fissionable material is considerably smaller in dimensions than the thermal type. At this stage it is only the thermal reactor which has produced power on a commercial scale, fast reactors still being in the experimental stage.

Control of reactors is achieved by varying the number of neutrons available in the reactor core. In the thermal reactor this is done by means of movable control rods made from non-fissile materials having good neutron absorbing properties, such as boron or cadmium. Fast reactor control usually requires either that the

neutron leakage should be a controllable variable or that a portion of the fissile material can be withdrawn, or inserted, as required. Any reactor control system is designed so that it will 'fail to safety' and hence in the event of any fault the reactor will be shut down and power production will virtually cease.

A diagrammatic cross-section of a Calder Hall thermal reactor is shown on page 332.

Power production from fusion. So far as is known the fusion reaction, involving the fusion of the nuclei of various light elements with the production of helium and heat, has only been used on a large scale in the hydrogen bomb. This reaction requires the existence of temps. of about 10,000,000° C. and, apart from the sun, it is only in the hydrogen bomb, which itself is probably initiated by a fission bomb, that such temps. are realised. However, there would appear to be little doubt that the problems inherent in the controlled fusion reaction will be overcome, and the vast global reserves of light elements will become available to mankind as a fuel. *See ZETA.*

Nucleus (Lat. *nucleus*, kernel; cf. *nux*, nut): 1. *Astronomy*: the name given to the central portion of a comet (q.v.). It is now thought that the diameters of the nuclei of comets have been greatly exaggerated, and in many cases 'central condensation' is a better description than 'nucleus.'

2. *Biology*: A N. is usually a spherical or ovoid body present in most living plant and animal cells, and playing a vital role in their activity. Among other things, it contains the *chromosomes* (q.v.) which carry the genes (q.v.) or unit characters of heredity. *See CELL and HEREDITY.*

Nucleus, Atomic. The existence of a 'unit' more fundamental than the atom was revealed by the experiments of J. J. Thomson in 1895, on the conduction of electricity through highly rarefied gases. This unit, named the electron (q.v.), was found to carry a negative charge of electricity, and was a constituent of every atom. The net charge on a whole atom being nil, it was theoretically evident that there must also be a unit carrying a positive charge of electricity in the make-up of an atom. The products of the spontaneous disintegration of radioactive atoms confirmed this conclusion, for while the β -particles (q.v.) were found to be fast electrons, the α -particles (q.v.) were found to carry positive charges. The general nature of each and every atom was finally discovered by Rutherford and his collaborators by the remarkable experimental method of firing α -particles into atoms. Approximately 1 in 10,000 α -particles was deviated, and the surprisingly large number scattered through angles greater than 90 degrees indicated that the positively charged component occupied an exceedingly minute portion of the space taken up by the atom, and that the atom consisted very largely of empty space. Exact computations led to the conclusion that every atom consists of a minute though relatively massive N. of

diameter about 10^{-13} cm. carrying a positive charge, and performing the function of the sun of a 'solar system' in which the planets are the electrons revolving rapidly in their distant orbits of radius about 10^{-8} cm. Since the atom as a whole is neutral, the positive charge on the N. is exactly equal to the sum total of the charges on the planetary electrons. Further, the chemical and physical properties of an element were shown to depend on the charge on the N. of its atom. The charge on the N. was determined by Chadwick in 1920 from the scattering of α -particles, using Rutherford's theory. This confirmed the interpretations of Moseley's work (1913) on X-ray spectra from which the nuclear charge had been deduced. Evidence provided by the disintegration of radioactive atoms, supported by further experiments of Rutherford and Blackett, led to the conclusion that atomic nuclei have a complex structure. By bombarding nitrogen atoms with α -particles, Rutherford (1917) showed that it is possible to break up these nuclei, that they then emit protons (q.v.), an atom of a heavy isotope of oxygen being formed. Later work showed that other atoms when bombarded with α -particles emit neutrons—particles which are electrically neutral, and have masses nearly equal to those of protons. The simplest atom, that of hydrogen, has a N. consisting of 1 proton, round which a solitary electron revolves in a distant orbit. The atom of the next element, helium, has a N. consisting of 2 protons and 2 neutrons; it thus has a net positive charge equal to that of 2 protons, so that there are 2 planetary electrons. The heaviest naturally occurring atom, that of uranium, has no fewer than 92 electrons describing orbits round a N. having a net positive charge equal to that of 92 protons. Now the mass of an electron is very small, being about 1/1839 of the mass of the proton. Hence the mass of an atom is largely concentrated in its N., and it might appear from the above that the helium atom would have 4 times the mass of the hydrogen atom and likewise that the mass of any atom would be a simple multiple of that of the hydrogen atom. This is only approximately true, and it is found that the mass of any atom is always less than that expected by adding up the masses of the individual protons and neutrons. As is shown by their radioactivity certain types of atomic nuclei are unstable, and disintegrate spontaneously with the emission of a relatively light component such as an electron or α -particle. A few of the heaviest nuclei (e.g. those of uranium) disintegrate in a different way when bombarded by neutrons, breaking down into 2 parts with roughly equal masses together with a few lighter particles. These processes of nuclear fission lead to the release of much greater amounts of energy than do ordinary radioactive changes, and have been used in atom bombs (q.v.). *See also ATOM AND ATOMIC THEORY; ATOMIC BOMB; HYDROGEN BOMB; NUCLEAR POWER; RADIOACTIVITY; TRANSURANIC*

ELEMENTS. See E. R. Rutherford, Sir J. Chadwick, and C. D. Ellis, *Radioactive Substances and their Radiations*, 1930; E. da C. Andrade, *The Atom and its Energy*, 1947; S. Glasstone, *Sourcebook of Atomic Energy*, 1952; R. D. Evans, *Atomic Nucleus*, 1955.

Nudd, see LUDD.

Nueces, riv. of Texas, U.S.A. It rises in Edwards co., and flows into Corpus Christi Bay, Gulf of Mexico, after a southerly and south-easterly course of 315 m. It contributes largely to irrigation, draining an area of 19,000 sq. m.

From E. E. Evans-Pritchard: *'The Nuer'* (Clarendon Press, Oxford)

A NUER YOUTH

Nuer, Nilotic Negro tribe of the S. Sudan. The N. inhabit the swamp region on both sides of the White Nile S. of its confluence with the Bahr-el-Ghazal, and their ter., estimated at 26,000 sq. m. in area, lies between that of the Shilluk (q.v.) and that of the Dinka (q.v.). The Nuer pop. is about 200,000. In 1917 Brit. troops went into the Nuer country, and in Feb. 1928 the N. took to the swamps but were bombed out by the R.A.F. and surrendered. They are transhumant pastoralists with many cattle, but with scattered permanent villages. The tribal organisation is based on a clan and lineage system. There is no king or chief, only certain ritual functionaries known as leopard-skin chiefs; there were also 'prophets' who were deposed by the gov. Initiation by forehead-scarring is

practised. Kwoth is the name for God, who is associated with the firmament, but the word also denotes any spirit except 'ghost.' When the 'sons of Kwoth' or 'sky-spirits' enter into a man he becomes a prophet. These sky-spirits are associated with certain natural phenomena or human relations in much the same way as the gods of classical or Norse mythology. The N. have been fully described by E. E. Evans-Pritchard, *The Nuer*, 1940, *Kinship and Marriage among the Nuer*, 1951, and *Nuer Religion*, 1956.

Nueva Esparta, state of Venezuela, comprising Margarita, Coche, and other is. There are pearl fisheries, and, at Puerto Formin, important magnesite workings. The cap. is La Asunción. Pop. 75,900.

Nuevo Laredo, port of entry into N. Mexico on the Rio Grande, opposite Laredo, Texas, on the Inter-Amer. Highway. Cattle and cotton are raised in the dist., and some industries, including cotton textiles and soap-making, are carried on. Pop. 29,000.

Nuevo León, industrial state of Mexico in the N. part of the rep., stretching from the Amer. border 300 m. S. to the tropic of Cancer. It is practically all mountainous. Monterrey, the cap., is a city of some 333,000 inhab., entirely surrounded by mts. From Monterrey there is a railroad to Laredo, another to the port of Tampico, and another to Matamoros on the Amer. frontier. The natural resources are silver, lead, copper, gold (in small quantities), and oil (not yet developed). Manufs. include beer, iron and steel, glassware, furniture, cotton goods, shoes, and enamel ware. Area 25,136 sq. m.; pop. 740,190.

Nuevo San Salvador, see SANTA TECLA.

Nuffar, see NIPPUR.

Nuffield, William Richard Morris, 1st Viscount (1877-), motor manufacturer and philanthropist, b. Worcester, and educ. at Cowley vil. school, near Oxford. He began business as a cycle-maker and repairer in a shed at Cowley, and later made motor-cycles. N. built his first motor-car in 1911, and, a year later, opened a car factory. The first 'Morris Cowley' assembled not many years before the First World War, was a challenge to the whole Brit. motor market. At that time Brit. motor-cars were not in favour, almost the only reliable machine being a monopoly of the rich. Morris (as he then was) cut his selling price and offered a dependable car at £165. To do this he had to open a new factory at Cowley, which had now become a township housing hundreds of his employees. The First World War brought a temporary halt to the enterprise, and in that period N. made mine-sinkers. After the war he made cars on mass-production principles. By 1925 the Cowley works were producing 50,000 cars annually. In 1938 the factories covered 120 ac. and employed 16,000 persons. Just before the Second World War N. celebrated the sale of the millionth Morris car. His business was expanded by the purchase of the assets of Wolseley Motors Ltd for £730,000 in 1927 and by the absorption of the Riley

business. His success has been phenomenal, and he will be remembered also as a philanthropist. By 1938 he had given £11,600,000 for research, education, and charity, including £3,128,000 to Oxford Univ. alone, where he founded 4 medical professorships in 1937. Subsequently he made a gift of no less than £10,000,000 to found one of the biggest charitable trusts ever conceived. This, the N. Foundation, will derive an ann. income of £400,000 to be devoted to medical research, the development of medical and health services, trade and industrial research, social studies, and the care and comfort of the aged. By 1943 he had presented out of his private purse something approaching £26,000,000. He was created baronet in 1929, baron in 1934, and viscount in 1938, and received honorary M.A. and D.C.L. degrees from Oxford Univ.

Nuffield College, research college of Oxford Univ. endowed by Viscount Nuffield (q.v.) in 1937. The college is under the control of the Hebdomadal Council and comprises full-time official fellows conducting research, faculty fellows already holding offices in the univ. or the colleges which would qualify them to assist in its work, and visiting fellows competent to further its researches by virtue of their experience in the professions or in industry or commerce. In addition there are a number of resident post-graduate students receiving emoluments apart from All Souls, N. C. is the only college in Oxford which is not primarily for teaching. In June 1958 it received a royal charter of incorporation.

Nugent, James (1822-1905), philanthropist, b. Liverpool. In 1872 he founded the Catholic Total Abstinence League of the Cross, which had many branches both in Great Britain and America. He also estab. the 'Save the Boy' refuge and a Magdalene home.

Nugent, Sir Richard, 15th **Baron Delvin** (1583-1642), Irish soldier. He took part in the rebellion of the Earls of Tyrone (q.v.) and Tirconnell, and was imprisoned in Dublin but succeeded in making his escape. He was pardoned by James I, and was created Earl of Westmeath (1621).

Nuichwang, see NEWCHWANG.

Nuisance in law is either public or private. Although the distinction is difficult to define, it may be said to be the extent to which the convenience of the general public is affected. *Public nuisance* is an unlawful act or omission which causes or is liable to cause inconvenience or interference with the normal state of order and comfort of the public. Public N.s. are indictable (see INDICTMENT) as misdemeanours. Examples are: (1) obstruction of public highways by causing unnecessary crowds to assemble or pitching rubbish on to a road; (2) pollution of rivers with refuse; (3) exposing persons lawfully on the highway to the risk of injury from adjacent dangerous structures; (4) the carrying on of offensive or dangerous trades whose smells or noises interfere with public health and comfort; (5) disorderly houses; (6) a varied class of acts

judicially held to be public N.s. such as eavesdropping and publicly exposing persons inflicted with infectious diseases.

A public N. can also give rise to a civil action for injunction or damages at the suit of an individual who must, however, show that he has suffered some special damage greater than that caused to the general public.

Private nuisance is an unauthorised act or omission which interferes with the reasonable enjoyment of land or of some interest in land. N. may cause material damage to property itself, infringe the exercise of some right over it, or impair the health or comfort of a person occupying property. Examples of private N.s. are: (1) acts infringing the enjoyment by an owner or occupier of property, e.g. flooding by the diversion of a watercourse, vibration caused by machinery, overhanging branches or undergrowing roots of trees, undermining by excavation; (2) acts continuously affecting the health or comfort of the occupier of property, e.g. excessive noise or odious smells; (3) acts infringing the exercise of rights over land, e.g. the pollution of waters over which another has fishing rights, the obstruction of rights of air, light, or way. Long acquiescence in the N. may deprive the complainant of his remedies. On the other hand, the existence of a N. prior to his acquisition of property will not necessarily bar a new owner from relief merely because he has 'come to the N.' The test as to what constitutes a N. is usually 'the character of the neighbourhood and the pre-existing circumstances' (e.g. fumes from a chemical works would constitute a N. in a predominantly residential area, but not in an area where industrial processes have been carried on for some time on a large scale).

Damages may be awarded for N. The prin. and most effective remedy is an injunction (q.v.) to abate it (e.g. a court order to restrain noise or the blockage of a right of way). A local sanitary authority may order an offender to abate a public N. within a specified time; if the order is ignored, the authority can itself remove the N. and recover expenses and penalties. For text-books see TORT.

Nukualofa, tn on the N. coast of Tongatabu, cap. of the kingdom of Tonga.

Nukunono, see TOKELAU.

Nulla poena sine lege, i.e. no penalty can be imposed on a person found guilty of a crime unless it is explicitly provided for by law. This legal principle and its correlative, *nullum crimen sine lege* (no act is a crime unless it is so defined by law), were applied in the consideration of atrocities committed by the central powers during the First World War and of new crimes which science made possible committed by belligerents in the Second World War. See CRIMES, WAR.

Nullification, in the hist. of the U.S.A., a term used to denote the action of a state for rendering null and void any Act of Congress, or Federal Act, regarded by the state as unconstitutional. The application of the doctrine of N., or, more fully, N. and secession (i.e. from the

Union), received its strongest expression in S. Carolina in 1832, during the agitation against the notorious Tariff Act of 1828, which imposed excessive duties on raw material and imported manufs., and which has ever since been known as the 'Tariff of Abominations.' The S. Carolina 'Nullifiers,' having obtained no relief from Congress up to 1831, inaugurated a campaign for the calling of a state convention to nullify the tariff. This policy at once split the whole country into 2 factions—the 'Nullifiers,' or the 'State Rights and Free Trade Party,' and the 'State Rights and Union Party.' Congress then made various concessions by amending the Tariff Act. But the antipathy of North and South was too deep for the Nullifiers to win in the long run, and later a compromise was effected and the Ordinance of N. repealed. The doctrine of N. is no longer a rated principle. The civil war settled for all time the right of a state to withdraw from its contract with the Union. See *The Cambridge Modern History*, vol. vii, 1905.

Nullity of Marriage, a decree of N. of M. may be petitioned for by a man or woman on any of the following grounds: the fact of a former undissolved marriage; impotency of either of the 2 parties; relationship of the parties within the prohibited degrees of affinity; marriage without licence or pub. of banns; force, fraud, or mistake; wilful refusal to consummate; venereal disease or pregnancy by some third person existing at the time of marriage on the part of the person against whom the decree is sought. In 1956 a Royal Commission on Divorce suggested certain changes in the law of N. of M.

Nullum crimen sine lege, see **NULLA POENA SINE LEGE**.

Numa Pompilius, 2nd King of Rome, who belongs to legend rather than to hist. He was a native of Cures in the Sabine country; was elected king one year after the death of Romulus. His reign is supposed to have lasted from 715 to 673 bc. He was instructed by the *camena* or water-nymph Egeria, who visited him in a grove near Rome, and who honoured him with her love. N. P. was considered as the author of Rome's religious worship. He founded the temple of Janus, which remained always shut during his reign.

Numantia, anct tn of Hispania Tarraconensis. It commanded a position of great natural strength, being situated on a steep hill. In 134 bc it was besieged by the Romans under Scipio Africanus the Younger, and capitulated after a resistance of 15 months. The tn was razed to the ground, and the few survivors were sold as slaves. The title 'Numantinus' was given to the victor Scipio. The vil. of Gnaray marks the site of the anct tn. Excavations of 1905-10 revealed the Rom. entrenchments and 13 camps. See A. Schulten, *Numantia* (4 vols.), 1914-31.

Number of the Beast, see **APOCALYPTIC NUMBER**.

Number Sequences, see **SERIES**.

Numbers, see **NUMERALS**.

Numbers, *The Book of*, forming the fourth book of the Pentateuch (q.v.), deals

with the travels of the Israelites from the second to the fortieth year of the Exodus. It also contains various collections of laws, e.g. in chs. v and vi. The institution of the Levites and the priestly duties receive much attention (chs. iii, iv, viii, xviii). See commentaries by L. Elliott-Binns, 1927, and P. Heinisch, Bonn, 1936.

Numbers, Theory of. This science consists of the investigation of the properties of whole or integral N., all incommensurable N. being excluded. It may be considered as including the investigation of rational fractions. An idea of the problems confronting the theory may be obtained by considering indeterminate equations. If a given equation contains 2 or more unknown quantities it is called *indeterminate*, i.e. no definite solution to the equation is possible (see **DIOPHANTINE EQUATIONS**). This also applies to the case of sev. equations, the total number of equations being less than the total number of unknown quantities contained in them. The problem in the theory of N. is to find every possible solution in which the unknown letters are integers. Sev. interesting properties of integers are proved by this theory. It is easily proved that the number of prime N. is infinite. The problem of finding in how many ways a composite number, i.e. a number which is divisible by N. other than itself and unity, can be resolved into 2 factors, is solved generally. It also proves that the product of n consecutive N. is divisible by $n!$, i.e. $n(n-1)(n-2) \dots 1$, thus $20 \times 21 \times 22 \times 23$ is divisible by $4!$, i.e. $4 \times 3 \times 2 \times 1$. Sev. other important properties are proved, among which Fermat's theorem is perhaps the most important. This states that if p is a prime number, and N is a positive integer prime to p , then $N^{p-1} - 1$ is a multiple of p . The interest of this branch of algebra is purely theoretical. The data of practical applications of mathematics are in the nature of things only approximate, and thus any solution given in whole N. is of very little interest. The first consideration of the theory probably took place in India, but the first book on the subject was written by Diophantus in his *Arithmetica*, the theory sometimes being called Diophantine Analysis. For further reading the most interesting books are Legendre's *Théorie des nombres*, while the beginner will find a suitable introduction to the subject in such standard works on algebra as Hall and Knight's *Higher Algebra*. For more advanced treatment and extension of the subject to algebraic N. see L. E. Dickson, *Theory of Numbers*, 1930; for the general principles of number see G. H. Hardy, *Pure Mathematics* (10th ed.), 1952.

Numea, see **NOUMÉA**.

Numerals. A numeral is a sign employed to express a number. It has long been recognised that the N., inaccurately termed 'Arabic' N., which nowadays are commonly used in daily life are of comparatively recent origin. Counting is nearly as old as speech and the N. are as old as writing. In anct times, and in some instances down to modern times,

each language had its series of N. Thus the number of systems of notation employed was about the same as the number of written languages, and in some cases a single language had sev. systems. The Egyptians, for instance, had 3 systems of N., respectively for the hieroglyphic, hieratic, and demotic scripts (q.v.). The Greeks had 2 systems of numerical notation, and the Romans frequently changed their numerical symbols. The great majority of the numerical systems are based on 5 or some multiple of 5, but there are traces of systems based on 4 (the Nabataeans had a sign for 'four'; the number 'eight,' 'acht,' 'octo' = Sanskrit *as-tau* = 'two fours'); the duodecimal system (which has left its traces in 'dozen,' 1 ft = 12 in., etc.) combined with 5 has given the hexagesimal system employed in Egypt and, especially, in Mesopotamia. The Maya and Aztec systems of notation were based on 20, and curiously enough the Fr. preserve traces of an ant. vigesimal system, perhaps of the Celts, in the numbers *quatre-vingts*, *quatre-vingt-dix*, *soixante-dix*. Nowadays numerical notation is mainly based on 10. Thus on the whole there are 4 main systems: the quaternary (based on 4), the quinary (based on 5), the decimal (based on 10), and the vigesimal (based on 20). To these, 2 secondary systems may be added: the pair system (still found amongst some primitive tribes of S. America, Australia, Indonesia, and Africa) and the hexad system (based on 6) with some traces in Africa. In the hist. of N. 5 main categories can be distinguished.

The Primitive Pictographic Notation. The number is given by repetitions of the symbol representing the object in question, e.g. '5 men' is represented by the symbol 'man' repeated 5 times; this notation system is often found in pictographic documents of N. Amer. natives. Many primitive tribes represent the N.

40; 'one of the other hand,' 6; 'foot one,' 11; 'foot two,' 12; and so forth. In some Eskimo dialects the word 'man' also means 20, and 'two men,' 40.

The 'Hieroglyphic' Systems of Numerical Notation consisted of repetitions of a single unit, with the use of hieroglyphics for higher numbers, and sometimes introducing the principle of multiplication when repetitions become too many for practical use. (For the Egyptian N. see under HIEROGLYPHIC AND HIERATIC WRITINGS, *Numbers*.) In the cuneiform (q.v.) Babylonian system, the numerical notation for small numbers was quite simple; 1 was represented by a short, straight, vertical stroke, or rather wedge. 2 to 9 by two to nine short strokes, 10 by an angle, and 100 by a short vertical wedge followed by a short horizontal wedge. Sometimes 10 was represented by a vertical crossed by a horizontal stroke, 20 by a vertical crossed by two horizontals, etc., and the units were represented by horizontal and not vertical strokes. The tens were sometimes represented by circles, and the units by a kind of crescent. In larger numbers, which were not standardised, the vertical stroke also stood for 60, 3600, and in general for 60 to the *n*th degree. The angle also stood for 10×60 , 10×3600 , etc., i.e. for 10×60 to the *n*th degree. The value to be taken entirely depended upon the context; 3600 was sometimes represented by a kind of irregular square consisting of 4 short oblique strokes; the same symbol with a small angle inside denoted (3600×10) 36,000; and with 2 similar angles, 72,000. In the ant. Cretan script a stroke represented the unit; a dot, 10; a longer stroke, 100; a lozenge, 1000; at a later stage the units were represented by upright lines, the tens by horizontals, the hundreds by circles, the thousands by circles with four spurs, and the ten thousands by similar signs with a dash in the middle.

FIG. 1. CHINESE 'ROD' NUMERALS

a, numbers 6 to 90; b, the number 46,431 in monogram form.

by the repetition of the vertical or the horizontal stroke, 1 by one stroke 2 by two strokes, etc.; such tribes have little need for or interest in numbers of any considerable size. The primitive tribes of New S. Wales have but 4 numerical words in their vocabulary: 'one,' 'two,' 'three,' and 'many.' In various primitive forms of speech the number 5 is expressed by the word 'hand' or 'the hand finished,' 10 by 'two hands' or 'two hands finished.' In some primitive S. Amer. dialects 'all the fingers' means 10; 'all the fingers and toes,' 20; 'fingers and toes of two men,'

The Chinese had, and still have, various numerical systems. The 'rod' N. are quite simple; the units 1 to 5 consist of one to five vertical strokes; 6 to 9 of one to four vertical strokes with superscribed bar; and the tens of horizontal strokes or of a combination of horizontal and vertical strokes (see Fig. 1a). The hundreds were written like the units and so on. These N. were frequently written in the monogram form (see Fig. 1b). In the present Chinese system there are signs for the numbers 1 to 9 (1 to 3 consisting of one to three horizontal strokes),

for 10, 100, 1000, and 10,000. The number 25,647, for example, may be written either from the top downwards or from left to right, as follows: 2 (10,000's), 5 (1000's), 6 (100's), 4 (10's), and 7; or else the symbol 2 followed by the symbol 10,000, the symbol 5 followed by the symbol 1000, the symbol 6 followed by the symbol 100, and so on. Apart from the 'rod' system, the Chinese have 3 general systems of N.—the ancient national, the modern national (with the 'place-value,' and the circle used as 'zero'), and the commercial.

The Maya and Aztec numerical systems were vigesimal, and they wrote 20 as we write 10, using their characters for 20 and zero. In the Maya system 1 to 4 were represented by dots; 5, 10, 15, by sticks, lines, or bars, and 20 perhaps by the moon. The symbols for the multiples of 20 (400, 8000, 160,000, etc.) are still uncertain; it may be, however, that they had the 'place-value' notation. In the Aztec system 1 to 19 were represented by dots or circles, 20 by a religious banner, 400 (20 × 20) by a pine tree, 8000 (20 × 20 × 20) by an incense-pouch. The most important feature of the Maya system was their zero, the importance of which was recognised by the Maya many cents. before any other people in the world; this symbol was similar to a shell, having numerous variants. The highest number found in a Maya inscription is 1,841,639,800 days, corresponding to over 5,100,000 years.

The Alphabetical Systems. The Jews, like the Syrians, the Arabs, and some other peoples, used the letters of their alphabet for numerical symbols, taking the first letter for 1, the second for 2, the tenth for 10, the eleventh for 20, and so forth, the last one (the 22nd) denoting 400. In the Talmud the numbers above 400 are formed by composition (500 = 400 + 100; 900 = 400 + 400 + 100); in later times the final forms of the letters *k*, *m*, *n*, *p*, *q* were

א	ב	ג	ד	ה	ו	ז	ח	ט	י
1	2	3	4	5	6	7	8	9	10
כ	ל	מ	נ	ס	ע	פ	צ	ק	
20	30	40	50	60	70	80	90	100	
ר	ש	ת	ך	ם	ן	ף	ץ		
200	300	400	500	600	700	800	900		

FIG. 2
HEBREW NUMERICAL SYSTEM

respectively used for 500, 600, 700, 800, 900. The later Hebrew numerical system is shown in Fig. 2. The thousands were represented by the same letters as the units, sometimes followed by a kind of apostrophe.

The Greeks used the letters of their alphabet for numerical notation in the same way as did the Jews. Since they had 24 letters in their classical alphabet, and

for a more satisfactory system of N. they needed 27 letters, they retained the ancient N.-Semitic-Gk letters *digamma* (as 6), *koppa* (as 90), and *sampi* as 900. Originally the capital forms were used; at a later stage the minuscules were employed. To distinguish the N. from letters a bar was commonly written over each number ($\bar{\alpha}$), but sometimes the letter was written as if lying on its side (ϵ). The thousands

α	β	γ	δ	ϵ	F	ζ	η	θ
1	2	3	4	5	6	7	8	9
ι	κ	λ	μ	ν	ξ	\omicron	π	ς
10	20	30	40	50	60	70	80	90
ρ	σ	τ	υ	ϕ	χ	ψ	ω	\nearrow
100	200	300	400	500	600	700	800	900

1000	2000	3000	4000	5000	6000	7000		
				η				
				8000	9000			

FIG. 3
GREEK NUMERICAL SYSTEM

were often indicated by placing a bar to the left of, in modern Gk type, by α , β , γ , δ , ϵ , F , etc. This Gk numerical system is shown in Fig. 3. The myriads (= 10,000's) were represented by M or Υ (10,000), $\overset{B}{M}$ (20,000), $\overset{\Gamma}{M}$ (30,000), and so on, or by a special symbol (\odot) superscribed on units.

The Greeks had also the numerical system known as Herodianic (so named after the grammarian Herodianus, late 2nd cent. AD, who fully described it) or Attic (it is the only system found on ancient Attic inscriptions) or acrophonic (the initial of the name of the number being used as its symbol), while simple vertical strokes were used for the numbers 1 to 4. Thus Γ (an old form for Π , initial of $\Pi\epsilon\tau\epsilon$, *pente*), 5; Δ ($\Delta\epsilon\kappa\alpha$, *déka*), 10; H ($\text{H}\epsilon\kappa\alpha\tau\omicron\text{n}$, *hekátôn*), 100; X ($\text{X}\iota\lambda\iota\omicron$, *khilioti*), 1000; M ($\text{M}\upsilon\pi\tau\iota\omicron$, *myrioti*), 10,000. These N. were frequently combined in ligatures. Tens of thousands were sometimes indicated by dots. Special symbols were sometimes used for fractions, sometimes an accent or a line above the numeral indicated the fraction; as, for instance; ν or $\nu' = \frac{1}{2}$, $\nu'' = \frac{1}{4}$, $\nu''' = \frac{1}{8}$, or $\frac{1}{5}$, $\nu'' = \frac{1}{5}$, $\delta' = \frac{1}{10}$.

The Etrusco-Roman Numerals. The origin of the Etruscan and Rom. N. is still obscure (apart from the N. 1 to 4, which were represented by one to four vertical strokes (I, II, III, IIII)). Etruscan had special symbols for 5, 10, 50, 100, and 500. According to some scholars (e.g.

Mattheus Hostus, 16th cent., and De Feis, 19th cent.), they were based on number 5; thus Λ for 5 would be the inverted form of V, which was derived from the open hand, the fingers with the exception of the thumb being held together; X for 10 would be a double V; 50 would be the 5 with a vertical stroke, and doubled would represent 100; and a horizontal stroke on the base of 50, 500 (see Fig. 4). According to another theory these symbols were based on the decimal system, X for 10 being derived from two oblique lines crossed, 100 being the same symbol with the addition of a vertical line, and 5 and 50 being the same symbols halved (Fig. 4). Concerning the origin of the

10,000, $((I)) = 100,000$. The last symbol, repeated 23 times (= 2,300,000), appears on the *columna rostrata* inscription, commemorating the Rom. victory off Mylae (Milazzo) in the First Punic war (260 BC). In some inscriptions we also find IXI (or IXI) for ten hundred thousand and IMI for thousand hundred thousand. The forms CID (= 1000) and IC (= 500) appear as late as the 16th cent. The subtractive principle (IV instead of IIII, for 4; IX instead of VIIII, for 9;

$$\oplus, \otimes, \ominus, \odot = C, C = 100$$

I	II	III	IIII	Λ	X	Λ	\times	Δ
1	2	3	4	5	10	50	100	500

FIG. 4

ETRUSCAN NUMERALS

Rom. symbols C (100), M (1000), L (50), and D (500), the most probable theory is that they derive from the Gk letters *thêta*, *phi*, and *khi*, which the Romans did not use as letters but retained as numbers. As to the use of *thêta* for 100 we have also early forms (see Fig. 5a), and we may assume that written rapidly with a stylus or a reed pen the circular symbol was left incomplete, and under the influence of the initial of C(ENTUM) (100) it became C. *Phi* (Fig. 5b) became the symbol for 1000 and under influence of M(ILLE) (1000) became M. An early form of the Gk letter *khi* (Fig. 5c) became L for 50. D is generally thought to be merely half of the letter *phi*; it was occasionally written CI (see Fig. 5b) and appears very commonly as ID. The Etruscans and the Romans also employed other numerical symbols, but the aforementioned were the most commonly used. The vitality of the Rom. N. is astonishing; they were used throughout the Middle Ages, holding their own against the Indo-Arabic N., even being preferred for the calculation of money accounts, and, of course, they are still in use at the present day, though apparently confined to such purposes as the numbering of chapters in a book, and the chaptering of private statutes to differentiate them from public acts.

The present system of Rom. N., in which, for example, 1958 is written MCMLVIII, is a relatively recent development. In classical and early medieval times there was no unified method, especially in the case of large N. For 1000 there were various symbols: ϕ , \bar{X} , α , or (I) or \bar{I} (see also above, concerning the origin of M = 1000); multiple thousands could be indicated either by a bar over a number, such as $\bar{I} = 1000$; $\bar{X} = 10,000$; $\bar{C} = 100,000$ (unless the bar was employed to distinguish the numeral from a noun), or by a semicircle: $(\phi) = 10,000$, $((\phi)) = 100,000$, or else (I) = 1000, ((I)) =

$$\text{D, CI, I, M (ch, } \infty, \bowtie, \sim) = M = 1000$$

$$\downarrow, \downarrow, \perp, L = 50$$

ORIGIN OF THE HIGHER ROMAN NUMERALS

a, 100 from the Greek *thêta*; b, 1000 from the Greek *phi*; c, 50 from an early form of the Greek *khi*.

XC instead of LXXXX, for 90; and XCIX instead of LXXXXVIII, for 99) was rather rare even in medieval times; indeed, we generally find CCCC for 400, IIII for 4, etc. But already in the late 16th cent. (ed. of Capella, Leyden, 1599) we find CID. IC (= 1000. 500. 99) for 1599. It is worth while mentioning that in France down to the 18th cent. we find Rom. numerals used in combination with the vigesimal system (see above): *iiij*²² (= $4 \times 20 =$ quatre-vingts = 80).

The 'Arabic' Numerals. The expression 'Arabic N.' used for our common system of numerical notation is a misnomer. Moreover the origin of this system is not quite certain. It is, however, generally believed that our common numerical symbols originated in India, that they were carried to Bagdad in the 8th cent. AD, and thence found their way to Europe, where they were known, in Spain and in Italy, at least in the 10th cent. The Arabs themselves attributed the origin of the 'Arabic' N. to the Hindu and called them *hindasi*. The great Arabian mathematician ('Abû 'Abdallâh Mohammed ibn Mûssa, al-Huwârizmî, of the 7th to 8th cent., wrote a treatise on the *hisâb hindî*, 'the Hindu calculation.' Carra de Vaux (*Scientia*, 1917, p. 273), however, suggested that the Arabic word *hind*,

or rather *hnd*, does not mean 'Hindu,' but is of Persian origin (*end*), meaning 'arithmetic measure, geometry'; that the 'Arabic' N. did not originate in India from alphabetic letters (as it is generally believed), but were conventional symbols invented in neo-Platonic schools, and were used in Persian pre-Islamic schools, whence they passed to Bagdad, on one hand, and on the other hand to India. But Carra de Vaux is practically alone in holding this view. On the other hand, it must be pointed out that our 'Arabic' N. were not used by the Arabs, who evidently derived their forms from some other source, and in course of time further modified them in some respect (see Fig. 6). At any rate, these N. are found in Spain as early as the 10th cent.; they were called *hurūf al-ʿubūr*, 'the dust N.,' probably because they were written on the dust *abacus* (see below) instead of being represented by counters. The first European scholar who is definitely known to have employed the new N. is Gerbert, who in 999 became Pope Sylvester II. He went to Spain in 967. The oldest definitely dated European MS. that contains these N. was written in Spain in 976 (see Fig. 6, line 3). The later changes in the forms of N. which took place in Italy may be seen in the same fig. (line 20).

A little consideration will convince one that, however obvious it may be to suggest arbitrary signs for the N. from 1 to 9, the relative positions of such signs according to a decimal indicate a maturity of thought in calculation that no merely arbitrary system can explain. It will be seen that what to moderns may seem arbitrary is in reality a slow development, starting from a simple if cumbersome principle, and worked out by a gradual and highly ingenious eclecticism. Lastly, researches by various scholars show that the Hindu system, all-important from the fact that after being improved by Arabian, Italian, and other savants it formed the basis of the system now in vogue throughout Europe, though admittedly obscure in origin, is not only clearly of high antiquity, but reveals on inquiry a foundation of still older systems. These began the only obvious mode of constructing symbols of number, viz. by repetitions of a single unit, and developed gradually by the use of zero, and a true denomination for each cipher, determinable on a decimal system. The great problem in these various ancient systems was to keep numbers of different denominations separate; it did not occur all at once even to the subtle orientals to represent units, tens, hundreds, etc., by position, for the use of a sign for zero comes late in the developed Indo-Arabic notation. The independent employment of a zero symbol by the pre-Columbian Mayas (see above) has no influence on the development of our common notation.

The old method of keeping digits distinct was by means of the *abacus*, or reckoning-board, consisting of balls strung on wires or rods set in a rectangular frame. The *abacus* was used both by the Greeks and the Romans, and is still

D. Düringer

FIG. 6
DEVELOPMENT OF THE ARABIC
NUMERALS

1, Deva-nagari letters of the 2nd cent. AD; 2, Arabic numerals of the 10th cent. AD; 3, the earliest examples of Arabic numerals in Latin MSS. Escorial Library, Spain; MS. of AD 976; 4, other forms of the Arabic numerals, E. type (8. modern Arabic numerals, as employed in Arabic script); 9-13, the so-called apices of Boëthius of the 11th and 12th cents. AD; 14, the numerals of John Basingestockes (d. 1252); 15-17, Arabic-Byzantine numerals of the 12th to the 15th cents.; 18, numerals in a MS. from France (now in Berlin), of the second half of the 12th cent. AD; 19, numerals in an Italian MS. from Florence of the first half of the 14th cent. AD; 20, numerals in an Italian MS. of the 15th cent.

used in many oriental countries, especially China, for complex calculations. The movable balls are used as counters to record the steps in an arithmetical operation, and each column or compartment represents a particular value to be

assigned to a counter or ball placed or moved on to it. As soon as distinctive symbols or ciphers are used instead of counters to represent the numbers from 1 to 9, and a sign for zero used, the abacus or any other similar mechanical contrivance becomes superfluous, and the problem of calculation by reference to position is solved. Apparently Europe owes the whole of its modern arithmetic to the Indians and Arabs, for the decimal system, or mode of reckoning by tens through the instrumentality of the zero, seems to come from India through the Arabs. Whether the Greeks arrived at the decimal system, and the use of position and the zero as the most convenient mode of reckoning, independently of the oriental nations is apparently unknown. Certainly it seems that the value of position might soon have been suggested to them by the dash which, as shown above, was written on the left of a sign for thousands; at all events it is possible that from this use of the dash or stroke the Greeks began to associate high numbers with position to the left. If then, for example, $7000 + 800 + 40 + 2$ were represented by ζ, ω, μ , and β respectively, it would be a natural step to eliminate the dash and run the 4 symbols together thus, $\zeta\omega\mu\beta$, with a line or vinculum over the top to differentiate from a mere word. However, our common numerical system, generally known as the 'Arabic N.' is the most simple and the most developed of all the numerical systems, ancient or modern.

Numerianus, Marcus Aurelius, Rom. emperor, younger son of the Emperor Carus, whom he accompanied on his expedition against the Persians. Carus was assassinated in AD 283, and N. was elected emperor by the soldiers, but was himself assassinated 8 months later, whilst on his way back to Rome.

Numerical Aperture, see MICROSCOPE AND MICROSCOPY, Components.

Numidia (from Gk *nomides*, nomads, the land of Nomads), name given by the Romans to a part of the northern coast of Africa, corresponding to some extent with the modern Algiers. It was bounded on the W. by the R. Mulucha (now Moluya),

which separated it from Mauretania; on the E. by the R. Tusca (now Wadi-el-Berger), which separated it from the ter. of Carthage; on the S. it reached to the chains of Mt Atlas. The inhab. of N., as of Mauretania, belonged to the race from which the modern Berbers are descended.

Numismatic Society, Royal, see ROYAL NUMISMATIC SOCIETY.

Numismatics (from Gk *nomisma*, a coin with customary value, currency), study of coins and currency, has engaged attention since the It. Renaissance, when their historical and artistic value was first appreciated. The stimulus then given to coin collecting resulted in the formation of notable cabinets by many scholars and gentlemen: such national collections as those of France, Austria, and Sweden began as royal cabinets. To-day the study is widespread, both among private collectors and also in public institutions, which emphasise the value of N. in furnishing historical, economic, and artistic evidence. Numismatic societies and journals exist all over the world.

Early coinage sprang from the desire for a more generally acceptable exchange medium than cattle or axes or spits (characteristic of biblical, Homeric, and W. European economies), or knives or cloth (used in early Chinese times), when it was seen that metal (normally copper or silver or gold), exchanged by weight, combined reasonable universality with utility, durability, and beauty. The copper talent (the limit of human burden) quickly emerged as the Gk unit of weight. But fluctuating metal values, and the cumbrousness of weighing out metal in bars or broken fractions, still hampered exchange until (as evidenced by Pollux quoting Xenophanes of Colophon) Lydian kings, c. 650 BC, revolutionised currency by expressing copper values in small pieces of a more precious metal (electrum), by ensuring centralised control of weight and purity, and by stamping these pieces with a standard design. Ability to dictate the exchange value of distinctively marked metal within a given area is the origin of true coinage.

Peninsular Greece followed suit with silver, its characteristic metal: Pheidon of Argos (c. 620 BC) was credited with the revaluation of the old iron spits of the Peloponnese in terms of silver coins struck with the 'turtle' design at Aegina, a 'handful' of 6 spits being worth a new silver drachma. The age of colonisation had intensified Gk trade, which thus increased the need for coinage, and by c. 600 both Corinth and Athens were in a position to strike their own coins. They too adopted the drachma unit, related to the universal talent by the intermediate mina weight (= 60 talent) borrowed from the E.; but the price of silver varied owing to differing availability and transport costs, and this caused variety in the weight of the drachma, heaviest at Aegina, lightest at Corinth, and tended to divide the world into rival groups. Most Gk weight standards were offshoots, in one sense or another, of these original systems,

1, Corinth, silver stater, 4th cent. B.C.; 2, Elis, silver stater, 5th cent. B.C.; 3, Rome, silver denarius, 2nd cent. B.C.; 4, Rome (Caracalla), silver antoninianus, A.D. 215; 5, Louis le Débonnaire of Germany, silver denier, 814-40; 6, Ethelred II of England, silver penny, 979-1016; 7, St Louis of France, silver gros tournois, 1226-70; 8, Florence, gold florino from 1251; 9, Henry VIII of England, gold angel, 1509-26; 10, Arabic silver dirhem, A.D. 768; 11, Jehangir Khan of India, silver half-rupee, 1619.

Asiatic, Aeginetan, and Attic-Corinthian Euboic.

By 500 BC many Gk city states had their own mints, and by 350 BC Gk coinage was universally regarded as an important sign of political autonomy. The distribution of the various coinages, in hoards and site finds, accurately mirrors the main streams of Gk commerce. Each state adopted a distinctive coin device (an owl at Athens, a pegasus at Corinth (*see illus.*, 1), a barley-ear at Metapontum, etc.), with or without an inscription giving the city's name, as a guarantee of weight and purity. The coins were circular in shape, and bore 'types' on both sides, and, though often struck very carelessly, came to display a wonderful degree of skill and beauty, as at Elis (*see illus.*, 2), Amphipolis, and many Sicilian cities. By c. 400 BC, master engravers were signing their dies.

Soon after 450 BC imperialist Athens had tried, with some success, to subject a wide variety of independent mints and standards to her own economic control. A more important attempt was made, at the end of the 4th cent. BC, by the Macedonian Empire, which coined great quantities of gold and silver with standard types from mints in Greece, Asia, and the Levant: these bore a royal portrait (e.g. of Alexander the Great) in place of the old city badge. In areas not subject to Macedon the former idiom continued, the Rhodian and S. It. coinages gaining special importance.

By 300 BC a purely Lat. coinage was increasing in central Italy, including Rome, in the form of asses, i.e. cast bars or disks of bronze, originally about 1 lb. in weight, with their fractions. Contact with Gk colonies of S. Italy resulted at Rome in experimental silver coins being struck on a Gk standard: and growing use of silver led to a new silver-bronze ratio expressed, c. 190-180, in the denarius, worth 10 (and later 16) asses of steadily shrinking weight and size. This coin, which was destined to dominate the coinage of the Rom. Rep. and early empire and to father the medieval denier and penny, was soon produced in great volume, at first from the central mint of Rome, later from subsidiary It. mints as well, and finally also from 'travelling' military mints, reflecting the deep economic repercussions of Rome's wars of conquest. In contrast to the multiple coinages of Gk city states, the Rom. Rep. struck a virtually uniform and severely centralised coinage for the Mediterranean area as a whole. Technical control was vested in an ann. board of 3 moneyers, who at first rigidly respected the original 'types,' head of Roma-Bellona, and the Dioscuri (*see illus.*, 3). But by 100 BC moneyers were developing designs which reflected the majesty of Rome by reference to the achievements of its noble families, and from this it was a short step to the personally controlled issues (including gold) of the great war-lords, Sulla, Pompey, and Julius Caesar, the last of whom received the right of portraiture on his coins. Rom. coinage was by now imperial in all but name, and, save for base-metal issues

still permitted to local communities, supplied vast dominions with centrally controlled money.

It became openly imperial with Augustus's foundation of the principate (27 BC), which involved fundamental reform based on gold aureus, silver denarius, brass sesterius and dupondius, and copper as struck at various mints, with Lyons and Rome at first dominant. Henceforth it acquired new importance as a flexible imperial gazette, emphasising the virtues of imperial rule by means of rapidly changing 'types' which almost always included the emperor's portrait and titles with some allusion to his policy or achievement (*see illus.*, 4, Caracalla). Inflation, beginning with Nero, and debasement, increasing after AD 200, led to economic collapse c. AD 258: but Diocletian's economic and monetary reforms (AD 296) paved the way to a coinage temporarily stabilised on gold solidus, silver siliqua, and sundry copper denominations: solidus and siliqua survived the economic chaos of the 5th cent., and became the basis of early medieval currency. Late imperial coinage was struck at a large number of co-ordinated mints, and supplied an area extending from Spain to Asia Minor and from Britain to Egypt: and, though unofficial issues sometimes reflected local shortage or political disturbance, these were not frequent.

The collapse of the W. Empire in AD 476 left to the invading Franks, Goths, Burgundians, etc., the massive tradition of imperial coinage, which they preserved and adapted. Until c. AD 700 the use of gold in W. Europe continued; later gold was mainly replaced by silver, as in the Rhineland, Gaul, and Britain, though it was retained at Byzantium, the cap. of the still flourishing E. Empire and the source of a coinage which, remarkable for its Greco-Rom. idiom and for the beauty of its religious types, continued until it was overwhelmed by Turkish power in the 15th cent., though not before it had decisively affected the medieval coinage of Russia.

In central and W. Europe the virtual disappearance of gold coinage resulted in the medieval system built on the silver denier (*see illus.*, 5, Louis le Débonnaire, emperor of Germany, AD 814-40), normal in England in the form of the penny. Early medieval coins in most countries were struck by a wide variety of mints. Their religious idiom was strong (*see illus.*, 6, Ethelred II of England), though their style was often rough: the inscriptions usually indicated the minting authority, the mint, and not infrequently the moneyer. The Holy Rom. Empire gave universality to the system, which, even when imperial control weakened and the rights of coinage passed to independent authorities (princely, eccles., and civil), remained in general use.

The crusades revived W. knowledge of the Levant and led to a resumption of gold coinage in Europe: to the earlier gold 'bezants' of Byzantium were added the fiorino of Florence (*see illus.*, 8) and the

sequins of Venice, Italy taking a large part in E. contacts. France, Spain, and England (the last with her nobles, ryals, and (see illus., 9) angels) followed suit with gold coinages in the 13th and 14th cents.: this multiplication of values encouraged the introduction of the Fr. gros tournois (see illus., 7, St. Louis, 1226-70), a silver coin much larger than the denier and imitated in England as the groat, worth 4 pennies. The development of central European silver-mines, and the discovery of the rich deposits of the new world, were soon reflected in the profuse issue of the large silver thaler and its derivative family of which the increased size allowed die-engravers scope for the splendid designs of the Renaissance to replace the austere Gothic idiom. The monarch's portrait became in general a standard requirement on the obverses: the reverses were usually given up to increasingly elaborate heraldic or naturalistic designs, often accompanied by religious inscriptions. Technical difficulties in striking such large coins were overcome by the introduction of machinery from 1560 onwards, adopted in England in 1662, after which time a grained ('milled') or raised edge protected coins against the evil of clipping.

Emphasis on gold and silver was modified from the 17th cent. onwards by the general development of low-value copper coins for everyday use, especially in France, Germany, and the Netherlands, an example soon followed in England, at first in the form of municipal or private trade tokens. The pattern of European coinage continued without major change in the 18th and 19th cents., though momentarily interrupted by the Fr. Revolution and by Napoleon's conquests. After 1814 it was radically altered. The rising price of gold made it unsuitable for further use as a coinage metal, and its place was largely taken by bank-notes (q.v.), which had already enjoyed a long hist.; and with the crumbling of monarchies and the rise of dictatorships republican or nationalist types displaced the traditional designs. The Second World War did for silver what the first did for gold, and nickel alloys are now in general use to take its place.

The expansion of the Brit. Empire from the 17th to the 19th cent. saw European coinage grafted on to many overseas possessions. The E. India Co.'s coinage, begun in the 17th cent., was transformed after 1857 into the imperial coinage of India. Amer. issues, first produced for the New England colonists, lapsed after 1773, to be replaced by the earlier U.S. issues from which, in association with the coinage of Canada (from 1820), the great N. Amer. dollar coinage has developed: the S. Amer. coinages derive more directly from the currency traditions of the invading Spaniards. The 19th cent. saw coinage extended to the W. and E. Indies, Africa, Australia, and New Zealand, and to many colonies, such as Hong Kong: even now many of such issues are produced by the Royal Mint (q.v.) in London, which, besides contracting to coin for other govts., has also struck its share of the Maria

Theresa dollars that for 150 years have been a traditional currency in N. Africa and the Middle E.

In contrast to the European coinage family, based on the idiom of state sovereignty displayed with the utmost variety of pictorial type and inscription, the immense Muslim group, extending in its time from Spain to Turkestan, is externally one of the most homogeneous in the world. It began in the 7th cent. AD, as a religious coinage from which representation of the human figure was excluded: its types consisted only of Arabic inscriptions defining ruler, mint, and date and including certain religious formulae. The spread of the Muslim faith introduced minor variations as Arabic coinages absorbed, or were merged in, other systems, sometimes becoming bilingual (as in the Sassanian series), and sometimes even admitting a pictorial type, as in the zodiacal series of Jahangir (or Jehangir) Khan in India (see illus., 11). But in general the original form has been strictly preserved. The gold dinar and the silver dirhem (see illus., 10), widespread in the Middle E. and characteristic of early N. European trade routes, developed a tradition of calligraphic beauty alive in Muslim coins to-day. The coinage of India has been in part Muslim and in part Hindu with Sanskrit inscriptions and pictorial designs.

Of the Far E. family Chinese coinage began in remote antiquity. The first round coins, which give a glimpse of an earlier stage of tool- and cloth-money, were made, by casting (regularly preferred in China to striking), appreciably before the first Lydian or Gk coins; and the Christian era saw a long-estab. series of pierced circular coins of bronze, the standard Chinese coinage metal. For some 19 cents. this continued with little change. The coins bore no pictorial representation of the emperors: their ideographs mentioned only mint and denomination. In the 20th cent. the series has been Europeanised, being based on a struck silver pictorial dollar of 100 cents. The origin of Jap. coinage was later by sev. cents., owing to isolation and a simple agric. economy: even after the first copper was produced in the 7th cent. AD, the majority of coinage from the 9th to the 15th cent. was imported from China. Afterwards a true Jap. series was developed based on the gold oban and koban, and from the late 19th cent. has followed the decimal system, in gold, silver, and copper, with traditional pictorial types but no imperial portraiture.

Notice must be taken, finally, of certain quasi-monetary issues, in addition to tokens and jetons (q.v.), which fall outside the class of true coinage. These are mostly pieces of necessity, such as siege-pieces (e.g. struck by Charles I in England) or camp-money (as produced in the Boer War) or purely temporary money (in the form of leather or porcelain or even of postage stamps) to tide over a period of crisis. In addition many examples survive, side by side

with true coinage, of primitive 'commodity currencies' such as sugar, tobacco, tea, or salt. Medals (q.v.) have never enjoyed the status of pieces of currency.

The chief public coin collections are as follows: in Great Britain, at the Brit. Museum and the univs. of Oxford, Cambridge, and Glasgow; on the continent of Europe, at Paris, Brussels, The Hague, Copenhagen, Stockholm, Oslo, Munich, Vienna, Rome, Milan, etc., and Budapest (the disposition of the great Berlin collection, which is now in Russian hands, is uncertain); and in New York. They are fed, partially, by recurrent finds of coins formerly hoarded for safety. The law of treasure trove varies from country to country: in the U.K. the Crown claims associated objects of gold and silver for their archaeological or historical value, allocating to the Brit. Museum what is there required and paying to the finder the full antiquarian value of any object thus retained. See also MEDALS and TRADESMEN'S TOKENS.

For the earliest coinages see W. Ridgeway, *The Origin of Metallic Currency*, 1892; G. Macdonald, *The Evolution of Coinage*, 1916; A. H. Quiggin, *A Survey of Primitive Money*, 1949; for Gk coins, B. V. Head, *Historia numorum*, 1911, and (ed. G. F. Hill) *The Principal Coins of the Greeks*, 1932; C. T. Selman, *Greek Coins*, 1933, and *Masterpieces of Greek Coinage*, 1949; for Rom. coins, H. Mattingly, *Roman Coins*, 1928, and (with E. A. Sydenham and C. H. V. Sutherland) *The Roman Imperial Coinage*, 1923-; for medieval and modern coins, A. Engel and R. Serrure, *Traité de numismatique du moyen âge*, 1891, and *Traité de numismatique moderne et contemporaine*, 1897; M. Comencini, *Coins of the Modern World*, 1937; Warty Raymond, *Coins of the World* (20th cent.), 1945; for Eng. coins, G. C. Brooke, *English Coins* (reprinted, with supplement), 1949. See also L. A. Mayer, *Bibliography of Moslem Numismatics (India excepted)*, 2nd revised ed., 1954; and for the law on treasure trove see G. F. Hill, *Treasure Trove in Law and Practice*, 1936.

Nummulites, large coin-shaped fossil foraminifera, composed of numerous whorls coiled in a plane spiral, the whorls being divided into chambers by septa. They are common in Tertiary rocks, particularly Eocene limestones in Egypt and elsewhere, and are valuable as index fossils.

Nummulitic Limestone, limestone composed of the large foraminifera known as Nummulites which flourished in early Tertiary times, especially characteristic of the Eocene. The pyramids of Egypt are made of N. L.

Nun (Lat. *nonna*), woman who has consecrated herself to God by vow and who has also bound herself to live in a convent under a certain rule. From the beginning of the Christian Church the existence of women devoted to virginity and religious offices may be recognised, and it is probable that they early joined together in communities. The commonest formula for vows is that binding them

to voluntary poverty, chastity, and obedience, to which is sometimes added a fourth concerning the particular task, e.g. education, to which they dedicate themselves. Convents are either under the authority of the bishop of the diocese in which they are situated, or (in the Rom. Church) are attached for purposes of supervision to the corresponding male branch of the order, and in this case they are termed 'exempt,' i.e. from episcopal control, the ultimate authority for them being the Holy See. N.s are either enclosed, which means that they never leave their cloister, or unenclosed, in which case they go out to perform works of charity in schools, hospitals, etc.; nearly all modern orders are of this latter type. All N.s bound by 'solemn' vows are under the obligation of reciting the divine office in choir; but practically all modern orders have 'simple' vows which do not carry this obligation, largely on account of the calls of the work in which they are engaged. See also CONVENT.

Nun, in Egyptian religion, the primeval watery chaos, on which the world floats as a disk. According to the Heliopolitan theory of creation, the oldest of 8 primordial deities. In the Heliopolitan theology Atum, a form of the sun god Ra, emerged from N., being reborn every morning. In the Memphite theology N. was one of 8 gods of creation contained in Ptah (q.v.).

Nun Moth (*Liparis monacha*), black and white moth known as Black Arches in Britain. It is a great pest in Europe, since its caterpillars destroy tree leaves. Poison dust-spraying from the air has been successfully used.

Nunatak, a mt peak which projects through the surface of an ice sheet.

Nunc Dimittis, or **The Song of Simeon** (Luke i. 29 ff.), canticle which forms part of the Catholic office of compline. It also appears in the Anglican office of Evening Prayer, after the second lesson.

Nuncio, see LEGATE.

Nuncomar, see HASTINGS, WARREN.

Nuncupative Will, verbal will or oral declaration of one's testamentary intentions before witnesses. In general a will, both in Eng. and Scots law, is totally void unless made in writing. Soldiers or sailors over 14 years of age can dispose of their goods and chattels by a N. W., but since the Navy and Marines (Wills) Act, 1865, a N. W. made by a man in his majesty's naval or marine forces will not be effectual so as to dispose of his wage or other money due to him by the Admiralty, though apparently the Admiralty have a discretion to pay the wages to the claimant under an oral will. It is to be noted that the term N. W. is often applied to an informal written will made by a soldier on active service, such wills generally being valid if sufficiently proved. It is doubtful how far the N. W. of a civilian is valid, but in all cases where effect has been given to such a will, it was satisfactorily proved that the testator at the time of making it was *in extremis*. See also DONATIO MORTIS CAUSA. See Jarman, *On Wills*.

Nuneaton, municipal bor. and mkt tn of Warwickshire, England, on the Anker,

8½ m. NE. of Coventry and 97 m. from London. Its chief buildings are the churches of St Nicholas and St Mary the Virgin, the former a handsome church in various styles of architecture and with a square embattled tower and pinnacles. There is a 16th-cent. grammar school; also Arbury Hall, one of the finest examples of Gothic architecture in the co. N. has coal-mines, iron works, and manufs. of woven worsted articles, elastic, ribbon, etc., and of tiles, sanitary pipes, and glazed bricks. Here was *b.* the novelist (George Eliot) (Marian Evans). A nunnery, founded in 1150, gave the tn its name, and on its ruins was built the church of St Mary's (1877). Pop. 55,000.

Nuñez, or Nonius, Fernan (c. 1470-1553), Sp. writer and teacher, *b.* Valladolid. He was a prof. of Gk at Alcalá and Salamanca Univs. He pub. various eds. of the classics and helped to compile the Lat. version of the Septuagint.

Nuñez Cabeza de Vaca, Alvar, see VACA.

Nunn, Sir Percy (1870-1944), Eng. educationist. Educ. at Bristol Univ., he taught in secondary schools from 1891 to 1905. In 1905 he was made vice-president of the London Day Training College, and in 1913 prof. of education in the univ. of London (prof. emeritus, 1937). He succeeded Sir John Adams as principal of the college (1922). In 1932 the college was transferred to the control of London Univ. and became the Institute of Education, N. continuing in office as director until 1936. He was president of the Training College Association in 1915; chairman of the education section of the Brit. Psychological Society, 1919; president of the Mathematical Association, 1923; and visiting prof., Columbia Univ., 1925. He also served as a member of the advisory committee of the Colonial Office on education and as a senator of London Univ. From 1923 to 1924 he was president of the Aristotelian Society, and in 1927 he delivered the ann. philosophical lecture to the Brit. Academy on 'Anthropomorphism and Physics'. His publs. include a report for the Board of Education on *The Training of Teachers in Mathematics*, 1912, *Teaching of Algebra*, 1914, *Education Reform*, 1917, *Education: its Data and First Principles*, 1920, and *Relativity and Gravitation*, 1923, generally regarded as his best work. The central thesis of his work on the data and first principles of education maintains that the primary aim of all educational effort should be to help boys and girls to achieve the highest degree of individual development of which they are capable, while not undervaluing the just claims of public duty and social service. N. gives much attention to the significance and the value of intelligence tests, and explains the ideas underlying the theory of the tests from the psychological standpoint in an analysis of the concepts of *hormé* and *mnémé* (the use of the term *hormé* embracing the concepts of purposive energy as manifested both in conscious and unconscious behaviour; and that of *mnémé* all the varied phenomena referred to by Samuel Butler to memory

conscious or unconscious). On vocational education N. concludes that, if conducted in a liberal spirit, it is permissible but cannot be made universal. On the other hand, 'in its concentration of interest on matters whose social value is evident, in its strong appeal to the practical activities, it contains elements which should, in some form, have a large place in every educational scheme.'

Nuoro: 1. Prov. of Italy, in central Sardinia (q.v.). It has a long coastline on the E., a short coastline on the W., and is generally mountainous, with numerous riv. valleys. Area 2805 sq. m.; pop. 269,000.

2. Tn in Sardinia, cap. of the prov. of N., 78 m. north by E. of Cagliari. It is a modern tn, and a popular holiday resort. Pop. 17,600.

Nupé, dist. of northern Nigeria, W. Africa; area 6400 sq. m., formerly part of the Fulani empire. The inhab. are predominantly Muslim. The emir installed by Brig. Gen. Lugard (afterwards Lord Lugard) in 1901 agreed to recognise Great Britain as protecting power and to put an end to slave raids. The products of N. include cattle, rice, guinea-corn, and shea-butter. See A. Burns, *History of Nigeria*, 1929; S. F. Nadel, *A Black Byzantium. The Kingdom of Nupé in Nigeria*, 1942.

Nuphar, genus of aquatic plants (family Nymphaeaceae), of which 2 are Brit. *N. lutea*, the yellow water-lily or brandy-bottle, is common in lakes and rivs. It bears large, yellow, strongly scented globose flowers and both submerged and floating leaves. *N. pumila*, a much smaller plant, occurs in small lakes in Scotland. *N. advena* is a N. Amer. species for garden streams.

Nuraghe, Nurragghi, Nurags, are the round towers of Sardinia (q.v.), of which there are about 3000, and which are of very great antiquity. These towers, which resemble the brochs (q.v.) of Scotland and tal-yots of Minorea, are built of various stones, such as granite, basalt, and limestone, and consist of 2 or 3 storeys, reached by means of a spiral staircase. Their original purpose is not known, nor is there any existing information as to their builders. See J. Fergusson, *Rude Stone Monuments in all Countries: their Age and Uses*, 1872, and Sir R. Lambert Playfair, *Handbook to the Mediterranean* (3rd ed.), 1890.

Nur ed-Din Mahmud, Malek-al-Ade (1117-74) (surnamed 'El-Shahid' (the martyr) by Mohammedan historians), sultan of Syria, *b.* Damascus. He succeeded his father as Emir of Aleppo in 1145, and tried to expel the Christians from Palestine. The Christian defeat at Edessa led to the second crusade, but by 1151 many Christian strongholds in Palestine were in his hands. In 1169 he overran Egypt, and was created Sultan of Syria and Egypt by the Caliph of Bagdad. He prepared the way for the destruction of the kingdom of Jerusalem by Saladin.

Nuremberg (Ger. Nürnberg), Ger. city in the Land of Bavaria (q.v.), on the Pegnitz, 93 m. north by W. of Munich (q.v.).

The earliest settlement grew up about a royal fortress. It rose rapidly to importance owing to its position at a junction of 2 great trade routes. In 1219 it was declared an imperial city, and it became the finest city in Germany; the Golden Bull (q.v.) ordained that every Ger. emperor should convoke his first diet in N. By the end of the 14th cent. the pop. numbered over 20,000. It was the first of the imperial cities to embrace Protestantism (1525). After the Thirty Years War (q.v.) the prosperity of the city declined. In 1806 it was incorporated into the kingdom of Bavaria. During the Nazi regime (see NATIONAL SOCIALISM) the ann. party rallies took place in the Dutzendteich dist. to the SE. of the city; the stadium here holds 50,000 spectators. The city suffered severe damage from bombing attacks, 1941-5, and from air and land attack in April 1945 during the final battle for its possession. At the end of the war N. was selected as the site for the trial of the Ger. war leaders (see NUREMBERG TRIAL). The riv. divides the city into 2 main dists.: St Sebald, the oldest, on the north, and St Lorenz on the S. On a rock, 200 ft above the level of the riv., stand the rambling buildings of the old fortress (11th-16th cent.), and the massive city walls, with their gates and watchtowers, still exist. The city is famous for its anct. houses and for its wealth of Gothic churches and public buildings; in spite of war damage many of these remain: the 13th-cent. *Sebalduskirche* contains fine statuary and the famous bronze shrine of St Sebald, which is the work of Vischer (q.v.); the 14th-cent. *Marthakirche* was the meeting-place of the Meistersingers (q.v.), made famous by Hans Sachs (q.v.); the 14th-cent. *Frauenkirche* contains work by Adam Kraft, and has, over its W. door, a 16th-cent. clock with moving figures of the 7 Electors paying homage to Charles IV.; and the *Lorenzkirche* (13th-15th cent.) has one of the finest rose-windows in Germany and a remarkable tabernacle of Adam Kraft. Few of Dürer's (q.v.) works are found in his native city, but a Dürer museum exists in a house which is a copy of the one in which the painter lived, 1509-28. In the Germanic National Museum there is a notable collection of Ger. art. The chief industries are the manuf. of machinery, electrical apparatus, motor vehicles, toys (ann. toy fair), paper, glassware, and celluloid. Pop. 411,200.

Nuremberg Decrees, name given to 2 decrees 'unanimously adopted' by the Ger. Reichstag at Nuremberg on 15 Sept. 1935, at the time of the Nazi party rally. Their effect was to exclude Jews from the privileges of citizenship. The *Law Respecting Reich Citizenship* declared (Para. 1, 1): 'One who belongs to the protective union of the German Reich and is therefore under particular obligation to it, is a national.' (Para. 2, 1): 'Only a national of German or kindred blood, who proves by his conduct that he is willing and likely to serve faithfully the German people and Reich, can be a citizen.' The *Law for the Protection of German Blood*

and *German Honour* declared (Para. 1, 1): 'Marriages between Jews and nationals of German or kindred blood are forbidden. Marriages concluded in defiance of this law are void. . . .'

Nuremberg Trial, international trial of major Ger. war criminals following the Second World War, which occupied 9 months between Nov. 1945 and Oct. 1946 and ended in the conviction and sentence of most of the surviving leaders of the Third Reich for their part in preparing and waging aggressive war and for crimes against humanity. Long before the war had ended the Allies gave consideration to the question of the treatment which should be meted out to Hitler and his leading criminal associates, and in the meantime the International War Crimes Commission was set up to examine material bearing upon individual war crimes. Some favoured the shooting of the Nazi leaders out of hand, but the alternative of a public trial before a bench of judges nominated by the chief allied govs. gradually prevailed, though it was only in the last year of the war that negotiations were begun and completed for a 4-power (America, Britain, Russia, and France) pact under which the Nuremberg court would be set up. Hence emerged the charter of the court, a document entirely without precedent, which authorised the tribunal, sitting as a court of criminal jurisdiction, for the trial of those brought before it for breaches of international law and cognate war crimes. The defect in the past in prohibitive provisions of international law had been that there was no court with power to try and to punish the transgressor. It was the creation of the court, not the enunciation of the law, that was the novelty; and few people felt their sense of justice outraged when, on Germany's collapse, the Allies decided to create such a court rather than allow those who were guilty of such outrages against humanity to violate the law with impunity.

The trial was actually opened on 20 Nov. 1945, under the presidency of Lord Justice Lawrence (later Lord Oaksey). The tribunal consisted of 4 members, each with an alternate to act in case of illness or the like, and each contracting country chose its own member and alternate. The accused were Marshal Goering (q.v.); Rudolf Hess (q.v.), the Fuehrer's one-time deputy; Joachim von Ribbentrop (q.v.), Reich foreign minister; Dr Robert Ley, leader of the Ger. labour front; Alfred Rosenberg, gauleiter of Poland; Dr Hans Frank, a former governor-general of Poland; Hans Kaltenbrunner, Heydrich's (q.v.) successor as chief of the Ger. security police; Julius Streicher (q.v.), governor of Franconia; Marshal Kettel, chief of staff and commander of the Wehrmacht; Dr Walter Funk, Reich minister of economics; Dr Hjalmar Schacht, Germany's leading economic and financial expert for many years; Gustav Krupp von Bohlen, head of the Krupp armament works; Adm. Raeder, naval commander-in-chief from 1935 to 1943; Adm. Doenitz (q.v.); Baldur von Schirach, founder of the

Hitler Youth; Fritz Sauckel, responsible for the Reich's total mobilisation and enslaving foreign workers in Ger. factories; Prof. Albert Speer, Reich minister of armaments and war production; Martin Bormann, chief of Hitler's chancellery, and deputy Fuehrer in place of Hess; Franz von Papen, Ger. diplomat; Gen. Alfred Jodl, Hitler's personal military adviser; Baron von Neurath, foreign minister before Ribbentrop became gauleiter of Czechoslovakia; Arthur von

women, and children, and in his final speech at Nuremberg Sir Hartley Shawcross, Brit. attorney-general, demanded the death penalty for all the prisoners, whom he said should be held responsible for the deaths of that number of victims. The tribunal was, further, asked by the prosecution to declare a number of named groups or organisations to be criminal within the charter, so that membership rendered the individual member liable to the death penalty. All the defendants

DEFENDANTS AT THE WAR CRIMES TRIAL AT NUREMBERG, 1946

Left to right, front row: Goering, Hess, Ribbentrop, Keitel, Rosenberg, Frank, Frick, Streicher, Funk, and Schacht.

Left to right, back row: Doenitz, Raeder, von Schirach, Sauckel, Jodl, von Papen, Seiss-Inquart, Speer, von Neurath, and Fritzsche.

Seyss-Inquart, minister of the interior and security in the Austrian Cabinet, and later Nazi commissioner for Holland; Wilhelm Frick; and Hans Fritzsche, deputy propaganda minister and a leading broadcaster, Robert Ley committed suicide in prison (25 Oct. 1945); Krupp von Bohlen's physical and mental condition precluded his trial; Bormann was tried in his absence under the provisions of the charter.

The indictment charged the defendants with crimes against peace by the planning, preparation, initiation, and waging wars of aggression, which were also wars in violation of international treaties and agreements, with war crimes, and with crimes against humanity (*see also* CRIMES, WAR). It charged them with responsibility for the death of 12,000,000 men,

were represented by counsel and also all counsel were chosen by themselves. The case against the defendants was opened (21 Nov.) by the chief Amer. prosecutor, Justice Robert Jackson, who said that the 'trial represented the practical effort of four of the most mighty nations, with the support of fourteen more, to utilise international law to meet the greatest menace of their times—aggressive war. These twenty-two broken men and others created in Germany under the *Fuehrerprinzip* a national socialist despotism equalled only by the dynasties of the ancient East. . . . They led their people on a mad gamble for domination, diverted energies and resources to the creation of what they thought to be an invincible war machine, and they overran their

neighbours, bringing in millions of human beings as slave labourers. At length bestiality and bad faith reached such excess that they aroused the sleeping forces of imperilled civilisation which by its united efforts had ground the German war machine to fragments.' The Brit. prosecutors included, besides the attorney-general, Sir David Maxwell Fyfe (later Lord Kilmuir). Gen. Rudenko was the chief prosecutor for Soviet Russia. Some 403 open sessions of the tribunal were held. Thirty-three witnesses gave evidence orally for the prosecution against the individual defendants, and 61 witnesses, in addition to 19 for the defendants, gave evidence for the defence. A further 143 witnesses gave evidence for the defence by means of written answers to interrogatories. The tribunal appointed commissioners to hear evidence relating to organisations and the tribunal itself heard 22 witnesses for the organisations. Much of the evidence presented to the tribunal on behalf of the prosecution was documentary evidence, captured by the allied armies in Ger. Army H.Q., gov. buildings, and elsewhere. The case, therefore, against the defendants rested in a large measure on documents of their own making, the authenticity of which was not even challenged except in one or two cases. Of the 22 prisoners present at the trial, only 3 were acquitted. These were Schacht, von Papen, and Fritzsche. The tribunal sentenced 12 of the accused to death, 3 to imprisonment for life, and 4 to lesser terms. The Soviet judge dissented from the acquittals. The Allied Control Council rejected all appeals for clemency by the prisoners and also rejected the plea by Goering, Jodl, and Keitel to be shot instead of hanged. Shortly before he was to have been hanged, Goering committed suicide. The remaining Nazis sentenced to death were hanged at Nuremberg on 16 Oct.

The court refrained from declaring 3 of the groups named in the indictment to be guilty. Those were the Reich Cabinet, the S.A. (mass militia of the Nazi party), and the high command. It was evidently reasonable to refrain from declaring the Reich Cabinet and the general staff criminal groups. These were bodies whose essential functions were *prima facie* legitimate. The number of persons involved, moreover, in the general staff and high command was small enough for the individual trial of implicated officers to serve the purpose more effectively than a declaration of criminality. The formations declared criminal were, firstly, the Leadership Corps of the National Socialist party; secondly, the *Schutzstaffel* and its offshoot the *Sicherheitsdienst*, better known under the initials S.S. and S.D., and, thirdly, the *Geheime Staatspolizei* or Gestapo. The first was the motive force of the whole ruthless policy of aggression, and therefore of all the crimes that followed upon that policy; the second were the assassins who served the brutal will of the tyrants; the third were the spies and torturers. Most of the 22 prin. defendants were found guilty, in

general terms, as members of the Leadership Corps, but each of them had many and grave particular charges to answer. In legal language, the court held that a criminal organisation was analogous to a criminal conspiracy in that the essence of both was co-operation for criminal purposes. The tribunal rejected the excuse of the Nazi leaders that Hitler was responsible for everything and it rejected the idea that a common plan would not exist because Hitler was the dictator. For 'Hitler could not make aggressive war by himself; he had to have the co-operation of statesmen, military leaders, diplomats, and business men.' The tribunal in the course of its judgment came to the following important decisions (*inter alia*): continued planning with aggressive war as the objective was estab. beyond all doubt; certain of the defendants planned and waged aggressive war against 12 nations; war crimes were committed on a vast scale never before seen in the hist. of war.

In declaring that aggressive war was the 'supreme international crime' for which individual heads of state could not escape punishment by seeking refuge in their sovereign rights the Nuremberg Military Tribunal in effect pronounced the judgment of the world's conscience upon an indictment without parallel in recorded hist. The proposition that 'the principle of international law, which under certain circumstances protects the representatives of a state, cannot be applied to acts which are condemned as criminal by international law,' is perhaps the most far-reaching laid down in the Nuremberg judgment; for it means that henceforth the law recognises no wholly irresponsible rule in the world; and absolute rulers whose acts cannot be challenged in their own countries may yet, in certain circumstances, be arraigned before a court of higher jurisdiction. As to the evidence, it may be said that never previously in hist. has a disintegrating major power, in surrendering, yielded practically all its state secrets, military, political, and economic from confidential speeches of its leaders down to their secret diaries and private correspondence. But manifestly time will be required to prepare a full official pub., with expert commentaries, on so great a mass of material, and the great lesson in contemporary hist., which the full range of these documents contain, could not be learned at the N. T.; for it was not the task of the tribunal to present to the world an authentic, fully documented account of those 12 years. Its task was to judge and to sentence 22 war criminals and pronounce on a number of groups or formations, and the prosecution made use of these documents which happened to be in allied hands only where and when they helped to substantiate particular points in the charges.

In addition, a number of German commanders were tried in 1948 by a U.S. military tribunal (not at Nuremberg) which gave judgment (27 Oct.) in the case of 3 field marshals, 9 generals, and an admiral for alleged war crimes. The

judgment, delivered by Judge Young (president) and Judge Harding, quoted at length from the findings of the international tribunal which sentenced Goering and his associates and said that the American tribunal would not fix a general rule, but only determine the individual guilt or innocence of the defendants. Staff officers (continued the judgment) had played an indispensable part in spreading the evil which originated with Hitler and the Nazi leaders, but to find an individual criminally guilty he must have passed the order (the indictments charged the prisoners with carrying out such orders as to execute commissars or the compulsory recruitment of Fr. labour, etc. etc.) to the chain of command, and the order must be on the face of it criminal. Among those tried were F.-M. Wilhelm von Leeb, who was commander-in-chief of Army Group N. against Russia until Jan. 1942, when he resigned. He was found guilty of war crimes against civilians and was sentenced to 3 years' imprisonment, but released immediately. F.-M. von Keuchler was declared guilty of crimes against belligerents and civilians and was sentenced to 20 years; Lt.-Gen. Hermann Reinecke, a member of the Nazi party, convicted of criminal segregation of prisoners of war for 'liquidation' or turning them over to the Gestapo, and Lt.-Gen. Walter Warlimont, who had a big part in bringing out and enforcing the order to execute captured prisoners of war and in plans of incitement to lynch captured airmen, were sentenced to imprisonment for life. Sev. other generals were sentenced to terms of imprisonment.

At the end of Aug. 1948 the Brit. War Office announced that the gov. had decided to bring F.-M. von Brauchitsch, F.-M. von Rundstedt, F.-M. von Manstein, and Col.-Gen. Adolf Strauss to trial as war criminals by a military court in the Brit. zone of Germany. F.-M. von Manstein was then 61; his trial took place at Hamburg (Oct.-Dec. 1949) and he was sentenced to 18 years' imprisonment (see R. T. Paget, *Manstein: His Campaigns and His Trial*, 1951). F.-M. von Brauchitsch (aged 67) d. in a Brit. military hospital at Hamburg on 18 Oct. 1948.

Following the first great trial, 12 separate cases were heard by U.S. military courts. The final case was that in which 21 Ger. diplomats, civil servants, industrialists, economists, and others, judged by a U.S. military tribunal at Nuremberg, were sentenced to varying terms of imprisonment on 15 April 1949. The accused were charged under Control Council Law (No. 10) enacted by the Allied Control Council on 20 Dec. 1945, and Article II, section 2, declared that any person who was principal or accessory was guilty of a crime outlawed by the law. The fact that a person acted under orders did not free him of responsibility for a crime, though it might be considered in mitigation. It was apparent that the success of the Nazi programmes depended largely on the men holding positions of authority in the various gov. depts. The tribunal concurred in, and applied the

principles laid down by the International Military Tribunal (see above in the judgment in the leading trial). See P. de Mendelssohn, *The Nuremberg Documents: Some Aspects of German War Policy, 1939-1946*, 1946; Sir I. Maxwell Fyfe (ed.), *War Crimes Trials*, 1948; Lord Russell of Liverpool, *The Scourge of the Swastika*, 1954.

Nursery Rhymes, jingling rhymes invented for the amusement of children, or in some cases survivals of ancient folklore, invocations or incantations preserved from remote antiquity. Many of them are without doubt survivals from O.E. May Day celebrations, ring-songs, and dances which were once practised by grown-up people. The jingling metre and doggerel rhymes, in which the sense is often sacrificed to the attempted rhyme, have been handed down orally from one generation of children to another. The verses generally consist of a rhyming couplet or a quatrain in which the second and fourth lines rhyme, and there is frequently a refrain accompanying the quaint old airs which have been handed down as their setting. The nursery rhyme proper, embodying a tale set forth simply, and marked by either wit or pathos, is almost peculiar to the Eng. tongue; the equivalents in the Lat. or Teutonic tongues are more ornate and fantastical. The 'counting-out' rhymes, in which one word is dropped for each player and the one on whom the last word falls drops out from the ring, form a most interesting branch of folklore, and are undoubtedly of great antiquity. See R. Chambers, *Popular Rhymes of Scotland*, 1826; J. B. Ker, *An Essay on the Archaeology of Popular English Phrases and Nursery Rhymes* (new ed.), 1837; J. O. Halliwell-Phillips, *Nursery Rhymes of England*, 1842, and *Popular Rhymes and Nursery Tales*, 1849; E. Rolland, *Rimes et jeux de l'enfance*, 1883; W. W. Newell, *Games and Songs of American Children*, 1884; Louey Chisholm, *Collection of Nursery Rhymes*, 1911; E. Rhys and A. Daglish, *The Land of Nursery Rhyme*, 1932; L. Derwent, *Nursery Rhyme Anthology*, 1938; Iona and Peter Opie, *Oxford Dictionary of Nursery Rhymes*, 1951.

Nursery School. The N. S. in Britain is intended to provide for the healthy physical and mental development of children between 2 and 5 years of age. Its purpose is twofold: nurture and education. Welfare centres are concerned with the health of the infant up to the age of 2. The school doctor examines the 5-year-old when he enters the primary school, but until the advent of the N. S. there was no proper provision in Britain for the 2,000,000 children between the ages of 2 and 5. In 1918 the minister of education, H. A. L. Fisher, attempted to bridge this gap. Realising the serious degree of physical defect apparent in children on their admission to school, he warmly advocated the estab. of N. S.s in all areas. During the year ending Mar. 1919, 13 N. S.s were

recognised by the then Board of Education. These consisted mainly of voluntary pioneer schools which had been estab. before the passing of the Act. Then came the national call for economy. The N. S.s in existence were regarded as costly institutions, and the estab. of further schools was not recommended by the board. Margaret McMillan (q.v.), the pioneer of this movement, had long foreseen that the cost of the small school was likely to prove a stumbling-block. She had always advocated the large open-air school, but the authorities had declined to follow her lead, because they feared the spread of infection if large numbers of the 'unprotected' little ones were gathered together, and they considered that ideal home conditions could more readily be realised in the small school. By her experiment at Deptford Margaret McMillan proved conclusively that a large N. S. of 260 children could be maintained at the low ann. cost of less than £12 per child, and that with open-air conditions there is no undue risk of infection. In Dec. 1929 a circular was sent out from the minister of health and the president of the Board of Education concerning the welfare of the pre-school child. The essentials for healthy development at this age were summed up as follows: open-air conditions, sun and light, exercise and play, rest, food, and cleanliness. The local authorities were encouraged to establish and support open-air N. S.s where these needs could be met. During the years before 1939 a number of N. S.s were opened up and down the country and some colleges began to offer training for girls who wished to specialise in N. S. work. With the advent of the war, when fathers were called up and mothers urged into industry, the need for N. S.s became more urgent. Many war-time nurseries were opened jointly by the Ministries of Education and Health. These entered chiefly for the child of the working mother. Infant schools opened nursery classes for children from 3 to 5 years and with evacuation a large number of residential nurseries appeared. In 1944 the passing of the Butler Education Act made it necessary for local authorities to set up N. S.s where there was the demand, but in 1947 the building of new N. S.s was banned by the Ministry of Education. In 1945 the minister of education took over 315 of the war-time nurseries and organised them into N. S.s, but apart from these there have been few N. S.s, although day nurseries have once more been opened by the Ministry of Health for children whose mothers are working. In 1949 plans for 21 new N. S.s were passed for building, practically all in industrial areas. The high cost of building a N. S. has been considerably lessened by the realisation that N. S.s of the shelter type which were advocated by Margaret McMillan are a suitable form of accommodation for young children. To this end the N. S. Association has designed a new building, similar to those first erected in Deptford. A prototype of this design has been built at Cookham and has been taken over by the

Berks education authority. In view of the greatly reduced cost of building the prototype, other authorities are now planning N. S.s on similar lines and it is expected that many more will be built in different parts of the country, so helping to improve the present lamentable position, when only 1.10 per cent of Brit. children between 2 and 5 years can find a place in a N. S.

The N. S. movement in America dates from the 1920's when Child Development Institutes came into being, and there has since been a rapid spread of N. S.s. The early N. S.s were supported by private funds, and laid most stress on physical health and habit training; but the modern approach is broader, based on psychological principles, and considers also the mental and emotional aspects of children's health. Although some N. S.s provide for children from the ages of 2 to 5, the 3 to 4 range is most common. There is usually 1 adult in charge of every 8 or 10 children. Greater emphasis is being laid on the relation between school and home, and between learning and play, and these trends are influencing education as a whole.

Bulint, *A Nursery School Group*, 1952; M. Rudolph, *Living and Learning in Nursery School*, 1954; Nursery School Association, *Nursery Schools To-day*, 1954; *The Educational Value of the Nursery School*, 1954; Dorothy May, *Nursery School Education*, 1957. *See also* KINDERGARTEN.

Nursing. Sick N. has evolved into a highly skilled profession since the Crimean War. In ancient times there were in existence hospitals, or at least some kind of dispensary system, for the sick poor in Egypt, India, Greece, and Rome. Essentially, however, organised N. as a branch of medical treatment may be said to have taken its rise amongst the deacons of the early Christian Church. From the 4th cent. on the development of N. was rapid, and the institutions were managed by the clergy, and the nurses recruited from the male and female monastic orders. The oldest institutions in England are St Thomas's and St Bartholomew's Hospitals, and their names indicate their religious connection. The Reformation caused a secular system to be introduced. Any measure of systematic N. was not attempted until the middle of the 19th cent. and until then all the skill that nurses possessed was acquired in the course of their work in the wards. Germany saw the birth of the new system at the foundation of the Institute of Pastor Fliedner in 1836 at Kaiserswerth; and it was at this place that Florence Nightingale (q.v.) was trained. Pastor Fliedner's institute was soon followed by the formation of societies in Philadelphia (1838) and in London (1840). The latter was founded by Mrs Fry, and the nurses were trained at Guy's and St Thomas's Hospitals.

Between 1842 and 1851 sev. schools were formed on the Continent.

The pub. of the horrors of the Crimean War gave a new impetus to the profession, and raised it considerably in the public esteem. Florence Nightingale with a band of trained nurses undertook the administration of the hospitals, and reformed them, besides nursing the sick. As a result, too, in 1860 the Nightingale Fund Training School for Nurses was founded at St Thomas's Hospital, with public subscriptions given in recognition of her great work; and all over the Continent similar schools were soon estab. The practice of preventive medicine and the advance of medical science generally have made it essential that nurses should be highly skilled and trained.

Nursing as a profession. N. ranks high as a profession for women, since it has an essentially feminine appeal. It gives opportunity for service, combined with the prospect of professional standing and an assured future with adequate salary and pension rights. The profession is also open to men. The number of male nurses has increased very considerably of recent years. Training is available to men in a number of general hospitals and mental hospitals, lists being obtainable from the Ministry of Health and the General N. Council for England and Wales.

To train as a nurse it is necessary to possess good health, an even temperament, and a spirit of service. The usual age of entry is between the ages of 18 and 30 years. Entry to hospital is by way of a preliminary training school attached to the hospital, or in the case of the smaller hospitals through a central preliminary training school. This period varies from 8 to 12 weeks, and at its completion the student enters the hospital and continues training in the wards and depts. The length of training varies; in some hospitals it is 3 and others 4 years. Three years is the period required by the General N. Council for England and Wales, the statutory body responsible for the training and professional education of the student nurse. This body regulates and sets the preliminary state examination which can be taken in 2 parts. Part I (theoretical) may be taken on completion of a pre-nursing course, arranged by many schools, and is taken at the completion of general education and prior to entering the preliminary training school, or at the completion of 6 months' training in the hospital. Part II (practical) is taken after 12 months' training. The final state examination is taken at the completion of 3 years' training. The successful candidate then becomes a state-registered nurse and her name is entered on the register kept by the General N. Council. Many hospitals now give training under a system known as the 'block system of training,' which means that the student takes the theoretical part of training away from the wards; during the time in this school of N. she works entirely as a student, returning to the wards again after a period of about 6 weeks. Other hospitals have a modification of this sys-

tem and others have a study-day a week. Many hospitals have adopted a straight span of duty, the 24 hours being split into 3 spans of 8 hrs each. The General N. Council frequently approves schemes of associated training between a general hospital and some special hospitals, e.g. children's, mental, T.B., etc. Other schemes cater for reduced periods of training by reason of previous specialised training. Reciprocity of training exists with many countries overseas, particularly Canada, the U.S.A., and S. Africa.

The young nurse in training at the present day has a much more free life than her sister of 20 years ago. She has student status, her practical work and her study are better balanced, and she has plenty of time off for relaxation. Nevertheless under the Brit. system, in contradistinction to the continental and Amer. method, the young nurse is not wholly a student. She is made to feel herself a part of the hospital staff and to take a gradually increasing share of responsibility for her patients' well-being.

At the completion of training many opportunities present themselves to the state-registered nurse. The post of staff nurse in hospital prepares for greater responsibility and higher posts such as that of ward sister, assistant matron, sister-tutor, and matron. There is the Queen's Institute of Dist. Nurses, for those who like to nurse the sick in their own homes and who like to work from their own home. Private N. appeals to many. At the present time great emphasis is laid on the preventive side of medicine, and there is a wide field for work as health visitors, school nurses, and industrial nurses. Interesting work is available with any of the services attached to her majesty's forces (see MILITARY NURSING SERVICE), and in the field of medical missions. Many post-graduate courses are arranged. A diploma of N. can be taken at the univs. of London and Leeds. The sister-tutor's diploma is awarded by the univ. of London. Courses are also arranged for hospital administration, the qualification of health visitors, etc. Training for qualification of midwives is controlled by the Central Midwives' Board. Part I training qualifies a nurse to act as a maternity nurse, working with a doctor, and Part II gives the qualification as a state-certified midwife.

Salaries and emoluments are controlled by a Whitley Council and an overall salary is paid, the nurse repaying the hospital for board and residence. The nurse pays a share of the superannuation contribution.

Certain hospitals have training schools (q.v.) for assistant nurses, those who qualify becoming state-enrolled assistant nurses. The nurse's name is then entered on the roll kept by the General N. Council. This training covers a period of 2 years and is designed for those who cannot take the full training for state registration.

Salaries alter from time to time, but the following table gives the 1956 figures:

<i>Gross Salary</i>	<i>Repayment to Hospital</i>
Student Nurses:	
1st year, £260	£119
2nd year, £270	£119
3rd year, £285	£119
Pupil Assistant Nurses:	
1st year, £260	£119
2nd year, £270	£119
Enrolled Assistant Nurses:	
£374 × £15-£479	£146
Staff Nurses:	
£417 × £15-£462; further increments of £20-£522	£153
Ward Sisters:	
£487 × £20-£607 by final increment to £615	£164
Sister Tutors:	
£630 × £20-£730	£193
Principal Tutors:	
£710 × £20-£810, and further increment of £25-£835	£193
Matrons vary considerably according to the size of hospitals.	
Minimum, £710-£845	£219
Maximum, £1095-£1290	£279

Salaries for sister-tutor, assistant matron, and matron are reviewed from time to time. Salaries for male nurses are approximately £10 per annum higher than above.

The status of the nurse is protected by the Nurses' Bill of 1943, by which Act it is an offence for any person to call herself/himself nurse who is not a state-registered or state-enrolled assistant nurse. The Nurses' Bill, which was before Parliament in 1949, is an Act to reconstitute the General N. Council for England and Wales and otherwise to amend the Nurses' Acts, 1919-45, to establish standing nurse training committees, registration of nurses trained abroad, etc. The professional negotiating organisation for nurses is the Royal College of Nursing. The National Council of Nurses of Great Britain and N. Ireland is an association of affiliated organisations through which the member bodies are affiliated to the International Council of Nurses. The Brit. Red Cross Society and the St John Ambulance Brigade arrange for lectures in home nursing and first aid. Members of the detachments are taught practical first aid and N. procedures. These societies have given very valuable help in augmenting hospital staffs most particularly during the two world wars.

Home nursing. Treatment of illness or injury in the home is usually by the non-professional, though also by the dist. nurse. Some knowledge of home N. is indispensable in every household, and is particularly necessary in homes where there are young children. Although some knowledge of medicine and hygiene is required, the essential qualifications for home N. are common sense, sympathy, and resourcefulness. The same qualities of obedience and loyalty which are demanded of the hospital nurse are demanded of the home nurse. If she is

sensible and capable she can do much to further the work of the doctor by carrying out his orders exactly and efficiently. Her actions can make or mar his prescribed treatment. For details of training in home N. see manuals of the Brit. Red Cross and St John Ambulance Societies.

The home nurse is usually dealing with patients who are not so ill as those under the treatment of the hospital nurse, and much of her work is connected with restoring her patient's confidence and interest in life, as well as health. She avoids fussiness and is always tactful and optimistic. She coaxes her patient to health, taking care not to give the appearance of bullying or forcing. Her task is complicated by the fact that her patients are usually members of her own family; she has no need, like the hospital nurse, to treat them consciously as individuals. Her effort has rather to be directed in the opposite direction, in the curbing of over-emotionalism, even though her firmness concerns those to whom she is related. See Lois Oakes and T. Davie, *A New Dictionary for Nurses*, 1943; Gladys Danby, *Elementary First Aid for the Housewife*, 1947; Mary Hutton, *Teach Yourself Home Nursing*, 1950; C. Woodham-Smith, *Florence Nightingale*, 1820-1910; Bettina A. Bennett, *A Guide to Professional Nursing*, 1951; Evelyn C. Pearce, *General Textbook of Nursing*, 1953; Hilda M. Graton, *The Practice of Nursing*, 1954; W. G. Sears, *Medicine for Nurses*, 1954; Lucy R. Soymer, *General History of Nursing*, 1954; D. F. E. Nash, *The Principles and Practice of Surgical Nursing*, 1955; J. Moroney, *Surgery for Nurses*, 1956; Brit. Red Cross Society, manuals of *First Aid and Home Nursing*.

Nursing in London. Central Council for District. The C. C. for D. N. in L. was formed in 1914 with the object of promoting the adequacy and efficiency of dist. nursing generally and throughout the administrative co. of London. In its constitution standing orders provide for appointment by 50 organisations (associations employing nurses and other bodies directly or indirectly concerned with the dist. nursing service) of 116 members, and for a president, 2 vice-presidents, a chairman, and a vice-chairman, who are *ex officio* members of committees. These orders also provide for administration through an executive and a finance committee, appointed annually by the council in full session, each committee electing its own chairman.

The National Health Services Act of 1946 empowered Local Health Authorities to provide a dist. nursing service by directly appointed nurses or by employing the existing organisations. The latter course was chosen for the co. of London and by a special arrangement, not adopted elsewhere in the country, 25 associations, each administered by a local committee with a long tradition of careful efficiency, supplement generous official grants by an agreed proportion of voluntary income. By this means they preserve a large measure of freedom and reasonable economy in management. The

C. C. for D. N. in L. has always had close touch with official bodies, maintaining its present independent and voluntary status, and was asked to organise the dist. nursing service for the co. of London when the Act came into force in 1948. Thus the link between the voluntary and official interests remained unbroken and the C. C. for D. N. in L. continues the work of co-ordination for which it was formed. One of the earliest concerns of the C. C. for D. N. in L. was the delimitation of associations' boundaries and the production of a *Directory and Streets List* indicating the association serving each street in the co. and the bor. to which the street belongs. This directory, revised and reprinted many times, is of great assistance to social workers in London.

Nut, Egyptian goddess, personification of the sky; according to Heliopolitan theology daughter of Shu, the air, and sister-wife of Geb, the earth; the universe was thus often represented as Shu holding N. above him, while Geb lies at his feet. Confused with Hat-hor (q.v.), an earlier sky-goddess, N. was sometimes represented as a heavenly cow. One idea was that the sun as a child (or a calf) entered N.'s mouth to be born from her lap each morning. When coffins were made to resemble the universe, N. was represented on the inside of the lid, with the stars, one of which the deceased was thought to become.

Nut, indehiscent fruit, containing one seed only in a hard pericarp. Most N.s are rich in oils and starches, and their value as food has received much attention in recent years. Many nutritious articles of diet, including butter substitutes, are prepared from them. The most important are the coco-nut, brazil, walnut, chestnut, hazel, cashew, and pea-nut (qq.v.). See also GROUNDNUT. See F. N. Howe, *Nuts: their Production and Everyday Uses*, 1948.

Nut-galls, see GALL-WASPS.

Nutation. It has been shown under precession (q.v.) that this is caused by the gravitational attraction of the sun and moon—the latter especially—on the equatorial bulge of the earth. The motion of the equinoxes would be uniform if the orbit of the moon coincided with the plane of the ecliptic and if the moon moved in a circular orbit round the earth and the earth also moved in a circular orbit round the sun. But as none of these occurs the gravitational attraction of the sun and moon on the earth's equatorial bulge varies, and in consequence the poles of the equator do not describe an exact circle round the poles of the ecliptic. Each pole travels along a wavy path as shown in the diagram where *AB* represents a small portion of the circle which a *mean pole* describes around the pole of the ecliptic. If any point *p* on the mean curve be taken as a centre and an ellipse be constructed with a major axis $18^{\circ}.5$ directed towards the pole of the ecliptic, and a minor axis $13^{\circ}.7$ coinciding at the instant with the tangent to the circle at *p*, the true pole *P* moves along the ellipse, completing its course in 18 years 220 days.

The true first point of Aries will differ from its mean position except when the point *P* representing the true pole is at either end of the major axis of the moving ellipse. A very good illustration of N. is found in the case of a spinning top; as its speed of spin slows down its head can be observed to 'nod' (hence the word N. from the Lat. *nutare*, to nod) while the centre of its head can be regarded as describing a *mean circle*. N. was discovered by Bradley (q.v.) soon after he had discovered

aberration (q.v.). Certain corrections must be made for the positions of the stars, taking precession, N., and other effects into consideration. The variations in the declinations of the sun and moon give rise to the *Solar Nutation* with a period of half a tropical year, and a *Fortnightly Nutation* with a period of half a month, respectively, each of these contributing a term to the formula for the computation of the N. at any time. *The Nautical Almanac*, *The American Ephemeris and Nautical Almanac*, and similar pubs. in other countries, supply tables for these corrections which are facilitated by the use of the *Besselian Day Numbers* and also by the *Independent Day Numbers*.

Nutracker, or *Nucifraga*, genus of birds of the crow family, *N. caryocatactes*, occasionally visits Britain. It is about the size of a jackdaw, having a brown back, with a long white spot on each feather, dark brown head, white tipped outer tail-feathers, black feet, and a black bill. In flight and habits it resembles the jay. It feeds on fruit, a variety of insects, and also the eggs and young of small birds. The nest is a big, clumsy structure, and in it about 3 eggs are laid, which are very light green, spotted with pale brown.

Nuthatch, or *Sitta europaea*, passerine bird fairly common in the S. half of England and in Europe. Its plumage is bluish-grey above, and the under surface is light reddish-brown or buff; the throat is white, and the tail-feathers have white tips. The bill is powerful and wedge-shaped, and is used to force away the bark in the search for insects, as well as to break nuts. It is a skilful climber, able to descend a tree head downwards. As in other tree-climbing birds, its first toe is much developed. The nest is made commonly in a hole in a tree, and the mouth of it is plastered up with mud, except for a hole just big enough to give the bird admittance. In it are laid about 7 white eggs, spotted with reddish-brown.

Nutley, n. of Essex co., New Jersey, U.S.A. Plush, paper, metal products, cutlery, pharmaceutical preparations, beverages, and textiles are manuf., and it

has poultry, truck, and dairy products. Pop. 27,000.

Nutmeg, kernel of the fruit of sev. species of *Myristica*, of the family Myristicaceae, tropical trees or shrubs, natives of Asia, Madagascar, and America. The fleshy part of the fruit is rather hard, and is often eaten as a sweetmeat, resembling candied fruit; the nut is enveloped in a curious yellowish-red aril, the mace. N.s. yield a peculiar yellow fat, called oil of mace, and by distillation an almost colourless essential oil. See also MACE OF THE NUTMEG.

Nutria, see COYPU.

Nutrition, the science which studies the requirements of the body and the nutritive value of foods. See also BLOOD; CALORIE; CIRCULATION; DIGESTION; FOOD AND DIET.

Nuts, see SCREWS, BOLTS, AND NUTS.

Nux Vomica, seeds of a small evergreen tree, *Strychnos Nux-vomica* (family Loganiaceae). The seeds are circular and disk-like, about the size of a halfpenny, and covered with soft fawn hairs. The tincture of the Brit. Pharmacopoeia is made by treating with rectified spirit the seeds when finely powdered. The tree occurs in Indian forests as well as in the N. parts of Australia. The rind of the fruit is brittle, and the pulp white and gelatinous, and a number of seeds are produced in each fruit. They have been used to produce a brown dye. The

existence in them of strychnine and brucine was not discovered until the early part of the 19th cent.; their presence accounts for the value of N. V. as a tonic.

Nyakyusa, Bantu people of S. Tanganyika, living in Tukuyu dist., and numbering some 230,000. They are cultivators, the staple crop being plantains. They have a peculiar vil. organisation, the men of each vil. being men of the same age who have been brought up together in one neighbourhood. Young men of the same age found new vils. and then marry at more or less the same time. They have been well described by M. Wilson, in *Good Company*, 1951, and *Rituals of Kinship among the Nyakyusa*, 1957.

Nyamwezi, one of the largest Bantu peoples of Tanganyika, living on the plains surrounding the tn of Tabora. They suffered greatly from Arab slavers, but to-day are peaceful and prosperous.

Nyanja Dialects, see NEGRO-AFRICAN LANGUAGES, Bantu.

Nyanza: 1. See ALBERT, LAKE; EDWARD, LAKE; VICTORIA, LAKE. The lake formerly known as Albert Edward N. is now known as Lake Edward.

2. Prov. of Kenya, cap. Kisumu.

Nyasa, or **Nyanja**, large lake in Nyasaland, central Africa, discovered by Livingstone in 1859. Its greatest length is 350 m., and its breadth from 15 to 45 m., with a total area of 14,000 sq. m. It lies 1650 ft. above sea level. The lake has abundance of fish, and is drained by the Shire into the Zambesi. Transport on the lake is by native craft and also by modern steamship.

Nyasaland Protectorate, strip of ter. about 320 m. in length and varying from 50 to 100 m. in width, lying approximately between lat. 9° 45' and 17° 16' S., and long. 33° and 36° E. A recent survey puts the area at 47,949 sq. m. (land area 37,374 sq. m.). Pop.: Europeans, 2500; Asiatics, 3350; natives, 2,300,000. N. is an integral part of the Federation of Rhodesia and Nyasaland (q.v.), and is represented in the Federal Parliament by 4 Africans and 2 Europeans. N. P. comprises the W. shore of Lake Nyasa, with the tablelands separating it from the basin of the Loangwa R., and the region lying between the watershed of the Zambesi and Shire R.s on the W., and the lakes Chiuta and Chilwa and the Ruw R. (an affluent of the Shire) on the E., including the mt. systems of the Shire highlands and Manje. N. P. is bounded on the N. by Tanganyika Ter., on the S. and E. by Portuguese E. Africa, and on the W. by N. Rhodesia. Since the Federation came into being in Sept. 1953, certain matters, including defence, immigration, transport and communications, external affairs, currency, health, and customs and excise, are dealt with by the Federal Gov. Other matters such as African education and emigration remain the responsibility of the protectorate gov., which is composed of the governor assisted by an executive council composed of 4 official and 2 unofficial members. The laws of the protectorate are made by the governor

with the advice and consent of the legislative council, consisting of the governor as president, 10 official members, 3 of whom are *ex officio*, and 12 elected unofficial members (6 African and 6 non-African). The chief towns are Blantyre, Zomba (the seat of gov.), and Limbe (q.v.). There was some opposition by sections of the local inhab. to joining the Federation and some of the dissidents (1956) profess to fear that federation is not in the interest of Nyasaland. It is submitted that capital investment now

prevalent in N. P. and there are 12 clinics administered by missions and assisted by gov. grants. Medical services are well organised, with a large African staff and a number of Asiatic surgeons. There are 2 European hospitals, 15 native hospitals, and 100 rural dispensaries.

There is as yet no mineral development in N. P. as there is in Kenya or Tanganyika, though there are unexploited bauxite deposits on the Mlanje plateau. Labour in E. Africa is attracted to mining in S. Africa and N. Rhodesia, the result being that the proportion of natives seeking work in other parts of the continent has created a problem of grave concern to the gov., leading, as it does, to a reduced taxable capacity and to detribalisation. Tobacco is the crop most favoured by Europeans. It was first planted in 1889 and exported in 1893, 24·2 million lb. being exported in 1954. Tea is cultivated and varies from 6500 to 7500 tons annually. Cotton crops vary widely but reached 21·6 million lb. in 1953. Tung oil production is increasing; in 1954 18,000 ac. were planted and in that year yielded 900 tons valued at £106,000. N. P. is comparatively well wooded, the forests occupying 11·8 per cent of its area. The area of the forest reserves is about 2600 sq. m. and covers the chief catchment areas and watersheds. There are a number of African foresters and forest guards, and forestry is for the most part administered by the native courts.

Communications. The port of entry to N. P. is Beira in Portuguese E. Africa, which is also the most convenient port of entry for Rhodesia. There is a 3-ft 6-in.-gauge railway system extending from Beira (Portuguese E. Africa) to Chipoka on Lake Nyasa (496 m.), crossing the Zambesi R. at Sena (199 m.) by the Lower Zambesi bridge and passing through Murraca, Port Herald, and Blantyre (353 m.). Main roads and 'carrier' roads are open all through the protectorate, the total mileage being 3400. N. P. is connected by telegraph overland with the Cape via Salisbury. Central African Airways operate frequent services to connect up with international routes and all local central African services.

Education. The course for native authorities at the Jeanes School at Zomba represents a modern attempt to deal with the problem of training chiefs in their new duties. The attendance at European schools in N. P. has, however, diminished rapidly since 1935, when S. Rhodesia abolished all tuition fees and extended this privilege to children from N. P. In 1947 there were over 4000 native schools, and 2 secondary schools for Africans.

History. Livingstone, at the head of a gov. expedition, reached the S. shore of Lake Nyasa in 1859, and this visit resulted in the founding of various missionary societies. The activities of these bodies were followed in 1883 by the formation of the African Lakes Corporation, and 2 years later the first Brit. consul was sent out. Opposition by the new settlers to the slave trade carried on by Arab coastmen and natives settled at the N. end of

E.N.1.

NYASALAND: A MOTOR ROAD SKIRTING
THE BASE OF MLANJE PEAK

attracted to Nyasaland spells an increase in the European pop. and therefore alienation of land from Africans. There is an intensified search for minerals in operation, and it is maintained that without minerals the protectorate cannot be self-supporting.

Climate and products. The climate of N. P. in its essential features is similar to that of the rest of SE. Africa within the tropics. The monsoon commences to blow strongly in Sept., and the first rains may be expected any time after mid Oct. From their commencement to the end of Dec. it is usual to experience violent thunderstorms and heavy precipitation in a few hours, followed by an interval of intense heat. Malaria is prevalent, especially after the rains, in many parts of the country, and occasionally is contracted in unexpected places, even in the highlands. Leprosy is

Lake Nyasa resulted in a conflict with the Chief Mlosi and the Yao chiefs. In 1889 the Brit. S. Africa Co. applied for a charter to trade in the country, and in the same year a large expedition was sent out under Maj. A. de Serpa Pinto to explore the Upper Zambesi and Lower Loangwe, and Sir H. H. Johnston arrived at Mozambique as consul with the special duty of composing differences with the Arabs of the interior. Treaties were concluded with the Makololo chiefs and with the Yaos round Blantyre and, following a brief encounter between Serpa Pinto and Maluri, a powerful Makololo chief, the Brit. Gov., on 21 Sept. 1889, proclaimed a Brit. protectorate over the Shiré dists. Johnston, in his journey up the lake, induced the 'Jumbe' or sultan of Kota Kota to put his country under Brit. protection and arranged similar treaties with Mlosi and other Arab and Wahonga chiefs. This work of Johnston was ratified in 1891 by an Anglo-Portuguese convention and, soon afterwards, a Brit. protectorate over the countries adjoining Nyasa was proclaimed. The protectorate of Nyasaland was confined to the Shiré and Lake Nyasa dists., the rest of the ter. under Brit. influence being placed under the Brit. S. Africa Co. In 1891 there were expeditions against slave-raiding Yaos at the S. end of the lake, while the next few years brought much trouble in the way of slave-trading and constant raids; but by placing 3 gunboats on the lake, the dispatch of Sikhs from India, and the recruitment of native troops, the slave trade was suppressed. In 1893 the name of the protectorate was changed to the 'Brit. Central Africa Protectorate,' but the old name N. P. was restored in 1897, by order in council amending the constitution. See also RHODESIA AND NYASALAND, FEDERATION OF. See H. L. Duff, *Nyasaland under the Foreign Office* (2nd ed.), 1906; W. P. Johnson, *Nyasa: the Great Water*, 1922; S. S. Murray, *A Handbook of Nyasaland*, 1932; L. S. Norman, *Nyasaland without Prejudice*, 1934; F. Debenham, *Nyasaland, Land of the Lake* (H.M.S.O.), 1955; Lord Hailey, *An African Survey*, 1957.

Nyborg, seaport on the E. coast of Fyn Is., Denmark, 17 m. ESE. of Odense. It is the terminus of the ferry to the is. of Zealand, and has a large oil depot. The castle, the oldest in Scandinavia (1170), suffered greatly from the attack of the Swedes in 1658; it was restored in 1923 and contains a museum. Pop. 11,320.

Nyctalopia, defect in the vision of people who can see distinctly in a faint light only, and not in bright daylight. The term is sometimes applied to the opposite defect of vision, by which some people are unable to see distinctly save in light of great intensity; this is 'night-blindness,' and is inherited as a Mendelian dominant character.

Nyíregyháza, tn of NE. Hungary, cap. of the co. of Szabolcs-Szatmár, 126 m. ENE. of Budapest (q.v.). It is the centre of the *Nyírség*, which is known for its tobacco and potatoes, and has furniture, cement, brick, and vegetable-oil industries. Julius Benzur (q.v.) was b. here,

and the Báthori (q.v.) family belonged to the dist. Pop. 53,000.

Nyírség, see NYÍREGYHÁZA.

Nyköping, seaport and the cap. of Södermanlän, Sweden, at the head of the Byfjord, on the Baltic, 98 m. SW. of Stockholm. Fifteen national diets were held at N. in the 13th to the 15th cents. It has a good harbour, and exports iron and zinc ore, timber, wood-pulp, and oats. There are engineering and textile manufs. Pop. 21,724.

Nylghau, Nilgai, or Blue Ox (*Boselaphus tragocamelus*), large antelope, found in central India. The male is slate or dark grey, darkening with age, the legs are black; the female is fawn or reddish brown. On the throat is a white patch and below it hangs a tuft of dark hair. The male is over 4 ft at the shoulders, but the back slopes down, as the hind legs are shorter than the fore legs. The female is about a third smaller, and lacks horns, which in the male are black, short, and erect. Though in the jungle it is a wary animal, in the more cultivated dists. it is very tame. Natives regard it as sacred. Its skin makes valuable leather.

Nylon, generic name for a whole class of new materials. The name itself, which has no etymological significance, was invented by the Amer. firm (E. I. du Pont de Nemours Incorporated) in whose laboratories N. was first made. N. has no exact counterpart in nature, although its chemical composition is akin to proteins. It is a product with its own characteristics and can be made up into various forms: powders, solutions, sheets, strands, and yarns. The following definition of N. has been accepted at H.M. Patent Office: 'Nylon is a generic term for synthetic fibre-forming polyamides, i.e. organic condensation products which contain a multiplicity of structural units linked in series by amide or thioamide groupings, produced by a process of manufacture in which non-fibre-forming organic substances of lower molecular weight are converted into products of such high molecular weight as to be capable of being formed into filaments, which, on cold drawing, form a true fibre structure recognisable by X-ray examination.'

Chemical basis. The building up of very long chain-like molecules from short molecules, a process known as 'superpolymerisation,' can be effected in many different ways. A method in general use is to form a particular superpolyamide, '66' polymer, by heating adipic acid and hexamethylene diamine together; water is eliminated during the reaction. The resultant polymer is called '66' because each molecule of these reagents contains 6 carbon atoms. The raw materials from which the diamine and adipic acid for making '66' polymer are obtained include phenol from coal, oxygen and nitrogen from the air, and hydrogen from water; hence the popular, though over-simplified, statement that N. is made from coal, air, and water.

Manufacture. N. yarn, used for many different textile purposes, is manuf. by an extrusion process. The polymer chips are

poured into a hopper and melted; the molten polymer is then pumped downwards through a spinneret, a metal disk containing fine holes. The thin streams of liquid forced through these holes are cooled by air currents and so become solidified into continuous filaments which are wound on to a cylinder. The yarn is next subjected to the process known as 'cold drawing,' mentioned in the Patent Office definition above. By this process the yarn is drawn out to 3 or more times its original length. During this stretching operation, the long chain-like molecules

British Nylon Spinners Ltd

BOBBINS OF NYLON AWAITING FURTHER PROCESSING

which make up the filament become oriented, so that they lie mainly parallel to the fibre axis and close to one another. It is this drawing operation which gives to N. the properties of a textile fibre; before this takes place the filaments are simply extruded polymer. The yarn is now ready for further processing, which varies according to the particular purpose for which it is required.

Properties. N. yarn has a combination of properties unique among textile fibres. One of the most notable is remarkable tensile strength combined with lightness in weight and a high degree of resilience. The tensile strength of N. yarns can be regulated during manuf., but N. is normally made into yarns considerably stronger than other textile fibres of the same dimensions. Compared with metal wires N. is twice as strong as the same size of aluminium wire. No other textile fibre in general use can equal N.'s elasticity. N. yarns are elastic up to about 8 per cent stretch, regaining their original length quickly. Above 8 per cent stretch a slight but permanent elongation occurs. Besides being strong and resilient, N. shows remarkable resistance to abrasion. This unusual durability has set new standards in the wearing qualities of a wide range of textiles. N. yarns have comparatively low moisture absorption, and therefore dry with unusual rapidity. The wet strength of N. is unusually high,

approximately 85 per cent of its strength when dry. N. fabrics are particularly easy to wash and clean; dirt comes away rapidly from the smooth cylindrical fibres. N. yarns resist alkalis and hydrocarbons, soap solutions, oils, and petroleum. They are attacked by strong mineral and certain organic acids.

A special property of N. yarns is that fabrics made from them can be set to any desired permanent shape by heat treatment with boiling water or steam under pressure. These heat-set fabrics show little or no shrinking or stretching. The melting-point of N. depends on the chemical composition of the particular N. concerned. Melting-point for most N. textile fabrics is approximately 480° F. N. yarn does not blaze when brought into contact with a flame; it fuses, forming a round hard bead. N. itself is not attacked by insects, micro-organisms such as bacteria and fungi, or mildew.

Uses. N. became famous for parachute fabrics and women's stockings, but it is now used for over 150 textile purposes, both domestic and industrial. N.'s particular combination of properties makes this yarn especially suitable for a wide range of uses. There is now a great variety of N. apparel fabrics, woven and knitted, and more are being developed. N. ropes and cords are well estab. Other industrial uses include nets, filter cloths, heavy duty canvases, tyre cords, and transport upholstery.

Centres of manufacture. All the N. yarn made in Britain is produced at Pontypool, Monmouthshire. Earlier development had been in continuous filament yarns, but N. staple is now being produced in appreciable quantities; this has extended the range and variety of N. products, particularly of blends with other fibres. N. yarns can be woven, knitted, or braided on normal textile machinery, so they can be used on existing plants. See PLASTICS.

Nymburk (Ger. *Nimburg*), Czechoslovakia in the region of Prague (q.v.), on the Labe (see ELBE). It has hydro-electric installations. Pop. 11,500.

Nymphaea, water-lily, genus of aquatic plants, chiefly of the N. hemisphere, family Nymphaeaceae, about 40 species; *N. alba*, the Common White Water-lily, and *N. occidentalis*, the Lesser White Water-lily, are native to Britain and N. Europe; cultivated varieties and hybrids, chiefly of *N. alba*, *N. lotus*, *N. rubra*, *N. capensis*, *N. caerulea*, and *N. mexicana* are widely grown in gardens.

Nymphæum (Lat. 'a temple of the Muses'), a pleasure-chamber, containing flowers, fountains, and statues, in a Gk or Rom. mansion.

Nymphs: 1. In Gk mythology, lesser goddesses with eternal youth, connected with the forces of nature, and generally with some divinity of higher rank: Artemis, Apollo, Pan, and Hermes. They were divided into the Oceanids, N. of the open sea, and Nereids, N. of the inland seas; Naiads, who presided over rivers, brooks, and lakes; Oreads, N. of the mts and grottoes, among whom was Echo; and

Dryads or Hamadryads, who dwelt in the forests and trees. See F. G. Ballentine, *Some Phases of the Cult of the Nymphs*, 1904.

2. In zoology nymph means the immature form of an insect, e.g. dragonfly, resembling the adult; it must not be confused with a larva (e.g. a caterpillar) which has a form entirely different from the adult, and in which the eyes are simple.

Nyon, small tn of the canton of Vaud, Switzerland, on the W. shore of Lake Geneva, about 12 m. north of Geneva. It stands at the junction of the railway to Geneva and Lausanne with the lines running into France. It has porcelain manufs. N. was the old Roin. colony of *Julia Equestris*. Pop. 8000.

Nyons, see DRÔME.

Nyren, John (1764-1837), Eng. cricketer and writer on cricket, son of Richard N., cricketer and captain of the famous Hambledon Club, Hants. N. was a moderate batsman and a good fielder at point and middle wicket, but his fame rests on his account of the Hambledon players in *The Young Cricketer's Tutor*, ed. by Charles Cowden Clarke (1833). This book, which is generally regarded as the classic of cricket literature, led Andrew Lang to describe N. as the Herodotus of cricket. There were numerous later eds., including *The Hambledon Men*, ed. by E. V. Lucas (1907). N. was a good

musician and one of the circle who met at the home of Vincent Novello.

Nysa (Ger. *Neisse*), tn of Poland, in Opole prov., on the Silesian Neisse (q.v.), 30 m. SW. of Opole (q.v.). It was formerly in Upper Silesia (q.v.). It was the cap. of a principality of the bishops of Breslau (see WROCLAW), 1198-1810, and was badly damaged in the Second World War. Chemicals, textiles, and machinery are manuf. Pop. 15,000.

Nysa (Polish riv.), see NEISSE.

Nystagmus, eye disorder consisting of an involuntary oscillation of the eyeball which may be either lateral, vertical, rotary, or mixed. It is present in disease of the labyrinth or semicircular canals which control the balance of the body. It is also present in some degenerative diseases of the central nervous system, and is one of the signs in disseminated or multiple sclerosis (q.v.). N. sometimes occurs in miners and is known as 'miners' N. This occupational complaint is thought to be a neurosis. Air pilots are specially tested for N. before being allowed to fly. See also EYE.

Nyx, personification of night, called Nox by the Romans. N. and Erebus are the offspring of Chaos, and parents of Aether and Hemera, pure air and day. N. was also the mother of Nemesis. She was a winged goddess in a chariot, and her residence was in Hades.

O, fifteenth letter of the Eng. alphabet, is the only vowel in the language which generally (but not always) corresponds in sound with the *o* of Ger., Fr., and other European languages. Besides the name-sound as in *cone*—a sound which is represented by a variety of spellings: *though*, *yeoman*, *roe*, *hauboy*, etc.—it has the short sound as in *lot*, and a third sound as in *none*, which links it with *u*. Indeed, A.-S. *as*, as well as *us* and *os*, is often transcribed in modern English by *o*. The N. Semitic alphabet, which was the prototype of the Greek, and thus of all the W. alphabets, had no vowel *o*; it was a purely consonantal alphabet (see ALPHABET). The Greeks obviated this difficulty by using the Semitic 'ayin, representing a Semitic sound (a kind of guttural breath), which did not exist in Greek. The reason for using 'ayin for *o* is not quite clear; at any rate it was the last letter still available for the purpose. The Greek and the Latin *o*, as well as the *o* of all the European alphabets, resemble in shape the early N. Semitic 'ayin much more than the 'ayin in modern Semitic alphabets (Hebrew or Arabic). In the primitive Gk alphabet the letter was used for *o*, *ou*, and *ō*. Later another symbol was devised for *ō*, namely *Ω*, called *omega* ('the big *o*') in Gk grammars to distinguish it from *o*, or *omicron* ('the small *o*'). Yet *omicron* and *omega* were not true pairs, for *o* + *o* contracted to *ou* (cf. *doulo-omen*; contracted form *douloumen*) and *o* was really a close, whilst *ω* was an open, sound. See ALPHABET.

Oahu, see HAWAIIAN ISLANDS.

Oak. There are about 250 species of *O.* (*Quercus*) widely distributed throughout the world. The best known and most important commercially are European *O.s*, including Eng. *O.*, Amer. *O.*, and Jap. *O.* Two European species, *Quercus robur* and *Q. petraea*, produce sev. varieties known as Eng. *O.*, Austrian *O.*, Slavonian *O.*, etc., and the quality of the timber varies according to the locality. In valleys with rich alluvial soil the predominating species is the Pedunculate *O.* (*Q. robur*), and a clear line of demarcation can often be distinguished when the Sessile *O.* (*Q. petraea*) takes the place of the Pedunculate at altitudes where the soil is poorer. The 2 trees are easily identified by the fact that the Pedunculate *O.* has its acorns borne on a long stem (botanically known as the 'peduncle'), while the Sessile *O.* has the acorns borne directly on the twigs.

The *O.* once covered large areas of Britain from Perthshire southwards, and has had a considerable influence on the development of the country, for its timber was vital to shipbuilding in the formative years of the country's sea-power. The last extensive planting occurred during the Napoleonic wars, but this stimulus to afforestation in Britain has ceased since

the middle of last cent. The *O.s* are not remarkable for height. In close canopy they may attain 100 ft, but in the open they do not exceed 60 to 80 ft. But they are very massive, with great girth, rugged bole, gnarled crooked branches, and a great spread of crown. They reach a great age, sometimes over 1000 years, and perhaps more. The leaf of the *O.* is oval, with deep rounded lobes, and in autumn the tint changes from bronze to pale brown. The flowers are borne in small groups on stalks which later bear acorns,

OAKN

A, Turkey oak; B, English oak.

each fruit fitted into the familiar patterned cup formed of fused bracts. *O.* timber is not only very hard and durable, but, owing to its broad medullary rays, shows most beautiful silver-grain, flower, or flash when cut 'on the true quarter.' To the true cutting of the timber the beauty of the old *O.* panelling is due. But *O.* timber, on account of its slow growth, does not pay to cultivate in most parts of Britain, though in combining the good qualities of other timbers it is unrivalled for certain purposes. See also HOG OAK; FORESTRY; TIMBER.

Oak-apple Day (29 May), day of the restoration of Charles II to the Eng. throne in 1660, specially celebrated at the Royal Hospital (q.v.), when oak-leaves or oak-apples are worn in memory of the king, who took refuge in an oak-tree while fleeing from his pursuers (6 Sept. 1651).

Oak-Fern, see POLYPODIUM.

Oak-gall and **Oak-apple**. No plant is more subject to the attacks of gall-producing insects than the oak, and the abnormal production of plant tissue takes many forms, which are remarkably

consistent in their variety. The beautiful gall-wasp (*Cynips kollari*), for instance, invariably causes the marble galls on young oaks by laying its eggs, which hatch into the fat grubs found inside the galls. Another (*Dryophanta scutellaris*) causes the formation of small cherry-like galls on the under surface of the leaves, usually along the midrib. A gall produced by *Cynips tinctoria*, found in S. Europe, was formerly used on a large scale in the manuf. of ink, but is now displaced by superior chemical processes.

Oak Park, residential vil. in Illinois, U.S.A., adjoining Chicago on the W., with manufs. of food products, tools, and dies. Pop. 63,500.

Oak Ridge, area in Tennessee, U.S.A., given over to a section of the atomic bomb project, and officially known as the Clinton National Laboratory until 1948; now O. R. National Laboratory. The plant, which covers nearly 60,000 ac., was set up in 1943 for the production of plutonium, considerations governing the choice of site being its distance from the coast and the proximity of Tennessee Valley Authority water and power supplies. In 1948 O. R. Institute of Nuclear Studies was organised by 14 member univs. Pop. 30,300.

Oakeley, Frederick (1802-80), Eng. tractarian; youngest son of Sir Charles O., one time governor of Madras. Educ. at Christ Church, Oxford, he was chaplain-fellow of Balliol College, Oxford, 1827, and prebendary of Lichfield, 1830. He joined the Tractarian movement, and became incumbent of Margaret Chapel, London, into which he introduced ritualism (1839-45). In 1845 he followed Newman (q.v.) into the Rom. Catholic Church. He was an original canon of Westminster diocese from 1852 to 1880. O. trans. the Lat. hymn *Adeste Fideles* as 'O come all ye faithful,' 1841. He pub. theological works before and after his conversion.

Oakham, co. tn of Rutland, England, in the vale of Catmose, 11 m. ESE. of Melton Mowbray. O. castle (12th cent.) has a good Norman hall. There is a school founded in 1584; it now accommodates about 300 boys, its constitution having been reorganised on public-school lines in 1875. The tn is a centre for hunting. There are manufs. of boots and shoes and knitted garments. Pop. 4000.

Oakingham, see WOKINGHAM.

Oakland, third largest city of California, U.S.A., co. seat of Alameda co., on the E. coast of San Francisco Bay, 6 m. from San Francisco. It is an important seaport, and shipbuilding, fruit-canning, and tanning are the chief industries. It has lumber-mills, oil refineries, and plants producing glass, cereals and feeds, beer, wine, chemicals, and building materials. It also manufs. cotton, woollen, and steel goods. O. is the seat of Mills College, the College of the Holy Names, and the California College of Arts and Crafts; the Chabot Observatory is also here. Pop. 384,575.

Oaks, The, see HORSE-RACING.

Oaksey, Geoffrey Lawrence, 1st Baron

(1880-), Brit. judge, educ. at Haileybury and New College, Oxford. He was called to the Bar by the Middle Temple, 1908, and took silk in 1925. From 1932 to 1944 he was a judge of the King's Bench div. followed by 3 years as a Lord Justice of Appeal. In 1947 he was appointed a Lord of Appeal in Ordinary. As Lord Justice Lawrence he was the Brit. president of the International Tribunal which tried Ger. war criminals at Nuremberg in 1945.

Oakum, hempen fibre made from old ropes, the best kind being produced from tarred ship's rope. It is used as a surgical dressing in emergencies, and for stopping leaks and caulking seams in ship construction. The name was once used to denote tow, a part of flax fibre.

Oamaru, chief tn of N. Otago, S. Is., New Zealand, situated on the E. coast and on the main N.-S. highway, 78 m. from Dunedin, and 152 m. from Christchurch. In 1853 the land on which the tn now stands was acquired as a grazing run. It was proclaimed a municipality in 1866 with a pop. of approximately 1000. Most of the streets, which are planted with trees, are named after Eng. or Scottish rivs. Many buildings in the business portion of the tn are built of O. stone, from the limestone quarries in the dist. The local stone deposits are the source of flourishing lime industries producing both carbonate of lime and burnt lime. There are 4 flour-mills, a woollen-mill, a freezing works, and engineering and joinery works in the dist. O. has a good harbour capable of handling overseas shipping. It has plentiful supplies of water, electric power, gas, and soft coal. Besides the primary schools there are 4 fine residential secondary schools. The surrounding dist. is a prosperous agric. community closely settled and generally well farmed. Pop. 9787.

Oarfish, species of large ribbon-like teleostean fishes (*Regalecus glesne*), remarkable for its shape and internal organisation. They are among the largest fishes known, most specimens observed measuring 12 ft in length, while some are recorded to have exceeded 20 ft. Like that of other members of this family the body of the O. is exceptionally elongated and compressed, and sword-shaped, but in the O. this feature is emphasised, for the length of the body is some 15-fold its depth. The O. has no scales on its body, it has a small mouth and large eyes, and a compressed head like that of a herring; its very long and many-rayed dorsal fin, whose foremost rays are enlarged into a crest, extends from behind the head to the tail fin, which is rudimentary (or even absent). The long slender ventrals, by which the O. is distinguished from the other ribbon fishes, become long paddle-tipped filaments. The range of the O. in the ocean seems to extend over all seas from the Mediterranean and N. Seas to the S. Atlantic, and from the Indian Ocean to the coast of New Zealand. During the past cent. and a half a number of specimens have been found stranded on Brit. coasts.

Oases (sing. **Oasis**), isolated fertile regions in deserts, caused by the presence of water. This may be due to springs, pools, or damp hollows in water-courses usually dry, or water-courses from beyond the desert not yet dried up. They are generally arranged along the foot of a range of hills or mts, or an outcrop of rock. Some are of large area, and form the homes of tribes. Many are being created by means of artesian wells.

Oast-house, building containing kilns for drying hops. The hops are placed on horse-hair covered floors, which are heated from below, and the O. is so constructed as to allow a constant draught of warm air to pass through and out at the top. Circular O.s with conical roofs are a feature of the hop-growing dists. of Kent, England.

Oastler, Richard (1789-1861), social reformer, *b. Leeds*, was articled to an architect, but became famous as the protagonist of the Ten Hours Bill in the campaign for factory reform. In 1830 children were employed in the worsted-mills for 13 hrs a day with an interval of half an hour, and in the woollen-mills 15 hrs with an interval of 2 hours. The struggle, which was aggravated by the tremendous slump in hand-loom weaving through which parents were reduced to living on their children, ended in 1847 with the passing of the Ten Hours Bill, which limited the actual work of all between 9 and 18 years of age to 10 hrs a day, exclusive of meal times. His was one of the chief names associated with this reform, others being John Fielden, Michael Sadler, and Lord Shaftesbury.

Oates, Lawrence Edward Grace (1880-1912), Brit. explorer, *b. Putney*. He was wounded in the S. African war, and joined Capt. Scott's Antarctic expedition (1910), being one of the final party which reached the S. Pole. On 17 Mar. O., who had been taken ill and feared that he would be a hindrance to his companions, deliberately left his tent to die. Scott in his diary commented: 'It was the act of a very gallant gentleman.' See also SCOTT, ROBERT FALCON. See E. R. G. R. Evans, *South with Scott*, 1921, and L. C. Bernacchi, *A Very Gallant Gentleman*, 1933.

Oates, Titus (1649-1705), conspirator, *b. Oakham*. Son of an Anabaptist preacher, who had taken Anglican orders at the Restoration. O. was expelled from Merchant Taylors' School after a year and was sent down twice from Cambridge, first from Caius and then from St John's—of which college he afterwards claimed to have been bursar. Having taken holy orders, he held sev. curacies and a naval chaplaincy, from which he was invariably dismissed for vicious conduct. The same thing happened also when he entered the Rom. Church. It was at this juncture, in 1678, that he concocted his story of a popish plot to murder the king, burn London, and slaughter the Protestants. He perjured himself by making an affidavit before Godfrey, the magistrate, and in spite of the palpable inconsistencies in his evidence succeeded in creating a panic, which led

to the execution of many innocent Rom. Catholics, and in securing for himself a pension of £600 and a suite of rooms in Whitehall. The Duke of York and the queen were victims of his slanders. In 1685 he was found guilty of perjury and condemned to life-long imprisonment with floggings. He regained his liberty and pension on the accession of William and Mary in 1688. See P. W. Sergeant, *Liar and Faker*, 1926, and Jane Lane, *Titus Oates*, 1949.

Oates Land, Australian Antarctic Ter., see ANTARCTIC AND ANTARCTICA.

Oath. An O. may be defined as a solemn declaration to a superior or divine being, or in the name of something held sacred, by which the declarant either undertakes to speak the truth or promises to do something in the future, on pain of calling down on his head divine or preternatural wrath. O.s of the former or assertory kind may be exemplified by the affidavit and the O. of a witness in a court of law; the latter or promissory kind by the O. of allegiance, by taking which a naturalised foreigner becomes a Brit. subject. By the Eng. law of evidence (q.v.) all oral testimony in any proceeding must be given upon O., except (1) under the Criminal Law Amendment Act, 1885, in the case of a child of tender years, where, in the opinion of the court, the witness does not understand the nature of an O.; and generally, in prosecutions under the various Acts for the prevention of cruelty to children, unsworn evidence of children may be accepted; (2) under the Oaths Act, 1888, every person who objects to being sworn on the ground either that he has no religious belief, or that the taking of an O. is contrary to his religious belief, may make a solemn affirmation in the prescribed form. The passing of the Oaths Act, 1888, was the result of the agitation of the celebrated Bradlaugh (q.v.), member for Northampton. The Act of 1888 effected the removal of the last of the tests for members of Parliament, the others being the O. of supremacy, the O. of abjuration, the O. of allegiance, and the declaration against transubstantiation. There were prior to 1888 Acts making provision for the taking of O.s by Quakers, Rom. Catholics, and Jews, but the Act of 1888 abolished the necessity for any religious beliefs in taking an O., whether by a member of Parliament or anyone else. At the present day the great majority of Eng. witnesses in the law courts still 'swear by Almighty God,' and kiss, or, since the Oaths Act, 1909, simply hold, a copy of the N.T. Jews swear on a copy of the Pentateuch, and keep their heads covered; Scots witnesses affirm with the hand uplifted, while Chinese witnesses require a saucer to be broken before their consciences will permit them to give evidence.

Oats as a food are very valuable, being well balanced in respect of protein, carbohydrate, and fat. They are rich in vitamin B₁ and are valuable for all classes of stock, while their value for human food has gained increased recognition. Boiled with water in the Scots fashion, oatmeal

porridge is a substantial, nutritious, and appetising dish. The origin of the cultivated species is unknown, none of them occurring in a truly wild state. The wild oat (*Avena fatua*) is supposed to be the original species. Two main races are recognised, viz. common O. (*Avena sativa*), with open spreading panicles, and Tartarian O. (*A. orientalis*), with contracted one-sided panicles. The white and black varieties of the latter are more productive in warm climates, and are favoured for their tall stiff straw. The varieties of the common O. differ chiefly in the colour and thickness of the husk, the shape of the grain, the period of ripening, the length of the straw, and the tendency to shed the grain when ripe. Other species are weeds. The bristle-pointed O. (*A. strigosa*) and the short O. (*A. brevis*) are sometimes, like the common O., grown as green fodder.

Oaxaca: 1. Pacific state and city of Mexico, at the S. end of the isthmus of Tehuantepec. The state is mountainous, broken in the interior, and tropical on the coast. Its red soil is well watered, and mining (of precious and other metals; coal and petroleum occur) and agriculture are the chief pursuits. Indian corn, coffee, sugar, cacao, wheat, fruits, tobacco, rubber, and indigo are produced. Area 36,370 sq. m.; pop. 1,422,717.

2. Oaxaca de Juárez, cap. of O. state, a city built by the Spaniards on the site of the Indian cap. It is situated in the central part of the state, on the Río Atoyac, at the foot of the jagged peaks of the Sierras that stand between it and the sea, at an elevation of 5034 ft. It is 230 m. S.E. of Mexico City, with which it is connected by railway and the Inter-Amér. Highway. In 1943 a 200-m. highway from O. to Matamoros (Puebla) was formally opened, and there is an airfield. The modern city remains even more Spanish and Indian than Guadalajara, with its early churches, old houses, and the descendants of Zapotec and Mixtec Indians in traditional costume and sandals in its modern streets. Porfirio Díaz (q.v.) was b. here. The church of Santo Domingo, with an interior which is regarded as the most superb example of Baroque decoration in Mexico, was founded by the Dominicans in the 16th cent. Its ceilings and interior are covered with gold and polychrome reliefs of remarkable richness. La Soledad (temple to the Virgin, Our Lady of Solitude, O.'s patron saint) is another massive 16th-cent. building. The markets of O. are noted for silverwork, pottery, serapes, and fruit and vegetables. Some 4 m. W. of the city are the ruins of Monte Albán, which was evidently once the cathedral of a whole Zapotec diocese, 'a cathedral without a cathedral town' for the Indians who lived in the valley. The Mitla ruins in a vil. of the same name (the anct. cap. of the Zapotec Indians) lie 26 m. N. from O. The Spaniards took the valley of O. in the 16th cent., and O., a vassal of the Sp. crown, was given to Cortés, marquess of the valley of O., as a grant. As a Sp. city O. prospered from

the vast agric. areas of the valley, and the precious metals of the mines. O.'s part in the political vicissitudes of Mexico is indicated by the fact that from its foundation in 1486 to 1876 it was besieged and taken 17 times. Pop. 29,300.

Ob', riv. in W. Siberia, rising in the Altay Mts (in 2 headstreams, Katun' and Biya) and flowing NW., then N. into the O. Bay (500-m.-long estuary) of the Kara Sea. Length from confluence of Katun' and Biya 2300 m., from the source of its main trib., the Irtysh (q.v.), 3500 m.; drainage area over 1,100,000 sq. m. Apart from the extreme upper reaches the O. is a typical plain riv., wide and slow, with many arms and is. It flows mostly through a marshy, forested area (see NARYN). The main tribs., besides the Irtysh, are the Chulym and the Tom'. The O. is navigable throughout its course and is chiefly used for transportation of timber, grain, and coal. The chief ports are Novosibirsk and Barnaul. Novosibirsk hydro-electric station (built 1954-7) is the first to exploit O.'s resources. O. was first visited by Novgorodians in the 11th cent., and was colonised by the Russians from the 16th cent. O. basin is an area of banishment (since the 17th cent.), labour camps, and rapid economic development.

Obadiah ('servant' or 'worshipper' of Yahweh), one of the 12 minor prophets. Nothing is known of him, and his book, the shortest of the prophetic writings, is at the same time one of the most difficult and interesting. Its 21 verses are directed against Edem and her behaviour to Judah when Jerusalem was captured and lots cast over it. The book shows parallels with Jeremiah too close to be due to coincidence. See (i. W. Wade, *Micah, Obadiah, Joel, and Jonah*, 1925, and G. A. Smith, *The Book of the Twelve Prophets*, 1928).

Oban, burgh and seaport of Argyll, Scotland, 30 m. NW. of Inveraray. The little is. of Kerrera shelters the excellent harbour from the Atlantic gales. The tn's picturesque situation at the foot of the hills and the proximity of Glencoe, the is. of Staffa and Iona, and the ruins of Dunolly and Dunstaffnage castles, have made it a favourite tourist centre. Prin. manufs. are whisky and tweed, and fishing is carried on. Pop. 6500.

Obbligato (It. = obligatory), instrumental part in a musical composition, performing an important soloistic function, usually in an accompaniment to a vocal solo. In Bach's Mass in B minor, for instance, the bass aria *Quoniam* has a horn O.

Oboresk, see SALEKHARD.

Obeah, system of magic prevalent among the Negro pop. of the W. Indian colonies, especially in Jamaica, and also in the S. U.S.A. It appears to have been introduced from Africa by Negroes who had been enslaved, and to those O.-men (or women) people resorted for the cure of disorders, seeking revenge, the granting of favours, the discovery of a thief or adulterer, and the prediction of future events. O. offers power over events and

is thus essentially magical, giving to the poverty-stricken and often oppressed peasant a means for obtaining redress against a hostile world. Historically it is important as a rallying point for rebellion. O. cults providing foci against the frustrations of slavery and, to-day, poverty. It is found in conjunction with the cults called Pocomania and Myal (qq.v.). See H. J. Bell, *Obeah: Witchcraft in the West Indies*, 1889; R. T. Banbury, *Jamaica Superstitions or the Obeah Book*, 1895; J. J. Williams, *Voodoo and Obeah: Phases of West India Witchcraft*, 1933; F. Henriques, *Family and Colour in Jamaica*, 1953.

Obeche (*Triplochiton scleroxylon*), large tree of tropical W. Africa. It produces a rather soft, light timber also called African whitewood because of its white colour. The timber has been used for coach-building, plywood manufl., shelving, and blackboards.

Obeid, El (Africa), see EL OBEID.

Obelisk (Gk *obeliskos*, diminutive of *obelos*, a spit), 4-sided monumental pillar with a pyramidal top derived from the *benben*, a squat O. representing a conical sand-hill, the seat of the sun god, the central cult object in the sun temple at Heliopolis. Always associated with sun worship, O.s were especially numerous at Heliopolis, but were later set up in pairs before temples as at Karnak, where 2 single O.s, one 109 ft. high, still stand. The earliest O. still in position is a 12th-dynasty O. at Heliopolis (68 ft.). Rom. emperors moved ser.; 12 are at Rome, 1 at Istanbul; 2 originally erected by Thothmes III at Heliopolis were taken by Augustus to Alexandria; one of these 'Cleopatra's Needles' was brought to London in 1877, and the other to New York in 1879. The O. in Paris, one of a pair of Rameses II which stood at Luxor, was presented by Mohammed Ali (1831). See R. Engelbach, *The Problem of the Obelisks*, 1923.

Oberalp Pass, in the Alps, on the borders of the cantons of Uri and Grisons, Switzerland. It attains a height of about 6730 ft., and connects Andermatt, above Goshenen, with the valley of the Vorder-Rhine to Disentis. With the Furka, it forms the chief route for tourists from the Simplon and Zermatt to the Engadine.

Oberammergau, Ger. Alpine vil. in the *Land of Bavaria* (q.v.), on the Ammer, 44 m. SW. by S. of Munich (q.v.). It is famous for its Passion Play (q.v.), which is performed every 10 years in fulfilment of a vow made by the inhab. in 1633 during a visitation of the plague. O. is a great wood-carving centre, and has a school to teach the craft. It has picturesque streets and brightly painted old houses. Pop. 5000.

Oberelchingen, see ELCHINGEN.

Oberhausen: 1. Ger. tn in the *Land of N. Rhine-Westphalia* (q.v.), near the Rhine and the Ruhr, 18 m. N. by E. of Düsseldorf (q.v.). It has important heavy industries, including the manufl. of iron, steel, machinery, ships, chemicals, and glass. The tn originated in 1846 as a halt on the Cologne-Minden railway, and

in 1862 its pop. was only 6000. Its outskirts are now practically a continuation of those of Duisburg (q.v.). Pop. 235,900.

2. Ger. tn in the *Land of Bavaria* (q.v.), a N. suburb of Augsburg (q.v.).

Oberlin, Jean Frédéric (1740-1826), Alsatian pastor and philanthropist, b. Strasburg, son of a teacher; studied theology, and became pastor of Waldbach in the Steinthal valley (Ban de la Roche), a wild, mountainous dist. devastated in the Thirty Years War. Its poverty offered scope for O.'s philanthropy, and he became known for his efforts to benefit the people spiritually and materially by new roads and bridges, an improved agric. system, substantial cottages for the peasantry, an itinerant library, and a number of vil. schools; he was in fact the founder of the first infant schools. He helped the Brit. and Foreign Bible Society in its efforts to disseminate the Scriptures in continental countries. See lives by Spach, 1866, and E. Bodemann, 1868.

Oberlin, vil. of Ohio, U.S.A., 30 m. SW. by W. of Cleveland. O. College was founded here in 1833. Pop. 7100.

Obermaier, Hugo (1877-1946), Ger. archaeologist, b. Ratisbon. He entered the Church in 1900, and in 1911 became a prof. at the Institut de Paléontologie Humaine in Paris. In 1914 he became prof. at Madrid, and conducted valuable and highly regarded prehistoric research in Spain and elsewhere on the older Stone Age and palaeolithic art. From 1938 to 1946 he was prof. at Fribourg, Switzerland, where he had been driven after the civil war in Spain. His pubs. include *Der Mensch der Vorzeit*, 1912, *El hombre fosil*, 1920, 1944 (Eng. trans. 1924), *Buschmannskunstliche Felsmalereien aus Südwestafrika* (with H. Kühn), 1930, and *The Cave of Altamira at Santillana del Mar, Spain* (with H. Breuil), 1935.

Oberon (Fr. *Alberon*, or *Auberon*, and Ger. *Alberich*, 'rich elf'), king of the elves. In England he is best known for the delightful part he plays with Titania, his wife, in Shakespeare's *Midsummer Night's Dream*. There is really no resemblance between this haughty little fairy and the ugly dwarf, Alberich, who steals the Rhine treasure in Wagner's *Ring*. O. is first called the 'roi du royaume de la féerie' in the 13th-cent. metrical romance, *Huon de Bordeaux*. His name is the title of a masque of Ben Jonson, 1616, an epic of Wieland, 1780, and an opera of Weber, 1826.

Oberon, outermost of the 5 satellites of Uranus (q.v.), discovered by Herschel in 1787. Mean distance 364,000 m. from the planet, periodic time 13 days 11 hrs, stellar magnitude 13.8.

Oberösterreich, see AUSTRIA, UPPER.

Obesity, abnormal excess of body fat. A certain accumulation of fat is normal, the main storage places being the subcutaneous tissues, the muscles, and in the abdomen. In states of undernourishment or in conditions in which the basal metabolic rate is increased the reserves of fat may be called upon to supply the

caloric requirements. O. usually results from a consumption of food, particularly fat and carbohydrates, which is excessive to normal requirements—requirements which vary from individual to individual. An active person requires more calories than one who is sedentary. In other cases the amount of O. seems to bear no direct relation to the amount of food intake. The endocrine glands play a part in the control of body weight. Thus there is a tendency to O. after middle age when endocrine function becomes less active. Inactivity of the thyroid and pituitary glands cause O.

Obi Group, see **MOLUCCAS**.

Obiter Dictum (Lat. 'said by the way'), expression used specially to denote those judicial utterances and decisions in the course of delivering a judgment which, taken by themselves, were not strictly necessary for the decision of the particular issues raised. In the language of jurisprudence an O. D. is of 'persuasive' and not 'authoritative' efficacy, when cited by counsel in support of an argument. Maine (*Ancient Law*) states that the anct Rom. jurisconsults, in the days when they were called upon to give *responses* or legal decisions on cases submitted to them, were in no way bound by the special facts of the case, but could multiply the data at pleasure, and so evolve a general rule from facts, both real and hypothetical. In other words, the formulation of legal principles of wide application was of greater importance than the mere settlement of the suitor's difficulties. But in the Eng. courts of to-day one of the most effective reasons that can be urged by counsel to prevail upon the bench to ignore a proposition contained in the law reports, is to show that it was not necessary or relevant to the decision of the matter in hand.

Object, see **SUBJECT AND SUBJECTIVE**.

Oblast, territorial administrative unit in the U.S.S.R., corresponding to a prov.

Oblates, in the Rom. Catholic Church, congregations of men and women, not professed monks or nuns, dedicated to the service of religion. The best-known congregation is that founded by St Charles Borromeo, Archbishop of Milan, in 1578, and now known as the O. of St Charles. They form a community of priests who put themselves in the hands of the bishop to be used where and how he wishes. The title O. is also given to lay persons who follow a rule of life under the direction of a religious order, although living outside the monastery or convent.

Obligation, term used in jurisprudence (q.v.) to denote the binding force of a legal contract (q.v.). With the Rom. lawyers an O. could have its source in delict (tort or actionable wrong), as well as in contract. The Rom. maxim, 'A nude pact gives rise to no obligation, but might be the basis of an exception,' meant that there were some agreements not falling under the recognised heads of contract, which were not enforceable, but were available as defences. Some nude pacts were, however, actionable, e.g. the *pactum constitutae pecuniae*, or agreement to pay

what one already owed. 'Natural O.s' were those which, devoid of a recognised legal force, had at least some moral claim to recognition, e.g. an agreement between a paterfamilias and anyone in his power, like a son or slave.

Obligation, Days (or Holidays) of, in the Rom. Catholic Church, days on which abstinence from servile labour and attendance at mass are commanded. These comprise all Sundays and (for England and Wales) the Circumcision, Epiphany, Ascension, Corpus Christi, SS. Peter and Paul, Assumption, All Saints, and Christmas Day. For Scotland, St Joseph and the Immaculate Conception must be added, and for Ireland the feasts of St Patrick and the Immaculate Conception.

Obook, or Obok, Fr. colony of E. Africa, on the Gulf of Aden, now called Fr. Somaliland (q.v.). The port of O. was acquired for France in 1862, but it was not till 1884 that it was actively occupied. It has been superseded by Djibuti.

Oboe (formerly *Hautboy*; Fr. *hautbois*), woodwind instrument with a double-reed mouthpiece and a conical bore. It is made of rose-wood or boxwood, and has 15 keys, exclusive of 2 octave keys which assist the production of the higher notes. The normal compass is from B \flat below the staff to about F' in alt., and includes all the semitones; the music is written in the G clef and the O. is non-transposing. The O. has great technical efficiency and rich, if somewhat penetrating and varied tones. It descended from the shawm, and was in full use by the 16th cent., though it remained primitive until the 18th cent., and was not fully perfected until the 19th cent. Two O.s, together with 2 horns, were the most constant instruments in the orchestra, apart from the strings, in the 18th cent. Bach was fond of both the *oboe d'amore* and the *oboe da caccia*, now obsolete. There is an 8-ft reed organ stop sometimes called the hautboy, and reproducing the tone of the O.

Obolus, or Obol (Gk *obolos*), smallest anct Gk coin, and the smallest Gk weight in common use. As a coin it was always equivalent to one-sixth part of a drachma, and was therefore worth about 1.625d., though the amount varied. As a weight it was again equal to one-sixth of a drachma, that is, to about 16 grains, although it fell to as low as 8.6 grains during the later Rom. empire.

OBOE

Obrecht, Jacob (c. 1452–1505), Netherlands composer, b. Berg-op-Zoom, studied at Louvain Univ. and became a priest in his home tn in 1480, but from 1484 held musical posts—that year at Cambrai from 1485 at Bruges, and 1491–6 at Antwerp. Seriously ill, he went back to Berg-op-Zoom, but returned to Bruges in 1498. He was obliged to resign in 1500, and after another spell at Antwerp in 1501–2 went to Italy for his health. He had already spent 6 months at the ducal court of Ferrara in 1487–8 and he returned there in 1504, only to die of the plague in 1505. His works are masses, motets, and *chansons*; a *Passion* according to St Matthew may be by him.

Obregón, Alvaro (1880–1928), president of Mexico; b. in Sonora of mixed Basque and Yaqui stock, worked as carpenter and farmer. After Madero was shot, O. joined Carranza against Huerta, 1913, defeated that president, and became minister of war; he defeated Villa in 1915. After Carranza's murder O. was president four years from 1 Nov. 1920, and was succeeded by his nominee Calles, 1924–8. Calles procured O.'s re-election, 1 July 1928; but O. was assassinated sixteen days later. *See also* MEXICO, *History*.

Obrenović, Serbian dynasty founded by Miloš O. (q.v.), which held power in Serbia from 1815 to 1903, except the years 1842 to 1858.

O'Brien, Kate (1898–), novelist and playwright, b. Limerick. Educ. at Univ. College, Dublin, she worked as a journalist in London. Her first novel, *Without My Cloak*, 1931, was awarded the Hawthornden and the Tait Black Memorial prizes. *The Ant-Room*, 1934, and *The Last of Summer*, 1943, contain shrewd pictures of the Irish temperament, with a background in co. Clare, while *The Land of Spices*, 1941, is an unusual and imaginative story somewhat marred by obscurity in the use of words. Other novels are *Mary Lavelle*, 1936, *Pray for the Wanderer*, 1938, and *That Lady*, 1946. Among her plays are *The Bridge*, 1927, and *The Schoolroom Window*, 1937. *Farewell Spain*, 1937, is a travel book.

O'Brien, William (1852–1928), Irish journalist and patriot, leader of the 'All for Ireland' party, b. Mallow, co. Cork. He estab. *United Ireland* in 1880, and ed. it with a view to popularising the aims of Parnell (q.v.) and the Land League (q.v.). He represented S. Tyrone, 1885–6; N.E. Cork, 1887–92; Cork City and N.E. Cork 1892. O.B. suffered continual imprisonments under the Crimes Act, in connection with the National League and Tenants' Defence League, 1887–91. At first an eager supporter of Parnell, he later veered round to the opposite side; but after he had sat on the Land Commission of 1903 he threw the whole weight of his influence into the scale of the conciliation policy, which looked towards the union of Irishmen of all creeds and classes. He represented Cork City again, 1910–18. At the election of 1918, he and his friends stood aside in favour of Sinn Féin (q.v.). Among his later books were *Evening*

Memories, 1920, and *The Irish Revolution and How it Came About*, 1923.

O'Brien, William Smith (1803–64), Irish patriot, b. Dromoland, co. Clare. He sat in Parliament, and, although a Protestant, favoured Catholic emancipation (q.v.). He joined the Repeal Association of Daniel O'Connell (q.v.), but in 1846 seceded to the Young Ireland (q.v.) party. In 1848 he led an abortive rising in Tipperary. He was captured and sentenced to death, but the sentence was commuted to one of transportation. In 1854 he regained his liberty.

O'Bruadair (Broder), David (fl. 1650–1694), poet, b. Limerick. He was a Jacobite and violent enemy of Protestantism and everything English. He was well versed in Irish hist. and literature, and the literary merit of his work as the bard of the Williamite wars is high. Nearly all of his 20 extant poems, which are written correctly in the difficult Irish metre (*Dan díreach*), reflect contemporary events. One of them, for example, is a 26-stanza political poem on Ireland's ills from 1641 to 1684; another is in praise of James II and dispraise of William of Orange, being dated 1688; another is on the exile of the native gentry after the siege of Limerick; and another, perhaps the most popular of all, is one whose first line trans. means 'O trooper, if thy desire be to rouse out from home.' Some of the poems were printed and trans. in the *Catalogue of Irish Manuscripts*, by Standish Hayes O'Grady (Brit. Museum). O.'s work was pub. in 3 vols. by MacErlain, in 1910–17.

Obscene Publications. The common law and statutory misdemeanour of publishing obscene matter is known to lawyers as obscene libel. The essence of the offence is not that the pub. complained of is a libel but that it contains obscene matter. The test of obscenity has been defined by Chief Justice Cockburn as the tendency of the matter charged as obscenity to deprave and corrupt those whose minds are open to such immoral influence and into whose hands a pub. of this sort may fall. A book may shock or disgust readers without necessarily being an obscene libel. Although the prin. object of prosecutions is to prevent the corruption of the morals of the young, Mr Justice Stabile in *Regina v. Secker & Warburg*, 1954, rejected the notion that literary standards should be of a level suitable for a 14-year-old schoolgirl. He added that many works of great literature are wholly unsuitable for reading by adolescents, but that did not mean that the publisher is guilty of a criminal offence in making them available to the general public. There is some doubt whether obscenity must depend on the dominant effect of the whole book or on the corrupting influence of selected passages. It has, however, been held that, notwithstanding the innocuous contents of a book, its dust jacket may taint the whole book with obscenity. The authors, publishers, printers, and distributors of obscene libels are liable to prosecutions, which may be brought by members of the

public; in practice, such prosecutions are usually by the police after consultation with the Director of Public Prosecutions. The jury must ignore the literary or artistic merit of an alleged obscene libel and confine itself to the question whether the work is likely to corrupt or deprave. It is not allowed to hear expert literary evidence and authors, as the motive of the author is irrelevant. Despite the sensible direction given by Mr Justice Stable to the jury in the Secker & Warburg case, which resulted in the defendants' acquittal, no author or publisher, however respectable, can ever be certain what magistrates or jurors may regard as obscene. As recently as 1954 the Swindon magistrates condemned the *Decameron* as obscene.

The Obscene Publications Act, 1957, empowers magistrates to order the destruction of books which they regard as obscene. They may issue a warrant authorising the police to enter premises believed to contain any obscene matter for sale and to seize any such matter found there. The occupier of the premises, usually a bookseller, is then summoned before the magistrates to show cause why the seized matter should not be destroyed. Booksellers often take the line of least resistance as neither the author nor the publisher may give or call evidence. The magistrates have complete discretion in reaching their decision and, even if the prosecution offers no evidence as to obscenity, may make a destruction order. If the defendant does not appeal within 7 days the destruction order is then executed. There are several other statutes dealing with O. P. The Vagrancy Acts, 1824 and 1838, make it an offence to hold indecent exhibitions. Advertisements dealing with venereal diseases unless sanctioned by local authorities or the Ministry of Health come within the Acts prohibiting the exhibition of indecent writings or prints. The Customs Acts, 1876 and 1952, prohibit the importation of obscene matter and render the importer liable to maximum penalties of a £100 fine and 5 years' imprisonment and to seizure and destruction of such matter. If the owner is not the importer, the customs authorities must notify him in writing that they have impounded the offending matter. Should he make a written claim for his property, it must be taken before the courts for a finding of obscenity or returned to him. The Post Office Act, 1953, prescribes penalties for sending indecent matter through the post or indecent messages by telephone or telegram. The Judicial Proceedings (Regulation of Reports) Act, 1926, prohibits the pub. of indecent matter in reports of any court proceedings and limits the details which may be included in reports of matrimonial cases.

The Society of Authors and other bodies have for some time been demanding that the law of obscene libel should be reformed. Lord Lambton on 21 Nov. 1956 introduced an Obscene Publications Bill which he later withdrew on an undertaking from the Gov. to refer the matter to a Select Committee. The Bill provided

a wider and more up-to-date definition of obscenity. A pub. would be deemed to be obscene (a) if its dominant effect was reasonably likely to deprave and corrupt persons to whom it was intended to be distributed, circulated, or offered for sale, or (b) if, whether or not related to any sexual context, it unduly exploited horror, cruelty, or violence.

Authors and publishers would be permitted to call expert evidence as to the literary or artistic merit or medical, scientific, legal, or political character or importance of allegedly O. P.s. Maximum penalties would be prescribed; at present there are no limits. Obscene libel would cease to be punishable at common law. Customs authorities who seized imported matter considered obscene would be obliged to apply within a reasonable time for a destruction order or return it to its owner. In any proceedings for a destruction order, authors, publishers, and printers would have the right to be heard on the question whether the offending matter was obscene. The foregoing proposals were strongly supported by many witnesses who gave evidence to the Select Committee which was appointed in 1957. Although opinions on detailed charges in the law may differ, the general trend of the evidence evinced a strong desire to protect genuine literary merit from squeamish censorship, but to punish the pornographer. See N. St John-Stevias, *Obscenity and the Law*, 1956.

Obscurantists (Lat. *obscurare*), term applied at the time of the revival of learning to those who were opposed to all new views, irrespective of their origin, by reason of religious prejudice. The word 'obscurantism' is derived from the pub. in Germany in 1516-17 of *Epistolae obscurorum virorum* (q.v.) against some monks of Cologne. It is still applied sometimes to opponents of progressive ideas.

Observants, see FRANCISCANS.

Observation, mental act whereby the intellect becomes aware of sense data, existents, and universals. Awareness may be defined as a direct cognitive relation with an object. Sensory O. is limited to the direct acquaintance with sense data. When we see a colour or hear a sound our direct cognitive relation is with that colour or sound as such. It is only by a further mental act that we become aware of the objects which causes the sense data of colour and sound. This act is known as perception. Perceptive O., of which sense data are a *sine qua non*, is that form of awareness which we have of particular existent objects. Thus when we see the moon sensory O. makes us aware of light over a defined surface; it is by perception that we have a direct cognitive relation with the luminous object which by convention we call the moon. Further, in the act of introspection we are often aware not only of certain objects, but also of those objects in various cognitive and conative relations with ourselves. We may perceive not only the moon, but also ourselves as perceiving agents; we may desire the satisfaction of

some appetite and at the same time perceive ourselves as desiring. Awareness, however, is not limited to sense data and existent particulars. It extends also to universals, and to universal relations. We are aware not only of red objects, but also of redness; not only of an object preceding another, but also of before and after. Nevertheless, awareness of these universals does not of itself prove the existence of an object partaking of such universals. *See also* EPISTEMOLOGY.

Observation, Errors of, *see* ERRORS.

Observatory, institution for the scientific observation, by means of highly specialised instruments, of natural phenomena, the conditions of which cannot be controlled by the scientist. O.s are classed as astronomical, magnetic, meteorological, tidal, and seismic and volcanic. Astronomical O.s date from very early times if we include obelisks, pyramids, temples, and stone circles, all of which had undoubtedly astronomical uses. The Chinese Emperor Huang-Ti (2698-2598 BC) is said to have been responsible for the erection of a great O., but as it is now generally accepted that Chinese emperors prior to about 800 BC are legendary, this statement should not be taken seriously. The O. at Alexandria, founded in the 3rd cent. BC, and associated with the names of Hipparchus, who carried out his observations between 161 and 126 BC, and of Ptolemy, who lived at Alexandria about the middle of the 2nd cent. AD, is usually considered the first, and continued until nearly the end of the 2nd cent. During the Middle Ages a number of O.s were founded in Muslim lands, amongst which may be noticed those at Damascus, Bagdad, Meragha, and Samarkand. The first European O. was that erected at Nuremberg in 1427 by Bernhard Walther, a wealthy citizen, who had the co-operation of John Müller, known as Regiomontanus, a very capable astronomer. In 1561 Kassel O. was founded by William IV, landgrave of Hesse, and later Hven in the Sound, where the Dane, Tycho Brahe, inaugurated observational methods (1576-97) which proved invaluable to astronomers of later years. The first post-Galilean O. was that connected with the Univ. of Leyden (1632), and the needs of the art of navigation gave rise to the Paris O., completed in 1671, and to the Greenwich O., completed 5 years later; during this cent. Helvelius worked at his own private O. at Danzig, measuring stellar altitudes and making careful drawings of the moon. The Greenwich O. commenced magnetic and meteorological work in 1838 and special solar photography in 1873. It is a Royal O. presided over by an Astronomer Royal, as also is the O. at Blackford Hill, Edinburgh, founded in 1818 at Calton Hill and moved to its present site in 1896. Herstmonceux Castle, Sussex, was chosen in 1946 as the home of the Royal O., Greenwich. Owing to the growth of London, astronomical observations at Greenwich were restricted by the impurity of the atmosphere and the glare of the sky at night; for this reason the

removal of the O. from the London area became necessary for satisfactory observations. Normal work is now in progress at Herstmonceux. *See* RADIO-ASTRONOMY.

Other institutions in Great Britain include Univ. O., Durham; Univ. O., Oxford (1875); Univ. O. and Solar Physics O., Cambridge, the former founded in 1820 and the latter removed from S. Kensington in 1913, both now under one director; Univ. of London O., Mill Hill; Imperial College O., S. Kensington; Norman Lockyer O., Sidmouth; Univ. O., Glasgow (1840); St. Andrew's O.; Liverpool O. (tidal); besides many private O.s. In N. Ireland there is the Armagh O. (1791), and in Eire Dunsink O. (1785), now part of the Dublin Institute for Advanced Studies and supported by the gov. of the rep. In S. Africa are the Royal O., Cape of Good Hope; Radcliffe O., Pretoria; Union O., Johannesburg, and the Yale O. branch station; Bloemfontein O., branch of Harvard College O., and also the Lamont-Hussey O., a branch of the O. of the Univ. of Michigan. In Australia, New Zealand, and Canada there are O.s at Canberra, Sydney, Perth, Wellington, Ottawa, Victoria, Toronto (2), and Quebec.

France has O.s at Paris, Meudon, Marseilles, Nice, and Pic du Midi (a branch of Toulouse Univ. O.); Germany at Bonn, Gotha, Göttingen, Leipzig, Munich, Potsdam (2), Bergerdorf, Heidelberg, and Berlin; Italy at Rome and also in the Vatican city, Milan, Naples, Pola, and Sicily at Catania and Palermo; Spain at Madrid and Barcelona; Portugal at Lisbon; Switzerland at Geneva and Zürich; Hungary at Budapest and Kalocsa; Czechoslovakia at Prague; Austria at Vienna and Kremsmünster; Holland at Leyden; Belgium at Brussels; Denmark at Copenhagen; Norway at Oslo; Sweden at Lund; Poland at Cracow and Warsaw; Latvia at Riga; Estonia at Tartu (formerly Dorpat); Finland at Helsingfors; Russia at Leningrad, Pulkovo, Odessa, Moscow, Ivov (2), and Nikolaev; Greece at Athens; Turkey at Istanbul.

America has a very large number of O.s and only a few can be noticed, amongst which are Yerkes O. at Williams Bay; Mt. Wilson O.s (2; 550 ft and 5715 ft); Lick O. at Mt. Hamilton (4210 ft); Flagstaff O. (the famous Lowell O.) in Arizona; Harvard Univ. O.; Leander McCormick O., Virginia; Naval O. at Washington; Delaware O., Ohio; Ann Arbor O., Michigan; Berkeley O., California. The 200-in. telescope is now working at Mt. Palomar, California, and great results have been obtained from it. In Mexico there is the National O. at Tacubaya and in S. America there are O.s at Caracas, Córdoba, La Plata, Quito, Rio de Janeiro, Santiago, and Montevideo. In other parts of the world there are a few more O.s, amongst which may be noticed those at Helwan, Tashkent, Hyderabad, Madras, Kodakanal, Bombay, Kunming, Tsingtao, Hong Kong, Kami-Tamakami, Kyoto, and Tokyo.

The modern tendency in astronomy has been specialisation, but combined international work, especially on star cataloguing, is carried on. The Royal O., Edinburgh, does a considerable amount of work on spectrophotometry; Oxford Univ. O. specialises on solar work; Liverpool O. and Tidal Institute is concerned solely with tides; Imperial College O., S. Kensington, is used mainly for teaching students and carries out laboratory investigation of molecular spectra; Heidelberg, Potsdam, and many other O.s concentrate on astrophysics; the Dominion O., Ottawa, has recently devoted a lot of time to meteor investigation with the use of radar. The Univ. of Manchester at Jodrell Bank (q.v.) Experimental Station has already played a prominent part in charting the artificial satellites; the Lowell O. was specially built for planetary work, in particular on Mars.

Many large O.s have been estab. in comparatively recent times, and special developments have taken place in equatorial mountings. The tower telescope is a feature in these; this telescope does not move, but the light from the sun is fed into it by a coelostat. This is a mirror mounted in such a way that it turns on an axis parallel to the earth's axis, and at such a rate that it just counteracts the earth's rotation. The light is reflected on another fixed mirror, which then sends it downward to an object glass which forms an image in the laboratory at the base of the tower. Under the laboratory is a well from which the sunlight, directed upon a grating, is returned to the laboratory dispersed into spectra, where it can be examined. One tower at Mt. Wilson O. is 150 ft high and a smaller one is 60 ft high. The Astrophysical O. at Arcetri (Florence) has a tower 80 ft high and the Einstein tower of the Astrophysical O., Potsdam, is 50 ft high. This tower was erected in 1921 and was named after the famous scientist. See also TELESCOPE.

Magnetic observatories. The chief Brit. magnetic O. was the magnetic dept of the Royal O., Greenwich, but this has been moved to Abinger. Two other magnetic O.s (under the control of the Air Ministry) have been estab.: at Lerwick, Shetland Is., and Eskdalemuir, Dumfries. There is an Admiralty Compass O. at Slough, but the work there is mainly connected with the gyro-compass, not with the magnetic compass. The naval O.s in various countries devote particular attention to magnetic work, and important investigations on the subject have been made by polar explorers who have determined the magnetic N. and S. poles, but not always with great accuracy in the case of the N. magnetic pole. Aerial observations in recent times have given the position of the N. magnetic pole with much greater accuracy than that obtained by previous investigators.

Meteorological O.s are referred to in the article METEOROLOGY, and seismological O.s in the article SEISMOGRAPH AND SEISMOLOGY.

The *Nautical Almanac* once pub. a list of O.s each year; this ceased in 1941, but

the list has been continued in the 1955 and subsequent issues. The *American Ephemeris and Nautical Almanac* publishes a list every year.

'Observer,' oldest Eng. Sunday newspaper, founded in Dec. 1791 on a capital of £100 by a young Irishman, W. S. Bourne, whose elder brother, W. H. Bourne, managed the new paper's finances. By 1799 they had estab. the O. as the first successful Sunday paper, with a circulation in London and the provs. and a guaranteed delivery to Dublin as the weather permitted. Early in the 19th cent. the O. was acquired by W. I. Clement, a pioneer in the field of pictorial journalism and the first man to establish a newspaper syndicate. In 1870 it was bought by Julius Beer, a wealthy friend of Gladstone, and with his son he conducted the paper with such distinction that it achieved much of the status and quality for which it is known to-day. In 1905 the O. was bought by Lord Northcliffe, who appointed J. L. Garvin as editor; Garvin made the paper the foremost Sunday jour. in England and gained for it international prestige. The first Lord Astor acquired the O. in 1911; in 1945 the second Lord Astor, and his son the Hon. David Astor, vested the ownership of the paper in a trust. The present sale is about 600,000 copies.

Observer Corps, Royal, uniformed civilian organisation under the operational control of R.A.F. Fighter Command which reports movements of aircraft and also gives aid by reporting the positions of aircraft in distress or which have crashed. H.Q. are at Bentley Priory, Stanmore, Middx. The corps was stood down on 12 May 1945, at the end of the war, but was reconstituted on 1 Jan. 1947, on a spare-time basis. In the Second World War its membership was 32,000, including 6000 women, and it had a network of 1420 posts reporting to 40 operations rooms. Up to April 1941, when the title Royal was conferred upon it in recognition of its work in the battle of Britain, the corps was known as the Observer Corps. It was constituted as such in 1925, the members being special constables. In 1927 operational control passed from the War Office to the Air Ministry and in Aug. 1939 the Air Ministry also took over administration from the Home Office. To-day the R. O. C. forms a vital part of the first-line early-warning defence system of R.A.F. Fighter Command, and is also responsible for reporting radioactive fall-out for the information of the services and civil defence forces in time of war.

Obsessional Psychoneuroses are characterised by a continuous preoccupation with some apparently unimportant idea or group of ideas, to the comparative exclusion of most other interests and to the distress of the patient. They may be divided into (1) obsessive ruminative states and (2) obsessive compulsive states. Clinically these are distinguishable by the fact that in the latter the preoccupation manifests itself as a compulsion to some form of activity, which is always symbolic,

although frequently illogical or purposeless. Obsessional reactions tend to occur in the intellectual, critical, over-conscientious, and rather introverted type of personality. It is said that it would be difficult to develop an obsessional psychoneurosis without a relevant constitutional predisposition. The mechanism in the production of the obsessional psychoneurosis may be explained as follows. There exists in the patient's mind an idea or a wish, which is of such a nature that it is repugnant and intolerable to the super-ego, and whose relevant effect is therefore one of guilt or reproach. The ego endeavours to prevent such an idea from entering consciousness by substituting for it either another idea, which is indifferent in itself, or (in the compulsive variety) an act. The genesis of the condition is therefore a conflict between a wish and a fear. This subterfuge does not, however, enable the patient to get rid of the affect, which now attaches itself to the substitute idea or act, and thereby maintains the latter in consciousness, and accounts for its 'compulsive' quality. The treatment of the milder forms of obsessive rumination and compulsion is the same as the treatment of anxiety states in general. In the severe types of illness treatment is a much more difficult matter and usually some form of analytical psychotherapy is called for. See also PSYCHONEUROSIS.

Obsidian, dark-coloured vitreous lava or volcanic rock, of varying composition, resembling common bottle-glass. It is generally black, but may be brown, red, or grey, or a combination of these colours. All *O.s* have a low sp. gr. because they are acid rocks and non-crystalline, and their lustre is vitreous. When broken, *O.* shows a conchoidal fracture similar to that of glass, and yields sharp-edged fragments largely employed by primitive races for spear-heads, knives, arrow-points, etc. *O.* occurs in the Lipari Is., Iceland, Hungary, Mexico, the Yellowstone Park, New Zealand, Ascension, and the Caucasus. *O.* was worked as a gem-stone by the ancients and Romans, the prin. source of the stone for the whole Aegean area being the is. of Melos. At the present time it is sometimes cut and polished as an ornamental stone.

Obsolete Weights and Measures, see METROLOGY.

Obstetrics (Lat. *obstetriz*, midwife; from *obstare*, to stand before), that part of medicine which deals with pregnancy, childbirth, and the puerperium. Midwives are mentioned in the Bible, and birth stools or obstetric chairs were in use (Exod. i. 15-20). Until early in the 18th cent. the practice of *O.* remained almost entirely in the hands of midwives. The great Wm Harvey (q.v.) practised *O.* and had written on the subject in 1651, and Peter Chamberlen (the elder, 1560-1631, q.v.), a Huguenot refugee and one of the second of 4 generations of medical Chamberlens, had invented his obstetric forceps, the secret of which remained closely guarded until the last of the Chamberlens, Hugh, d. in 1728. But it was not until Richard

Manningham, who instituted lying-in wards in 1739, Sir Fielding Ould, who helped to found in 1710 the Dublin School of Midwifery, and Wm Giffard (1726), and Edmund Chapman (1733) began to specialize in the subject that so-called 'man-midwives' estab. an ascendancy in the practice of *O.* Perhaps the real founder of Brit. midwifery was Wm Smellie (1697-1763) (q.v.), a Scot who settled in London in 1739. During his 10 years there, 900 students attended his classes, and with them he attended 1150 labours. Smellie was one of the first to use the 'new' forceps, but such was the prejudice of midwives and patients against them that he used them seldom. Wm Hunter (q.v.) joined Smellie in London, and when the latter returned to his native country Hunter became the leading obstetrician. It was another 100 years before the next notable event in the hist. of *O.* James Young Simpson (1811-1870) (q.v.), an Edinburgh obstetrician, brought chloroform into use in childbirth. He was strongly attacked, even by some of his colleagues, not on medical but on moral grounds, it being said that chloroform would 'rob God of the deep earnest cries' of women in labour. Queen Victoria did much in a practical way to settle this controversy by allowing Dr John Snow (q.v.) to administer the anaesthetic to her for 2 of her confinements. The chief monument to-day of Sir J. Y. Simpson is the Simpson Maternity Hospital, Edinburgh. At the same time that Simpson was introducing chloroform, Ignaz Philipp Semmelweis (1818-65) (q.v.) was putting forward, in Vienna, his theory on puerperal fever. Obstetricians had long been familiar with this septic infection in the lying-in room and although no proper statistics were kept, it was, however, estimated that from 10 to 20 per cent of women contracted the infection, and that 30 per cent of those who contracted it died of it. Alexander Gordon in Aberdeen in 1795 had declared his opinion, based on observation, that puerperal infection was transmitted by doctors and midwives, but he could not explain how, and his forthright views made him so unpopular that he found it expedient to leave the city and join the navy. Twenty years later Gordon's ideas received strong support in America from Oliver Wendell Holmes, and in 1843 Holmes pub. his findings in a classic paper 'On the Contagiousness of Puerperal Fever.' Knowledge of microbic agents being lacking at that time, Holmes had no idea how the infection was being conveyed, but, like Gordon before him, he was convinced it was by human agency. He urged that any doctor who had attended one case of puerperal fever should not attend another until he had 'purified' himself. As in the case of Gordon, Holmes's views were also received with scepticism. This, then, was the background to Semmelweis's approach to the subject. He was on the staff of the largest maternity clinic in the world at the time, and this clinic, in Vienna, was built in 2 separate divs. In one the cases were

conducted by male obstetricians who taught students, and in the other female midwives delivered the cases. Semmelweis noticed that in the male div. there was at least 3 times more puerperal infection than in the female div. He came to the conclusion that the discrepancy was due to the fact that the male obstetricians and the students were in the habit of attending post-mortem examinations, and sometimes assisting in them, and then going straight to the lying-in wards to attend women in labour. Moreover they did not always wash their hands. Semmelweis, of course, did not know of bacteria any more than did Gordon or Holmes. He postulated the theory of 'cadaveric particles' and 'decomposed animal organic matter,' and he persuaded his fellow obstetricians at least to wash their hands in antiseptic before attending obstetric cases. This simple measure brought down the case mortality in the male div. to the same as that in the female div. Semmelweis, however, became unpopular with his colleagues, who never really accepted his views, and it remained for Pasteur (q.v.) in 1879, 14 years after Semmelweis's death, to give proof to what previously had been only supposition based on clinical observation. Pasteur identified the causative streptococcus from the blood of women with puerperal fever. A few years later Koch (q.v.) was able to grow the streptococcus on culture medium. From then on the story of puerperal fever became that of the investigation of the epidemiology of the disease—what was the source of the infection, how was it transmitted, and how did it enter the patient's system? The answer to all these questions was provided by the brilliant and patient work of many bacteriologists, and, from the answers, a policy aimed at preventing infection was formulated. Midwifery began to be practised with the same rigorous attention to asepsis as was followed in surgical operations. Accoucheurs wore masks, instruments, towels, and gowns were sterilised, and the wearing of sterile rubber gloves became *de rigueur*. This was the policy that was pursued between 1928 and 1935. It had results but not to the extent that had been hoped for, and the outlook for curing, as opposed to preventing, the disease seemed as remote as ever. Then came the discovery by G. Domagk in Germany of the red dye 'prontosil' and from this the development of sulphathiazole, the first of the 'sulpha drugs.' Their lethal action on the streptococcus of puerperal infection was dramatic, and the cure for this dread disease, which from 1880 to 1930 had killed 2000 mothers in England and Wales every year, was found. The antibiotics followed soon after, and by 1950 the number of deaths had fallen to 85, of which 64 had followed abortion.

Great though it was, the victory over puerperal fever was not by any means the only advance that was made in the field of O. Although the Medical Act of 1856 had included midwifery as one of the subjects in which it was necessary for a doctor to

quality in order to obtain registration with the General Medical Council, it was not until the beginning of the present cent. that O. began to be regarded as a branch of medicine in its own right. Previously the obstetrician's duties were regarded to be that merely of a dexterous manipulator. He seldom saw his patient until labour began, and in the lying-in room he was assisted by uneduc. and untrained women of the 'Gamp' type. The perpetuation of this state of affairs was fostered by Victorian prudery, which largely stifled any attempts at rational public discussion of what was regarded as an indelicate subject, but it was one which, nevertheless, vitally affected the health and welfare of the nation. Fortunately a few determined women, led by Miss Louisa Hubbard, banded together in 1881 and founded the Midwives Institute with a view to 'raising the efficiency and improving the status of midwifery' so that the mothers and babies of this country could get the better care they so sorely needed. From this small beginning there grew the College of Midwives, to become the Royal College of Midwives in 1947, with a membership (in 1955) of some 10,000 trained professional women with the status of practitioners of normal midwifery in their own right and accepting responsibility for 80 per cent. of all the deliveries in this country. Miss Hubbard and her friends were not alone in their agitation for better conditions for midwifery. The Brit. Medical Association made 2 attempts to promote Bills to regulate the practice of midwifery, and at last, in 1902, the first Midwives Act reached the Statute Book. The Act set up a Central Midwives Board to keep a register of midwives, to make rules for the conduct of their work, and to set minimum standards of professional educational attainment. Thus it was that out of chaos was created a body of trained, registered, and supervised women. The present low maternal mortality rate, which stood in 1955 at just over one per 1000 live births compared with about six per 1000 at 1900, is largely attributable to the midwives' skill. In the medical field the beginning of the cent. saw the dawn of the idea of preventive medicine in midwifery, and the era of antenatal supervision was ushered in (see under PREGNANCY). The new doctrine was greatly expedited by the shock to the national conscience caused by the revelations of a deplorable standard of national physique in the First World War. It was realised that to improve this a start should be made at the beginning and that healthy babies must have healthy mothers. Antenatal clinics were estab. by local authorities in the early twenties, and nowadays every pregnant woman has antenatal care. At the same period a nation-wide campaign against rickets was started, with the result that the frequency of deformed and contracted pelvis has been diminished to-day almost to vanishing point. Medical teaching in O. greatly improved from the beginning of this cent. and the final emancipation of

this branch of medicine was in 1928, when the Brit. College of Obstetricians and Gynaecologists was formed. This infant grew to full stature in 1938, when King George VI granted it the right to call itself 'Royal.' The diplomas of the R.C.O.G. are now the recognised portal of entry to specialisation in gynaecology and O. Together with the growth of O. as a speciality came the tendency for the number of confinements taking place in hospitals to increase. Many of the facilities for the practice of modern O. could be properly available only in institutions, and popular demand and medical prudence both dictated the wisdom of admitting to hospital those in their first pregnancy and those in whom antenatal examination suggested the possibility of some complication arising. For normal cases and those who have had previous pregnancies, domiciliary confinement has much to commend it. There is less risk of infection, and the services of midwives and of general practitioner obstetricians are available without cost to the patient under the National Health Service. Also available are health visitors, domestic helps, and other adjuncts to the welfare state. The relief of pain in childbirth has travelled a long way since Simpson's day, and all midwives are now trained in the use of analgesics. Inhalation of nitrous oxide gas and air, for long the standard analgesic, is now being displaced by 'trilene,' which is efficient and safe. 'Twilight sleep,' induced by the administration of the drugs morphine and scopolamine and once in vogue, has now been abandoned in favour of more modern and less harmful drugs such as pethidine.

Antenatal care and the early detection of abnormalities, together with an ever improving standard of health and physique in young women, have led to a marked reduction in the number of cases of childbirth needing operative interference in delivery. At least 80 per cent of all births are by natural means. The stillbirth and neonatal mortality rate, due in large measure to birth injury, has been practically halved in this country since 1928. A much improved technique in caesarean section (q.v.) and safe anaesthesia has made this operation one of choice in all cases in which there might be undue hazard to mother and child if delivery were left to follow its natural course. The special complication of toxæmia of pregnancy is described in the article on pregnancy (q.v.). Haemorrhage, antepartum and postpartum, is a complication which is one of the emergencies of O. Thanks to modern methods of blood transfusion and the arrangements for the immediate availability of blood of the right group in all parts of the country, this one-time nightmare of O. has to a large extent lost its terrors. Most hospital centres have an obstetric 'flying squad' equipped with all facilities for dealing immediately with an emergency domiciliary case should the call come.

The discovery by Landsteiner and Wiener in 1940 of the rhesus factor in the blood increased our knowledge of an

important condition known as haemolytic disease of the newborn. About 5 babies in every 1000 births suffer from it, and of these there is a risk that between 10 per cent and 80 per cent will be still-born. Those that survive show anaemia and jaundice at birth or developing within 24 hrs. The latter must not be confused with an ordinary physiological jaundice, which often develops harmlessly after about the third day of life. The cause of haemolytic disease of the newborn may be explained in the following way. The blood of 85 per cent of persons in this country is rhesus-positive and 15 per cent are rhesus-negative. When rhesus-positive blood is transfused into the blood stream of a person who is rhesus-negative, the rhesus-negative person develops antibodies in their blood (in the same way as antibodies are developed after vaccines). If at any time more rhesus-positive blood is transfused into an already immunised rhesus-negative person (i.e. one who has developed antibodies against rhesus-positive blood) the antibodies 'attack' the transfused rhesus-positive blood, destroying the red cells and liberating haemoglobin. This is known as 'haemolysis.' The signs of this haemolysis are jaundice, anaemia, and, in severe cases, death. In haemolytic disease of the newborn the same thing occurs. If the blood of the foetus is rhesus-positive and that of its mother rhesus-negative, and some of the foetal blood leaks into the maternal circulation across the placental barrier (see PLACENTA) then rhesus antibodies develop in the maternal circulation. These antibodies then pass back into the foetal circulation and produce haemolysis. It is important, therefore, that all pregnant women's blood group should be determined early in the antenatal period so that if it is rhesus-negative plans may be made to treat the baby should it happen to suffer from haemolytic disease when born. If antibodies are absent from the mother's blood at the thirty-fourth week of pregnancy then it is likely that the baby will not be affected. The only effective treatment for severe haemolytic disease of the newborn is what is known as 'exchange blood transfusion.' The baby's haemolysed blood is drained from it and at the same time fresh, normal blood is transfused into it. In mild cases simple blood transfusion without exchange may suffice.

Puerperal fever has been referred to earlier in this article. Other milder infections such as breast abscess and thrombophlebitis may affect the mother during the puerperium. Infections of mother and baby by the staphylococcus may occur and epidemics of penicillin-resistant staphylococcal boils and abscesses are not uncommon in maternity hospitals. Seldom serious, they nevertheless present a constant challenge to aseptic technique and are a continual reminder that, despite the antibiotics, bacteria have a way of keeping an ace or two up their sleeves. Modern practice brings the paediatrician and the obstetrician together in the management of

the newborn baby, particularly in those suffering from shock and in need of resuscitation, and in estab. of lactation, breast-feeding being the special concern of the paediatrician. The latter also advises in cases of premature birth, and considerable advance has been made in the rearing of premature babies.

Obuda, see BUDAPEST.

Obwalden, see UNTERWALDEN.

Ocarina, musical toy wind instrument of metal or terracotta, in shape resembling a goose's (lt. *oca*) egg. It was introduced into England by travelling Ger. or Tyrolean musicians, and sounds somewhat like a flageolet. There are 10 finger-holes, a whistle-like mouthpiece, and a large internal cavity. The Chinese *shüan* (c. 3000 bc) was perhaps its anct prototype.

O'Carolan, Turlough, see CAROLAN.

O'Casey, Sean (1884-), dramatist, b. Dublin. Reared in the Dublin tenements, which often serve as a setting for his plays, O'C. exploited the sheer comedy, coupled with intense tragedy, to be found by discerning eyes in those grim slum dwellings. He read omnivorously as a boy, and began to write in his early thirties. His Abbey Theatre career began in 1923. His *Juno and the Paycock*, produced in 1925, was a great success in London. It was followed by *The Plough and the Stars* in 1926. These plays estab. him as master of comedy and pathos on the grand scale, native in idiom and convincingly true. He was always an experimentalist and forsook the purely realistic theatre for fantasy, as shown in *The Silver Tassie*, 1928, and *Within the Gates*, 1933, both expressionist plays. 'Van Gogh,' he said, 'and particularly Cézanne, took from the extravagance of Cubism its possibilities and, uniting these with the greater possibilities of Realism and Impressionism, burst into a new art in painting. Now that is what I want to do in drama.' To those who relish propaganda on social and political problems these later plays were welcomed as masterpieces, but to others the excessive use of symbolic types in place of individual characters seemed to render them inferior as drama to his early works. O'C. has long been settled at Totnes. Other works include *The Shadow of the Gunman* (an early play), 1915, *Windfalls*, 1934, *Essays on the Theatre*, 1937, *Purple Dust*, 1940, *Oak Leaves and Lavender*, 1946, and *Collected Plays*, 1949. He also wrote a lengthy autobiography of which the separate parts are *I Knock at the Door*, 1939, *Pictures in the Hallway*, 1942, *Drums under the Window*, 1945, *Irishfallen Fare Thee Well*, 1949, *Rose and Crown*, 1952, and *Sunset and Evening Star*, 1954. See S. Gwynn, *Irish Literature and Drama*, 1936.

Occam, William of, see OCKHAM.

Occasional Conformity. The Test and Corporation Acts were designed to exclude non-Anglicans from certain public offices by making attendance at communion a condition of service. To evade this barrier many nonconformists adopted the practice of taking communion occasionally to satisfy the Acts. The Occasional Conformity Act of 1711 made this practice

illegal, but was repealed in 1718. An ann. indemnity Act, to permit nonconformists to hold office, was in operation from 1727 to 1829.

Oocleve, Thomas, see HOCLEVE.

Occlusion, absorption of a gas by a metal. Many solids are capable of occluding gases when in a molten state, and the gas so occluded is usually emitted on solidification. Certain metals, notably the platinum metals, have the property of absorbing gases without being fused, especially when the metal is in a finely divided state. Platinum black, for instance, takes up 100 times its volume of oxygen, and 110 times its volume of hydrogen; palladium absorbs over 600 times its volume of hydrogen; iron, cobalt, nickel, copper, silver, and gold exhibit the phenomenon of O. in a lower degree. The intimate contact of these gases when occluded leads to chemical combination, in which great heat is evolved. Thus a jet of hydrogen or coal-gas directed against platinum black causes the metal to glow, and the jet is speedily ignited. The large proportion of hydrogen occluded by palladium led to the supposition that a definite compound, palladium hydride, Pd₂H, had been formed, and recent chemical opinion confirms this. There are also hydrides Pd₃H and Pd₄H, but their compositions are not yet certain and they are merely referred to as palladium hydrides.

Occlusions, Cold and Warm, see METEOROLOGY.

Ocult Sciences, see MAGIC; NECROMANCY; WITCHCRAFT.

Ocultation usually refers to the concealment of a star or planet by the moon. By its eastward motion the moon eclipses the body, which disappears behind the E. limb and reappears at the W. In the first half of the lunation, the E. limb being dark and the star a mere point, the O. is sudden, forming a most accurate means of determining the moon's position, and thus assisting in ascertaining certain inequalities of a very complicated nature in the moon's mean motion. When the Greenwich time is known the long. of a place can be found by noting the instant of O. but the comparative rarity of these phenomena renders this method of little practical use at sea. The phenomenon is confined to a belt about 10° 17' wide in the heavens.

Occupational Diseases. There are few occupations entirely free from risk of disease. Even agric. and other workers are liable, in consequence of exposure to the weather and the sun's rays, to contract cancer of the skin (epithelioma). Writers, telegraphists, and typists are all liable to cramp of the hand, musicians may acquire callosities and emphysema, whilst clergymen, as well as housemaids, are said to be liable to inflammation of bursae associated with the knee joint. Clergymen also suffer from laryngitis, a disease which they share with teachers, singers, and public speakers. Medical men, in addition to the obvious hazards of infection, are reputedly prone to attacks of angina pectoris, perhaps in consequence

of the nervous strain to which they are subjected. The industrial diseases proper are governed by the Factories Acts, the most recent being passed in 1937 and 1948; the provisions of these Acts are supervised by inspectors of the Ministry of Labour and by examining surgeons specially appointed for the purpose. Most large factories now have their own medical and welfare workers. Many such diseases are subject to compulsory notification by medical practitioners; compensation of diseases and injuries is governed by the Workmen's Compensation Acts of 1925-46. Industrial diseases include anthrax, or wool-sorters' disease, which affects chiefly the lungs and spleen, and is often fatal; caisson disease, common in divers if they are released too suddenly from high pressures; cataract and emphysema, which occur in glass-blowers. Workers in mines, tunnels, and sewers are sometimes attacked by spirochaetal jaundice (Weill's disease) and by hookworm (ankylostomiasis, q.v.). Poisons which may affect workers include metals such as lead, arsenic, antimony, mercury, and nickel; non-metallic substances, as for instance phosphorus, carbon disulphide, and a large number of coal-tar products (benzene, aniline, trinitrotoluene, picric acid, etc.) used in dyeing and as explosives; gaseous poisons, e.g. chlorine, arsine, and the gases of coal-mines. Other very important O. D. are pulmonary tuberculosis, silicosis, and asbestosis, caused by the inhalation of foreign particles; also dermatitis, ulceration, and cancer of the skin induced by irritating chemicals, such as alkalis, paraffin, chromium salts, tars, oils, and the like. Finally mention should be made of the risks to operatives using radioactive substances in medical work and atomic bomb factories.

Occupational Therapy, psychological treatment, the success of which depends upon the transference of the patient's focus of attention from his disability to an objective centre, in this case to some congenial occupation. It originated as a treatment in mental hospitals, but it is becoming increasingly important in both general and mental hospitals. In mental hospitals activities are devised to hold the attention of the patient, and to encourage him to concentrate. In general hospitals O. T. is used whenever possible in conjunction with physiotherapy to stimulate circulation and muscle tone, and it plays an important part in the treatment of traumatic injuries, arthritis, tuberculosis, and paralysis. Among the many crafts which serve both to stimulate the interest of the patient, and at the same time to exercise special muscles, are weaving, spinning, table weaving, joinery, book-binding, leatherwork, pottery, rug-making, country dancing, and other recreational activities. Throughout the course of treatment the occupational therapist works under medical direction, in the early stages in co-operation with the nurses and physiotherapists, in the convalescent stage with technicians and recreational training experts, and in the final stages with industrial psychologists

and others. O. T. thus takes an important part in the eventual rehabilitation of the patient.

Experiments in O. T. were first carried out in Great Britain during the First World War, mainly by craft-workers untrained in the medical side. Between the 2 wars a group of people began to realise the importance of a specialised training for occupational therapists, and in 1930 Dr Elizabeth Casson founded the Dorset House School in Oxford. Other schools quickly followed, and the Association of Occupational Therapists was formed in 1936 with Sir Hubert Bond as president and Mrs Glyn Owens as first chairman. Membership is limited to those who hold the association's diploma, or that of an approved school obtained before the establishment of the association's examinations, the first of which was held in 1938. A fully qualified occupational therapist has a working knowledge of anatomy, physiology, psychology, and first aid, and also departmental management, general medicine, and surgery, together with some knowledge of either psychiatry, psychopathology, and O. T. applied to psychiatric conditions, or advanced anatomy and physiology, physical medicine, and orthopaedics, according to specialisation. Added to this is a knowledge of at least 10 crafts. See R. H. Finnegan, *Occupational and Physiotherapy*, 1948; E. N. M. O'Sullivan, *Textbook of Occupational Therapy*, 1955.

O'Ceallaigh, Seán Tomas, see O'KELLY, SEAN THOMAS.

Ocean and Oceanography. O.s or surfaces of continuous water, as distinct from the enclosed and shallow seas, cover about 140,000,000 sq. m., comprising 71 per cent of the total surface area of the globe. Their mean depth is estimated at 2080 fathoms (12,480 ft.), as compared with the mean height of the land, 375 fathoms (2250 ft.).

Distribution. In the N. hemisphere the proportion of land to water is 2 : 3; in the S., 1 : 4.7. There is a 'land hemisphere,' however, centred on the Bay of Biscay, in which the proportions are nearly equally distributed, and a 'water hemisphere' centred on the SW. Pacific, in which the water covers an area 10 times that of land. The arrangement of the O.s and the continents is an almost symmetrical alternation. The Arctic O. around the N. pole is antipodal to the high Antarctic continent. The S. circumpolar O. matches the almost complete ring of land round the Arctic basin.

The 2 great O.s, the Pacific and the Atlantic, cover sections of 150° and 90° respectively in the S. and then taper northwards between the continents to their shallow and narrow connections with the Arctic O. The Indian O. covers a sector of 120° in the S., and is enclosed by a semicircular sweep some 20° N. of the equator.

Importance. The greatest influence of the oceanic bodies of water is that of moderating and regulating the climatic conditions of the earth. They are the great source and store of moisture brought

by winds as cloud and rain to the lands. Their reactions with the sun's heat differ from, but delicately counterpoise, those of the land, and prevent the development of extremes of temp. in their bordering regions. In brief, proximity to the O.s determines to a very large extent the habitability, development, and even character of the pop. of certain regions, e.g. the monsoon countries of SE. Asia. The deep-sea fisheries centred off the banks or oceanic shallows are of vast importance, and the O.s also are of the greatest value as highways of commerce. The N. Atlantic O. may be regarded especially as one of the controlling factors in the supremacy and progress of the great W. European and Amer. peoples. Its contributing land margin is considerably more extensive than that of the Pacific

take place. The most striking fact is the uniformity of temps. at great depths in all lats., bottom temps. varying only from 30° F. in high lats. to 35–40° F. in the N. Atlantic and Pacific O.s. The freezing-point of sea water is about 28° F. In enclosed seas like the Mediterranean, anomalous conditions arise as the result of the presence of submarine barriers. Owing to the fact that the sun's warmth is not usually felt to a greater depth than 300 fathoms, there is a lag in the seasonal change of temp., and whereas in N. lats. the hottest time of the year is June, the water, on account of the slow warming up of the sea, does not reach its maximum temp. until Aug. There is a further lag in the warming of the deeper water, until at about 50 fathoms there is a complete reversal of seasons. There the hottest

WATER HEMISPHERE

LAND HEMISPHERE

or the Indian O., since much longer and greater rivs. drain into it. (For further special characteristics see ATLANTIC, PACIFIC, etc.)

Temperature. The mean ann. surface temps. of the O. vary from over 80° F. within the tropics to freezing-point in polar seas. The surface temp. of the sea changes markedly from place to place. In the tropics it is hot compared with the polar regions. The highest recorded temp. is 96° F. in the Persian Gulf, the lowest 28° F. in polar seas; and between these 2 extremes all temps. are to be found. The specific heat of sea water is high, and therefore, as compared with land, the O.s remain cool in summer and warm in winter, accounting indirectly for the oceanic climate of marginal lands. There is very little daily variation, and only a small ann. range of temp., a range of as much as 15° F. being exceptional at sea in surface waters. The vertical distribution of temp. has some notable features in common throughout the O.s. There is a small drop in the first 12 to 25 fathoms due to mixing by waves, a rapid decrease of temp. to about 200 fathoms, with a further slower fall to about 1200 fathoms, after which only slight changes

time of the year is in Dec., and the coldest about May–June. Below 100 fathoms there is no seasonal change at all in temp., and, year in year out, the conditions are uniform. From this depth downwards the temp. gradually falls until in the O. abysses it remains constantly at somewhere near the freezing-point.

Pressure. The pressure in the sea varies with the depth. At every 10 metres it is increased by one atmosphere, i.e. by one stone to the sq. in. In the great depths the pressures rise to 3 tons to the sq. in. Yet there is no part in the O.s in which animal life cannot be supported. The great pressures in the depths of the O. have a slight effect on the water's density, but, water being almost incompressible, the increase in density with depth is very small. One of the effects of living at these great pressures is that when animals are brought up quickly in a trawl they break to pieces on account of the sudden reduction of pressure. In the laboratory small unicellular animals have been subjected to pressures of as much as 600 atmospheres without suffering any apparent harm.

Light. The amount of light to be found at any depth of the O. depends on the

altitude and strength of the sun, on the weather conditions, and upon the turbidity of the water. It is seldom that all the light from the sun penetrates the actual sea surface; this only happens when the sun is vertically overhead and the sea perfectly calm. But the rays that do pass through the surface cannot penetrate to the bottom in very deep water. In the great O.s the darkness on the sea-floor, thousands of fathoms below the surface, is absolute, the light being absorbed completely by the water. But not all the different colours of which white light consists are absorbed to an equal extent; thus red rays are quickly absorbed but blue and violet light penetrates much further, while in clear O. waters, such as the Sargasso Sea, violet light may be present at over 500 fathoms, though its strength is necessarily very weak. An excellent example of the absorption of light by sea water is supplied by the celebrated cave at Capri called the Blue Grotto, within which everything is enveloped in the purest blue light. The explanation of this phenomenon is that the only light that can enter the cave itself has to pass first beneath the water which practically fills its narrow entrance. The blue colour of the sea is also due to the same phenomenon, for the colour of the water is due to the reflection of light upwards from the small particles suspended in the water; much of the remaining red and yellow light has become absorbed in this upward journey, and it is mostly the blue and green light which can survive to appear above the surface and so lend to the sea its typical hue. As all these rays of light are being absorbed in their downward passage it follows that the actual strength of the light is gradually being reduced as the water gets deeper. In the open O. the strength of light is too weak at 100 fathoms to support very much plant life, while below that depth few living plankton plants are to be found. None the less this upper layer of water, 100 fathoms thick, is sufficient to sustain a great mass of plant life that forms the sea's pasturage, and it is on the dead plants and organisms that have fed on them that the animals in the dark O. depths depend for their food.

Composition and salinity. Oceanic water contains nearly 200 times the dissolved salts of fresh water. Its 'salinity' is usually expressed as the amount of dissolved salts contained in 1000 parts of water, an average value being about 35 per 1000, or 3.5 per cent. Regions of heavy rainfall, slight evaporation, or large ingress of fresh water have a low salinity. In the Baltic Sea, for instance, the salinity is very low, being always below 29 parts per 1000. Down at the mouth of the Baltic, however, where it meets the North Sea in the Skagerrak, there is a considerable rise in the salinity due to the mingling of more saline waters from the North Sea itself and from water borne round by the drift of the Gulf Stream which penetrates the North Sea off the N. of Scotland. Regions of the trade winds and permanent anticyclonic conditions show high salinity,

but the enclosed seas, the Mediterranean and the Red Sea, are highest. The most striking contrasts of salinity, however, are a surface feature only, and are greatly reduced in deeper waters. In the case of the Dead Sea riv. water has been pouring down for thousands of years into a comparatively small lake in which constant evaporation is taking place, and, as a result, the enormous salinity of over 200 parts per 1000 has been reached.

The brine of O. waters consists of salt ions dissolved in the sea. On evaporation one kilogram of sea water with a salinity of 3.5 per cent will give salts in the following proportions.

Grams of salt crystallising from one kilogram sea water; salinity 3.5 per cent

Sodium chloride	27.213
Magnesium chloride	3.807
Magnesium sulphate	1.658
Calcium sulphate	1.260
Potassium sulphate	0.863
Calcium carbonate	0.123
Magnesium bromide	0.076

35.000

Density. This varies with both the salinity and the temp. on the surface. It also increases with depth from a mean of 1.025 at the surface to one of 1.028 at the bottom. Even small differences in density, however, have most important effects on oceanic circulation.

Depth. The greatest depth sounded (H.M.S. *Challenger*, 1951) is 5940 fathoms (6½ m.) in the Marianas trough, 200 m. SW. of Guam. The largest area is always that between 2000 and 3000 fathoms, 48 per cent in the Atlantic, 59 per cent in the Indian, and 65 per cent in the Pacific. Only 6 or 7 per cent exceeds 3000 fathoms, this comprising the elongate troughlike deeps; their breadth is of the order of 60 to 120 m. and their length one of several thousands of m. The majority of O. deeps have curved ground plans. These are especially abundant in the SW. Pacific. The Tonga trough and the Marianas trough are examples. The deepest sounding in the Atlantic is 5227 fathoms off Puerto Rico. Elsewhere the 'abyssal plain' has a configuration of depressions, rises, and plateaux, though details are only imperfectly known. At the margins it rises through the 'continental slope' to the 'continental shelf,' a sill of very varying breadth with a maximum depth of 100 fathoms. This has a very great influence on the tides.

The deposits on the O. bottom have been classed as follows:

(1) The *terrigenous*, including *littoral*, between high- and low-water marks, sands, gravels, muds, etc. *Shallow water and neritic*, less than 100 fathoms—the same plus organic remains. *Continental or hemipelagic*: blue mud, dark and slaty in colour, owing to the formation of ferrous oxide and ferrous sulphide from the ferric oxide in the presence of decomposing organic matter (shell fragments do not form a large percentage); red mud, in which the ferric oxide is sufficiently abundant

not to be completely reduced; and green mud, really another variety of blue mud characterised by the abundance of the green mineral glauconite of land or organic origin. Volcanic and coral muds and sands occur in the regions of volcanoes and coral formation.

(2) The *pelagic or deep sea*. These are oozes due to siliceous and calcareous organisms, mostly microscopic, including globigerina, very widely spread, especially in the Atlantic, pteropods, typical of the summits of rises, and diatoms (microscopic plants), covering an Antarctic belt and part of the N. Pacific. Red clay is found in the deepest parts of the O.s, especially the Pacific, while a local variety, radiolarian ooze, is limited to the deeper parts of the Pacific and Indian O.s. Around the poles, especially in the Antarctic O., the surface waters contain vast numbers of diatoms, each of which is enclosed in a delicate case of silica, and it is these minute plant 'skeletons' which form the prin. constituent of the deposits in these regions, hence called diatom ooze. Another type of deposit, which is strictly a variety of globigerina, is called pteropod ooze; it is named from the predominance in it of the limy skeletons of swimming snails known as pteropods or 'sea butterflies,' which are commonest near the equator, where this type of ooze is exclusively found, always in shallower water than globigerina ooze and, particularly, near coral is. and on submerged elevations far from land. Beneath a certain depth oozes with limy shells as their chief constituents are no longer found, all calcareous matter having been dissolved away. At the greatest depth of all even the silica of the minute animals known as radiolarians is dissolved and the deposits then consist exclusively of what Murray called 'red clay,' a true clay which has been formed by the prolonged action of the sea water on volcanic dust which is all that has remained after the long journey from the surface to the bottom. In this red clay are found spherules probably of meteoritic origin, and also the insoluble teeth of sharks and ear-bones of whales.

Circulation. The surface currents of the O. are due mainly to winds, though the shapes of land masses often control their direction. In each hemisphere great swirls (centred near Cancer and Capricorn) are formed by the agency of the trades and westerlies, clockwise in direction in the N. hemisphere and anticlockwise in the S. hemisphere. These induce minor counter-currents along the equator. In the Atlantic and Pacific warm currents run off to the N. and S. along their W. sides, and cold currents flow from the Arctic and S. O. along their E. sides towards the equator. A belt current circles the globe in the 'Roaring Forties.' In the N. Indian O. the currents change with the monsoons. The influence of these currents, together with the winds above them, is the determinant of climate for oceanic land margins, a marked effect being that in the tropics, where the E. continental margins are warm and

humid, the W. tending to desert conditions. The warm and cold branches in higher lats. produce climatic contrasts in similar lats., as, for example, between W. Europe and Labrador. Within the great 'whirls' are large areas of practically still water, covered with a mass of living, floating weed known as sargassum. In addition to the surface circulation (*see further ATLANTIC, PACIFIC, etc.*) there are sub-surface currents which have only recently been investigated. These movements are in the nature of creeps affecting distinct zones or layers of water, differing in temp., salinity, and density. There is a definite bottom creep of very cold saline water from polar regions to the equator. Slow and more or less vertical currents are set up by the 'welling up' of this water, compensated by downward movements of dense saline water near the tropics. There is still a great need, however, for a more complete and systematic study of O. waters and their circulation.

Life in the ocean is made possible by the oxygen and carbon dioxide dissolved in sea water. The surface waters are normally saturated with oxygen, containing from 4.5 to 9 c.c. per litre, depending on the salinity and temp. The longer sea water has been removed from the surface the less oxygen it contains. In consequence the oxygen content falls off at depth, though plunging currents carry oxygen down from the surface. Surface waters contain about one-tenth of a gm per litre of carbon dioxide absorbed from the air. Respiration of animals and rotting vegetation contribute carbon dioxide, while it is removed by the photosynthesis of plants in the sea. (*See further under BIOLOGY; BOTANY; FISH.*)

Scientific oceanographical investigation received its great impetus in connection with the laying of submarine cables about 1855. Kircher had in 1664 attempted a map of O. currents, but before that interest lay in the wind circulation. Saussure made observations of temps. at great depths in 1780. Rennell attempted a scientific account of the currents between 1742 and 1830, while Arctic exploration added to knowledge. Capt. Cook, Sir John Ross, and others took true deep-sea soundings, and Brooke in 1850 introduced a method of sounding and obtained a sample of bottom-deposit at the same time. In 1857 H.M.S. *Cyclops* made observations of temp. with a self-registering sheathed thermometer. M. F. Maury pub. his *Physical Geography of the Sea* in 1856, the result of investigations organised by the U.S.A. Hydrographic Office, and this led to similar research being undertaken by many countries. In England Forbes, Michael Sars, Wyville Thomson, and Carpenter gave a start to marine biology. Their work led to the dispatch of the great *Challenger* expedition by the Brit. Gov. for complete investigation of the O. This great voyage, 1872-6, led to a systematic scheme of oceanography and to great improvements in instruments and methods.

Other famous expeditions sent out by many nations include *Voragen*, Norwegian, in N. Atlantic, 1876-8; *Travailleur*, French,

Bay of Biscay, 1880-3; *Ingolf*, Danish, 1896; *Blake* and *Albatross*, American, Atlantic, Caribbean, and Pacific, 1877-1901; *Princess Alice*, Prince of Monaco, N. Atlantic, from 1888; *Valdivia*, German, Atlantic, Indian, and S. O.s, 1898-9; *Siboga*, Dutch, Malay Archipelago, 1900; *Meteor*, German, S. Atlantic, 1925-7; *Albatross*, Swedish, Pacific O., 1947-8. The expeditions of the *Gauss*, *Belgica*, *Scotia*, *Fram*, *Discovery*, *Discovery II*, etc., added immensely to the science of marine biology and to the knowledge of conditions, especially in Arctic and Antarctic waters. An International Council for the exploration of the sea and marine laboratories in many parts of the world have been estab.

Methods and instruments. The increasing study of the O.s has resulted in a great improvement of methods and instruments used in deep-sea work. For sub-surface work special instruments, the actions of which can be controlled, have to be employed. Thus for temp. observations reversing thermometers, registering at any desired depth, are used. Samples of water for the determination of salinity are obtained by sending reversing water-bottles down to any required depth. Many instruments are used for the measuring of the velocity and direction of currents. Drifting objects, like icebergs, wreckage, or drift bottles, give information regarding surface currents, but for direct measurements of under-currents Ekman's ingenious self-recording current meter is favoured. Hydrometers and densimeters are employed for the determination of density and relative densities of samples. One of the most important branches of oceanographical research is deep-sea sounding. A depth sounding on the *Challenger* with the stout hempen cable and lead took sev. hours. With the modern Lucas sounding machine steel piano wire is run out from the drum until the sinker touches bottom and becomes detached, when the depth is automatically recorded. The latest method, however, is by echo-sounding apparatus, with which continuous soundings can be taken by a ship under way. Depth is calculated by timing the echo, or sound wave reflected from the sea floor, produced by a controlled explosion in the ship's bottom. Cores of the rocks underlying the O. floor can be obtained by allowing a tube to fall to the bottom or by firing a tube from a gun arranged to go off when the apparatus reaches the sea bed. In the latest sampler, a piston is mounted inside a tube; the tube is released into the bottom deposits, which it can penetrate for as much as 75 ft. Information as to the deeper-lying deposits below the sea bed is obtained by geophysical work; seismic, gravity, and magnetic surveys of the O. floor have been made (see CONTINENT and GEOPHYSICS). Dredges and trawls, up to 50 ft span, are used for obtaining specimens of bottom life, while tow-nets and vertical nets and traps, which can be opened or closed at desired depths, and which are made of extremely finely meshed silk, are used to capture

animals and plants in intermediate waters. Many marine organisms are so small, however, that they have to be concentrated into drops for microscopic examination by large and hand centrifuges.

Permanence of the ocean basins. There has been much discussion as to the permanence of the deep O. areas beyond the limits of the continental shelf. The absence of geological representatives on land of the deep-sea oozes led to the theory of permanence, particularly elucidated by Wallace, Lord Kelvin, and Jukes-Brown. They have, however, been recognised in such oceanic marginal lands as Barbados, Cuba, Borneo, and elsewhere. The distribution of plants and animals appears to require the non-permanence of O.s or the presence of 'land bridges' across present O. basins. Wegener has postulated the shifting of continents in the geological past by the splitting up of a large primeval continent and the drift of its parts towards the equator and towards the W. This continental drift theory is based on the well-established difference in the composition of the continental blocks and the O. floor. The former consist of lighter rock materials making up the 'sial', and are supported in the denser materials of the O. floor termed the 'sima'. They may almost be compared to icebergs floating in water. See also HYDROMETER; NAVIGATION; RIVER; SEA; SEA WAVES AND SWELL; TIDES; WIND.

See W. C. Thomson and J. Murray, *Report on the Scientific Results and Narrative of Cruise of H.M.S. 'Challenger', 1882-1895, and Summary of Scientific Results, 1897*; A. Yonge, *The Seas*, 1944; T. A. Ryder, *Mother Earth*, 1948; F. D. Ommaney, *The Ocean*, 1949; F. C. Lane, *The Mysterious Sea*, 1949; P. H. Kuenen, *Marine Geology*, 1950.

Ocean Falls, tn of Brit. Columbia, Canada, 350 m. NW. of Vancouver. There are large pulp and paper works. Pop. 2700.

Ocean Island, situated in the Pacific Ocean, 0° 52' S., 169° 35' E. In 1901 the is. was taken under Brit. rule, and in 1916 was formally annexed to the Gilbert and Ellice Is. colony. It is very rich in high-grade phosphate; in 1921 the Brit. Phosphate Commissioners purchased the working rights from the Pacific Phosphate Co. The Japanese occupied the is. during the Second World War until 1945, deporting the pop., which numbered 2500. O. Is. is 6 m. in circumference. After the war the native pop. was resettled in the is. of Rambi in the Fiji archipelago.

Oceania, general or collective name for the groups of is. in the S. and central Pacific Ocean or S. Seas, comprising all those intervening between the SE. shores of Asia and the W. shores of America.

Physically O. includes all the is. from Australia to the Marquesas and the Low Archipelago, and from New Zealand to the Hawaiian group. The main divs. of the regions are the 3 large is., Australia, Tasmania, and New Guinea, and the 3 is. groups Melanesia (q.v.), including the Solomon Is. (q.v.) and New Hebrides and New Caledonia, Micronesia (q.v.), including the Carolines and Ladrones, and Polynesia (q.v.), extending from New Zealand to Hawaii. The most important group is the Australian chain or chains stretching from New Guinea to Macquarie Is. and including the Papuan is. and New Caledonia. The grouping into Melanesia, Micronesia, and Polynesia is a loose ethnic classification. Most of the small is. are coral atolls, though some are of volcanic origin. O. is divided among Britain, France, Japan, Australia, New Zealand, U.S.A., and Chile.

Oceanic Steam Navigation Company, see CUNARD STEAMSHIP COMPANY.

Océanie Française, see FRENCH OCEANIA.

Oceanus, in Homer, a great belt of riv. sweeping round the earth, and the father of all things, even of the gods. Herodotus and the later Gk poets, e.g. Euripides, identify him with the sea, and later he became synonymous with the Atlantic. Hesiod makes him the son of Uranus and Gaia, the husband of Tethys, and the father of all the great rivs., besides 4000 sea nymphs or Oceanides.

Ocellus, Lucanus (fl. c. 500 BC), Gk philosopher of the Pythagorean school, named from his bp., Lucania in S. Italy. A few fragments of his works are extant; but a treatise *On the Nature of the Universe* once attributed to him is now recognised as spurious. There is an ed. with commentary in German by R. Harder, 1926.

Ocelot, Panther-cat, and Tiger-cat are popular names applied to *Leopardus pardalis*, a species of Felidae found in tropical America. It is a beautiful animal, averaging in length from 2½ to 3 ft, and has a tail about 1 ft long; the colour is usually tawny, with dark spots or bars. The O. is a good climber, and feeds for the most part on birds caught in its native forests.

Oc-oo, site of an anc't city, about 110 m. NE. of Camau Point in modern Cochinchina (q.v.). The site covers 450 hectares and was excavated by Louis Malleret, 1942-5. The city fl. between the 1st and 9th cents. AD, and must have formed part of Fu-nan (see ANGKOR). Inscriptions found on small objects are written in the Brahmi script of Sanskrit. Architecturally heavy masonry was supported on timber, which latter has collapsed with the consequent ruin of the whole structure. The reason for the decline of O. is unknown. See G. Coedès, 'Fouilles en Cochinchine, le site de Go-Oc-oo,' *Artibus Asiae*, vols. x-xiii, 1947; L. Malleret, 'L'Art et la métallurgie de l'étain dans la culture d'Oc-oo,' *Artibus Asiae*, vol. xiv, 1948; R. Grousset, 'Traces des Romains en Indochine,' *La Revue Française*, Dec. 1949; 'Les Fouilles d'Oc-oo, Rapport préliminaire,' *Bulletin de l'École Française d'extrême Orient*, vol. xiv, 1951.

Ochil Hills, range of hills in Scotland, in Perthshire, Clackmannan, Kinross, and Fife, extending for about 25 m. from the Firth of Tay to Bridge of Allan. The highest summit is Ben Cleuch (2363 ft). Coal, iron, copper, and lead are found, and rich pasture is afforded to sheep and cattle.

Ochino, Bernardino (1487-1564), It. reformer, b. Siena. A friar at first, he was vicar-general of the Capuchins, but, fearing the Inquisition, because of his heretical sermons, he fled to Geneva, and attached himself to Calvin. He confirmed his conversion by marriage, and after travelling as a Protestant preacher, accepted from Cranmer a prebend at Canterbury, and pub. in Lat. his spirited *Tragedy or Dialogue* against the Pope. But his apology for polygamy and his attack on the Trinity discredited him with the Reformers, and eventually he d. a miserable death from plague in Moravia. See lives by K. Berath, 1892, and E. Negri, 1912; also A. Stucki, *Christus in Italien*, 1936.

Ochra, Okra, Gobbo, or Combo, names for the pods of *Hibiscus esculentus*, family Malvaceae, a tropical annual, cultivated in NW. India and America for food.

Ochre, name given to sev. varieties of native earths, which consist of a mixture of hydrated oxide of iron with silica and alumina. They range in colour from light yellow to brown. The incrustations of oxides of other metals, antimony, bismuth, nickel, etc., are also called O.s. though they are not so important. Red and yellow O.s. are prepared by grinding and washing, and are extensively used as pigments. O. is found in sev. parts of Great Britain, notably in Anglesey and Devon; also in Canada, France, India, and S. Africa. See PIGMENTS.

Ochs, A. Simon, see 'NEW YORK TIMES.'

Ochterlony, Sir David (1758-1825), Brit. soldier, b. Boston, Massachusetts. He joined the Indian Army in 1777, and first distinguished himself as the defender, with a small garrison, of Delhi against Holkar's invading army of 20,000 (7-16 Oct. 1804) until the siege was raised by Lake's army. He held the Sikhs in check on the NW. frontier, and eventually concluded a treaty of peace with their leader, Ranjit Singh (1808). In 1814, in the campaign against the Nepalese, he captured the fort of Nalagur, and followed up this success by taking Maláun, which was defended by the gallant and skilful Amar Singh, whom O. permitted to march out with his arms and colours and personal possessions. O. was made K.C.B., and, later, baronet, and given a large pension by the E. India Co. (1815). Later, taking the field against the Ghurkhas, he advanced on Khatmandu, and defeated them decisively at Hariharpur. The Nepalese then ratified the treaty which previously they had rejected (1816). For these services O. received the thanks of Parliament and the award of the G.C.B. His last campaign was against the Maratha chiefs and the Pindaris, and he succeeded in dividing the 2 major bodies of the Pathan forces without striking a blow (1818). See C. MacFarlane, *Our Indian*

Empire, 1844; J. C. Marsham, *History of India*, 1867; Sir G. Dunbar, *A History of India*, 1944.

Ochus, see **ANTAXERXES III.**

Ocimum, genus of half-hardy annuals and shrubs (family Labiatae), bearing whorls of white flowers. *O. basilicum* is the sweet or common basil, which is grown in kitchen gardens. See **BASIL**.

Ockham, or **Occam**, **William** of (1290–1349), called 'Doctor Singularis et Invincibilis,' nominalist philosopher, was b. at O., Surrey. He probably studied at Oxford as a member of the Franciscan house there, but not, as has often been stated, at Morton College. In Paris he became associated with the celebrated Marsiglio of Padua, on whose political opinions he exercised considerable influence. Like his master, Duns Scotus, whose rival in philosophy he afterwards became, he belonged to the order of Franciscans. O.'s eminence rests on his work in logic, in philosophy, and in political theory. In his political writings he supported the secular power as against the claims of the papacy, and was cited before a papal court in consequence. In philosophy he revived the tenets of nominalism in a modified form. 'O.'s Razor' is a dictum which states *Essentia non sunt multiplicanda praeter necessitatem*—Essences are not to be multiplied without necessity. There is no ed. of the complete works. The political works have been ed. by J. G. Sikes and others (1940 ff.). O. must not be confounded with Wm de Ockham, Archdeacon of Stow in 1302. See further **KNOWLEDGE**. See E. A. Moody, *The Logic of William of Ockham*, 1935, and M. H. Carré, *Realists and Nominalists*, 1946.

Ockingham, see **WOKINGHAM**.

O'Comhraíde, **Eoghan**, see **O'CURRY**, **EUGENE**.

O'Connell, **Daniel** (1775–1847), 'The Liberator,' Irish patriot and orator, b. Carhan, near Cahirciveen, co. Kerry. In 1798 he was called to the Irish Bar. As a lawyer he displayed an exceptional gift for examining witnesses, whilst his vigorous and earnest oratory exercised a powerful influence over the jurymen, as later over the House of Commons, to which he was returned in 1828. The year 1829 saw the emancipation of the Catholics (see **CATHOLIC EMANCIPATION**), a reform which would never have come so soon had it not been for O'C. In 1841 O'C. began his second and greater agitation, this time for the repeal of the union. Peel was then at the head of a Tory Cabinet, and O'C. realised that the Catholics of his country would win nothing from a Tory gov. The activities of the Catholic Association were revived, and huge mass meetings were everywhere organised. O'C. felt confident of success, when he was condemned to prison on a charge of sedition (1844). A few months later he was set free, but ill health and the devastating famine in Ireland combined to defeat his ends. He d. at Genoa on the way to Rome in 1847. See **IRELAND, History**. See lives by W. Fagan, 1847; M. Cusack, 1872; J. O'Rourke, 1875; J.

Hamilton, 1888; D. Gwynn, 1929; see also J. O'Connell (ed.), *Life and Speeches*, 1846; W. J. Fitzpatrick (ed.), *O'Connell's Correspondence*, 1888; R. Houston, *Daniel O'Connell: his Early Life and Journal*, 1906; M. MacDonald, *O'Connell and the Story of Catholic Emancipation*, 1929; M. Tierney, *Daniel O'Connell*, 1949.

O'Connell School, Dublin, secondary school for boys and the largest in the Rep. of Ireland. The foundation stone of this school was laid by Daniel O'Connell in 1828. It was primarily estab. as a model Catholic school for the city of Dublin. Many distinguished ecclesiastics as well as laymen have been educ. here.

O'Connor, **Fergus Edward** (1794–1855), agitator and Chartist, b. Ireland, and educ. at Trinity College, Dublin. He was called to the Irish Bar, but it is as a politician that he is remembered. He was an active supporter of the Reform Bill of 1832, and was returned to Parliament for co. Cork. After being unseated for lack of the required property qualifications he allied himself with the 'physical force' Chartists, and in 1846 was imprisoned for seditious libel. From 1847 he sat in the House of Commons for Nottingham, and led the great Chartist demonstration at Kennington in 1848; declared insane, 1852.

O'Connor, **Thomas Power** (1848–1929), Irish journalist and politician, b. Athlone, and educ. at Queen's College, Galway. He became a journalist in Dublin; later he became a sub-editor on the London *Daily Telegraph*, but gave this up for an appointment in the London office of the *New York Herald*. In 1880 he entered Parliament as member for Galway, and became a prominent personality in the Parnell party. In 1885 he ceased to represent Galway, and became M.P. for the Scotland div. of Liverpool. He remained so for the rest of his life, becoming Father of the House on the death of Campbell-Bannerman. He was made privy councillor, 1924. 'Toby M.P.' of *Punch* christened him 'Tay Pay.' His pubs. include *Lord Beaconsfield: a Biography*, 1879; *Gladstone's House of Commons*, 1885; *The Parnell Movement*, 1886; *In the Days of my Youth*, 1901; *Memoirs of an Old Parliamentarian*, 1929, and numerous essays. See life by Hamilton Fyfe, 1934.

Ocotea, or **Oreodaphne**, genus of tropical trees (family Lauraceae), bearing tough alternate leaves and racemes or panicles of small green flowers. *O. bullata* is sometimes grown in the greenhouse. *O. opifera* exudes a volatile oil.

Ocotlán, tn of Jalisco, in central Mexico, on the NE. shore of Lake Chapala (q.v.). O. is an agric. and food processing centre, and has an airfield. Pop. 14,300.

Octahedrite, see **ANATASE**.

Octahedron, see **POLYHEDRON**.

Octane (C_8H_{18}), name given to those hydrocarbons of the paraffin series which contain 8 carbon atoms. There are 18 compounds having this formula, many being known. The normal O., $CH_3(CH_2)_6CH_3$, is a colourless mobile liquid, sp. gr. 0.702 at 20° C., boiling point 125.5° C., and is found in petroleum. It may be obtained in the pure state by heating

oetyl iodide with zinc and dilute hydrochloric acid. It may also be synthesised by heating *n*-butyl iodide with sodium. Iso-octane (β -methylheptane) is a colourless liquid, boiling at 116° C., and has a sp. gr. of 0.7035; it may be synthesised by the action of sodium on a mixture of propyl and isoamyl iodides, and fractionally distilling the product.

Octane Number, percentage of an octane in a mixture of this octane with *n*-heptane which behaves, as far as 'knocking' in an internal combustion engine is concerned, with a petrol to be characterised by the O. N. The octane shows little tendency to 'knock,' but the heptane has a very low resistance to it. Hence a petrol with a high O. N. will not 'knock' easily.

Octave, interval in music comprising 8 notes of the diatonic scale, called the tonic, supertonic, mediant, subdominant, dominant, submediant, leading-note, and O. It has 4 intervals of a whole tone and 2 of a semitone in its diatonic form, or 12 semitones with the chromatic notes included. The O. of any note always has exactly double the number of vibrations per second of that note, giving the ear an effect of unison. There are usually 7 O.s in the pianoforte. In eccles. usage the O. of a festival is the period of 8 days including and following the festival, or the seventh day after it. Thus New Year's Day is the O. of Christmas Day.

Octavia: 1. Sister of the Rom. Emperor Augustus. She married first Marcellus, consul in 50 BC, and on his death (40) became the wife of Mark Antony, who quickly abandoned her for Cleopatra. To Marcellus she bore a son; to Antony 2 daughters, one of whom married into the Claudian house.

2. Daughter of the Emperor Claudius and Messalina, b. c. AD 40, and wife of Nero, who in AD 62 divorced her on account of her being barren, and later accused her of unfaithfulness. He had her put to death in the same year.

Octavo, term used in bookbinding for a book or sheet of printed paper which has been folded 3 times, or one-eighth of its original size, so forming 8 leaves or a section of 16 pages. The word O. is generally abbreviated to 8vo, and certain sizes of books are classified as foolscap 8vo, demy 8vo, royal 8vo, crown 8vo. See PAPER.

Octet, composition for 8 instruments, usually in sev. movements, and in some kind of sonata or suite form. An O. may also be vocal, but would not then be given the name O. as a title, and it would probably be merely an incidental section for 8 voices in a larger composition. Thus the double quartet 'Lift thine eyes' in Mendelssohn's 'Elijah' is only an O. in fact, while his O. for strings is one in name and form as well.

October (Lat. *octo*, eight), originally the eighth month of the old Rom. calendar, the year beginning in Mar. It retained its old name in the Julian calendar, but then became the tenth month with 31 days. The Slavs term it 'yellow month,' from the falling of the leaf, and an old name for it in Germany was 'wine month.'

In England it has long been the chief month for brewing.

October Revolution, seizure of power by the Bolsheviks in Russia on 7 Nov. (25 Oct. Old Style) 1917. The Military Revolutionary Committee of the St Petersburg Soviet (see SOVIETS), composed of Bolsheviks, Left Socialist Revolutionaries (see SOCIALIST REVOLUTIONARIES), and Anarchists, overthrew Kerensky's Provisional Gov. (q.v.) with the help of the Red Guards (q.v.), whereupon a new 'Provisional Workers' and Peasants' Gov.' was set up—the Council of People's Commissars headed by Lenin. See also KERENSKY; LENIN; TROTSKY. See W. H. Chamberlin, *The Russian Revolution*, New York, 1935, and E. H. Carr, *The Bolshevik Revolution*, vol. 1, 1950.

Octobrists, Russian political party, so called after the Imperial Manifesto of 17 Oct. 1905 which introduced the constitution. O. were right-wing liberals and drew their support from the right wing of the Zemstvo (q.v.) movement, business men, and liberal civil servants. Their leader was A. I. Guchkov. They were the majority party in the 3rd and 4th Dumas (see DUMA), and participated in the 'progressive block' (see CONSTITUTIONAL DEMOCRATS) during the First World War and in the Provisional Gov. (q.v.) in 1917.

Octomeria, genus of small epiphytals, tropical Amer. orchids, bearing yellow, purple, and white, spotted with red, flowers. They are grown in moist, fibrous peat and sphagnum in the warm greenhouse.

Octopus, name for species of di-branchiate cephalopods, with 8 arms and without the internal shell or 'bone' which is found in the mantle of many cephalopods. The body is oval or rounded, and the suckers are generally sessile. O.s are widely distributed on the shores of almost all temperate and tropical seas, and do not attain the great size of some of the squids, although the giant O. of the N. Pacific may have a span of 30 ft. The mature females are extraordinarily prolific, and may lay as many as 50,000 eggs in the course of a few days. The eggs resemble grains of rice in appearance, but are translucent and are attached to a common stalk in clusters of about 1000 each. These are fixed to a rock or stone, and, as Aristotle knew, the period of incubation is 50 days. The female watches over them with ceaseless attention the whole time. O.s spend the day-time lying hid in the shadow of rocks, but are more active at night. Their powers of colour change have often been observed.

Octoroon, see MULATTO.

Octroi, term used with special reference to the system of duties imposed on certain essential commodities coming into different dists. or municipalities, a kind of inland tariff. The system formerly prevailed in France and in sev. other continental European countries. Six principal classes of commodities were taxed in France, and 6 types of area existed (reduced to 3 in 1941) until the system was discontinued in Jan. 1949. Certain large

Fr. tns had abolished the O. before the Second World War; it was abolished in Paris in Aug. 1943. It was still operating in parts of Italy, the Iberian peninsula, and Austria, in 1946.

O'Curry, Eugene (Gaelic, **Eoghan O'Comhraidhe**) (1796-1862), Irish scholar, b. Dunaha, co. Clare. He was first employed in the topographical and historical section of the Irish Ordnance Survey, and in 1854 was appointed first prof. of Irish hist. and archaeology at the Catholic Univ. of Ireland. His *Lectures on the Manuscript Material of Ancient Irish History*, 1861, is one of the standard accounts of Irish medieval literature.

Oda the Good, St. (d. 958), Archbishop of Canterbury, b. E. Anglia of Dan. parents. He became archbishop in 942, and prepared the way for the monastic restoration under St Dunstan.

Odal, see ALLodium.

Oddfellows, members of a friendly or benefit society, whose fundamental principle is the obligation to render assistance to every member who applies for it in sickness, distress, or other misfortune. The largest order of O. in the world is the famous Manchester Unity Independent Order of O., estab. in 1810. This society, with the Grand United and sev. other orders of O., has long appropriated to itself this once generic name. Any respectable person not under 16 or over 50 may be proposed for membership by a subscribing member. There are also juvenile and female lodges and members. The contributions are graduated according to the age of the member, and benefits are payable throughout life or until pension age, according to the insurance effected. At the end of 1956 the Manchester Unity had a gross membership of 649,275 (including members overseas), with capital of over £34 million. Oddfellowship was introduced into the U.S.A. from the Manchester Unity in 1819; the Grand Lodge of Maryland and U.S.A. was formed in 1821. Connection was severed with the Manchester Unity in 1842, and the U.S. order rivals in influence the Manchester Unity, the 2 orders now having inter-fraternal arrangements. The first Canadian lodge was opened in 1843 at Montreal. There are many lodges in Australia, New Zealand, S. Africa, and other Brit. dominions, and in the U.S.A. Other branches flourish in France, Switzerland, Denmark, Norway, and Sweden. See also FRIENDLY SOCIETIES.

Ode (Gk *ōdē*, a song), rhymed or (rarely) unrhymed lyric, frequently in the form of an address, usually exalted and stately in style, and often in varied or irregular metres, the length being commonly between 50 and 200 lines. The term originally meant any poem adapted to be sung, and in anct Gk poetry there were 2 main types: the dignified lyric poem, such as Sappho's celebrated 'Ode to Aphrodite,' and the formal choral O. of Pindar and the dramatists, which employed elaborate though regular stanza forms. The lyric type was followed in Latin by Horace, whence it is sometimes called Horatian. In English he had many
